Uses: Production of methylene blue, vulcanization accelerator.

Shipping regulations: None.*

N-nitrosodiphenylamine (diphenylnitrosamine; nitrous diphenylamide) $(C_6H_5)_2NNO$.

Typical specifications: Yellow to brown or orange powder or flakes; m. p. 62 to 67°C; sp. gr. 1.23, insoluble in water; soluble in alcohol, acetone, benzene, and ethylene dichloride. Somewhat soluble in gasoline.

Containers: Fiber drums.

Uses: Retarder of vulcanization of rubber;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pesticide.

Shipping regulations: None. *

nitroso dyes (quinone oxime dyes). Dyes whose molecules contain the $-NO$ or $=NOH$ chromophore group in their structure and whose Colour Index is from 10,000-10,299 (2nd ed.)

nitrosoguanidine $ONNHC(NH)(NH_2)$. A yellow powder used as fuel in percussion primers. Shipping regulations: Explosive, class A. Initiating explosive label. Not accepted by express. *

nitrosonaphthol (naphthoquinoneoxime) $NOC_{10}H_6OH$. Several isomers are available; the following description is for alpha-nitroso-beta-naphthol, or 1-nitroso-2-naphthol.

Properties: Yellow needles. Soluble in alcohol and ether; insoluble in water. M. p. $110^\circ C$.

Derivation: By the action of nitrous acid on beta-naphthol.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Organic synthesis; prevention of gum formation in gasoline; analytical reagent.

para-nitrosophenol C_6H_4OHNO .

Properties: Crystallizes in light brown leaflets which decompose at $140^\circ C$. Soluble in alcohol, ether and acetone; moderately soluble in water. M. p. $140^\circ C$.

Derivation: From phenol by action of nitrous acid in the cold.

Grades: Technical.

Containers: Steel barrels kept tightly covered.

Use: Dyes.

Fire hazard: Ignites instantly when small amounts of acid or alkali are dropped into it; if impure it sometimes explodes by self-ignition; if ignited it burns explosively.

Shipping regulations: None shipped; for intra-plant transfer must be handled in tightly covered steel barrels.

nitroso rubber. Copolymer of tetrafluoroethylene and trifluoronitrosomethane, with unit structure $-(N(CF_3)OCF_2CF_2-)_n$.

Properties: Clear transparent gum, non-flammable, resistant to chemicals and solvents except the "Freons"; flexible at $-40^\circ F$.

nitrostarch (starch nitrate) $C_{12}H_{12}(NO_2)_8O_{10}$

Properties: Orange-colored powder; contains 16.5% nitrogen; highly explosive; soluble in ether-alcohol.

Containers: Steel drums or earthenware pots containing water.

Use: Explosives.

Shipping regulations: Various, according to whether dry or wet, and to solvent used.

High explosive, red, or yellow labels. *

beta-nitrostyrene $C_6H_5CH:CHNO_2$.

Properties: M. p. $58^\circ C$. Available as a 30% solution in styrene.

Use: Chain stopper in styrene type polymerization.

para-nitrosulfathiazole $NO_2C_6H_4SO_2NHC_2H_4NS$. A sulfathiazole derivative.

Properties: Pale yellow powder; odorless; slightly bitter taste; m. p. $258-266^\circ$. Slightly soluble in alcohol, very slightly soluble in chloroform, ether and water and practically insoluble in benzene. Freely soluble in solutions of fixed alkali hydroxides.

Grades: N. F. XI.

Use: Medicine.

nitrosyl chloride $NOCl$. One of the oxidizing agents in aqua regia.

Properties: Yellow-red liquid; b. p. $-5.5^\circ C$; yellow gas, poisonous; corrosive; decomposed by water.

Grades: Pure, 93% min.

Containers: Steel cylinders.

Uses: Synthetic detergents; catalyst; intermediate.

Shipping regulations: Non-flammable compressed gas. Green label. *

nitrosylsulfuric acid $ONOSO_3H$ with H_2SO_4 .

Properties: Clear, straw-colored, oily liquid. Approximately 40% nitrosylsulfuric acid and 54% sulfuric acid. Pure $ONOSO_3H$: crystalline, m. p. $73^\circ C$.

Grades: Technical.

Containers: Carboys; drums.

Use: In the manufacture of dyes and intermediates.

Shipping regulations: Corrosive liquid. White label. *

nitrotoluene $NO_2C_6H_4CH_3$ (methylnitrobenzene; methylnitrobenzol).

Properties: Soluble in alcohol, ether, and benzene; insoluble in water.

(a) meta-: Yellow crystals; sp. gr. 1.1570, m. p. $16^\circ C$; b. p. $230-231^\circ C$.

(b) ortho-: Yellow liquid; sp. gr. 1.163 ($20/4^\circ C$); m. p. $-9.55^\circ C$; b. p. $222.3^\circ C$.

(c) para-: Yellow crystals; sp. gr. 1.2856, m. p. $51.4^\circ C$; b. p. $237.7^\circ C$.

Derivation: (a) From meta-nitro-para-toluidine. (b) and (c) From toluene by nitration and separation by fractional distillation.

Grades: Technical.

Containers: Fiber drums; multiwall paper sacks; tank cars.

Uses: (a) Organic synthesis. (b) and (c) For production of toluidine, tolidine, fuchsine and various synthetic dyes.

Shipping regulations: None. *

para-nitrotoluene-ortho-sulfonic acid (4-nitrotoluene-2-sulfonic acid)

$NO_2C_6H_3(CH_3)SO_3H$.

Properties: Crystallizes from water in pale yellow prisms. Soluble in alcohol, ether and chloroform. M. p. $133.5^\circ C$.

Derivation: From para-nitrotoluene by sulfonation with oleum.

para-nitro-alpha-toluic acid. See para-nitro-phenylacetic acid.

meta-nitro-para-toluidine (3-nitro-4-toluidine) $NO_2C_6H_3(CH_3)NH_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** Orange-red crystals; soluble in alcohol and concentrated sulfuric acid. M. p. 117°C.
- Derivation:** From acetyl-para-toluidine by nitration.
- Method of purification:** Recrystallization.
- Grades:** Technical.
- Containers:** Fiber drums; multiwall paper sacks.
- Use:** Dyes.
- Shipping regulations:** None.*
- para-nitro-ortho-toluidine** (4-nitro-2-toluidine)
 $\text{NO}_2\text{C}_6\text{H}_4(\text{CH}_3)\text{NH}_2$.
- Properties:** Yellow crystalline solid. Soluble in alcohol and ether. M. p. 104°C.
- Derivation:** From ortho-toluidine by nitration.
- Method of purification:** Crystallization.
- Grades:** Technical.
- Containers:** Barrels; fiber drums, multi-wall paper sacks.
- Use:** Dyes.
- Shipping regulations:** None.*
- para-nitro-alpha-tolunitrile.** See para-nitro-benzyl cyanide.
- nitrotrichloromethane.** See chloropicrin.
- meta-nitrotrifluoromethylbenzene.** See meta-nitrobenzotrifluoride.
- 2-nitro-4-trifluoromethylbenzonitrile.**
Constants: B. p. 156-158°C (18-19 mm), m. p. 47-48°C.
- Derivation:** From a cyclic halogen compound by heating with copper cyanide in the presence of amines.
- Grades:** Technical.
- Use:** Dyes.
- meta-nitro-alpha, alpha, alpha-trifluorotoluene.**
 See meta-nitrobenzotrifluoride.
- nitrourea** $\text{NH}_2\text{CONHNO}_2$.
- Properties:** White crystalline powder; slightly soluble in water; soluble in alcohol or ether; m. p. 158-159°C.
- Derivation:** Urea nitrate and concentrated sulfuric acid.
- Containers:** Steel drums.
- Caution!** Decomposed by heat. Explosive.
- Shipping regulations:** Explosive, class A; high explosive label.*
- nitrous diphenylamide.** See N-nitrosodiphenylamine.
- nitrous oxide** (nitrogen monoxide, laughing gas)
 N_2O .
- Properties:** Colorless, sweet-tasting gas; nonflammable; condensable into a colorless liquid, sp. gr.: gas, 1.52 referred to air; liquid, 1.22 (-89°C); m. p. liquid, -102°C; b. p. -89.8°C; soluble in alcohol and concentrated sulfuric acid; slightly soluble in water.
- Grades:** Pure, 98.0% min, U. S. P. XVI.
- Containers:** Steel cylinders.
- Uses:** Anesthetic in dentistry and surgery; food aerosols.
- Shipping regulations:** Nonflammable gas. Green label.*
- "Nitrox."** ²⁹² See "Solvay Nitrox."
- nitroxanthic acid.** See picric acid.
- nitroxylene** (dimethylnitrobenzene)
 $\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NO}_2$. (a) 4-nitro-ortho-xylene; (b) 4-nitro-meta-xylene; (c) 2-nitro-para-xylene.
- Properties:** (a) Pale yellow, crystalline needles. (b) Yellow liquid becoming red-brown on exposure. (c) Pale yellow liquid becoming red-brown on exposure. Soluble in alcohol and ether; insoluble in water.
- Sp. gr.** (a) 1.139, (b) 1.135, (c) 1.132; m. p. (a) 29°C, (b) 2°C; b. p. (a) 258°C, (b) 246°C, (c) 240°C.
- Derivation:** By nitrating xylene, resulting in a mixture of the three nitroxylenes, consisting largely of the 4-nitro-meta-xylene.
- Method of purification:** Rectification.
- Grades:** Technical.
- Containers:** Iron drums.
- Uses:** Organic synthesis; gelatinizing accelerators for pyroxylin.
- Shipping regulations:** Poison, class B. Poison label.*
- "Ni-Vee."** ²⁸³ Trademark for nickel tin bronzes containing 5% nickel, 5% tin, 2% zinc and 0 to 20% lead, balance copper. Simple heat treatments applied to these compositions improve the cast strength. Useful in most engineering applications requiring strengths up to 85,000 psi tensile strength.
- nivenite.** A variety of uraninite (q. v.) containing rare earth metals.
- N. N. D.** Abbreviation for New and Nonofficial Drugs, an annual compilation published by the Council on Drugs of the American Medical Association. In general it lists the more recent drugs not included in the U. S. P. or N. F. This dictionary has descriptions of most of the drugs (those which are distinct chemical substances) in the 1960 N. N. D., and where the grade N. N. D. is cited, it means that material is in the 1960 edition.
- "NNO."** ⁸⁹ Trademark for glycerol mannitan laurate, used as a wetting agent and spreader for contact insecticides, insecticidal stomach poisons, and hormone sprays.
- "NNOR."** ⁸⁹ Trademark for a combination of "NNO" and rotenone, used for control of common greenhouse and garden insects.
- No.** Symbol for the element nobelium (q. v.). See also actinide elements.
- Noah's ark.** See cypridium.
- nobelium** No. Synthetic radioactive element number 102; one of the actinide series of elements; produced in a cyclotron by bombarding curium 244 with nuclei of carbon 13 accelerated to high energies. The original discovery was at the Nobel Institute of Physics in Stockholm, Sweden. The element has a half-life of only about 10 minutes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Like the other actinide elements of atomic numbers near 100, the element probably has properties similar to those in the rare earth metals.

noble laurel. See laurus.

noble metals. Gold, silver, mercury, platinum, palladium, iridium, rhodium, ruthenium and osmium.

"NOBS" No. 1 Accelerator. ⁵⁷ Trademark for a selected blend of N-oxydiethylene benzothiazole-2-sulfenamide and benzothiazyl disulfide. A delayed-action accelerator for use in furnace black-rubber stocks where processing safety is important.

"NOBS" Special Accelerator. ⁵⁷ Trademark for N-oxydiethylene benzothiazole-2-sulfenamide. A delayed-action accelerator for use in furnace black-rubber stocks where processing safety is important. Imparts greater scorch protection than "NOBS" No. 1.

"No Bunt." ¹⁴⁷ Brand name for a wettable powder seed disinfectant containing hexachlorobenzene.

Containers: 5-lb bags; 40- and 75-lb drums; liquid 1-gal jugs and 12 1/2- and 25-gal drums.

Uses: Control of covered smut of wheat and loose and covered smut of sorghum.

"Noctec." ⁴¹² Trademark for chloral hydrate (q. v.).

"No D-K." ²⁵⁶ Trade name for a wood preservative.

"Nogas." ²⁸ Trademark for metal pickling agent.

Properties: Amorphous brown powder, soluble in water and acids. Will give foam-producing solutions when dissolved in water or acids.

Containers: 65-lb fiber drums; 325-lb bbls.

Use: As an addition agent in acid pickling of iron and steel products to produce a foam blanket and to improve the atmosphere around pickling operations by elimination of acid mist particles usually given off by the pickling operation.

"Nolane." ³⁴² Trademark for 2,6-allyl-dichlorosilane-resorcinol, used for priming glass fibers, i. e., prior to laminating.

"Noludar." ¹⁹⁰ Trademark for a brand of methypylon (q. v.).

nonadecane $C_{19}H_{40}$ or $CH_3(CH_2)_{17}CH_3$.

Properties: Leaflets; soluble in alcohol, insoluble in water; soluble in ether; sp. gr. 0.777; m. p. 32°C, b. p. 330°C.

Grades: Technical.

Use: Organic synthesis.

n-nonadecanoic acid $CH_3(CH_2)_{17}COOH$. A saturated fatty acid normally not found in natural vegetable fats or waxes.

Properties: Colorless crystals; m. p. 68.7°C; b. p. 297°C (100 mm); soluble in alcohol and ether; insoluble in water. Synthetic

product available 99% pure for organic synthesis.

gamma-nonolactone. See gamma-nonyl lactone.

nonanal (pelargonic aldehyde; n-nonyl aldehyde; aldehyde C-9) $C_9H_{17}CHO$.

Properties: Colorless liquid with an orange-rose odor; sp. gr. 0.822-0.830; refractive index 1.424-1.429. Soluble in 3 volumes of 70% alcohol.

Containers: Glass bottles; 1-, 5- and 10-gal tins.

Use: Perfumery.

Shipping regulations: None. *

nonane (nonyl hydride) C_9H_{20} or $CH_3(CH_2)_7CH_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.722; b. p. 150.7°C; m. p. -51°C; refractive index 1.40561 (20°C); C. S. T. aniline 74.9°C; flash point 44°C.

Grades: Technical (95%); 99%; research.

Containers: Glass bottles, drums.

Use: Organic synthesis.

Hazard: Flammable liquid.

Shipping regulations: Red label not required. *

nonanedioic acid. See azelaic acid.

nonanoic acid. See pelargonic acid.

nonanol. See nonyl alcohol.

nonanoyl chloride. See pelargonyl chloride.

nondrying oils. See drying oils.

nonene. See nonylene.

"Non-Fer-Al." ²⁴⁴ Brand name for a high purity precipitated calcium carbonate.

Properties: Oil absorption, 30-35, density as shipped, 55-60 lbs/cu ft, wt/solid gal, 22.07 lbs; color, pure white; particle size, 5-10 microns.

Derivation: Precipitated calcium carbonate.

Containers: Multiwall paper bags, 50-lbs net.

Uses: Paint, plastics, rubber.

non-geminate. See gem-.

"Nonic." ²⁰⁴ Trademark for a line of non-ionic surface-active agents based on polyethylene glycol tert-dodecylthioether or related compounds.

Uses: Detergents, paper manufacture, grease removal, wetting agent, emulsifier; clouding agent.

nonionic detergents. See detergents, synthetic.

"Nonisol." ²¹⁹ Trademark for a series of nonionic surface-active fatty acid esters of higher polyglycols.

Properties: Light color, bland odor. Free fatty acid content is maintained at less than 3% and ash content less than 0.1%. Comparatively low melting points, high boiling points and low vapor pressure. Either soluble or readily dispersible in cold water; characteristically insoluble in hot water. Solubility in presence of electrolyte is good. All soluble in polar and semi-polar solvents with the exception of glycerine and glycols; solubility in aliphatic hydrocarbons varies inversely with water solubility. Stable to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

heating at 200°C or autoclaving.

Uses: Cosmetics; solvent emulsions; polishes; rust preventative oils; insecticide and agricultural sprays.

n-nonoic acid. See pelargonic acid.

nonoic acids. Acids of the formula $C_8H_{17}COOH$, of which there are many possible isomers. Pelargonic acid (q. v.) is the normal or straight-chain acid. Various mixtures of branched chain nonoic acids are recovered from the products of the Fisher-Tropsch process.

"Nonox." ²⁰⁶ Brand name for rubber anti-oxidant.

"Nonoxol." ²⁰⁶ Brand name for antioxidants for oils, fats and oxygenated soap powders.

non-viscous neutral oil. A neutral oil of viscosity lower than 135 S. U. S. at 100°F.

nonwoven fabrics. Staple lengths of any of the common textile fibers mechanically positioned into a random pattern, and then bonded with suitable resins or plastics to form sheets of the nonwoven fabric.

nonyl acetate $C_9H_{19}OOCCH_3$. Exists in numerous isomeric forms so that any one of several compounds may be indicated by this name and formula, particularly since the Oxo and Fisher-Tropsch synthesis have been developed. See following:

n-nonyl acetate (acetate C-9)

$CH_3COO(CH_2)_8CH_3$.

Properties: Colorless liquid, strong and pungent odor, sp. gr. 0.864-0.868, refractive index 1.422-1.426. Soluble in 4 volumes of 70% alcohol.

Containers: Glass bottles; 1-, 5- and 10-gal tins.

Use: Perfumery.

Shipping regulations: None.*

diisobutyl carbinyl acetate

$(C_4H_9)_2CHOOCCH_3$.

Properties: Colorless liquid, sp. gr. 0.8530 (20/20°C); b. p. 192.4°C; f. p. -48.1°C, refractive index 1.4152 (20°C), slightly soluble in water (0.02 wt% at 20°C).

nonyl alcohol $C_9H_{19}OH$. Exists in numerous isomeric forms, any one of which may be referred to by the above name and formula. See following:

n-nonyl alcohol (nonanol; alcohol C-9; octyl carbinol, pelargonic alcohol)

$CH_3(CH_2)_7CH_2OH$.

Properties: Colorless liquid, with rosy odor; sp. gr. 0.826-0.829; refractive index 1.431-1.435; m. p. -5°C, b. p. 215°C. Soluble in 7 volumes of 50% alcohol; insoluble in water.

Containers: Glass bottles; 1-, 5- and 10-gal tins.

Uses: Perfumery, flavors.

Shipping regulations: None.*

nonyl aldehyde $C_8H_{17}CHO$. There are available mixtures of various isomeric nonyl aldehydes. These are produced by the Fisher-Tropsch or related process, and properties vary with the particular source. For the

n-nonyl aldehyde, see nonanal.

n-nonylamine $C_9H_{19}NH_2$.

Properties: B. p. 75-85°C (20 mm); sp. gr. 0.798 (25°C); refractive index 1.4366 (n 20/D); may be prepared by the catalytic reduction of nonanonitrile and from nonyl halides by conventional techniques.

tert-nonylamine. Principally tert- $C_9H_{19}NH_2$ and tert- $C_{10}H_{21}NH_2$.

Properties: Boiling range 160-174°C; sp. gr. 0.789 (25°C); refractive index 1.428 (25°C); flash point 120°F; insoluble in water; soluble in common organic solvents, especially in petroleum hydrocarbons.

Containers: Drums; tank cars.

Caution! Avoid prolonged contact with skin; prolonged inhalation.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

nonylbenzene $C_9H_{19}C_6H_5$.

Properties: Light-straw; faint aromatic odor; boiling range 245-252°C; sp. gr. 0.864 (20/20°C); refractive index 1.488 (20°C); viscosity 41.9 cps (20°C); flash point 210°F.

Uses: Raw material for the manufacture of surface-active agents.

nonyl benzoate $C_9H_{19}OOC C_6H_5$.

Properties: B. p. 140-145°C (5 mm); sp. gr. 0.961 (25°C), refractive index 1.4911 (n 20/D); viscosity 5.35 centistokes (100°F), 1.68 centistokes (210°F).

nonyl bromide $C_9H_{19}Br$.

Properties: B. p. 81-85°C (10 mm); sp. gr. 1.101 (25°C); refractive index 1.4583 (n 20/D).

Derivation: High yields of nonyl bromide are obtained by passing hydrogen bromide into the alcohol while heating or by refluxing with aqueous hydrobromic acid in the presence of an acid catalyst.

nonyl chloride $C_9H_{19}Cl$.

Properties: B. p. 58-63°C (8 mm); sp. gr. 0.878 (25°C); refractive index 1.4379 (n 20/D).

Derivation: Nonyl alcohol reacts with hydrogen chloride at elevated temperatures and pressure to give nonyl chloride. It can also be readily made by refluxing a mixture of concentrated hydrochloric acid with the alcohol in the presence of zinc chloride.

1-nonylene (1-nonene) C_9H_{18} or

$CH_3(CH_2)_7CH=CH_2$.

Properties: Colorless liquid; soluble in alcohol, insoluble in water. Sp. gr. 0.7433; b. p. 149.9°C.

Grades: Technical.

Use: Organic synthesis, wetting agent, lube oil additive.

nonylenes (nonenes). A mixture of hydrocarbons boiling about 279-296°F; sp. gr. 0.7440 (60°F), used for alkylation and as a chemical intermediate for surfactants and Oxo alcohols.

nonyl hydride. See nonane.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Like the other actinide elements of atomic numbers near 100, the element probably has properties similar to those in the rare earth metals.

noble laurel. See laurus.

noble metals. Gold, silver, mercury, platinum, palladium, iridium, rhodium, ruthenium and osmium.

"NOBS" No. 1 Accelerator. ⁵⁷ Trademark for a selected blend of N-oxydiethylene benzothiazole-2-sulfenamide and benzothiazyl disulfide. A delayed-action accelerator for use in furnace black-rubber stocks where processing safety is important.

"NOBS" Special Accelerator. ⁵⁷ Trademark for N-oxydiethylene benzothiazole-2-sulfenamide. A delayed-action accelerator for use in furnace black-rubber stocks where processing safety is important. Imparts greater scorch protection than "NOBS" No. 1.

"No Bunt." ¹⁴⁷ Brand name for a wettable powder seed disinfectant containing hexachlorobenzene.

Containers: 5-lb bags; 40- and 75-lb drums, liquid 1-gal jugs and 12 1/2- and 25-gal drums.

Uses: Control of covered smut of wheat and loose and covered smut of sorghum.

"Noctec." ⁴¹² Trademark for chloral hydrate (q. v.).

"No D-K." ²⁵⁶ Trade name for a wood preservative.

"Nogas." ²⁸ Trademark for metal pickling agent.

Properties: Amorphous brown powder, soluble in water and acids. Will give foam-producing solutions when dissolved in water or acids.

Containers: 65-lb fiber drums; 325-lb bbls.

Use: As an addition agent in acid pickling of iron and steel products to produce a foam blanket and to improve the atmosphere around pickling operations by elimination of acid mist particles usually given off by the pickling operation.

"Nolane." ³⁴² Trademark for 2,6-allyl-dichlorosilane-resorcinol, used for priming glass fibers, i. e., prior to laminating.

"Noludar." ¹⁹⁰ Trademark for a brand of methypylon (q. v.).

nonadecane $C_{19}H_{40}$ or $CH_3(CH_2)_{17}CH_3$.

Properties: Leaflets, soluble in alcohol, insoluble in water; soluble in ether, sp. gr. 0.777; m. p. 32°C, b. p. 330°C.

Grades: Technical.

Use: Organic synthesis.

n-nonadecanoic acid $CH_3(CH_2)_{17}COOH$. A saturated fatty acid normally not found in natural vegetable fats or waxes.

Properties: Colorless crystals; m. p. 68.7°C; b. p. 297°C (100 mm), soluble in alcohol and ether; insoluble in water. Synthetic

product available 99% pure for organic synthesis.

gamma-nonolactone. See gamma-nonyl lactone.

nonanal (pelargonic aldehyde; n-nonyl aldehyde; aldehyde C-9) $C_9H_{17}CHO$.

diisobutyl carbinyl acetate
 $(C_4H_9)_2CHOOCCH_3$.

Properties: Colorless liquid, sp. gr. 0.8530 (20/20°C), b. p. 192.4°C, f. p. -48.1°C; refractive index 1.4152 (20°C); slightly soluble in water (0.02 wt% at 20°C).

nonyl alcohol $C_9H_{19}OH$. Exists in numerous isomeric forms, any one of which may be referred to by the above name and formula. See following:

n-nonyl alcohol (nonanol; alcohol C-9; octyl carbinol, pelargonic alcohol)
 $CH_3(CH_2)_7CH_2OH$.

Properties: Colorless liquid, with rosy odor, sp. gr. 0.826-0.829, refractive index 1.431-1.435; m. p. -5°C; b. p. 215°C. Soluble in 7 volumes of 50% alcohol, insoluble in water.

Containers: Glass bottles; 1-, 5- and 10-gal tins.

Uses: Perfumery; flavors.

Shipping regulations: None.*

nonyl aldehyde $C_8H_{17}CHO$. There are available mixtures of various isomeric nonyl aldehydes. These are produced by the Fisher-Tropsch or related process, and properties vary with the particular source. For the

n-nonyl aldehyde, see nonanal.

n-nonylamine $C_9H_{19}NH_2$.

Properties: B. p. 75-85°C (20 mm); sp. gr. 0.798 (25°C); refractive index 1.4366 (n 20/D); may be prepared by the catalytic reduction of nonanonitrile and from nonyl halides by conventional techniques.

tert-nonylamine. Principally tert- $C_9H_{19}NH_2$ and tert- $C_{10}H_{21}NH_2$.

Properties: Boiling range 160-174°C; sp. gr. 0.789 (25°C); refractive index 1.428 (25°C); flash point 120°F; insoluble in water; soluble in common organic solvents, especially in petroleum hydrocarbons.

Containers: Drums; tank cars.

Caution: Avoid prolonged contact with skin; prolonged inhalation.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

nonylbenzene $C_9H_{19}C_6H_5$.

Properties: Light-straw; faint aromatic odor; boiling range 245-252°C; sp. gr. 0.864 (20/20°C); refractive index 1.488 (20°C); viscosity 41.9 cps (20°C); flash point 210°F.

Uses: Raw material for the manufacture of surface-active agents.

nonyl benzoate $C_9H_{19}OOCOC_6H_5$.

Properties: B. p. 140-145°C (5 mm); sp. gr. 0.961 (25°C); refractive index 1.4911 (n 20/D); viscosity 5.35 centistokes (100°F), 1.68 centistokes (210°F).

nonyl bromide $C_9H_{19}Br$.

Properties: B. p. 81-85°C (10 mm); sp. gr. 1.101 (25°C); refractive index 1.4583 (n 20/D).

Derivation: High yields of nonyl bromide are obtained by passing hydrogen bromide into the alcohol while heating or by refluxing with aqueous hydrobromic acid in the presence of an acid catalyst.

nonyl chloride $C_9H_{19}Cl$.

Properties: B. p. 58-63°C (8 mm); sp. gr. 0.878 (25°C); refractive index 1.4379 (n 20/D).

Derivation: Nonyl alcohol reacts with hydrogen chloride at elevated temperatures and pressure to give nonyl chloride. It can also be readily made by refluxing a mixture of concentrated hydrochloric acid with the alcohol in the presence of zinc chloride.

1-nonylene (1-nonene) C_9H_{18} or

$CH_3(CH_2)_6CH=CH_2$.

Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.7433; b. p. 149.9°C.

Grades: Technical.

Use: Organic synthesis, wetting agent; lube oil additive.

nonylenes (nonenes). A mixture of hydrocarbons boiling about 279-296°F; sp. gr. 0.7440 (60°F), used for alkylation and as a chemical intermediate for surfactants and Oxo alcohols.

nonyl hydride. See nonane.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

n-nonylic acid. See pelargonic acid.

gamma-nonyl lactone (gamma-nonolactone; aldehyde C-18; prunolide; nonanolide-1,4; coconut aldehyde; gamma-n-amylobutyrolactone) $C_9H_{16}O_2$.

Properties: Yellowish to almost colorless liquid; coconut-like odor; sp. gr. 0.956-0.963; refractive index 1.447; soluble in 5 volumes of 50% alcohol.

Uses: Perfumery; flavors.

nonyl methacrylate. Ester of nonyl alcohol.

Properties: B. p. 76-78°C (1 mm); sp. gr. 0.880 (25°C); refractive index 1.4422 (n 20/D).

nonyl nonanoate. Ester of nonyl alcohol.

Properties: B. p. 148-166°C (10 mm); sp. gr. 0.863 (25°C); refractive index 1.4419 (n 20/D).

nonyl phenol $C_9H_9C_6H_4OH$. Trade designation for a mixture of isomeric monoalkyl phenols, predominantly para-substituted.

Properties: Pale yellow, viscous liquid with a slight phenolic odor. Insoluble in water; soluble in most organic solvents.

Typical specifications: Sp. gr. (20/20°C) 0.94-0.95; boiling range (95%) 283-302°C; color (APHA) 200; hydroxyl number 240-255.

Grades: Technical.

Containers: 5-, 55-gal drums; tank cars.

Uses: Intermediate for surface active agents, lube oil additives; wetting agents, stabilizers, petroleum demulsifiers, fungicides; bactericides; dyes; drugs; adhesives; rubber chemicals; phenolic resins and plasticizers.

nonyl thiocyanate $C_9H_{19}SCN$.

Properties: B. p. 84-86.5°C (1 mm), sp. gr. 0.919 (25°C); refractive index 1.4696 (n 20/D); nonyl thiocyanate can be made from nonyl chloride by refluxing with alcoholic sodium thiocyanate solution using conventional technique.

nonyl trichloroarsine

Shipping regulations: Corrosive liquid. White label.*

"No-Odorol." ⁵⁷ A sulfonated oil used for textile finishing and softening. Recommended for cotton, silk and rayon fabrics, whether dyed, printed or bleached. Fabrics finished with "No-Odorol" possess a full soft, drapy hand, free from development of discoloration or odor.

"Nopalcol." ³⁰⁹ Trademark for a series of polyoxyethylene fatty acid derivatives (esters, amido amines, amides) used as detergents, penetrants, emulsifying or wetting agents.

"Nop-cap." ³⁰⁹ Trademark for calcium pantothenate containing products for the fortification of foods and feeds.

"Nopcay." ³⁰⁹ Trademark for a series of dry vitamin-containing products for fortifying animal and poultry foods and feeds.

"Nopcocell." ³⁰⁹ Trademark for polyurethane foamed plastic for general uses.

"Nopcofoam." ³⁰⁹ Trademark for a series of polyurethane-foamed plastics in sheet, slab, block, and like form.

"Nopcogen." ³⁰⁹ Trademark for a series of fatty acid derivatives, including alkylol-amides, polyamine condensates, alkylol-amine condensates, and sulfonated amine condensates, used as softeners, detergents, wetting, or emulsifying agents.

"Nopcolene." ³⁰⁹ Trademark for a series of fat-liquoring and finishing compositions.

"Nopcosant." ³⁰⁹ Trademark for a series of naphthalene sulfonated derivatives for general use in the industrial arts.

"Nopcoset." ³⁰⁹ Trademark for a series of polyvinyl acetate emulsions for general use in the industrial arts, particularly for use in the paper, textile, paint, leather and wood-working industries.

"Nopcosulf." ³⁰⁹ Trademark for a series of sulfated oils for general use in the industrial arts.

"Nop-Dry." ³⁰⁹ Trademark for high potency vitamin-containing solids for fortifying foods and feeds with vitamins.

"Nopol." ²⁹⁶ Trade name for a synthetic bicyclic primary alcohol derived from beta-pinene, a major constituent of turpentine. Used as a chemical raw material for perfluorine, wetting agents.

NOPON. See para-bis[2-(5-alpha-naphthyl-oxazolyl)benzene].

"Nop-Sol." ³⁰⁹ Trademark for water-dispersible vitamin concentrates.

nor-. A prefix signifying normal and indicating the parent from which another compound may theoretically be derived, usually by removal of one or more carbon atoms (with attached hydrogen). It is used rather ambiguously in terpene and steroid chemistry, and differs completely from the meaning of normal which is shown by the abbreviation n-. See normal.

"Norad." ¹²¹ Trade name for a water-soluble adhesive used to prevent slippage of palletized multiwall bags. Shipped in 55-gal steel drums.

"Norane" R. ⁴² Proprietary compound. A quaternary type of compound with thermo-setting characteristics.

Properties: Tan colored paste. Disperses in water at 70°C for application.

Containers: 30-35 gal fiber containers.

Uses: Applied to cotton fabrics to produce durable water-repellent finish.

"Norane" Silicone. ⁴² Proprietary product. A 30% silicone resin emulsion.

Properties: White emulsion. Disperses readily in water and resin mixtures of neutral pH at 30°C.

Containers: 55-gal lined steel drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Used alone or in combination resins with suitable catalysts on cotton, rayon, acetate, nylon and blends for durable water repellent finish.

"Norane" 4 Star A. ⁴² Proprietary product. A hydrophobic thermosetting resin composition.

Properties: Cream colored paste. Disperses readily in water at 40°C.

Containers: 55-gal steel drums.

Use: Durable type of water repellent treatment for cotton, rayon and their blends.

"Norane" 4 Star GG-2. ⁴² Proprietary compound. A special fatty acid amide condensation suitable for use with textile resins.

Properties: A viscous white emulsion, disperses in water at 50°C.

Containers: 55-gal steel drums.

Uses: Durable water repellent for cellulosic textiles. When combined with thermosetting resins, shrinkproofing and crease-proofing effects can also be obtained simultaneously.

"Norane" W1 and W2. ⁴² Proprietary compounds. Wax emulsion and metallic salt combination; when combined, make water-repellent.

Properties: Forms white dispersion in water at 85°C.

Containers: 55-gal steel drums for each.

Use: Two-product fabric water-repellent combination applied from single bath for woolen or nylon textile fabrics especially where durable repellency is desired.

"Norbide." ²⁴⁹ Trademark for boron carbide (q. v.).

nordefrin hydrochloride

$C_6H_3(OH)_2CH(OH)CH(NH_2)(CH_3) \cdot HCl$.

dl-1-(3',4'-Dihydroxyphenyl)-2-amino-1-propanol hydrochloride, *dl*-3,4-dihydroxynorephedrine hydrochloride.

Properties: White crystals, melting range 175-180°C, soluble in water, alcohol; insoluble in ether.

Grade: N. F. XI

Use: Medicine.

nordhausen acid. Fuming sulfuric acid of sp. gr. 1.86-1.90.

nordihydroguaiaretic acid (NDGA)

$[C_6H_3(OH)_2CH_2CH(CH_3)]_2$. 4,4'-(2,3-Dimethyltetramethylene)dipyrocatechol.

Properties: Crystals from acetic acid, m. p. 184-185°C. Soluble in methanol, ethyl alcohol, ether; slightly soluble in hot water, chloroform; nearly insoluble in benzene, petroleum ether.

Derivation: Extraction from guaiacum, also synthetically.

Uses: Food grade antioxidant to retard rancidity of fats and oils.

***dl*-norephedrine hydrochloride.** See phenylpropanolamine hydrochloride.

***l*-norepinephrine.** See levarterenol.

***l*-norepinephrine bitartrate.** See levarterenol bitartrate.

norethandrolone (17- α -ethyl-19-nortestosterone; 17- α -ethyl-17-hydroxy-19-nor-4-androsten-3-one) $C_{20}H_{30}O_2$.

Properties: Crystals; m. p. 140-141°C.

Insoluble in water; soluble in alcohol, benzene, ether, ethyl acetate.

Derivation: Prepared by catalytic hydrogenation of 17- α -alpha-ethynyl-19-nortestosterone.

Grade: N. N. D.

Use: Medicine.

norethindrone (19-nor-17- α -ethynyltestosterone, 17- α -ethynyl-19-nortestosterone) $C_{20}H_{26}O_2$.

Properties: White to creamy white, odorless; crystalline powder. Melting range 202-208°C.

Derivation: Prepared from 19-nor-4-androstene-3,17-dione.

Grade: N. N. D.

Use: Medicine.

19-nor-17- α -ethynyltestosterone.

See norethindrone.

Norge niter. See calcium nitrate.

"Norisodrine Sulfate." ³ Trademark for isoproterenol sulfate (q. v.).

"Norit." ¹⁰⁷ Trade name for activated adsorption carbons of vegetable origin.

Grades: Powder and several granular sizes in different qualities for different applications.

Containers: Powder form: 50-lb bags; 100-, 150-lb drums. Granular form: 100-, 200-lb drums.

Uses: Decolorizing, adsorption of impurities, bad odors and tastes, catalyst carrier; solvent recovery; gas mask carbon.

norleucine (alpha-aminocaproic acid)

$CH_3(CH_2)_4CH(NH_2)COOH$. A nonessential amino acid found naturally in the L(+) form.

Properties: Leaflets, crystallized from water.

DL-norleucine: Soluble in water; slightly soluble in alcohol; soluble in acids; decomposes 327°C. Available commercially.

L(+)-norleucine: Slightly sweet; sublimes 275-280°C; m. p. 301°C (dec).

D(-)-norleucine: Bitter; partially sublimes 275-280°C; m. p. 301°C (dec).

Derivation: Found in traces in proteins, organic synthesis.

Use: Biochemical research.

"Norlig" Binders and Dispersants. ¹²¹ Trade name for a line of unmodified or partially modified lignosulfonates derived from spent sulfite liquor. Available in both powder and liquid forms. Liquids are darker brown in color and more sticky as solids concentration is increased.

Uses: Road binder; linoleum paste; foundry products, leather tanning, gypsum board.

"Norlutate." ³³⁰ Trade name for norethindrone

• acetate, 17- α -ethynyl, 19 nortestosterone acetate, $C_{22}H_{28}O_3$.

Properties: White to creamy white crystalline powder. Soluble in dioxane, insoluble in water. Melting range: 157-163°C.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Norlutin." ³³⁰ Trademark for norethindrone, (q. v.).

normal.

1. A term, abbreviated as the prefix n-, used to designate those hydrocarbons or hydrocarbon radicals whose molecules contain a single unbranched chain of carbon atoms. Thus normal butane or n-butane is the compound whose molecular structure is indicated by the formula $\text{HCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

See also amyl-alcohol for examples.

2. A term used in analytical chemistry and abbreviated as N, to describe a solution containing one gram equivalent weight of reactive material per liter of solution.

See also nor-.

"Normasal." ³⁰⁴ Trademark for normal lead salicylate vinyl stabilizer.

Properties: Soft creamy-white crystalline powder; sp. gr. 2.36, refractive index 1.78. Containers: Fiberboard drums containing 25 and 200 lbs.

Uses: Stabilizer or costabilizer for vinyl flooring and other vinyl compounds; in paints to impart durability, retard chalking and prolong color fastness.

"Normocytin." ⁵⁷ Trademark for vitamin B₁₂.

norphytane. See "Pristane."

"Norva." ⁵¹ Trademark for non-soap grease for specialized applications as, for instance, where high temperature prevails. Has water resistance and good adhesiveness.

Norway salt peter. See ammonium nitrate.

Norwegian salt peter. See calcium nitrate.

noscapine (l-alpha-narcotine, narcosine).

An isoquinoline alkaloid of opium.

$\text{C}_{22}\text{H}_{23}\text{NO}_7$.

Properties: Fine white crystalline powder. M. p. 176°C, sublimes at 150-160°C. Insoluble in water; practically insoluble in vegetable oils, slightly soluble in hot solutions of potassium and sodium hydroxide; soluble in most organic solvents. Salts formed with acids are dextrorotatory and unstable to water.

Derivation: Prepared from the seed capsules of Papaver somniferum.

Grade: N. F. XI.

Use: Medicine.

noscapine hydrochloride.

Properties: Fine, white powder, odorless, soluble in water, chloroform, methanol, ethanol; slightly soluble in acetone, insoluble in ether, pH of solution (5%) is between 2.5 and 3.5.

Use: Medicine.

nosophen. See iodophthalein.

nosophen sodium. See iodophthalein sodium.

novaculite. An exceedingly fine-grained quartzose rock, used as an abrasive. Occurs in Arkansas, Georgia, Massachusetts, North Carolina, Oklahoma and Tennessee.

"Novadelox." ²⁸² Proprietary name for a mixture of benzoyl peroxide and an inert filler used to bleach flour.

"Novaldin." ¹⁶² Trademark for dipyrone.

"Novalgin." ¹⁶² Trademark for dipyrone.

"Novatone." ¹⁹ Brand name for a proprietary product. Anisic ketone; aromatic chemical. Fused crystals, m. p. 35°C; used in soaps and perfume compounds. Aubepine odor.

"Novege." ²³³ Trademark for 2,4,5-T compositions.

novobiocin calcium $\text{C}_{62}\text{H}_{70}\text{CaN}_4\text{O}_{22} \cdot 2\text{H}_2\text{O}$.

Calcium salt of an antibacterial substance produced by the growth of *Streptomyces niveus*, or *S. spheroides*.

Properties: White or practically white crystalline powder. Odorless; soluble in alcohol, slightly soluble in water, ether; very slightly soluble in chloroform; pH of saturated solution 6.5-8.5.

Grade: U. S. P. XVI.

Use: Medicine (antibiotic).

novobiocin sodium $\text{C}_{31}\text{H}_{35}\text{N}_2\text{NaO}_{11}$. Sodium salt of an antibacterial substance produced by the growth of *Streptomyces niveus* or *S. spheroides*.

Properties: White or practically white crystalline powder; odorless; hygroscopic.

Very soluble in water, soluble in alcohol and glycerol, pH of saturated solution 6.5-8.5.

Grade: U. S. P. XVI.

Use: Medicine (antibiotic).

"Novocaine." ¹⁶² Trademark for a brand of procaine hydrochloride.

novolaks. Thermoplastic, soluble phenol-formaldehyde resins (q. v.) obtained by the use of acid catalysts or of excess phenol. They can be cured to the thermosetting, insoluble form with hexamethylene-tetramine. Used principally in varnishes.

"Novoviol." ¹⁸⁸ Brand name used to identify a series of ionones.

"Noxfish." ³⁴² Trademark for rotenone fish-toxicant compositions.

Np. Symbol for neptunium.

N-P-K mixtures. Fertilizers containing nitrogen, phosphorus and potassium. These are usually characterized by numbers such as 5-10-10, meaning 5% nitrogen, 10% phosphorus as P_2O_5 , and 10% potassium as K_2O . The percentages show the amount of available N, P or K, rather than the total amount present.

NPN. Abbreviation for n-propyl nitrate.

NPO. See alpha-naphthylphenyloxazole.

"NSAE." ³²⁸ Brand name of an alkyl aromatic sulfonate that is a highly effective anionic wetting agent in concentrated solutions. In the textile processing industry it is used as an assistant in detergent and dispersing operations, with moderate foaming action.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

It is also used in fruit and vegetable washing, and in the manufacture of insecticides and fungicides; as a conditioner for paper mill felts; and a pigment dispersant in printing.

NSR. Abbreviation for nitrile silicone rubber.

NTP. Abbreviation for normal temperature and pressure, i. e. 0°C and 760 mm pressure.

n-type crystal. See transistor.

"Nuact Paste." ⁷⁴ Trademark for a lead "feeder" drier to counteract loss of drying properties in paints during storage.

"Nuade." ⁷⁴ Trademark for rubber base product which increases tack of roller mill pastes resulting in faster, lower cost grinding.

"Nubrite." ¹³⁴ Trademark for brightener for nickel plating solutions.

"Nuchar Activated Carbon." ²²⁸ Trade name for carbon of vegetable origin.

Grades: Industrial and water purification.

Containers: Multiwall paper bags; bulk hopper cars.

Uses: Deodorization and decolorization.

nuclear chemistry. A term used to denote the chemical aspects of the study of the atomic nucleus, the central, positively charged portion of the atom. Nuclear chemistry includes the investigation of the fission or disruption of nuclei, their joining or fusion, and also the characterization of the properties of the reaction products.

nuclear cross section. See cross section.

nuclear energy. Energy resulting from the rearrangement of the nuclei of atoms, either the fragmentation of heavy nuclei as in the fission of U-235 or plutonium into two approximately equal parts, or the formation of heavier nuclei from light ones as in the fusion of hydrogen into helium. The energy is equivalent to a slight loss of mass in the system undergoing such a transformation according to the Einstein mass-energy relationship ($E = mc^2$).

The energy manifests itself predominantly as the kinetic energy of the fragments, especially the energy of fission as released in a nuclear reactor. A smaller portion of the energy is emitted as gamma rays from the fission process, or as beta and gamma rays from the fission products. The fission products may be separated from the nuclear fuel and used as a separate source of nuclear energy. Power plants for satellites have been designed using the nuclear energy of fission products to generate electrical energy for radio communication. Radioactive isotopes prepared by irradiation of materials in nuclear reactors have also been used as a source of nuclear energy. In one or another of these forms nuclear energy has

been applied to chemical processes such as the synthesis of nitric acid from air, the synthesis of hydrazine, the cross-linking (hardening) of polymers, and the sterilization of pharmaceuticals.

nuclear fuel. Any material which may undergo the appropriate reaction and be the source of energy in a fusion or fission nuclear reactor. At the present state of technology the term usually means uranium, thorium, or plutonium, either as natural materials, or enriched or synthesized isotopes of these elements in some chemical form and physical state suitable for the reactor in question. They are used as solutions, or as shaped metals, oxides, or carbides, giving rise to the terms fuel element, fuel plate, or fuel rod.

nuclear fusion. A nuclear reaction in which the nuclei of light atoms fuse together to form heavier nuclei, and since the heavier ones are more stable, energy is released in the process. These energy releases are large, and much research is being devoted to developing the process as a practical power source. Very high temperatures are necessary in order that the nuclei will have kinetic energies high enough to overcome the repulsive forces between the electric charges on the nuclei. The source of energy in the sun is a reaction of this kind in which the nuclei of hydrogen atoms are combined to form helium at the temperature of the sun, and when high temperature is the driving force of the reaction it is called a thermonuclear reaction. Uncontrolled release of fusion energy has been achieved on earth in the hydrogen bomb in which a fission reaction acts as the trigger and supplies the initial high temperature to start the fusion reaction. If controlled fusion can be achieved, it will have the advantages of a cheap and practically unlimited source of energy (deuterium) and no radioactive by-products such as are produced in a fission reactor, though an installation will probably necessarily be quite large with a high capital cost.

nuclear magnetic resonance. An electromagnetic field method of determining whether hydrogen atoms in a molecule are part of a CH_3 -group, a $-\text{CH}_2$ -group, an $-\text{OH}$ group, or other characteristic grouping. The method also indicates the number of hydrogen atoms in each category.

The method is carried out by placing the sample in a strong constant magnetic field, and then applying a perpendicular radio frequency alternating magnetic field. At certain frequencies of the latter field the hydrogen atom nucleus will absorb and emit energy, and the frequency and amount of energy depend on the characteristic grouping in which the hydrogen atom is located. The method is particularly useful in complex substances with many hydrogen atoms.

nuclear reaction. Any process or change that involves the nucleus of an atom.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Spontaneous radioactivity is a nuclear reaction for which only a single nucleus is required. Nuclear reactions also occur when a nucleus is bombarded with particles such as neutrons, protons, positrons, etc. Fission of uranium 235, and fusion of hydrogen into helium are other types of nuclear reactions. Nuclear reactions are usually accompanied by large energy changes, that are millions of times greater than those of ordinary chemical reactions such as combustion.

nuclear reactor. A device for the controlled liberation of nuclear energy, particularly from the fission of uranium. The essential parts of a reactor are (1) the nuclear fuel (q. v.); (2) the moderator, which serves to slow down the energetic neutrons produced in fission, because low energy neutrons are more effective at inducing fission than fast ones. Graphite, beryllium, heavy water, or ordinary water are the usual moderators; (3) the coolant - water, mercury, molten sodium or molten salt, or a gas - which is circulated through the reactor core to remove the heat energy of fission; (4) the shield, usually of ordinary or high density concrete which surrounds the reactor to absorb the nuclear radiations associated with the fission process for the protection of personnel; (5) the control system - radiation detectors which monitor the radiation level, especially the neutron flux level in the reactor core, and through electronic and hydraulic mechanisms determine the degree of insertion of control rods. These are rods of neutron-absorbing material that soak up excess neutrons and maintain the level of operation at a given value.

The term reactor may be modified for several purposes. The terms fast, intermediate or epithermal, and thermal refer to the energy of the neutrons propagating the chain reaction. A fast reactor will have no moderator. In a heterogeneous reactor the lumps or rods of fissionable material are imbedded at regular intervals in a mass of the moderator. In a homogeneous reactor the fuel is dissolved in a liquid moderator or carrier and the entire solution is circulated as coolant. Breeder reactors use surplus neutrons to produce more fissionable material; thus in one type uranium 238 is converted to U-235.

Nuclear reactors are generally classified into types depending on the purposes for which they are intended. Power reactors are associated with electrical generating equipment and use the heat from the reactor to produce electricity. Test reactors are designed to have regions of very high radiation density for the exposure of materials for engineering test. Production reactors are used for the production of fissionable material like plutonium or to make radioactive isotopes. Research reactors are designed for flexibility of application, for the study of reactor behavior or as a source of nuclear radiations

for studies in the physical and biological sciences.

Sizes of reactors are usually quoted as gross heat energy output, but in electrical units as so many thermal kilowatts. Power reactor sizes however are sometimes quoted in net electric kilowatts of electric power produced. The size range from small research reactors to large power reactors is from a few watts to several hundred thousand kilowatts.

nuclear transformation. See disintegration.

nucleic acid, metallic salts. Water-soluble salts of variable composition, depending on conditions of formation. The percentage of metal varies within definite limits.

nucleic acids. Complex compounds found in all living cells. They are usually found chemically bound to proteins to form nucleoproteins. Nucleic acids are of high molecular weight and are easily changed by many mild chemical reagents. They contain carbon, hydrogen, oxygen, nitrogen (15-16%), and phosphorus (9-10%).

The fundamental units of nucleic acid are nucleotides (q. v.); nucleic acids are polynucleotides in which the nucleotides are linked by phosphate bridges. Upon extensive heating in the presence of water (hydrolysis), nucleic acids yield a mixture of purines and pyrimidines, D-ribose or D-deoxyribose, and phosphoric acid. Nucleic acids are subdivided into two types: ribonucleic acid (RNA), containing the sugar D-ribose, and deoxyribose nucleic acid (DNA) containing the sugar D-deoxyribose. Good sources of nucleic acids are salmon, thymus, yeast, and wheat kernel embryo.

Uses: Biochemical and medical research in heredity, virus diseases and cancer.

nucleon. General name applied to neutrons and protons, the essential constituents of atomic nuclei, and also used as a class name for fundamental particles of that mass. See fundamental particle.

nucleonics. A general term, not defined by other than common usage, but which is usually taken to encompass the broad areas of science and technology involving nuclear phenomena, with emphasis on the applied aspects.

nucleoprotein. A type of protein universally present in the nuclei and the surrounding cytoplasm of living cells. A nucleoprotein is composed of a protein, which is rich in basic amino acids, and a nucleic acid (q. v.). The nucleic acid portion is isolated and used in medical and biochemical research.

nucleosides. Compounds of importance in physiological and medical research, obtained during partial decomposition (hydrolysis) of nucleic acids (q. v.), and containing a purine or pyrimidine base linked to either D-ribose, forming ribosides, or D-deoxyribose, forming deoxyribosides. For specific nucleosides see adenosine, cytidine, guanosine and uridine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

nucleotides. The fundamental units of nucleic acids (q. v.); some are important coenzymes. The nucleotides found in nucleic acids are phosphate monoesters of nucleosides (q. v.); examples are adenylic acid, guanylic acid, and uridylic acid.

The term nucleotide is also applied to compounds not found in nucleic acids and which contain substances other than the usual purines and pyrimidines. Nucleotides of the latter type are modified vitamins and function as coenzymes; examples are riboflavin phosphate (flavin mononucleotide) flavin adenine nucleotide, diphosphopyridine nucleotide, triphosphopyridine nucleotide, and coenzyme A.

nucleotriphosphoric acid. See thymine acid.

nucleus.

1. The dense positively charged central portion of an atom. This contains essentially all of the mass of the atom and determines its kind. Its linear dimension is only about one ten-thousandth of the whole atom. The remainder of the volume of the atom is the electron cloud which neutralizes the nuclear charge.
2. The central portion of a living cell.

nuclide. A particular kind of atom, characterized by the mass, the charge (number of protons), and the energy content of its nucleus. A radionuclide is a radioactive nuclide.

"NuGreen." ²⁸ Trademark for a fertilizer compound containing 45% urea nitrogen.

Properties: Tiny round green pellets, much like buckshot in size and shape, specially treated to maintain free-flowing, non-caking characteristics.

Containers: 80-lb paper bags.

Use: For spray application to the foliage of plants or for soil application either direct or in mixed fertilizers.

"NuGreen" L-B. ²⁸ Trademark for a fertilizer compound containing 45% urea nitrogen, less than 0.2% biuret.

Properties: Light tan granular solid specially treated to maintain relatively free-flowing, non-caking characteristics.

Containers: 80-lb paper bags.

Use: As a low-biuret nitrogen fertilizer for spray application to citrus crops.

"Nu-Iron." ⁹³ Trade name for an iron supplement for plants.

Properties: Yellow powder; fine particle size, water insoluble, non-hygroscopic; iron in neutral form, 30%, stable in storage; forms good water suspension.

Containers: 50-lb bags.

Uses: Corrects iron deficiencies in plants, particularly ornamentals, grasses and vegetables. Most effective as foliar spray or dust.

"Nulix 15." ⁷⁹ Trade name for limed polymerized wood rosin. Approx. 6.5% lime added per 100 lbs. of rosin.

Constants: M. p. (capillary tube) 150°C;

m. p. (ball and ring) 168°C; acid number 55; color M.

Containers: Non-returnable, light gauge galvanized drums of about 500 lbs net. Tare 14-16 lbs.

Uses: Linoleum print paint, paint and varnishes, gloss oils, printing inks. •

"Nullapon." ³⁰⁷ Now carried under "Cheelox" (q. v.).

"Nulocrystal." ¹⁵⁷ Brand name for a partial invert sugar, proprietary pure-food non-crystallizing product, consisting of sucrose, levulose, dextrose and moisture.

Properties: Practically colorless; solids content, 77%; soluble in water, glycerin, glycols, and slightly soluble in alcohol.

Containers: Drums and pails.

Uses: Confectionery; baking; beverages; syrups, pharmaceuticals; animal and vegetable adhesives; paper (as a plasticizer); and varied other uses where glycerin can be used.

"Nulomoline." ¹⁵⁷ Brand name for invert sugar; proprietary, pure-food product consisting of levulose, dextrose and moisture.

Properties: Practically colorless; solids content, 77%; soluble in water, glycerin, glycols, and slightly soluble in alcohol.

Containers: Drums and pails.

Uses: Confectionery; baking; beverages; syrups; pharmaceuticals; animal and vegetable adhesives; paper (as a plasticizer) and various other uses, where glycerin can be applied.

"Nu-Manese." ⁹³ Trade name for a manganese supplement for plants.

Properties: Brownish-black powder; water insoluble, acid soluble, essentially MnO.

Containers: 100-lb bags and bulk.

Uses: Source of manganese as a nutritional trace element. Suitable for direct soil application or spraying or dusting.

"Number 20 Flux." ⁵⁶ Brand name for a specially prepared galvanizing flux. Very water soluble, crystalline material consisting mainly of zinc chloride (ZnCl₂) and ammonium chloride (NH₄Cl) with foaming and wetting agents added. Sold in 400-lb barrels.

"Nu-Met." ²⁴⁴ Trademark for an alkaline detergent. Moderately alkaline sudsing detergent yielding available chlorine in solution.

Uses: Manual cleaning in dairy farms, milk plants, food processing plants.

"Numet." ⁴³⁹ Trade name for depleted uranium.

Properties: Uranium metal wherein U-235 isotopic content has been reduced below 0.7 of 1% as found in normal uranium. Has high structural strength coupled with high density of 18.9 g/cc.

Derivation: Processed from uranium hexafluoride as tailing from the gaseous diffusion plants.

Uses: Balance weights for aircraft, high speed rotors in gyro-compasses, gamma

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

radiation shielding, radioisotope transportation casks and fuel element transfer casks, in general as structural material applicable to radiation shielding.

Hazards: Has slight radioactivity; use must be licensed with Atomic Energy Commission.

"Nuodex 100 V. T." ⁷⁴ Trademark for quaternary ammonium naphthenate.

Use: Fungicide for vinyl formations.

Also available as "Nuodex 100 S. S.," solvent soluble formulation.

"Nuogel." ⁷⁴ Trademark for a series of aluminum soaps, used to produce stable gels in aliphatic hydrocarbons.

"Nuogel" A. O. ⁷⁴ Trademark for aluminum octoate, used to produce stable gels in many hydrocarbons.

"Nuolates." ⁷⁴ Trade name for driers based on metallic salts of tall oil acids.

"Nuophene." ⁷⁴ Trademark for a technical grade of dihydroxydichlorodiphenylmethane.

Use: Industrial fungicide.

"Nuosperse 657." ⁷⁴ Trademark for a combination of surface active agents which react synergistically in many systems to develop effective wetting, dispersing, and anti-settling properties; also has film forming properties.

"Nuostabe." ⁷⁴ Trademark for a series of vinyl stabilizers and fungicides. Many of them are metallic soaps or metal-organic complexes.

"Nupercainal." ³⁰⁵ Trademark for dibucaine, a local anesthetic.

"Nupercaine." ³⁰⁵ Trademark for dibucaine hydrochloride, an anesthetic.

"Nu-Pon." ⁴⁴⁸ Trade name for epoxy resin primers and enamels for household appliances, metal products, and corrosion resistant applications.

"Nuray." ⁵¹ Trademark for highly refined straight mineral, lubricating oils of paraffinic type, which serve general plant use as lubricants and hydraulic mediums.

Nuremberg red. See iron oxide reds.

"NuRexform." ²⁸ Trademark for arsenate of lead powder, colored pink to comply with certain state laws.

"Nurish." ²⁴¹ Trade name for a water soluble fertilizer (20-20-20) derived from diammonium phosphate, urea and muriate of potash. Sold in 1-, 50-lb polyethylene bags.

"Nusope" 33-A." ⁷⁴ Trademark for liquid sodium naphthenate, used as pigment wetting and dispersing agent in aqueous systems and as an emulsifier.

Nusselt number. A number used in heat transfer studies and calculations to compare heat losses by conduction from various shaped objects under various conditions. It combines into a single number the actual heat

loss (Q), the temperature difference (ΔT) between the body and its surroundings, the size (d) and shape of the body and the thermal conductivity (k) of the fluid surrounding the object, in the equation

$$Nu = Qd / \Delta T k.$$

nutgalls. See galls.

nutmeg. See myristica.

nutmeg oil (myristica oil).

Properties: Thin, colorless or pale-yellow liquid, volatile oil, strong nutmeg odor; warm, spicy taste; sp. gr. 0.880-0.910 for East Indian oil, 0.854-0.880 for West Indian oil, optical rotation +8 to +30° for East Indian oil, +25 to +45° for West Indian oil, refractive index 1.4740-1.4880 for East Indian oil, 1.4690-1.4760 for West Indian oil (both at 20°C), soluble in 90% alcohol, carbon disulfide and glacial acetic acid.

Chief known constituents: Myristicin; pinene; dipentene.

Derivation: By distillation from nutmegs, *Myristica fragrans*.

Grades: Technical, U. S. P. XVI.

Containers: Glass bottles; cans.

Uses: Medicine, flavoring; perfumery.

"Nuto." ⁵¹ Trademark for lubricating oils of good color and high resistance to oxidation, recommended for circulating and hydraulic systems.

"Nutralac." ²⁴⁴ Proprietary name for a hydrated compound consisting of sodium carbonate and sodium bicarbonate.

Properties: White, needle-like crystals, free-flowing, soluble in water, total Na₂O content, 41.45%, density, 40-50 lbs/cu ft.

Containers. 80-lb wooden kegs, 100-lb multiwall paper bags, 280-lb wooden barrels.

Uses: Dairy and food industry for neutralizing acidity in cream and related foods, compounding both salts and hand dishwashing preparations; leather tanning, and textile processing.

nutrient solution. A water solution of minerals necessary for plant growth which is used instead of soil, the plants being supported by mechanical means. Such solutions contain various proportions of potassium, phosphorus, calcium, sulfur, and magnesium, together with traces of iron, boron, zinc, and copper. They are extensively used for commercial growing of flowers and vegetables, and also to some extent for house plants.

See hydroponics.

"Nuvis." ⁷⁴ Trademark for a series of bodying agents for viscosity control and prevention of sag and pigment settling in paint systems.

nux vomica (quaker buttons; poison nut, dog button, vomit nut). Dried ripe seed of *Strychnos nux vomica*. Odorless, pale brown to olive color.

Habitat: Southern Asia and Northern Australia.

Grades: Technical; N. F. XI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 70-lb bags; powder, 200- to 250-lb barrels.

Uses: Medicine; source of alkaloids strychnine and brucine.

Shipping regulations: None. *

"Nu-Z." ⁹³ Trade name for a nutritional zinc compound, 52-55% Zn; white powder; water insoluble; stable in storage.

Containers: 50-lb bags.

Uses: Corrects zinc nutritional deficiency in plants through foliar absorption. An additive to animal feed mixtures and salt cakes.

N. W. acid. Abbreviation for Neville and Winther's acid. See 1-naphthol-4-sulfonic acid.

"Nydrazid." ⁴¹² Trademark for isoniazid (q. v.).

nylidrin hydrochloride $\text{HOC}_6\text{H}_4\text{CH}(\text{OH})\text{-CH}(\text{CH}_3)\text{NHCH}(\text{CH}_3)(\text{CH}_2)_2\text{C}_6\text{H}_5 \cdot \text{HCl}$. para-Hydroxy-alpha-[1-(1-methyl-3-phenyl-propyl-amino)-ethyl] benzyl alcohol hydrochloride.

Properties: White, odorless, tasteless, crystals or powder, slightly soluble in water, alcohol; very slightly soluble in chloroform, ether, pH of 1% solution is between 4.5 and 6.5.

Grade: N. F. XI.

Use: Medicine.

nylon. This word is a generic term for any long-chain polymeric amide which has recurring amide groups -CONH- as an integral part of the main polymer chain. The term does not refer to a particular product but rather to a family of chemically related materials which may be fabricated and used in many different physical forms. The chemical forms are described in separate articles following this one, under nylon 4, nylon 6, etc. The physical forms are described as follows within this article.

nylon bristles. See nylon monofilaments.

nylon fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polyamide having recurring amide groups (-CONH-) as an integral part of the polymer chain (Federal Trade Commission).

nylon molding powders. The descriptive material below applies to one particular nylon resin molding powder, and may be inapplicable to molding powders made from nylons of chemically different types or containing different auxiliary ingredients.

Properties: In molded or extruded form, the natural color is translucent cream white. Colored material is available in some types. Outstanding characteristics are toughness over a wide range of temperatures; strength in thin sections, along with ability to be molded in thin sections; resilience; abrasion-resistance, good bearing characteristics; dimensional stability at temperatures as high as 275°F, and hence ability to be steam-sterilized; low specific gravity; generally good

resistance to chemicals and solvents; good dielectric properties; self-extinguishing character.

Uses: Molding powder for coilforms, sheathing of insulated wire, electrical insulation, sterilizable utensils, brush-backs, combs, gear and bearings, slide fasteners, impact tools and machine parts.

nylon monofilaments. Nylon in the form of relatively coarse, flexible monofilaments, available in a rather wide range of diameters. Characterized by a high degree of toughness, strength, and durability; resistant to chemicals and heat. Commercial products made from nylon monofilaments include such items as fishing leaders, snells, and lines; level bristles for tooth-brushes, hair-brushes, and industrial brushes; racket strings; surgical sutures; and tapered paintbrush bristles.

nylon plastic. A thermoplastic material, similar in chemical structure to nylon fiber-forming polymeric amides and derivable from the same basic substance.

Properties: Nylon plastic is available in a range of properties depending upon the chemical type and auxiliary ingredients, as follows: tensile strength (73°F) 5000-9600 psi; elongation (73°F) 35-300%, modulus of elasticity (73°F) 38,000-285,000 psi; dielectric constant (60 cycles) 4.1-10.7, (10⁶ cycles) 3.4-4.5; power factor (60 cycles) 0.014-0.19, (10⁶ cycles) 0.03-0.14; mold shrinkage 0.010-0.015 in. per in., compression ratio 2.1-2.5.

nylon resin, soluble. The descriptive material below applies to one particular nylon resin, and may be inapplicable to other soluble polyamide resins.

Properties: Resistant to aqueous alkali solutions (hot or cold), to oxygen and to ozone. At temperatures below 25°C it is little affected, chemically, by nonoxidizing acids. Soluble in phenols and in lower aliphatic alcohols, particularly methanol and ethanol, with aid of heat. Insoluble in most other solvents, including aliphatic and aromatic hydrocarbons, halogenated hydrocarbons, ketones, esters, carbon disulfide, water.

Containers: Fiber drums, multiwall paper bags.

Uses: Adhesives for wood, textiles, metals, glass, hydrocarbon barrier in fuel cells; coatings for textiles and paper, protective coating for thread, finishes; stiffeners and binders for textiles.

nylon staple and tow. Crimped nylon fibers in a variety of lengths and deniers. Nylon staple is converted on standard textile equipment into 100% nylon spun yarns, or blended with natural or other synthetic fibers.

Containers: Bales or cartons.

Use: In all branches of textile industry, as in yarns for sweaters and men's hosiery, woven suiting fabrics.

nylon yarn. Continuous single and multifilament types for use in all branches of the textile industry.

Containers: Bobbins, tubes, and beams.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nylon 4. A type of nylon made from pyrrolidone.

nylon 6. A nylon obtained by polycondensation of caprolactam.

Properties of fiber: Tensile strength (lbs/sq in.) 73,000-120,000; elongation 16 to 42%; sp. gr. 1.14; moisture absorbency 8% at 95% relative humidity; m. p. 215°C.

Use: Fiber and molding resins; used in tires.

nylon 66 (nylon 6,6; nylon 6/6). A nylon obtained by the condensation of hexamethylenediamine with adipic acid (polyhexamethylene adipamide).

Properties: Sp. gr. 1.14; tensile strength (psi) 58,000-134,000; break elongation 16-42%; moisture regain 4.2% (70°F, 65% R. H.); m. p. 250°C; soluble in 90% formic acid, meta-cresol.

Containers: Bobbins, tubes, beams, bales, and cartons.

Uses: Fiber for apparel and home furnishings, tires, tarpaulins, etc.

nylon 610 (nylon 6,10; nylon 6/10). A nylon obtained by the condensation of hexamethylenediamine with sebacic acid. Used for brush bristles and monofilaments.

nylon 7. A comparatively new nylon which is a polymer of ethyl aminoheptanoate, a 7-carbon acid ester. It has a higher softening temperature (430°F) than the older nylons and is especially suitable for tire cords.

nylon 8. A type of nylon made from caprolactam.

nylon 9. A type of nylon made from 9-amino-nonanoic acid.

nylon 11. A type of nylon made from 11-amino-undecanoic acid, and used commercially for fiber and molding purposes.

nylon, elastic. A modification of nylon 610 in which sebacic acid is condensed with hexamethylenediamine and a relatively small amount of an alkyl-substituted hexamethylenediamine.

nystatin (fungicidin) $C_{46}H_{77}NO_{19}$. An anti-fungal agent.

Properties: Yellow to light tan powder; odor suggestive of cereals; hygroscopic; affected by light, heat, air and moisture. Sparingly soluble in methanol, ethanol; insoluble in water, chloroform, ether and benzene. In solution is rapidly inactivated by acids and bases.

Derivation: Produced by fermentation with *Streptomyces noursei* and *aureus*.

Grade: U.S.P. XVI.

Use: Medicine.

"Nytal." ⁶⁹ Trademark for a proprietary talc, or magnesium-calcium silicate.

"200": White; sp. gr. 2.85±.03; fineness (through 325 mesh) 98%.

"300," "400": Finer size particles than "200" but similar in composition and properties.

Uses: Dusting uncured rubber; filler in specialized applications.

nytril. Generic name for a manufactured fiber containing at least 85% of a long-chain polymer of vinylidene dinitrile, $-CH_2C(CN)_2-$, where the vinylidene dinitrile content is no less than every other unit in the polymer chain (Federal Trade Commission).

Properties: Soft, resilient fabric is obtained; is easy to clean; does not pill, resists wrinkling, and retains shape after pressing.

Uses: Fur-like pile fabrics; sweaters; yarns; blended fabrics for coats and suits.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

O

O. Symbol for oxygen.

o-. Abbreviation for ortho- (q. v.).

oakmoss resin (mousse de chêne). Concrete oleoresin.

Derivation: Extracted from *Evernia prunastri* and *E. furfuracea*, lichens growing on oak, spruce and fruit trees; collected principally on French and Italian mountains bordering the Mediterranean.

Use: Perfumery (important fixative).

Shipping regulations: None.*

Oberphos process. A process for the granulation of superphosphate fertilizers by heating to 300°F at a pressure of 90 psi in an autoclave.

"Obra."⁵¹ Trademark for stiff consistency, soda soap greases, dark green in color for specialized open bearing uses.

"Obron."²⁹⁹ Trademark for a vitamin and mineral preparation. Used in medicine.

obsidian (volcanic glass). An igneous rock composed largely of silica which has been fused and cooled to a glassy rather than a crystalline condition. Usually dark in color, with a vitreous luster and fracture. Used in acid-concentrating plants on account of its acid-resisting properties.

O.C. Abbreviation for oxygen consumed (q. v.).

occlusion compounds. See inclusion complexes.

"Ocenol."²⁸ Trademark for a mixture of fatty alcohols, principally oleyl alcohol. Used as a chemical raw material, plasticizer, antifoam agent, and lubricant.

ocher, burnt. See ochers.

ochers. A name given to various native earthy materials used as pigments and consisting, essentially, of hydrated ferric oxide, admixed with clay and sand in varying amounts and in impalpable subdivision. When carrying much manganese they grade into umbers (q. v.).

Ochers are either yellow, brown, or red. Depending on the impurities present some ochers can be marketed after such simple preliminary treatment as drying, grinding and bolting; others, however, require more elaborate treatment, including calcining, in order to obtain the desired shade. The best reds are sometimes obtained by calcining the yellow varieties. They are called burnt ochers. Others, again, are obtained by calcining copperas or as a residue from the roasting of iron pyrites.

In general, the native yellows and browns

are varieties of limonite (q. v.) and the native reds varieties of hematite (q. v.). One variety of the red ocher is known as scarlet ocher. Their value as pigments depends not only on depth of color but also on the amount of oil required as a vehicle.

ocher scarlet. See ochers.

ocotea oil. A volatile oil derived from *Ocotea cymbarum*, and used for its saffrole content for the manufacture of heliotropin.

Containers: Drums.

"OCPN."²³³ Trademark for a chloronitro-aniline, $C_6H_5ClNO_2NH_2$, a dye and pigment intermediate.

Properties: Yellow, crystalline powder; m. p. 108.4°C; insoluble in water; soluble in methanol and ether.

9, 11-octadecadienoic acid. See linoleic acid.

9, 12-octadecadienoic acid. See linoleic acid.

octadecadienol. See linoleyl alcohol.

n-octadecane $C_{18}H_{38}$ or $CH_3(CH_2)_{16}CH_3$

Properties: Colorless liquid, sp. gr. 0.7767 (28/4°C), b. p. 318°C; m. p. 28.0°C; refractive index 1.4369 (n 28/D). Soluble in alcohol, acetone, ether, petroleum, coal-tar hydrocarbons; insoluble in water.

Typical specifications: Sp. gr. 0.7750-0.7769 (28/4°C), b. p. 190-193°C (30 mm); m. p. 26.5-28.0°C, refractive index (n 28/D) 1.436-1.470.

Containers: Glass bottles.

Uses: Solvents, organic synthesis, calibration.

Shipping regulations: None.*

1, 12-octadecanediol. See 1, 12-hydroxystearyl alcohol.

n-octadecanoic acid. See stearic acid.

1-octadecanol. See stearyl alcohol.

n-octadecanoyl chloride. See stearoyl chloride.

9, 12, 15-octadecatrienoic acid. See linolenic acid.

octadecatrienol. See linolenyl alcohol.

9-octadecen-1, 12-diol. See ricinoleyl alcohol.

1-octadecene $C_{18}H_{36}$ or $CH_3(CH_2)_{15}CH=CH_2$.

Properties: Colorless liquid; sp. gr. 0.7884 (20/4°C); refractive index (n 20/D) 1.4456, b. p. 180°C (15 mm); soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.788-0.790 (20/4°C); m. p. 16-18°C; b. p. 177-181°C, (15 mm); refractive index 1.4450-1.4475

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(n 20/D).

Grades: 95% min. purity.

Containers: Glass bottles.

Uses: Organic synthesis of flavors, perfumes, medicines, dyes, oils, resins, plastics.

Shipping regulations: None.*

octadecene-octadecadieneamine. See oleyl-linoleylamine.**cis-9-octadecenoic acid.** See oleic acid.**trans-9-octadecenoic acid.** See elaidic acid.**octadecenol.** See oleyl alcohol.**cis-9-octadecenoyl chloride.** See oleyl chloride.**octadecenyl aldehyde** $C_{17}H_{33}CHO$.

Properties: B. p. 167°C (20 mm); refractive index 1.4620 (25°C); sp. gr. 0.847 (25°C).

Uses: Preparation of octadecyl aldehyde and octadecylamine. Intermediate for other products for use as vulcanization accelerators, rubber antioxidants, synthetic drying oils and pesticides.

Shipping regulations: None.*

octadecyl alcohol. See stearyl alcohol.**octadecyl carboxymethylmercaptosuccinate** (MECSA). Mentioned as a preservative for flavor of cooking oils, functioning by chelation.**octadecyldimethylbenzylammonium chloride** $C_{18}H_{37}(CH_3)_2(C_6H_5CH_2)NCl$. White, crystalline powder. Very soluble in water, chloroform. Soluble in benzene, acetone, xylol. A typical quaternary ammonium salt.**octadecyl mercaptan.** See stearyl mercaptan.**octadecyl trichlorosilane.**

Shipping regulations: Corrosive liquid.

White label.*

octafluorocyclobutane ("Freon-C318") C_4F_8 .

Chemically inert dry gas; high electric strength; used for electrical equipment.

octafluoro-1-pentanol. See fluoroalcohols.**octafluoropropane.** See perfluoropropane.**octahedrite.** See anatase.**octakis(2-hydroxypropyl) sucrose.**

Properties: Very viscous straw-colored liquid; sp. gr. 1.170 (70/20°C), refractive index 1.485 (25°C), pour point 38°C, flash point 485°F; soluble in water, methanol and ether.

Uses: Crosslinking agent for urethane foams, plasticizer for cellulose; glue, starch and many resins.

octamethyl pyrophosphoramidate (OMPA; schradan) $OP[N(CH_3)_2]_2OP[N(CH_3)_2]_2O$. Bis(bisdimethylaminophosphonous) anhydride. Caution! Very toxic.

Properties: Viscous liquid; sp. gr. 1.137; b. p. 120-125°C (0.5 mm); refractive index (n 25/D) 1.462. Miscible with water; soluble in most organic solvents; hydrolyzed in the presence of acids, but not by alkalis or water alone.

Use: A major commercial systemic

insecticide for plants; is absorbed by the plant, which then becomes toxic to sucking and chewing insects.

"Octamine." ²⁴⁸ Trade name for a reaction product of diphenylamine and diisobutylene. Properties: Light brown granular waxy solid; sp. gr. 0.99; m. p. 75-85°C; good storage stability. Soluble in gasoline, benzol, ethylene dichloride and acetone. Insoluble in water.

Uses: Antioxidant in natural, SBR, neoprene and nitrile rubbers. Used in tire carcass, footwear, molded heels and soles, proofing, sponge, automotive rubber, wire insulation and tiling.

octanal (n-octyl aldehyde; aldehyde C-8;caprylic aldehyde) $CH_3(CH_2)_6CHO$.

Properties: Colorless liquid with strong fruity odor; sp. gr. 0.820-0.830; refractive index 1.418-1.425; b. p. 163°C. Soluble in 70% alcohol.

Containers: Glass bottles.

Uses: Perfumery; flavors.

n-octane C_8H_{18} or $CH_3(CH_2)_6CH_3$.

Properties: Colorless liquid; sp. gr. 0.7026 (20/4°C), refractive index (n 20/D) 1.39745; b. p. 125.667°C; m. p. -56.798°C; flash point 22°C; soluble in alcohol, acetone, ether; insoluble in water.

Typical specifications: Sp. gr. 0.702-0.7045; b. p. 125-126°C; refractive index 1.3970-1.4000.

Grades: 95%; 99%; research.

Containers: Bottles, 5-gal drums; tank cars.

Uses: Solvent, organic synthesis; calibrations.

Shipping regulations: Flammable liquid.

Red label.*

1,8-octanedicarboxylic acid. See sebacic acid.**octanediolic acid.** See suberic acid.**octane number.** A number indicating the degree of knocking of a fuel mixture under standard test conditions. Pure normal heptane is arbitrarily assigned zero octane number, while isooctane is assigned 100. A rating of 75 for a given fuel indicates that its degree of knocking in the standard test is equal to that of a mixture of 75 parts isooctane and 25 parts n-heptane.**octanoic acid.** See caprylic acid.**1-n-octanol** (n-octyl alcohol, primary; alcohol C-8; heptyl carbinol) $CH_3(CH_2)_6CH_2OH$.

In industrial practice, the term octyl alcohol has been used for both 1-octanol and 2-ethylhexanol, which latter is also sometimes called isooctanol. The term capryl alcohol has been used for both 1-octanol and 2-octanol. It therefore seems preferable to distinguish the normal primary alcohol as 1-n-octanol.

Properties: Colorless liquid with penetrating, characteristic, aromatic odor; sp. gr. 0.826 (20°C); b. p. 194-195°C (760 mm), 108.7°C (30 mm); refractive index 1.430 (20°C); m. p. -16°C. Miscible with alcohol, chloroform, ether; immiscible with water.

Derivation: By reduction of caprylic acid.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical; C. P.; pure, perfume.

Containers: Glass bottles; 1-, 5-, and 10-gal tins; drums; tank cars.

Uses: Perfumery, cosmetics, organic synthesis; solvent; manufacture of high boiling esters; as an anti-foaming agent.

2-n-octanol (sec-n-octyl alcohol; methyl hexyl carbinol) $\text{CH}_3(\text{CH}_2)_5\text{CHOHCH}_3$. Frequently and confusingly called capryl alcohol (q. v.). Properties: Colorless, oily liquid; refractive; characteristic, disagreeable, but aromatic odor. Miscible with alcohol, ether, immiscible with water. Sp. gr. 0.825 (15°C), b. p. 178-179°C; m. p. -38°C; refractive index 1.437 (20°C).

Derivation: By distilling sodium ricinoleate with an excess of sodium hydroxide.

Grades: Technical, pure.

Containers: Bottles, drums; tank cars.

Uses: Solvent, manufacture of plasticizers, wetting agents, foam control agents, hydraulic oils, petroleum additives, perfume intermediates.

Shipping regulations: None. *

2-octanone. See methyl hexyl ketone.

3-octanone. See ethyl amyl ketone.

octanoyl chloride (capryloyl chloride, sometimes called caprylyl chloride) $\text{CH}_3(\text{CH}_2)_6\text{COCl}$.

Properties: Clear, water-white to straw-colored liquid with characteristic pungent odor. Miscible with most common solvents, reacts with alcohol and water. Fairly stable below the boiling point. Freezing point below -70°C, distillation range 183-212°C, sp. gr. 0.9576 (15.5/15.5°C), refractive index 1.4357 (n 20/D), flash point 82°C, fire point 87°C.

Containers: 5-, 13-gal carboys.

Use: Synthesis.

"Octasol." ¹³⁴ Trademark for metal salts of 2-ethylhexoic acid, in liquid form. Soluble in most hydrocarbons, vegetable oils, paint vehicles, etc. Used as paint driers, wetting agents, catalysts, etc.

1-octene (1-octylene, 1-caprylene) C_8H_{16} or $\text{CH}_3(\text{CH}_2)_5\text{CH}=\text{CH}_2$.

Properties: Colorless liquid, sp. gr. 0.7160 (20/4°C), b. p. 121.27°C, m. p. -102.4°C, refractive index (n 20/D) 1.4088, flash point 21°C, soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Typical specifications: Sp. gr. 0.7150-0.7175 (20/4°C), b. p. 121-123°C, refractive index (n 20/D) 1.4070-1.4105.

Grades: 95%, 99%, research.

Containers: Glass bottles; drums.

Use: Organic synthesis.

Shipping regulations: Flammable liquid.

Red label. *

2-octene C_8H_{16} or $\text{CH}_3(\text{CH}_2)_4\text{CH}=\text{CHCH}_3$. Cis and trans forms exist.

Properties: Colorless liquid; sp. gr. cis 0.7243, trans 0.7199, commercial 0.7185-0.7200 (20/4°C), b. p. cis 125.6°C, trans 125.0°C, commercial 124.5-127°C;

m. p. -94.04°C; refractive index cis 1.4150, trans 1.4132, commercial 1.4120-1.4145 (n 20/D); flash point (mixed isomers) 21°C;

soluble in alcohol, acetone, ether, petroleum, coal-tar solvents; insoluble in water.

Containers: Glass bottles; drums.

Grade: 95%.

Use: Organic synthesis.

Shipping regulations: Flammable liquid.

Red label. *

"Octin." ⁹ Trademark for isomethheptene (2-methyl-amino-6-methyl-heptene-5) employed as the mucate and hydrochloride salts.

"Octin" Mucate. ⁹ Trademark for the mucic acid salt "Octin" (isomethheptene). The mucate salt is a white crystalline, bitter powder; m. p. 144-151°C (with decomposition). It is very soluble in water, and very slightly soluble in ether and in chloroform.

Use: Medicine.

octoic acid. See caprylic acid.

octyl. The general name describing all eight-carbon radicals having the formula C_8H_{17} . It has often been used interchangeably for the 2-ethylhexyl isomer (q. v.).

octyl acetate. See n-octyl acetate and 2-ethyl hexyl acetate.

n-octyl acetate (acetate C-8, caprylyl acetate) $\text{CH}_3\text{COO}(\text{CH}_2)_7\text{CH}_3$.

Properties: Colorless liquid with strong floral-fruity odor. Slightly soluble in water; soluble in alcohol and most other organic liquids. Sp. gr. 0.865-0.869, refractive index 1.419-1.422 b. p. 199°C.

Containers: Glass bottles.

Uses: Perfumery, flavors.

octyl alcohol. See 1-octanol, 2-octanol, 2-ethylhexyl alcohol.

n-octyl alcohol, primary. See 1-n-octanol.

n-octyl alcohol, secondary. See 2-n-octanol.

octyl aldehyde. See octanal and 2-ethylhexaldehyde.

n-octylamine $\text{CH}_3(\text{CH}_2)_7\text{NH}_2$.

Properties: Water-white; amine odor, boiling range 170-179°C, sp. gr. 0.779 (20/20°C); refractive index 1.431 (20°C); flash point 140°F.

tert-octylamine $(\text{CH}_3)_3\text{CCH}_2\text{C}(\text{CH}_3)_2\text{NH}_2$.

Properties: Liquid, b. p. 137-143°C, sp. gr. 0.771 (25°C), refractive index 1.423 (25°C), flash point 92°F (o. c.), insoluble in water; soluble in common organic solvents, especially petroleum hydrocarbons.

Containers: Drums, tank cars.

Caution: Avoid prolonged contact with skin, prolonged inhalation.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

N-octylbicycloheptene dicarboximide

$\text{C}_8\text{H}_{17}\text{NC}_2\text{H}_5\text{O}_2$.

Properties: Liquid, b. p. 158°C (2 mm), sp. gr. 1.05 (18°C); refractive index 1.505

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(n 20/D). Miscible with most organic solvents and oils.

Derivation: From maleic anhydride, cyclopentadiene and 2-ethylhexylamine.

Use: Insecticide and pesticide synergist.

octyl bromide (capryl bromide; caprylic bromide) $\text{CH}_3(\text{CH}_2)_6\text{CH}_2\text{Br}$.

Properties: Colorless liquid. Miscible with alcohol, ether; immiscible with water. Sp. gr. 1.118 (15°C); b. p. 202°C; m. p. -55°C; refractive index 1.4503 (25°C).

Grades: Technical.

Use: Organic synthesis.

octyl carbinol. See nonyl alcohol.

n-octyl n-decyl adipate.

Properties: Liquid, mild characteristic odor, sp. gr. 0.92-0.98 (20/20°C).

Containers: 1-gal and 5-gal cans; 55-gal drums; tank cars.

Use: Low temperature plasticizer.

n-octyl n-decyl phthalate.

Properties: Clear liquid, mild characteristic odor. Sp. gr. 0.972-0.976 (20/20°C).

Containers: 55-gal drums, tank trucks, tank cars.

Uses: Plasticizer for vinyl resins.

octylene. See octene.

octylene glycol titanate.

Properties: Light-yellow solid.

Derivation: Reaction of butyl titanate with octylene glycol.

Uses: Cross-linking agent, surface active agent.

See also titanium chelates.

octylene oxide $\text{Mixed } \text{CH}_3(\text{CH}_2)_5\overline{\text{CHCH}_2\text{O}}$
and $\text{CH}_3(\text{CH}_2)_4\overline{\text{CHCH}(\text{CH}_3)\text{O}}$.

Use: Organic intermediate, additive to epoxy resins. Sp. gr. of liq. 0.830 (25°C).

octyl hydride. See octane.

octylic acid. See caprylic acid.

octyl iodide (caprylic iodide, secondary normal capryl iodide) $\text{CH}_3(\text{CH}_2)_6\text{CHICH}_3$.

Properties: Oily liquid. Caution! Keep away from light and air! Sp. gr. 1.318 (18°C); b. p. (approx) 210°C (dec).

Grades: Technical.

Containers: Amber glass ground stoppered bottles.

Use: Organic synthesis.

Shipping regulations: None.*

n-octyl mercaptan $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: A water-white liquid with mild odor; b. p. 199°C; sp. gr. 0.8395 (25/4°C); refractive index 1.4497 (25°C).

Grades: Technical (95% min mercaptan).

Uses: Polymerization conditioner; synthesis.

tert-octyl mercaptan $\text{C}_8\text{H}_{17}\text{SH}$.

Properties: Boiling range 154-166°C, sp. gr. 0.848 (60/60°F); refractive index 1.454 (n 20/D), flash point 41°C.

Grades: 95%.

Containers: Drums; tank cars.

Uses: Polymer modification.

Shipping regulations: None.*

n-octyl methacrylate $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_8\text{H}_{17}$.

Properties: A water-insoluble colorless liquid; polymerizes to a colorless resin if a stabilizer is not added.

octyl peroxide (caprylyl peroxide).

Shipping regulations: Solution: oxidizing material. Yellow label.* Legal label name is caprylyl peroxide.

octyl phenol (diisobutyl phenol) $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{OH}$.

Properties: White flakes; congeals 72-74°C; sp. gr. 0.89 (90°C); b. p. 280-302°C; hydroxyl coefficient 259-275. Insoluble in hot and cold water. Limited solubility in alkalis. Soluble in 1-1 mixture of methanol and 50% aqueous potassium hydroxide, also in alcohol, acetone, benzene, ether, chloroform, carbon tetrachloride.

Containers: Bags; drums; carloads; tank cars.

Uses: Non-ionic surfactants; plasticizers; antioxidants; fuel oil stabilizer; intermediate for resins, fungicides, bactericides, dye-stuffs, adhesives, rubber chemicals.

Shipping regulations: None.*

octylphenoxy polyethoxyethanol

$(\text{CH}_3)_2\text{CCH}_2\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{O}(\text{CH}_2\text{CH}_2\text{O})_x\text{H}$.

Anhydrous liquid mixture of mono-para-(1, 1, 3, 3, -tetramethylbutyl)phenyl esters of polyethylene glycols in which x varies from 5 to 15.

Properties: Clear, yellow, viscous liquid; faint odor, bitter taste, sp. gr. 1.060; refractive index 1.489 (25°C), soluble in water, alcohol, acetone, benzene, toluene; insoluble in hexane; pH is between 7 and 9.

Grade: N. F. XI.

Use: Medicine, food packaging; probably as a plasticizer for films.

para-octylphenyl salicylate

$\text{C}_6\text{H}_4\text{OHCOOC}_6\text{H}_4\text{C}_8\text{H}_{17}$. Prevents photo-oxidation in polyethylene and polypropylene.

octyl phosphate. See trioctyl phosphate.

octyl trichloroarsine.

Shipping regulations: Corrosive liquid.

White label.*

"**Odamask**." ³⁴² Trademark for deodorizing and reodorizing aromatics for industrial use.

"**Odrenes**." ¹² Trademark for a series of economical industrial perfumes possessing masking and reodorizing properties. Versatile compositions containing blends of natural and synthetic chemicals resulting in many different odor types.

"**Odrex**." ¹⁸⁸ Brand name for an industrial odorant.

oenanthal. See heptanal.

oenanthic acid. See n-heptanoic acid.

oenanthic aldehyde. See heptanal.

oenanthic ether. See ethyl oenanthate.

oenanthylic compounds. Same as oenanthic compounds.

"**Oenethyl**." ⁹ Trademark for 2-methyl-amino-heptane, employed as the hydrochloride salt.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

oenology. The study of wines.

"Ohopex" Q-10 Plasticizer. ⁵⁵ Trademark for fatty phthalic acid esters.
Properties: Slightly yellow, oily liquid.
Typical specifications: Sp. gr. 0.957 ± 0.005 (20/20°C); f. p. -50°C (stiff gel); boiling range $215\text{--}235^{\circ}\text{C}$ (4 mm); acidity 0.1% (max) as acetic acid; flash point 415°F , fire point 480°F , refractive index 1.477 (25°C); viscosity 47 cps (20°C), vapor pressure <0.06 mm Hg (150°C), surface tension 32 dynes/cm (20°C); wt/gal 8 lbs. Insoluble or limited solubility in glycerin, glycols and certain amines. Soluble in most other organic liquids.

Containers: 1-, 5-gal cans; 55-gal drums, tank cars.

Uses: Primary plasticizer for most resins imparting permanent flexibility, low water extraction, excellent hand and drape, low temperature flexibility, high gloss, and heat stability. An excellent plasticizer for extrusions or polishing stocks.

"Ohopex" R-9 Plasticizer. ⁵⁵ Trade name for mixed octyl fatty acid esters.

Typical specifications: Sp. gr. 0.864 ± 0.005 (20/20°C); freezing point -10°C (approx); boiling range $210\text{--}239^{\circ}\text{C}$; acidity (max) 0.3% as acetic acid, odor mild, characteristic; flash point 410°F ; fire point 475°F , vapor pressure <0.06 mm Hg (150°C), refractive index 1.452 ± 0.002 ; viscosity 14.2 cps (20°C), surface tension 29 dynes/cm (20°C); thermal expansion $0.00083/^{\circ}\text{C}$ (10–40°C); wt/gal 7 lbs. Limited solubility in many compounds containing OH group such as alcohols, "Cellosolves," glycols, glycerine, etc. Soluble in most other organic liquids.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Primary plasticizer for chloroprene and many other types of synthetic rubber, ethyl cellulose and chlorinated rubber.

"1320 Oil." ¹⁷⁵ Brand name for a semi-refined coal-tar solvent.

Properties: Light amber color; not over 5% distills to 135°C ; not less than 95% distills to 200°C , sp. gr. 0.860 (15.5/15.5°C); approx. 7.46 lbs/gal.

Containers: 55-gal steel drums.

Uses: A medium-boiling paint and enamel solvent; industrial solvent where slight color is permissible.

oil blue. A violet-blue pigment consisting of copper sulfide. It is not very durable but when used in varnish, which protects it from the action of air, it is fairly permanent.

"Oil Blue A." ²⁸ Trade name for proprietary grade of 1,4-di(isopropylamino)anthraquinone, a petroleum dye used to color gasoline, etc.

oil bois de rose Brazilian (rosewood oil; bois de rose oil).

Properties: Pale-yellow to yellow liquid; fragrant odor; sp. gr. $0.8750\text{--}0.8950$ (15°C);

optical rotation -4° to $+5^{\circ}$; refractive index $1.4620\text{--}1.4685$ (n 20/D); total alcohols (as $\text{C}_{10}\text{H}_{18}\text{O}$) 84–92%; soluble in 6 volumes of 60% alcohol and in 2 volumes of 70% alcohol; soluble in fixed oils, propylene glycol, benzyl benzoate; slightly soluble in glycerin.

Derivation: Steam distillation of the so-called Brazilian linaloe tree (the botanical derivation for the tree is obscure).

See linaloe oil, Mexican.

Containers: Glass bottles; copper flasks.

Use: Perfumery.

Shipping regulations: None. *

"Oil Bronze." ²⁸ Trade name for blend of Oil Red and Oil Orange, petroleum dyes used to color gasoline, etc.

oil cakes. The residue obtained after the expression of vegetable oils from the oil-bearing seeds. These cakes are valuable both as cattle feed and fertilizer. When ground they are known as meal. For further data see under specific headings, such as cottonseed cake and meal; peanut oil meal, etc.

"Oildag." ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in petroleum oil.

Properties: Liquid consistency; solids content 10%; average particle size 0.5 micron, max. particle size 4 microns; sp. gr. 0.977; flash point 196°C ; completely miscible with petroleum oils.

Uses: General industrial lubrication; oil additive for internal-combustion engines; formulation of glass-mold oils and specialty lubricants, meets U. S. Military Specification MIL-L-3572, Grade B.

"Oilfos." ⁵⁸ Trademark for glassy sodium phosphate, a dry powder used exclusively for controlling viscosity of oil well drilling muds.

Containers: 100-lb net paper bags; triotex bags.

oil gas. A gas made by the interaction of oil vapors and steam at high temperatures by methods similar to those used for water gas production. Heating value about 554 Btu/cu ft. A typical analysis is illuminants 4.2%, carbon monoxide 10.4%, hydrogen 47.6%, methane 27.0%, carbon dioxide 4.6% oxygen 0.4%, nitrogen 5.8%.

"Oil Orange." ²⁸ Trade name for proprietary grade of phenylazo-2-naphthol, a petroleum dye used to color gasoline, etc.

oil plant. See ricinus.

"Oil Red." ²⁸ Trade name for proprietary grade of methyl derivatives of azobenzene-4-azo-2-naphthol, a petroleum dye used to color gasoline, etc.

oils. Any liquid of relatively high viscosity and slippery feel is likely to be called an oil. The term is applied to a great many different kinds of substances, many of which are described under specific entries

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

such as coconut oil, olive oil, peanut oil, shale oil, myrrh oil.

There are three major categories of oils: (a) petroleum or mineral or hydrocarbon oils derived from crude petroleum; (b) fatty oils which are glycerol esters and derived from vegetable or animal fats or similar materials; (c) essential oils (q. v.), derived from plants, usually possessing a characteristic odor or flavor, usually not esters but more often terpene hydrocarbons.

The term oil is also applied to other oily substances that do not come under the preceding headings. Examples of these are oil of vitriol and oil of mirbane.

oil shale. A sedimentary rock with relatively high organic content (30 to 60% volatile matter and fixed carbon) that yields an oil when heated in the absence of air, but does not yield oil when extracted with ordinary solvents. Typical shales yield from 20 to 50 gallons of crude oil per ton, this oil being of a relatively unsaturated or olefinic character compared with petroleum.

See also kerogen.

oil varnish. See varnish.

oil well drilling mud. See drilling mud.

oil white. Usually mixtures of lithopone and white lead or zinc white (q. v.). It may also contain gypsum, magnesia, whiting, or silica. Used as a white-lead substitute. Shipping regulations: None.*

"Oil Yellow N." ²⁸ Trade name for proprietary grade of para-dimethylaminoazobenzene, a petroleum dye used to color gasoline, etc.

oiticica oil.

Properties: Light yellow drying oil which slowly solidifies to a buttery consistency unless first heated for about 30 minutes at 210-220°C. Hence properties vary according to whether the oil is raw or heat-treated (semi-polymerized).

Typical specifications:

(raw) A semi-solid white or cream-colored mass, sp. gr. 0.965 (min), acid value 5.0 (max), saponification value 185 (max), refractive index 1.514 (25°C) (min), moisture and volatile matter 0.9% (max), polymerization, by the Browne heat test, 22 min (max), Gardner-Holdt viscosity O to P, color, according to the 1933 Gardner scale, 10 (max).

(semi-polymerized): An amber-colored viscous liquid. Sp. gr. 0.975 (min), acid value 7.5 (max), refractive index 1.507 (25°C) (min), moisture and volatile matter 0.5% (max), Gardner-Holdt viscosity Z-2 to Z-3, color, by the 1933 Gardner scale, 12 (max).

Derivation: By expression from the seeds of the Brazilian oiticica tree, *Licima rigida*.

Chief constituents: Glycerides of alpha-lipoic acid (4-keto-9,11,13-octadecatrienoic acid).

Containers: Steel drums; tank trucks.

Uses: Drying oil in paints, varnishes, etc.; substitute and adjunct for tung oil.

"Oittoil." ⁹⁰ Trade name for a raw oiticica oil.

Properties: Viscosity, M to O (Gardner-Holdt 25°C); color, max 12 (Gardner); heating test (ASTM), max 22 min; sp. gr. 0.960-0.980 (20°C), refractive index 1.5150-1.5190 (25°C), acid value, max 4% F. F. A., saponification value 186-193; unsaponifiable matter, 1.5%.

Uses: Drying oil for paints and varnish; substitute for tung oil.

"OKO." ⁶⁴ Trade name for a line of polymerized linseed oils produced by vacuum polymerization to remove all traces of decomposed matter. Low acid, light color, minimum after-yellowing.

Uses: Paints, varnishes, enamels, flats, printing inks, brake linings.

okonite. A mixture of raw rubber and the black residue obtained in the purification of ozocerite which is vulcanized to give a flexible, tough, waterproof insulator.

"Olancho Clay." ³⁸ Trade name for a natural montmorillonite used in the preparation of insecticide concentrates. Unusually high absorptive capacity for DDT, toxaphene and other types of insecticides. Supplied in several different mesh sizes and in both powdered and granular form.

old yellow enzymes. See Warburg's yellow enzyme.

oleamide $\text{cis-CH}_3(\text{CH}_2)_7\text{CH:CH}(\text{CH}_2)_7\text{CONH}_2$. Properties Ivory-colored refined powder, approximate melting point 72°C, sp. gr. 0.94.

Grades: Refined.

Uses: Slip-agent for extrusion of polyethylene, wax additive, ink additive.

oleandomycin phosphate $\text{C}_{35}\text{H}_{61}\text{NO}_2 \cdot \text{H}_3\text{PO}_4$. Properties: White, odorless, crystals or powder, soluble in water, alcohol, slightly soluble in ether.

Derivation: *Streptomyces antibioticus*.

Grade: N. F. XI.

Use: Medicine

oleanolic acid. See caryophyllin.

"Olefane." ⁴²⁹ Trademark for polypropylene film.

olefiant gas. See ethylene.

olefin fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of ethylene, propylene, or other olefin units (Federal Trade Commission).

Properties: Extreme light weight, good abrasion resistance, easily cleaned.

Uses: Seat covers for automobiles, outdoor furniture, marine ropes, shoe fabrics; belts; handbags.

olefins. A class of unsaturated hydrocarbons of the general formula C_nH_{2n} and named

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

after the corresponding paraffins by adding "ene" or "ylene" to the stem. Characterized by relatively great chemical activity. See ethylene, propylene, and butenes for typical examples.

oleic acid (cis-9-octadecenoic acid; red oil) $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$. A mono-unsaturated fatty acid; a common component of almost all naturally occurring fats as well as tall oil. Most commercial oleic acid is derived from animal tallow or natural vegetable oils.

Properties: Commercial grades: Yellow to red oily liquid; lardlike odor; darkens on exposure to air. Insoluble in water, soluble in alcohol, ether and most organic solvents. It is itself a good solvent for other oils, fatty acids and oil-soluble materials.

Purified grades: Water-white liquid; sp. gr. 0.8905 (20/4°C); m. p. 13.2°C; b. p. 286°C (100 mm), 225°C (10 mm); refractive index 1.4599 (20°C).

Derivation: The free fatty acid is obtained from the glyceride by hydrolysis, steam distillation and separation by crystallization or solvent extraction. Filtration from the press cake results in the commercial oleic acid of commerce (red oil) which is repurified and bleached for specific uses. Several grades are available containing varying proportions of other acids as impurities, such as linoleic, linolenic, myristic, palmitic, and stearic acids.

Grades: Variety of technical grades, grade free from chick edema factor, U. S. P. XVI, purified 99+ %.

Containers: Bottles; barrels; tank trucks; tank cars.

Uses: Soap base, manufacture of oleates; ointments, cosmetics, polishing compounds, lubricants, ore flotation; organic synthetic intermediate, surface coatings.

Shipping regulations: None.*

olein (triolenin, glyceryl trioleate) $(\text{C}_{17}\text{H}_{33}\text{COO})_3\text{C}_3\text{H}_5$. The triglyceride of oleic acid, occurring naturally in most fats and oils. It constitutes about 70-80% of olive oil.

Properties: Yellow, oily liquid; sp. gr. 0.915; m. p. -4 to -5°C, soluble in chloroform, ether, carbon tetrachloride; slightly soluble in alcohol.

Impurities: Stearin, linolein.

Derivation: Refined natural oils.

Uses: Textile lubricants.

oleoresin black pepper. See oleoresin pepper.

oleoresin capsicum.

Derivation: From the fruit of *Capsicum frutescens* (cayenne or African pepper) by ether or acetone extraction.

Grade: N. F. XI. Same as capsaicin (q. v.).

oleoresin cubeb.

Derivation: From the fruit of *Piper cubeba* by alcohol extraction. Soluble in alcohol and ether.

Grade: Technical.

Containers: Glass bottles, boxes.

Use: Medicine.

Shipping regulations: None.*

oleoresin ginger.

Derivation: From rhizome of *Zingiber officinale*, by acetone, alcohol, or ether extraction. Soluble in alcohol and ether.

Grades: Technical; N. F. XI.

Containers: Glass bottles; boxes.

Use: Medicine.

Shipping regulations: None.*

oleoresinous varnish. An oil varnish. See varnish.

oleoresin pepper (oleoresin black pepper).

Derivation: By acetone extraction of the fruit of *Piper nigrum*.

oleoresins.

Derivation: Semi-solid mixtures of the resin and the essential oil of the plant from which they exude. They have a pungent taste and a peculiar odor and are sometimes referred to as balsams.

See also benzoin gums; Peru, tolu and styrax balsams.

oleovitamin A. Natural vitamin A in oil. It may be (1) fish liver oil, or (2) fish liver oil diluted with an edible vegetable oil, or (3) a solution of vitamin A concentrate in fish-liver oil or in an edible vegetable oil. The vitamin A concentrate may be derived from natural (animal) sources, from synthetic vitamin A, or from its fatty acid esters. It is a thin oily liquid with a fishy but not rancid odor and taste. Unstable to air and light; insoluble in water; soluble in alcohol, ether and vegetable oils.

Grade: U. S. P. XVI.

Use: Nutrition.

oleovitamin D synthetic. A form of vitamin D (q. v.). It is a solution of calciferol or activated 7-dehydrocholesterol in an edible vegetable oil, or a solution in an edible vegetable oil of the products of activated ergosterol or 7-dehydrocholesterol.

Properties: A clear, colorless to light yellow, oily liquid, nearly odorless, bland taste, slightly soluble in alcohol, miscible with ether and with chloroform.

Units: One U. S. P. unit of vitamin D activity is the specific biologic activity of 0.025 microgram of vitamin D₃.

Grades: U. S. P. XVI.

Uses: Medicine; nutrition.

oleoyl chloride (cis-9-octadecenoyl chloride) $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COCl}$.

Properties: Liquid, b. p. 175-180°C (3 mm); soluble in hydrocarbons and ethers; reacts slowly with water.

Containers: Bottles; carboys, 55-gal drums.

Uses: Chemical intermediate.

oleum. The Latin name for oil. Also applied to fuming sulfuric acid (q. v.).

oleyl alcohol (octadecenol)

$\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$.

The fatty alcohol derived from oleic acid.

It has a long straight carbon chain with one double bond in it. Available commercially

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

as 80-90% pure. Clear liquid at room temperature.

Typical specifications: Iodine value 88, cloud point 20°F, boiling range 282-349°C.

Impurities: Linoleyl, myristyl and cetyl alcohols.

Derivation: Reduction of oleic acid.

Uses: Chemical synthesis, resins, petroleum additives, surface active agents, polymers.

oleylhydroxamic acid $C_{17}H_{33}CONHOH$.

Properties: Waxy solid; off-white color; sp. gr. 0.897 (70/25°C); insoluble in water; soluble in aqueous potassium hydroxide and organic solvents.

oleyl-linoleylamine (octadecene-octadecadiene-amine).

Properties: Highly unsaturated primary amine; soluble in many organic solvents; insoluble in water.

Constants: Sp. gr. 0.83; m. p. 19°C, b. p. 198-209°C; amine no. 200-210; iodine value 90 min.

Use: Organic intermediate.

oleyl methyl tauride. See sodium N-methyl-N-oleoyl taurate.

olibanum (frankincense, gum thus).

Distilled from the dried exudation of *Boswellia* species.

Habitat: Nubia; Egypt and Somaliland.

Grades: Technical.

Containers: Kegs.

Uses: Pharmacy, incense, fumigating preparations, perfumery (fixative).

Shipping regulations: None.*

olibanum oil (frankincense oil).

Properties: Colorless or yellowish oil having an agreeably balsamic and faintly lemon-like odor. Soluble in 4 to 6 vols. of 90% alcohol, occasionally with slight turbidity. Soluble in ether, chloroform, and carbon disulfide.

Chief known constituents: Pinene; phellandrene; dipentene.

Constants: Sp. gr. 0.876-0.892 (15°C).

Derivation: By distilling gum thus.

Containers: Cases; bottles.

Use: Medicine.

Shipping regulations: None.*

oligomer. Name suggested for a polymer compound molecule consisting of only a few monomer units, as 2, 3, 4.

olivenite $Cu_2(AsO_4)(OH)$. A natural basic arsenate of copper. Color various shades of green, brown, and gray; luster adamantine to vitreous, streak olive green to brown; sp. gr. 4.4, hardness 3.

Occurrence: England; Chile; Utah.

olive oil (sweet oil).

Properties: Pale yellow or greenish-yellow, fixed, liquid oil; slight characteristic odor and taste; faintly acrid aftertaste. Soluble in ether, chloroform and carbon disulfide; sparingly soluble in alcohol.

Chief known constituents: Olein; palmitin.

Constants: Sp. gr. 0.910-0.918; saponification value 188-196; iodine value 77-88.

Derivation: By expressing the pulp of the fruit of the olive tree, *Olea europea*. The best oil comes from fruit not quite ripe. The crude oil is washed and filtered. The cake is subjected to further pressings and finally solvent extraction, a lower grade of oil being produced each time.

Impurities: Free fatty acids, sediment, water and adulterants.

Adulterants: Cottonseed, peanut, sesame and poppy oils.

Grades: U. S. P. XVI; edible; commercial; sulfur oil (olive oil foots). The edible oil and also the commercial oil are obtained by expression, and the last grade by extraction usually with carbon disulfide.

Containers: Drums.

Uses: As food (substitute for butter in Italy and other countries), in ointment, liniments, etc.; for manufacture of Castile soap; special textile soaps; lubricant; wool oil; tanning.

olive oil foots. See olive oil (grades).

olivine (chrysolite) $(Mg, Fe)_2SiO_4$. Natural magnesium-iron silicate, found in igneous and metamorphic rocks, meteorites, and blast furnace slags. A complete series exists from Fe_2SiO_4 to Mg_2SiO_4 . Some of the more important varieties are:

Forsterite Mg_2SiO_4 . Color green; luster vitreous, hardness 6.5-7, sp. gr. 3.2-3.3.

Fayalite Fe_2SiO_4 . Color yellow to black; luster vitreous; hardness 6.5-7, sp. gr. 3.6.

Peridot is a transparent green gem variety. Other minerals often grouped with olivine are monticellite $CaMgSiO_4$, and tephroite Mn_2SiO_4 .

Occurrence: North Carolina, Washington, New Zealand; Europe.

Grades: Crude, 20 mesh, 100 mesh.

Use: Refractories, cements, possible source of magnesium metal.

"OLOA."¹⁵¹ Brand name for mixtures of metal-organic and/or organic compounds in a lubricating oil carrier. Used to fortify well-refined base stocks to yield motor oils that minimize engine deposits, engine wear, bearing corrosion, engine rusting, and friction between rubbing surfaces.

"Omamids."⁸⁴ Trademark for a series of thermoplastic resins of the polyamide type. Properties: "Omamid" S and "Omamid" C are solid, water insoluble, amber colored, thermoplastic resins, readily dispersible on heating in many organic systems.

Uses: In surface coatings, inks, and adhesives, as thixotropic viscosity modifiers and gelling agents. Impart "built in" thixotropy to solvent or oil based systems.

"Omazene."⁸⁴ Trade name for copper dihydrazinium sulfate (q. v.). Available as 50% wettable powder.

Use: Foliage fungicide.

Caution: Avoid skin exposure and inhaling dust or mist.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

OMC. Abbreviation for oxidized microcrystalline waxes (q. v.).

"Omnadin." ¹⁶² Trademark for prolipin.

OMPA. Abbreviation for octamethyl pyrophosphoramide.

"O-M Special." ¹⁸⁸ Brand name for an odor modifier for isopropyl alcohol.

ONB. Abbreviation for ortho-nitrobiphenyl.

"Oncor." ³⁰⁴ Trademark for a series of pigments. Available as:

"Oncor 23A." Antimony silico-oxide pigment.

Properties: White powder; sp. gr. 3.6.

Tinting strength in oil 160.

Containers: Multiwall paper bags (50 lbs net).

Uses: Imparts flame resistance to halogenated plastic and paint compositions.

"Oncor 45X." Basic silicate white lead pigment.

Properties: White powder, sp. gr. 4.0.

Tinting strength in oil 70.

Containers: Multiwall paper bags (50 lbs net).

Uses: Imparts film durability and good performance in house paints.

"Oncor M50." Basic lead silico-chromate pigment.

Properties: Orange colored powder; sp. gr.

4.1. Resistance to exposure excellent.

Containers: Multiwall paper bags (50 lbs net).

Uses: Imparts corrosion resistance, exposure durability and color retention to anti-corrosive paints.

"Oncor T15." Lead silico-titanate pigment.

Properties: Off-white colored powder; sp. gr. 4.05. Tinting strength in oil 200.

Containers: Multiwall paper bags (50 lbs net).

Uses: Imparts color retention to tinted outside house paints.

"Ondal" A Oxidizing Agent. ²⁸ White powder.

Use: For one-bath oxidizing and soaping of vat colors in the textile industry.

"Ondelette." ²⁸ Trademark for a random slubbed rayon fashion yarn. See also rayon.

onion oil.

Properties: Yellowish liquid; penetrating odor. Soluble in ether, chloroform, and carbon disulfide.

Chief known constituent: Allylpropyl bisulfide.

Constants: Sp. gr. 1.035-1.045.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Use: Flavoring.

onyx. A form of silica or quartz (q. v.),

essentially a chalcedonic silica. Contains colored bands (black and white, red and white) like agate (q. v.) but the bands are straight and the layers in even planes.

See also sardonyx. Used for cameos.

Most of the commercial onyx has been artificially colored. Onyx marble is a form of limestone.

"Onyxide 75%." ³²⁸ Brand name for a 75% concentration of alkenyl dimethyl ethyl ammonium bromide in which the alkenyl radical contains predominantly 18 carbon atoms. It is a cationic surface-active compound supplied as a tan paste of pleasant characteristic odor. Use dilutions are virtually odorless, colorless and slightly bitter in taste.

Containers: 15-, 30-, 50-gal specially lined steel drums.

Suggested uses: For the control of algae and slime in swimming pools, cooling towers, and air conditioning units.

"Onyxol 336." ³²⁸ A brand-named liquid detergent, wetting and dispersing agent, and thickener. It is a lauric acid alkanolamine condensate, employed as liquid household detergent ingredient, carpet and rug wet cleaner, for wallpaper removal, and as a dispersant.

"Onyxol 9162." ³²⁸ A brand-named, amber-colored liquid 96% active that can be used in all types of wool scouring machines, also as an auxiliary emulsifying agent, and an automobile cleaner. It is a coconut fatty acid alkanolamine condensate.

"Onyxsan HSB; -S; -S-50." ³²⁸ Cation-active permanent softeners, particularly effective in the softening and finishing of rayons and cottons. "Onyxsan"-treated fabrics do not become rancid in storage, do not mark-off, and are compatible with many other special finishing products.

opal. A form of native amorphous hydrated silica containing 3-13% water. It may be transparent or opaque; vitreous, dull, or pearly luster; and varied in color, or colorless with varied internal reflections. The play in color is thought to be due to thin curved layers with a different refractive index from the material around them, thus breaking the light up into various prismatic colors. Sp. gr. 1.9-2.3, hardness 5.5-6.5. Use: Gem stone.

"Opalon." ⁵⁸ Trademark for vinyl chloride.

"Opalwax." ²⁰² Trademark for hydrogenated castor oil. See "Castorwax" and glyceryl tri-12-hydroxystearate.

"Opax." ³³⁷ Trade name for 90% ZrO₂ (zirconium oxide) containing 7% SiO₂, 0.6% Al₂O₃, 0.8% Na₂O. White cream powder; sp. gr. 5.4; m. p. 4500°F, average particle size 15 microns. Used as opacifier for glazes, enamels and ceramic pigments, in dinner ware, art ware, wall tile and sheet steel enamels. Promotes craze resistance and color stability.

Containers: 80-lb paper bags; 500-lb barrels; 36,000-lb carloads.

"Opax S." ³³⁷ Similar to "Opax" but contains 88% ZrO₂, 7% SiO₂; sp. gr. 5.2; and has average particle size 5 microns. The finer particle size results in greater opacity in enamels or glazes.

"Opex." ¹⁴¹ Trade name for nitrocellulose lacquer for automotive and industrial finishes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

OPG. Abbreviation for oxypolygelatin (q. v.).

"Ophthalmine." ⁴¹² Trademark for proparacaine hydrochloride (q. v.).

opianyl. See meconin.

opium,

Derivation: The air-dried, milky exudation obtained by incising the unripe capsules of *Papaver somniferum* L. or its variety album De Candolle (Fam. Papaveraceae).

Properties: Gum opium: more or less rounded, somewhat flattened masses; externally dark brown; internally dark brown, interspersed with lighter areas, strong, peculiar odor; bitter, somewhat acrid taste; somewhat plastic when fresh, becoming hard and brittle or tough on keeping, sp. gr. 1.336. Official opium, for purposes other than the preparation of alkaloids or their salts, must yield, when dried and powdered, not less than 9.5% and not more than 10.5% anhydrous morphine. When used as a source for tincture or extract, it must contain, when dry, not less than 7.5%.

Granulated opium: A U. S. P. XVI product produced by drying gum opium below 70° followed by granulation and screening so that no more than 10% passes a 60-mesh screen and all passes a 10-mesh screen.

Powdered opium: U. S. P. XVI grade consisting of a fine powder with 10-10.5% anhydrous morphine.

Gum opium, granulated opium and powdered opium are listed in the U. S. P. XVI.

Denarcotized or deodorized opium: Powdered opium from which has been removed its odor and nauseating substances.

Commercial varieties: (1) Asia Minor, Smyrna, Constantinople, (2) Macedonian, (3) Bulgarian; (4) Persian; (5) Indian; (6) Chinese, (7) Egyptian.

Containers: Tins.

Use: Medicine.

Shipping regulations: None.*

opium gum. Crude opium.

opium, tincture of. See laudanum.

"Oppanol B." ⁴⁴⁰ Trademark for isobutene (q. v.) in various stages of polymerization. Varies from oily liquid through highly viscous material to rubberlike solid according to degree of polymerization.

Uses: Insulation and lining material, and production of adhesives and sealing compounds in the rubber industry.

optical bleach. See optical brightener.

optical brightener (optical bleach). A dyestuff which will absorb ultraviolet energy and emit the energy in the visible range. By selection of the color of the emitted light the sum of the total visible light reflection can enhance the surface reflection as desired or retard undesirable shades. Optical brighteners are used in soaps, detergents, paper, textiles and plastics. Typical examples are stilbene-triazine derivatives. See also white dye.

optical crystals. Crystals, either naturally occurring, or, more frequently, synthetic, which are used for infrared and ultraviolet optics, piezoelectric effects, and short wave radiation detection. Examples are sodium chloride, potassium iodide, silver chloride, calcium fluoride, and, for scintillation counters, such organic materials as anthracene, naphthalene, stilbene, and terphenyl.

optical glass. Carefully made glass of great uniformity and usually special composition to give desired transmission, refraction, and dispersion of light.

optical isomerism. The existence of two stereoisomeric forms of a compound which differ in properties only with respect to the direction in which they rotate the plane of polarized light, the angles of their crystal faces, and some related properties. Mixtures of such compounds with one another are not separable by ordinary means. The situation arises with compounds having an asymmetric carbon atom in their molecules. The classical examples are the dextrorotatory and levorotatory tartaric acids studied by Pasteur, but hundreds of other cases are known. A common example is the active amyl alcohol from fusel oil (2-methyl-1-butanol). This has the formula $\text{CH}_3\text{CH}_2\text{C}^*\text{H}(\text{CH}_3)\text{CH}_2\text{OH}$ in which the starred carbon is asymmetric since it is joined to CH_3CH_2 , H, CH_3 , and CH_2OH .

optical rotation. The property of some substances of rotating the plane of vibration of polarized light through an arc to an extent characteristic of the substance.

"Ora-Lutin." ³³⁰ Trademark for anhydro-hydroxyprogesterone.

orange III. See methyl orange.

orange cadmium. See cadmium sulfide.

orange flower oil (neroli oil).

Properties: Essential oil, pale yellow, fluorescent liquid becoming brownish red on exposure to light; pleasant orange blossom odor, bitter aromatic taste; sp. gr. 0.863-0.880 (25/25°C); optical rotation +1.5° to +9.1° (25°C). Soluble in an equal volume of alcohol.

Chief known constituents: Limonene, linalool, methyl anthranilate, geraniol, linalyl acetate.

Derivation: Distilled from the flower of *Citrus aurantium* L.

Grades: N. F. XI.

Containers: Glass bottles.

Uses: Perfumery; flavoring.

Shipping regulations: None.*

orange lakes. Pigments made by precipitating an orange dyestuff on a base, usually of aluminum hydrate. They are transparent and vary from poor to fair with respect to lightfastness, depending upon the particular dyestuff used. Their principal use is in the production of transparent metal

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

coatings for cans, bottle caps, etc. They are non-bleeding in oil and withstand the high temperatures at which finishes of this type are usually baked. They are not sufficiently lightfast for sign coatings that are to be subjected to exterior exposure. When used in combination with the transparent yellow lakes a "gold" effect is produced.

orange mineral. A lead oxide pigment made in a furnace by roasting lead carbonate or sublimed litharge; it is a very bright orange, but has low tinting strength. It is not all that is to be desired from the standpoint of permanency as on weathering a chemical change occurs and a white chalking or scum develops on the surface, probably due to the formation of some carbonate. It has very good opacity, very low oil absorption and is sometimes employed as a base for vermilion, permanent (q. v.). "Orange mineral" is not used in pigmented enamels to any very great extent, but is employed in primers for metal surfaces.

orange oils. See orange peel oil, sweet, orange peel oil, bitter; orange flower oil, orange oil, terpenesless.

orange oil, sweet. See orange peel oil, sweet.

orange oil, terpenesless.

Concentration: About 35 to 50 times that of the ordinary orange oil.

Constants: Sp. gr. about 0.894, optical rotation, varies between wide limits according to the degree to which the terpenes have been extracted. Soluble in 50 parts per 100 parts of 70% alcohol.

Shipping regulations: None. *

orange oil, U. S. P. XVI. See orange peel oil, sweet.

orange peel, bitter.

Derivation: Dried rind of unripe but fully grown fruit of *Citrus aurantium*, L.

Grades: Technical, N. F. XI.

Containers: Bags, bales.

Use: Flavoring, medicine.

Shipping regulations: None. *

orange peel oil, bitter. A volatile oil.

Properties: Similar to orange peel oil, sweet (q. v.) excepting that the taste is bitter.

Constants: Sp. gr. 0.845-0.851 (25/25°C), optical rotation +88° to +98° (25°C), refractive index 1.4725-1.4755 (20°C).

Soluble in 4 volumes alcohol, in dehydrated alcohol and glacial acetic acid.

Derivation: Expressed from the fresh peel of *Citrus aurantium*, L.

Containers: Bottles, tins, drums.

Uses: Flavoring, perfumery; medicine.

Shipping regulations: None. *

orange peel oil, sweet (orange oil, sweet, orange oil, U. S. P. XVI.)

Properties: Yellow to yellowish-brown essential oil; mild, aromatic, not bitter taste; characteristic orange odor.

Chief known constituents: Limonene.

Constants: Sp. gr. 0.848-0.853 (15°C); optical rotation +95° 30' to +98°; refractive index 1.473-1.475.

Soluble in 7 to 8 vols of 90% alcohol (usually not clear) and in glacial acetic acid.

Derivation: Expressed from the peel of *Citrus aurantium*, L., subspecies *sinensis*.

Grade: U. S. P. XVI.

Containers: Bottles; tins, copper flasks.

Uses: Flavoring; perfumery; medicine.

Shipping regulations: None. *

orange peel, sweet (sweet orange; Portugal orange; China orange).

Derivation: Rind of the fresh fruit of *Citrus aurantium*.

Habitat: Northern India, Spain and West Indies, cultivated near the Mediterranean, Florida, California, etc.

Grades: Technical.

Containers: Bags.

Uses: Flavoring; medicine.

Shipping regulations: None. *

orange root. See hydrastis.

orange toners. Dyestuffs consisting of diazo compounds coupled to diacetoacetic acid arylides and containing no sulfonic or carboxylic groups. Used in printing inks.

"Orasols." ⁴⁴³ Trade name for dyes, soluble in organic solvents, used for organic coatings, inks and plastics.

"Ora-Testryl." ⁴¹² Trademark for fluoxymesterone (q. v.).

"Oratol." ⁷⁸ Trademark for a neutralized sulfonated ester of a higher alkanolamide, containing added solvents for increased scouring efficiency. Used for scouring rayons, acetates, wool, and mixed fabrics previous to dyeing, to remove sizings, lubricants, and weaving stains.

orbital angular momentum. See spin.

orbital electron capture. See K-capture.

orcanette. See alkanna.

orchidaë. See isoamyl salicylate.

orchil (archil, orseille).

Properties: Dark brown-red paste or aqueous extract, a coloring matter obtained from various species of lichens, roccella, variolaria, lecanora, etc.

Habitat: Azores, Canary Islands, Mediterranean region.

Chief constituents: Orcin and orcein.

Derivation: By macerating lichens with dilute ammonia and caustic soda, allowing to ferment, and adding sulfuric acid and salt.

Grades: Paste, extract.

Containers: Glass bottles.

Uses: Dyeing, particularly carpet yarns or to modify the effect of other dyes.

Shipping regulations: None. *

orcin (dihydroxytoluene; methylresorcinol; orcinol) $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})_2 \cdot \text{H}_2\text{O}$. 1-Methyl-3,5-dihydroxy-benzene.

Properties: White, crystalline prisms, becoming red in air, intensely sweet,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

unpleasant taste. Soluble in water, alcohol, and ether. Sp. gr. 1.2895; m. p. (anhydrous) 107°C, (hydrated) 56°C; b. p. 287-290°C.

Derivation: By fermentation of various species of lichens (roccella), and extractions.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine; reagent for certain carbohydrates.

Shipping regulations: None.*

orcinol. See orcin.

ordeal bean. See physostigma.

ore. An aggregation of valuable minerals and gangue (q. v.) from which one or more metals can be extracted at a profit.

ore flotation. See flotation.

"Orefraction." ²⁸⁸ Trademark for domestic zircon. Used for ceramic and foundry purposes.

"Oreton." ³²¹ Brand name for testosterone propionate.

"Oreton Methyl." ³²¹ Brand name for methyl-testosterone.

organometallic compounds. Compounds containing carbon and a metal. Ordinary metallic carbonates (calcium carbonate, etc.) are excluded and also metallic salts of common organic acids. Examples of organometallic compounds are Grignard compounds such as CH_3MgI , metallic alkyls such as butyllithium ($\text{C}_4\text{H}_9\text{Li}$), tetraethyl lead, triethyl aluminum; or tetrabutyl titanate, sodium methylate, dibutyl tin dilaurate, copper phthalocyanine, zineb, ethylmercuric acetate, various arsonic acids, stearato chromic chloride, ferrocene, nickel carbonyl.

organo-phosphates. Fertilizer ingredients consisting of phosphoric esters of glycerol, glycol, sorbitol, glucose, etc., which retain their solubility when in contact with the soil long enough to penetrate into the deeper soil layer and thus supply phosphorus to the deeper part of the plant root system.

organosol. Colloidal dispersion of any insoluble material in an organic liquid, but more specifically the finely divided or colloidal dispersion of a synthetic resin in plasticizer in which dispersion the volatile content exceeds 5% of the total weight. See plastisol.

Oriental cashew nut. See semecarpus nut.

Oriental sweet gum. See styrax.

Orient yellow. See cadmium sulfide.

origanum oils. Essential oils obtained from various species of the genus *Origanum* indigenous to the Mediterranean countries. The botanical origin of the various oils cannot always be determined due to the large number of species and also, because

commercial oils are not always distilled exclusively from a single species. All origanum oils contain carvacrol, together with cymene and sometimes linalool.

Physical characteristics of typical oil from Cyprus: Light-yellow color but becomes darker on exposure to the air; sp. gr. 0.962-0.967 (15°C); optical rotation inactive or slightly dextrogyrate up to +0° 20'; soluble in 2 to 3 vols. and more of 70% alcohol.

Containers: Bottles; tins.

Uses: Flavoring; pharmaceutical.

Shipping regulations: None.*

"Orlon Red." ¹⁴¹ Trade name for azo red pigments derived from beta-naphthol.

Properties: Good light resistance, good heat resistance, non-bleeding in water and organic solvents. Yellowish-red, clean in masstone and tint.

Uses: Printing inks, rubber, plastics.

"Orizon." ⁵⁸ Trademark for polyethylene.

"Orlon." ²⁸ Trademark for an acrylic fiber. Available in various types of staple and tow. See also acrylic fiber, "Orlon Cantrecre," "Orlon Sayelle."

Properties: Sp. gr. 1.14-1.17; tensile strength (psi) 32,000-39,000; break elongation 20-28%, moisture regain 1.5% (70°F, 65% R. H.); softens at 455°F; soluble in butyrolactone (hot), dimethyl formamide (hot), ethylene carbonate (hot). Resistant to mineral acids, fair to good resistance to weak alkalis. Insoluble in alcohol, acetone, benzene, carbon tetrachloride, and petroleum ether; soluble in dimethyl sulfoxide, maleic anhydride, ethylene carbonate, nitriles, and nitrophenols.

Derivation: A solution of polymerized acrylonitrile is forced through minute holes of a spinneret, the solvent is removed and the resulting fiber is stretched.

Containers: Bales and cartons.

Uses: In apparel, home furnishings, and industrial applications.

"Orlon Cantrecre." ²⁸ Trademark for "Orlon" as a filament yarn.

"Orlon Sayelle." ²⁸ Trademark for a bi-component acrylic fiber available as staple and tow only.

ornithine (2,5-diaminovaleric acid) $\text{NH}_2(\text{CH}_2)_3\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential amino acid produced by the body and important in protein metabolism.

Properties: L(+)-ornithine: Crystals from alcohol-ether, m. p. 140°C; soluble in water and alcohol.

DL-ornithine: Crystals from water, slightly soluble in alcohol.

Derivation: Isolated from proteins after hydrolysis with alkali.

Use: Biochemical research.

"Oronite." ¹⁵¹ First word of each of a series of trademarks or trade names for products derived from petroleum. Included are: "Oronite Alkane". An alkyl aromatic hydrocarbon used as raw material for synthetic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

detergents.

"Oronite SA88." Sulfonic acid from "Alkane."

"Oronite Detergent Slurry." Neutralized sulfonic acid from "Alkane."

"Oronite Wetting Agent S." Paste type sulfonate from "Alkane."

"Oronite Dispersants NI-E, NI-O, NI-W." Non-ionic surfactants of the alkyl phenol ethylene oxide type, for use in low-foaming detergents and emulsifiers in retail and industrial syndets.

"Oronite ADE-50." Quaternary ammonium compound.

"Oronite ABC." Alkyl benzyl chloride used for manufacture of quaternary ammonium compounds.

"Oronite Aromatics ABH." High molecular weight liquid alkyl aromatic hydrocarbons.

"Oronite LPG." Mercaptan type gas odorant for odorization of liquefied petroleum gas and natural gas.

"Oropon." ²³ Trademark for proteolytic enzyme concentrates, formulated with or without deliming salts. Various grades include enzymes of pancreatic, fungal or bacterial origin, to remove undesirable protein matter and excess lime from de-haired animal skins.

Use: Bating or puering of skins in preparation for leather tanning.

"Orotan" TV. ²³ Trademark for a synthetic tanning agent with attributes of vegetable tannins. Dark-red viscous solution, 31% tannin. Imparts high degree of tannage, strength, fullness and solidity to leather. Also solubilizing, penetrating and bleaching agent.

Use: Tanning of leather.

orotic acid (uracil-6-carboxylic acid, 6-carboxyuracil) $C_4N_2H_3(O)_2COOH$. It is found in cow's milk and has also been isolated from certain strains of molds (Neurospora). Orotic acid is a growth factor for certain micro-organisms.

Properties: Crystals with m. p. 345-346°.

Containers: 10-, 25-, 100-, and 1000-g.

Use: Biochemical research, especially the biosynthesis of nucleic acids.

orphenadrine hydrochloride (N,N-dimethyl-2-ortho-methyl-alpha-phenylbenzyloxyethylamine hydrochloride)

$C_{16}H_{21}N(CH_3)_2O(CH_2)_2N(CH_3)_2 \cdot HCl$.

Properties: Crystals, m. p. 156-157°C,

soluble in water, alcohol, chloroform.

Slightly soluble in acetone, benzene; insoluble in ether.

Grade: N. N. D.

Use: Medicine.

orpiment (arsenic yellow, auripigment, king's yellow, royal yellow, yellow arsenic sulfide) As_2S_3 . A term applied to arsenic trisulfide (q. v.) whether obtained native as the mineral or artificially by chemical reaction.

Properties of the mineral: Color lemon yellow; luster resinous to pearly; good micaceous cleavage; hardness 1.5-2; sp. gr. 3.5.

Occurrence: Utah, Nevada, Wyoming, Peru, Rumania.

Use: Dye, tanning. Now displaced by the artificial product.

Shipping regulations: Class B poison. Poison label. *

orris (orris root; white flag; iris).

Rhizome of *Iris florentina*, *I. germanica*, *I. pallida*.

Habitat: Central and southern Europe.

Grades: Florentine, Verona. Whole, powdered, fingers.

Containers: Whole: bales; powdered: barrels, boxes.

Uses: Medicine; tooth powders; perfumery.

Shipping regulations: None. *

orris oil (orris root oil).

Properties: Semi-solid, yellowish, fatty, volatile oil; slightly dextrogyrate.

Chief known constituents: Myristic acid,

oleic acid, irone, and their methyl esters.

Constants: M. p. 44-50°C; acid value 213-222. Soluble in alcohol, ether and chloroform.

Derivation: Distilled from the rhizome of *Iris florentina*.

Method of purification: Rectification.

Grades: Technical.

Containers: Copper flasks; glass bottles.

Use: Perfumes.

Shipping regulations: None. *

orris root. See orris.

Orr's white. See lithopone.

orselle. See orchil.

orthamine. See ortho-phenylenediamine.

orthite. See allanite.

ortho-. A prefix. Ortho-, meta- and para-compounds are di- substitution products derived from benzene in which the substituting radicals or groups are structurally placed in certain definite positions in the benzene nucleus. When two substituting groups (A and B) are in such position that they are attached to adjoining carbon atoms of the benzene nucleus (which contains six carbon atoms arranged in the form of a hexagon), B is in the ortho position with respect to A, and the compound is an ortho-compound. If A and B are so attached that they have a third carbon atom of the nucleus between them, a meta-compound results. If A and B are attached to opposite atoms in the nucleus (two other carbon atoms between them) a para-compound results. The ortho-compounds will be found under the name of the compound, as: ortho-cresol, see cresol. In other words, for organic compounds in this dictionary, ortho-, meta-, and para- are not used in alphabetizing. In inorganic chemistry the prefix ortho- designates the most highly hydrated acid, or its salt, to contrast with the meta- or less hydrated acid or salt. For example $H_3PO_4(P_2O_5 \cdot 3H_2O)$ is orthophosphoric acid and $HPO_3(P_2O_5 \cdot H_2O)$ is metaphosphoric acid. For inorganic compounds in this

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

dictionary, ortho- and meta- prefixes are used in alphabetizing.

orthoarsenic acid. See arsenic acid.

orthoboric acid. See boric acid.

"Orthobrite." ²⁴⁴ Trademark for a laundry detergent.

Properties: Rapidly soluble yellow flake with a strongly alkaline reaction.

Uses: Soap builder and break compound for commercial laundries.

"Orthochrom." ²³ Trademark for pigmented plasticized nitrocellulose lacquers and thinners. Produce durable, washable, flexible, colored lacquer finishes of good light fastness.

Use: Finishing of belt, garment, upholstery and other leathers.

"Orthocide." ²⁵³ Brand name for a type of fungicide products containing captan.

orthoclase. See feldspar.

"Orthoclear." ²³ Trademark for permanently plasticized nitrocellulose binders and lacquers in various solvents. Produce clear, durable, flexible finishes.

Use: Topcoat finishes for glazing or high gloss leather coatings.

orthocoll. See potassium guaiacol sulfonate.

"Orthodull." ²³ Trademark for a dulling agent dispersion.

Uses: Additive for "Orthochrom" and "Ortholite" finishes.

orthoform. See methyl-meta-amino-para-hydroxybenzoate.

orthoformic ester. See triethyl orthoformate.

orthoform, new. See methyl-meta-amino-para-hydroxybenzoate.

"Ortho-Klor." ²⁵³ Brand name for insecticide products containing chlordan.

"Ortholate." ²⁴⁴ Trade name for a laundry alkali. White, rapidly soluble flake with sequestering and dispersive properties. Strongly alkaline.

Uses: Soap builder and break compound for commercial laundries.

"Ortholeum." ²⁸ Trademark for line of lubricant additives.

"Ortholeum" 162. A lubricant assistant consisting of mono- and di-alkyl phosphates RH_2PO_4 and R_2HPO_4 .

Properties: Light brown or pale amber viscous liquid; f. p. about 15°C , sp. gr. 0.99, miscible with oil in all proportions.

Containers: 55-gal steel drums (400 lbs net).

Use: In oils to improve film strength and to impart rust preventive properties. Concentrations vary with nature of applications.

"Ortholeum" 300. A grease stabilizer comprising a mixture of aromatic amines providing a combination of an antioxidant and a metal deactivator. A tan colored flaked solid.

Containers: 51-gal leverpak (175 lbs net).

Use: As a stabilizer for greases. Concentration required is usually 0.1 to 1.0% by weight.

"Ortholite." ²³ Trademark for clear and pigmented vinyl lacquers, binders, and solvents. Produce finishes of outstanding abrasion resistance and low temperature flexibility.

Use: Finishes on upholstery, automotive, luggage, and case leathers.

"Orthol-K." ²⁵³ Brand name for pesticide products containing phytonomic or similar type petroleum oils.

"Orthophen." ²⁰⁴ Trademark for a special blend of mixed amyl phenols for the paint industry.

Properties: Straw colored liquid; sp. gr. 0.95-0.97 (30°C), distillation, 95% between $235-270^\circ\text{C}$, flash point 200°F ; solidification point $< -10^\circ\text{C}$.

Use: Anti-skinning agent.

"Orthophos." ²⁵³ Brand name for a type of insecticide containing parathion.

orthophosphoric acid. See phosphoric acid.

"Orthorix." ²⁵³ Brand name for a type of parasiticide containing lime sulfur.

"Orthosil." ²⁰⁴ Trademark. Also called "Pennsalt" Cleaner Number 30. A quick-acting detergent used in heavy-duty metal cleaning. Removes drawing, cutting, and other fabricating oils and greases from steel and brass before plating, enameling, lacquering, tinning, bonderizing, and other final finishes. For use in power washers and electrolytic cleaning tanks. "Orthosil" is a practically anhydrous, water-soluble, sodium orthosilicate in granular form. It combines high alkaline concentration and electric conductivity with excellent buffer action. Special "Orthosils" made for still tank cleaning have suitable wetting and water softening additions. Packed in 400-lb steel drums.

"Orthosolv." ²⁹² Trademark for a product that combines the properties of straight ortho-dichlorobenzene with the advantages of mixing readily with water, thus making possible the preparation of solutions of different strengths. Used to control objectionable odors of sewage plants, refuse cans and trucks, etc.

orthotungstic acid. See tungstic acid.

"Orthoxine" Hydrochloride. ³²⁷ ($\text{C}_{11}\text{H}_{18}\text{ClNO}$). Trademark for methoxyphenamine hydrochloride, beta-(o-methoxyphenyl)-isopropyl-N-methylamine hydrochloride.

Properties: Colorless crystals, m p. $125-128^\circ\text{C}$, very soluble in water, alcohol, insoluble in ether and benzene.

Derivation: Synthetic.

Use: Medicine.

"Ortolan." ⁴⁴⁰ Trademark for a series of metal complex dyestuffs for dyeing and printing on wool, silk and polyamide fibers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Orzan." ⁴⁸ Trade name for a group of spent sulfite liquor products.

"Orzan" A: ammonium lignosulfonate plus wood sugars, available as dark brown 50% solids solution in 500-lb drums, tank cars, or brown free-flowing powder in 50-lb bags.

"Orzan" AH: partially polymerized ammonium lignosulfonate plus wood sugars, a dark brown free flowing powder in 25-lb bags.

"Orzan" S: sodium lignosulfonate plus wood sugars, available as dark brown 50% solids solution in 500-lb drums, tank cars, or light brown free-flowing powder in 50-lb bags.

Uses: Dispersant; flotation reagent; chelating agent; emulsion stabilizer; binder; tannin extender; adhesive ingredient.

Os. Symbol for osmium.

"OS-45" Type III. ⁵⁸ Trademark for hydraulic fluid. Clear amber liquid; useful from -65° to 400°F.

"OS-45" Type IV. ⁵⁸ Trademark for hydraulic fluid. Clear amber liquid, useful from -65° to 550°F.

oscine. See scopoline.

osmic acid anhydride (osmium tetroxide; perosmic acid anhydride; perosmic oxide) OsO_4 .

Properties: Yellowish crystals, very pungent, disagreeable odor, vapor irritating when breathed; highly poisonous! Soluble in water, alcohol, and ether. Sp. gr. 4.90; m. p. 40°C; b. p. 130°C.

Derivation: By heating powdered osmium in air, or by treating it with nitric acid, aqua regia, or chlorine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine, microscopic reagent; photography, incandescent gas mantles, catalyst in organic synthesis.

osmic-ammonium chloride. See osmium-ammonium chloride.

osmiridium. See iridosmine.

osmium Os. Element having atomic number 76 and in group VIII of the periodic system.

Properties: Hard white metal of the platinum group. Has a bluish cast. On heating in air gives off a pungent poisonous fume of osmium tetroxide. Insoluble in acids and aqua regia; attacked by fused alkalis.

Constants: Sp. gr. 22.5; m. p. 2700°C.

Derivation: Occurs with platinum from which it is recovered during the purification process. Also occurs with iridium as a natural alloy called iridosmine.

Uses: Hardener for platinum; pen points; catalysts.

Shipping regulations: None. *

osmium-ammonium chloride (osmic-ammonium chloride) $(\text{NH}_4)_2\text{OsCl}_6$.

Properties: Red powder. Contains 43.5% osmium. Soluble in alcohol, water.

osmium chloride (osmium dichloride; osmious chloride) OsCl_2 .

Properties: Dark green needles. Hygroscopic. Caution! Keep away from air! Soluble in alcohol, ether, water.

osmium dichloride. See osmium chloride.

osmium-potassium chloride (potassium-osmic chloride) K_2OsCl_6 .

Properties: Dark red, octahedral crystals. Nearly black. Contains 39.6% osmium. Soluble in alcohol, water.

osmium-sodium chloride (sodium-osmic chloride) Na_2OsCl_6 .

Properties: Orange, rhombic prisms. Contains 40.3% osmium. Unstable. Soluble in alcohol, water.

Grades: Technical.

Use: Catalyst (organic oxidation).

osmium tetroxide. See osmic acid anhydride.

osmocene. Dicyclopentadienylosmium. Like ferrocene (q. v.).

"Osmon." ¹⁶⁹ Trademark for 1-naphthylamine-4,6,8-trisulfonic acid used in the colorimetric determination of osmium.

osmosis. Passage of solvent from pure solvent into a solution, or from a less to a more concentrated solution, through a membrane which is permeable to the solvent but not to the solute. Important in biological processes.

osmotic pressure. The excess pressure which when applied to a solution will just prevent osmosis (q. v.). In ideal very dilute solutions the osmotic pressure is equal to the pressure which the solute would exert if it were an ideal gas at the same temperature and in the same volume. The molecular weights of solutes may be calculated from measured osmotic pressures. The method is practical only with large molecules such as proteins and high polymers.

osmious chloride. See osmium chloride.

os sepiae. See sepia (2).

"Ostensin." ²⁴ Trademark for trimethidinium methosulfate (q. v.).

Othmer process. Production of acetic acid from pyroligneous acid by azeotropic distillation. The pyroligneous acid is first stripped of methanol and then distilled in the azeotropic dehydrating column using an entrainer such as butyl acetate to separate the acetic acid from the water. The acetic acid is then further refined to separate the tar.

"Otrivin." ³⁰⁵ Trademark for xylometazoline. Used in medicine.

otto of rose oil. See rose oil.

ouabain (G-strophanthin; strophanthin thoms) $\text{C}_{29}\text{H}_{44}\text{O}_{12} \cdot 8\text{H}_2\text{O}$. A glucoside.

Properties: White odorless crystals; extremely poisonous; soluble in water and alcohol; specific rotation (alpha) -31 to -32.5° 20/D (anhydrous). M. p. 190° (dec).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: U. S. P. XVI.

Caution: Extremely poisonous!

Containers: Tight, light-resistant bottles.

Use: Medicine.

ouricury wax. A vegetable wax exuded by the leaves of *Cocos coronapa* (South America).

Properties: Brown; acid value 10; saponification value 80; sp. gr. 0.970 (15°C), m. p. 83°C; foreign matter (dirt, etc.) sometimes 18%.

Containers: Bags.

Use: A substitute for carnauba wax.

outgassing of metals. The removal of gas from a metal by heating at a temperature somewhat below melting, while maintaining a vacuum in the space around the metal. Usually done before melting but may be done afterward.

ovalbumin. See albumin, egg.

ovalecithin. See lecithin.

Overglaze Colors. ²⁸ Finely ground mixtures of pigments and low-melting glasses suitable for use over standard ceramic glazes. Temperature range 1300°-1500°F, cones 018-014.

Uses: For bands, decalcomania, and similar decorative designs fired on china, pottery, terra cotta, tile, and other glazed ceramic surfaces.

"Ovocylin." ³⁰⁵ Trademark for estradiol.

Use: Medicine.

"O & W Compound." ²⁴⁴ Trademark for a compound consisting of a blended clay-alkali mix.

Properties: Light grey mechanical mixture, forms colloidal alkaline solution in water with surface active and soil suspending properties.

Containers: 100-lb multi-wall paper bags, 350-lb fiber drums.

Uses: Commercial laundries, for cleaning heavily soiled work clothing and wiping cloths; low temperature washing, dark fabrics.

"OXAF." ²⁴⁸ Trade name for the zinc salt of 2-mercaptobenzothiazole. $\text{Zn}(\text{SCNSC}_6\text{H}_4)_2$.

Properties: White to pale yellow powder.

Sp. gr. 1.63; melting range, decomposes without melting when heated to 200°C or over. Excellent storage stability. Slightly soluble in ethylene dichloride and acetone. Insoluble in water, benzol, and gasoline.

Handling precautions: None. Approved for use in rubber stock in contact with the skin.

Use: Rubber accelerator; all types generally but more especially in latex, foam sponge, wire insulation, air cured footwear, drug-gist sundries and specialties.

oxalic acid $\text{HOOC}\text{COOH} \cdot 2\text{H}_2\text{O}$.

Properties: Transparent, colorless crystals; poisonous! Soluble in water, alcohol and ether.

Constants: Sp. gr. 1.653; m. p. 187°C of anhydrous form, 101.5°C for dihydrate.

Derivation: (a) Carbon monoxide and hot sodium hydroxide under pressure react to

give sodium formate. This is converted to sodium oxalate in an autoclave at 400°C. Calcium oxalate is formed by reaction with calcium hydroxide, and sulfuric acid then used to produce oxalic acid. (b) Oxidation of carbohydrates such as sawdust with nitric acid, or other reactions of carbohydrates with dilute acids or alkalies.

Method of purification: Crystallization.

Grades: Technical (crystals and powder); C. P.

Containers: 100-lb bags; kegs; 300-lb barrels; 100-, 375-lb drums.

Uses: Automobile radiator cleanser; acid rinse in laundries; leather tanning and processing agent; purifying agent in manufacture of glycerol, glycolic acid; formic acid and esters, dextrin from starch, purification of tartaric acid and cream of tartar; bleaching agent; photography; medicinals; dyes and inks; purifying stearin; component of metal polishes; textile treating baths; ink and rust removers; cleansing agent in breweries; precipitating agent for rare earths, wood cleansing compositions; engraving and lithography; catalyst for some organic reactions.

Warning: Harmful if swallowed; causes skin irritation. MCA warning label.

Shipping regulations: None. *

oxalyl chloride (ethanedioyl chloride) $(\text{COCl})_2$.

Properties: Colorless liquid. If cooled to -12°C, solidifies to a white, crystalline mass. Gives off carbon monoxide on heating. Decomposed by water and alkaline solutions. Caution! Very toxic! Soluble in ether, benzene, chloroform.

Constants: B. p. 64°C; m. p. -12°C; sp. gr. 1.43.

Derivation: Interaction of oxalic acid and phosphorus pentachloride.

Grades: Technical.

Containers: Steel drums.

Uses: Military poison gas, chemical (chlorinating agent in organic synthesis).

oxamide $\text{NH}_2\text{COCONH}_2$.

Properties: A white, odorless powder, m. p. 419° (dec) (probably the highest melting organic compound), insoluble in water; very slightly soluble in alcohol and ether.

Containers: Carload lots.

Use: Stabilizer for nitrocellulose preparations.

oxammonium. See hydroxylamine.

oxamycin. See amino-3-isoxazolidone.

oxanamide (2-ethyl-3-propylglycidamide) $\text{OCH}(\text{C}_3\text{H}_7)\text{C}(\text{C}_2\text{H}_5)\text{CONH}_2$.

Use: Medicine.

oxetane (trimethylene oxide), $\text{CH}_2\text{OCH}_2\text{CH}_2$. An oxetane group would be $=\text{COCH}_2\text{C}=\text{CH}_2$ and

is one kind of an epoxy group.

oxetane resins. See "Penton."

oxidase. An enzyme whose activity results in the transfer of electrons on the substrate; an oxidizing enzyme.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

oxidation. Originally, the combination of oxygen with some substance. Now, any chemical change in which the oxidation state (positive valence) of an element is increased. According to atomic theory, a change in which an atom loses one or more electrons. Since some other atom gains the electrons, the latter atom undergoes the opposite change, reduction. Hence an oxidation is always accompanied by a reduction.

oxidation-reduction indicators. Substances that have a color in the oxidized form different from that of the reduced form, and that can be reversibly oxidized and reduced. Thus if diphenylamine is present in a ferrous sulfate solution to which potassium dichromate is being added, a beautiful violet color is formed with the first drop of excess dichromate.

"Oxidex." ¹⁸⁸ Trademark for a proprietary anti-oxidant for soap fats and oils. It can be added to the oils before saponification or it can be added by milling into the finished soap in the same manner that perfume is incorporated. The correct proportion for solid soaps is 0.1%.

oxidized asphalts. See blown asphalts.

oxidized oils. See blown oils, also blown asphalts.

oxidized microcrystalline waxes (OMC). Waxes made from tank-bottom residues obtained in petroleum refining. This sludge is extracted with methyl ethyl ketone and the extract chilled, filtered, and refined. The product is ordinary microcrystalline waxes. These are then oxidized with air in the presence of manganese, cobalt, or other catalysts. The resulting waxes are emulsifiable, and are especially useful in floor polishes. See also waxes, microcrystalline.

oxine. Synonym for 8-hydroxyquinoline.

oxirane. A synonym for ethylene oxide, H_2COCH_2 . Hence an oxirane group is one having the structure $=\text{COC}=\text{}$, and is one kind of an epoxy group.

"Oxiron 2000" Resin. ⁵⁵ Brand name of an epoxy polyolefin.
Properties: Sp. gr. 1.010 (20°C); epoxy equivalent 177, per cent epoxy 9.0; viscosity (25°C) 1800 poise. Has epoxy, hydroxy and double bond functionality and can be cross linked to a thermoset by agents like amines, anhydrides and acids, and combination of anhydride-glycol, anhydride-peroxide and anhydride-glycol-glycol-peroxides to give high temperature properties.
Also available: Low viscosity version (Oxiron 2001), viscosity (25°C) 160 poise; and enhanced double bond reactivity version (Oxiron 2002), viscosity (25°C) 15 poise.
Uses: Adhesives, electrical potting, encapsulating, laminating, tooling, prepregs, castings, coatings.

"Oxone." ²⁸ Trademark for an acidic, white, granular, free-flowing solid containing the active ingredient potassium peroxymonosulfate; readily soluble in water; 1% solution has pH of 2-3. Minimum active oxygen content 4.5%. Strong oxidizing agent.
Containers: 50-lb bags.

Uses: For manufacture of dry laundry bleaches, detergent-bleach washing compounds, scouring powders, plastic dishware cleaners, and metal cleaners; preparation of hair wave neutralizers and pharmaceuticals; general oxidizing reactions.

2-oxopentanedioic acid. See alpha-ketoglutaric acid.

oxophenarsine hydrochloride. See 2-amino-4-arsenosphenol hydrochloride.

Oxo process. Production of alcohols, aldehydes and other oxygenated organic compounds by passage of olefin hydrocarbon vapors over cobalt catalysts in the presence of carbon monoxide and hydrogen gases. Aldehydes are produced as products, but in most cases these are hydrogenated at once to produce the corresponding alcohol. Propylene produces normal and isobutyraldehyde; higher olefins produce a mixture of aldehydes containing one more carbon atom than the olefins. n-Butyl, isobutyl, amyl, iso-octyl, decyl and tridecyl alcohols are produced in large quantities.

oxosilanes. See siloxanes.

oxtriphylline (choline theophyllinate, theophylline cholineate) $\text{C}_7\text{H}_6\text{N}_4\text{O}_2 \cdot (\text{CH}_3)_3\text{NC}_2\text{H}_4\text{OH}$.
Properties: White crystalline solid (contains about 60% anhydrous theophylline). Extremely soluble in water.
Grade: N. N. D.
Use: Medicine.

oxy-. The -O- radical. Sometimes represents the hydroxy radical, -OH, but this is not considered good usage in the United States.

oxyacanthine (vinetine) $\text{C}_{37}\text{H}_{40}\text{N}_2\text{O}_6$. An alkaloid.
Properties: White crystalline powder, needles from alcohol or ether, m. p. 202-214°C; soluble in water, chloroform, benzene, alcohol, and ether.
Derivation: Occurs in the root of *Berberis vulgaris*.
Use: Medicine.

oxybenzoic acids. See hydroxybenzoic acids.

para, para'-oxybis(benzenesulfonylhydrazide). See "Celogen."

oxybutyric aldehyde. See aldol.

oxycellulose. See cellulose, oxidized.

oxyconline. See conhydrine.

N-oxydiethylenbenzothiazole-2-sulfenamide.
Properties: Yellow color with sweet odor; masked by morpholine after sealed storage; sp. gr. 1.37; m. p. 75-80°C; insoluble in water; soluble in benzene, acetone, methanol.
Use: Rubber accelerator.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

beta, beta'-oxydipropionitrile (ODPN)

Properties: Colorless liquid; m. p. -26.3°C ; b. p. 120°C (1 mm); b. p. 155°C (5 mm); sp. gr. 1.0405 (30°C); viscosity (30°C) 8.00 cps; refractive index (n_D²⁵) 1.4392; flash point, Tag (closed cup) greater than 176°F ; soluble in water. It is thermally unstable, yielding acrylonitrile and water above 175°C . Hydrolyzed by strong acids and bases; quite immiscible with paraffin hydrocarbons, but dissolves aromatics.

Derivation: From acrylonitrile.

Use: Solvent in fractional extraction.

oxyethylene oxypropylene polymer. See poloxalkol.**oxygen** O. Element of atomic number 8; group VI of the periodic table.

Properties: Colorless, odorless, tasteless, diatomic gas, liquefiable at -183°C into a slightly bluish liquid, which is solidifiable at -227°C . Atomic weight 16. It constitutes roughly one-fifth (by volume) of the air. (Gas) Sp. gr. 1.10535, referred to air. Soluble in molten silver; slightly soluble in water.

Derivation: (a) From liquid air by fractionation to remove the other gases of the air; (b) by electrolysis of water.

Impurities: Nitrogen, carbon dioxide, water vapor, ammonia, argon, helium and other rare gases.

Grades: Technical; pure, U.S.P. XVI.

Containers: As a compressed gas: in steel cylinders or "gas-bottles;" as a liquid: in vacuum-jacketed containers which range in size up to an entire truck load.

Uses: To increase capacity of steel and iron furnaces; with hydrogen or acetylene for production of exceedingly hot flames for cutting and welding metals, including platinum; for resuscitation in asphyxia and stimulation in various diseases, in combustion to promote better utilization of fuel; as a constituent of explosives produced by allowing liquid oxygen to be adsorbed on charcoal or similar material, anesthesia; for production of carbon monoxide-hydrogen gas mixtures by partial combustion of natural gas or coal; and thus the production of ammonia, methanol, etc., as oxidizer for liquid rocket propellants.

Fire hazard: Dangerous.

Shipping regulations: Nonflammable gas. Green gas label.*

oxygen 18 (heavy oxygen). Oxygen isotope (nonradioactive) of atomic weight 18 (instead of the usual 16). Occurs in proportion of 8 parts to 10,000 of ordinary oxygen in water, air, rocks, etc. The proportion may be increased by passing carbon dioxide gas repeatedly through a packed column down which water is passed. The carbon dioxide leaving the top of tower is enriched in heavy oxygen and the water leaving the bottom is depleted. Like other isotopes, the heavy oxygen 18 is useful in tracer experimentation. See also heavy water.

oxygen consumed (C.O.D.) (O.C.) (D.O.C.).

A measure of the quantity of oxidizable components present in water. Since the carbon and hydrogen, and not the nitrogen, in organic matter are oxidized by chemical oxidants, the oxygen consumed is a measure only of the chemically oxidizable components and is dependent upon the oxidant, structure of the organic compound and manipulative procedure. Since this value does not differentiate stable from unstable organic matter, it does not necessarily correlate with the biochemical oxygen demand value. It is also known variously as chemical oxygen demand (C.O.D.); oxygen consumed (O.C.) and dichromate oxygen consumed (D.O.C.). See also biochemical oxygen demand; dissolved oxygen.

oxyhemoglobin. See hemoglobin.

oxymethandrolone. See oxymetholone.

oxymetholone (oxymethandrolone) $\text{C}_{21}\text{H}_{34}\text{O}_3$. 17-beta-Hydroxy-2-hydroxymethylene-17-alpha-methyl-3-androstanone.

Properties: White, odorless crystalline powder. M. p. $173-179^\circ\text{C}$.

Use: Medicine.

oxymethylene. See formaldehyde.

oxymorphone $\text{C}_{17}\text{H}_{19}\text{NO}_4$. 14-Hydroxydihydromorphinone.

Properties: M. p. $248-249^\circ\text{C}$ (decomposes). Soluble in boiling acetone-chloroform mixture, boiling ethanol, aqueous alkalis; somewhat soluble in benzene.

Use: Medicine.

beta-oxynaphthoic acid. See 3-hydroxy-2-naphthoic acid.

oxyneurine. See betaine.

oxyphenbutazone. 1-Phenyl-2-(para-hydroxyphenyl)-3,5-dioxo-4-n-butylpyrazolidine monohydrate. An analog of phenylbutazone and one of its metabolites.

Use: Medicine.

oxyphencyclimine hydrochloride

$\text{C}_{20}\text{H}_{29}\text{ClN}_2\text{O}_3 \cdot \text{HCl}$. 1-Methyl-1,4,5,6-tetrahydro-2-pyrimidinylmethyl-alpha-cyclohexyl phenylglycolate hydrochloride.

Properties: White crystals; bitter taste; decomposes at $231-232^\circ\text{C}$; soluble in water.

Use: Medicine.

oxyphenonium bromide $\text{C}_{19}\text{H}_{30}\text{NO}_3\text{Br}$. Diethyl-(2-hydroxyethyl)methylammonium bromide alpha-phenyl-alpha-cyclohexylglycolate. A synthetic quaternary ammonium compound.

Grade: N. N. D.

Use: Medicine.

oxyphosphoranes. A class of compounds derived from trialkyl phosphites and orthoquinones. Their molecules have a five atom ring, OCCOP(OR)_3 in which the two carbon atoms are part of an aromatic ring. They react by liberating a phosphate ester.

oxypolygelatin (OPG). A purified gelatin treated with glyoxal, followed by oxidation

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with hydrogen peroxide. A possible plasma substitute.

oxyquinoline. See 8-hydroxyquinoline.

oxyquinoline sulfate. See 8-hydroxyquinoline sulfate.

oxytetracycline $C_{22}H_{24}N_2O_9 \cdot 2H_2O$. An antibiotic obtained from *Streptomyces rimosus*, an actinomycete. It is relatively non-toxic. Its chemical structure is that of a modified naphthacene molecule.

Properties: Dull yellow, odorless, slightly bitter crystalline powder. M. p. 179-182° (dec). Soluble in acids and alkalis, very slightly soluble in acetone, alcohol, chloroform and water; practically insoluble in ether. Stable in air, affected by sunlight. Deteriorates in solution with pH below 2; destroyed rapidly by alkali hydroxide solutions, pH (saturated solution) about 6.5.

Grade: N. F. XI.

Use: Medicine, feed supplement, other agricultural and industrial uses.

oxytetracycline hydrochloride $C_{22}H_{24}N_2O_9 \cdot HCl$. The hydrochloride salt of oxytetracycline (q. v.).

Properties: Yellow, crystalline, odorless, powder with bitter taste. M. p. 180° (dec). Very soluble in water; soluble in alcohol, sparingly soluble in acetone; slightly soluble in chloroform, very slightly soluble in benzene and ether, pH (1% solution) about 2.5. Hygroscopic and affected by sunlight. Potency affected in solutions with pH below 2 and rapidly destroyed in alkali hydroxide solutions.

Grade: N. F. XI.

Use: Medicine.

oxytocin (alpha-hypophamine). One of the hormones secreted by the posterior lobe of the pituitary gland. Its chief action is the stimulation of the contraction of the smooth muscle of the uterus. It is an octapeptide containing eight different amino acids and has been purified and synthesized. It is available as a solution for injection (oxytocin injection, U. S. P. XVI.)

oxyluene, meta-, ortho-, para-. See corresponding cresol.

oyster shells. Shells of *Ostrea virginica*, taken principally from the Gulf of Mexico coast in Texas and Louisiana, also from Chesapeake Bay. Average analysis: $CaCO_3$ 93-97%, $MgCO_3$ 1%; silica 0.5-2.0%; SO_4 (as $CaSO_4$) 0.3-0.4%, also miscellaneous substances.

Uses: Source of lime, drilling muds, road beds, poultry and cattle feeds.

"Ozark." ¹⁴¹ Trade name for zinc sulfate.

"Ozene." ²⁹² Trademark for a chlorinated benzene composition.

"Ozide." ¹⁴¹ Trade name for zinc oxide.

"Ozlo." ¹⁴¹ Trade name for leaded zinc oxide produced by the co-fumed process.

Composition: Zinc oxide 50-88%;

$PbSO_4 \cdot PbO$ 12-55%.

Grades: "Ozlo" 55: 55% $PbSO_4 \cdot PbO$;

"Ozlo" 50: 50% $PbSO_4 \cdot PbO$; "Ozlo" 35: 35% $PbSO_4 \cdot PbO$;

"Ozlo" 12: 12% $PbSO_4 \cdot PbO$;

"Ozlo" 18M: 18% monobasic lead sulfate, more efficient because of higher available lead content.

Uses: Paint pigment; zinc salts; activator in rubber manufacture; mold growth inhibitor in paints.

ozocerite (mineral wax; fossil wax; native paraffin).

Properties: A native, waxlike hydrocarbon mixture, yellow-brown to black or green in color, translucent when pure and having a greasy feel. Soluble in light petroleum hydrocarbons, benzene, turpentine, kerosene, ether, carbon disulfide, slightly soluble in alcohol, insoluble in water.

Constants: Sp. gr. 0.85-0.95; m. p. 55-110°C, usually about 70°C.

Derivation: Found in nature in Utah, Austria, near the Caspian Sea, and Galicia.

Method of purification: Filtration.

Grades: Technical.

Containers: 80- to 100-lb stands; bags.

Uses: Electric insulation; rubber products, paints; leather polish; sealing wax; candles; lithographic and printing inks, electrotypers' wax; carbon paper, source of ceresin; floor polishes; impregnating furniture and parquet floor lumber, lubricating compositions; grease crayons, sizing and glossing paper; waxed paper; cosmetics, ointments; matrices for galvano-plastic work, textile sizings; waxed cloth; substitute for carnauba and beeswax.

Shipping regulations: None.*

ozocerite, purified. See ceresin wax.

ozokerite. Same as ozocerite.

ozone. An allotropic form of oxygen corresponding to the formula O_3 .

Properties: Unstable blue gas with a pungent odor, decomposes to ordinary oxygen, powerful bleaching action, oxidizes more rapidly than oxygen and promotes spontaneous ignition of many substances. Its presence in air is known to contribute to the characteristic properties of smog. Embrittlement of rubber is accelerated by the presence of traces of ozone in the air.

One can detect the odor of ozone when present in the air to the extent of only one part in 500,000,000. In concentrations of about one part in 50,000,000 the odor is pleasant, resembling that of clover. When the concentration reaches one part in 1,000,000 the more characteristic sulfur-like odor becomes apparent. B. p. -112°C, m. p. -250°C, sp. gr. (liq.) about 1.6.

Ozone is more soluble in water than is oxygen, a few milligrams per liter dissolving at ordinary temperatures. Its solubility is greater in acetic acid, acetic anhydride, propionic acid, chloroform, carbon tetrachloride, and dichloroacetic acid than in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Commercial mixtures containing 1-2% ozone are produced by electronic irradiation of air or oxygen. Ozone is also formed when air or oxygen is exposed to ultraviolet light and when alkaline perchlorate solutions are electrolyzed. Since it is too expensive to ship because so diluted with air or oxygen, it is usually manufactured in place. Tonnage lots are being used.

Uses: Oxidizing agent; purification of drinking water; treatment of industrial wastes; deodorization of air and sewage gases; preservation of foods in cold storage; bleaching waxes, oils, textiles;

promoting production of peroxides; bactericide. Oxidizing agent in several chemical processes (acids, aldehydes, ketones from unsaturated fatty acids); steroid derivatives; removal of chlorine from nitric acid; oxidation of phenols and cyanides.

Caution: Dangerous to breathe even in low concentrations for a protracted period! Liquid ozone is easily exploded as are concentrated ozone-oxygen mixtures (above about 3% ozone) in either the liquid or the vapor state.

Not shipped. See Derivation.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

P

P. Symbol for phosphorus.

p- Abbreviation for para-.

"P-10." ²⁰² Trademark for a technical grade of castor oil fatty acids containing approximately 90% ricinoleic acid. Used to enhance dye colors in inks; to impart lubricity and rust-proofing qualities to soluble cutting oils; in germicidal soaps and pharmaceuticals; and in glycerine-free soaps for foam rubber stabilization.

"P-33." ⁶⁹ Trademark for a proprietary thermatomic carbon. Available as a soft type of carbon black used in inner tubes, belting, hose, and molded rubber compounds. Also available in pellet form. It imparts high tensile, stretch, and resilience, with good tear and fair abrasion resistance.

Pa. Symbol for protactinium.

PA. Abbreviation for phthalic anhydride, also used for polyamide.

"PA." ²⁴¹ Brand name for pre-attrited silica gel available in several mesh sizes. Marketed in a "PA 100" and a "PA 400" series. Used for liquid and vapor phase dehydration of refrigerants in either the high pressure side or low pressure side of the system; also for drying air, gases, and other organic liquids.

PABA. Abbreviation for para-aminobenzoic acid.

PABA sodium. See sodium para-aminobenzoate.

"Pabst Brewers Yeast." ¹¹⁴ Brand name for a proprietary product. Bottom-type, debittered yeast derived from the brewing process. Thiamin, 50 International Units per gram, riboflavin, 45 gammas. Contains nicotinic acid, pantothenic acid, filtrate factor, vitamin B₆.

Use: For mixing with pharmaceutical products requiring vitamin potency. Also finds use in the food industry as a reinforcement for its vitamin and protein values in infant and geriatric food products.

"Pabst Industrial Malt Extracts." ¹¹⁴ Brand name for a proprietary product. Maltose value: to specifications, 55-60%; total solids: to specifications, 79.5-82%; color: to specifications.

Uses: For all food industries; candy manufacturers; flavoring; malt and milk mixtures; ice-cream manufacturers; cake and cookie bakers.

"Pachkote." ³²³ Trademark for a heavy duty coal tar mastic.

"Pacific Crystals." ¹⁷⁷ Trademark for pure, crystalline sodium sesquicarbonate, stable, non-caking and free-flowing.

pack fong. Chinese alloy of copper, nickel and zinc and resembling German silver.

packing-house pitch. See stearin and fatty acid pitches.

"Padutin." ¹⁶² Trademark for vascormone.

"Pagitane Hydrochloride." ¹⁰⁰ Trade name for cycrimine hydrochloride (alpha-cyclopentyl-alpha-phenyl-1-piperidinopropanol hydrochloride or cyclopentyl-phenyl-3-(1-piperidyl)-1-propanol hydrochloride). Properties: A white, odorless, bitter solid, m. p. 241-244°C, practically insoluble in benzene and ether; soluble in alcohol, chloroform and water; pH (0.5% solution) 4.9-5.4.

Use: Medicine.

PAHA. See para-aminohippuric acid.

paint. A liquid mixture which may be applied to surfaces to form a dry, thin, protective or decorative film. A paint is composed of a solid (the pigment) and the liquid "vehicle." The latter consists of a binder which forms the film and, usually, a volatile solvent or thinner to improve the ease of application. The solvent may be omitted from paints that are to be applied by hot melt or flame spraying techniques. In other cases the solvent may be such that it will change into a resin and become part of the film.

Paints may be either water-base or oil-base according to whether the thinner is water or an organic liquid such as turpentine, petroleum ether or naphtha, benzene, acetate esters, acetone, or an alcohol. Water-base paints have the advantage of a cheap, nonflammable thinner and suitability for use on damp or porous surfaces. A recent development is the heavy-bodied (thixotropic) paint. See gel paint.

Paint binders are classified or selected according to the manner in which the film is formed. (1) Binders that form films by oxidation or polymerization. Examples are drying oils (q. v.) (including drying oil-modified alkyl or epoxy resins, etc.); formaldehyde condensation resins (phenolic, urea, and triazine resins), allyl resins; and polyurethanes. (2) Binders that form films by evaporation of the thinner or by

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

congealing from a melt. Examples are nitrocellulose and most other cellulose esters and ethers, vinyl resins, styrene resins, many polyacrylates and polymethacrylates, rubber derivatives, some polyamide resins, and polyethylene.

(3) Binders that form a film when particles coagulate from a latex or dispersion of synthetic rubbers and other resins such as "Teflon" and high molecular weight vinyl resins. For these resins, subsequent heat treatment to fuse the particles into a continuous film is required. (4) Water-soluble binders such as casein or glue may be used in water-base paints although these have largely been supplanted by the latex type or by emulsions (emulsion paints) of typical oil-base vehicles.

The pigments (q. v.) may be various organic or inorganic materials used principally to impart color, opacity, and body to the paint film.

Paints may also contain as minor constituents plasticizers, driers, and extenders (q. v.). In addition, water-base paints usually contain emulsifiers, stabilizers, and anti-foam agents.

Special uses: Imparting resistance to corrosion, to fire, and to marine, mildew, or fungus growths, providing electrical insulation or conduction, protection against radiation; indication of temperature; reduction of frictional resistance (in aeronautical applications).

Shipping regulations: May be classified as flammable liquid. Red label. *

"Paint Deodorant No. 5." ¹⁸⁸ Brand name for a deodorant for paints.

paint driers. See driers.

paint extenders. Primarily cost-reducing materials used in paint formulation. They have, however, secondary functions which vary in importance with the kind of paint in which they may be formulated.

The following is a list of the materials commonly used for this purpose.

barium sulfate (natural; barytes, precipitated)
calcium sulfate (gypsum, terra alba, plaster of Paris)
calcium carbonate (whiting, chalk)
magnesium carbonate
silica (quartz, diatomaceous earth)
magnesium silicates and related minerals (talc, soapstone)
kaolin
miscellaneous (mica, pumice).

"Paintodors." ¹² Trademark for a series of specific masking agents designed for use in finished paint products to cover odors at application, during and after drying. No adverse properties with vehicles, pigments, preservatives or driers.

paint pigments. See pigments.

paint remover (varnish remover; finish remover). A preparation in liquid or paste form intended to be applied to objects coated with

a dried film of paint, varnish, lacquer or enamel for the purpose of removing the finish. A uniform coating of the remover is generally applied to the surface under treatment, allowed to act for a longer or shorter time, and the softened or dissolved finish scraped, rubbed or washed away. A satisfactory remover will not affect the coated object and will leave it in good condition for refinishing. Removers containing volatile solvents usually contain nonvolatile constituents intended to retard the rate of evaporation of the liquid, thereby prolonging its action. Typical solvents are: methanol, denatured ethyl alcohol, toluene, benzene, and ethyl acetate. Paraffin (120°) is most often used as the retarder. Caustic removers are made of sodium phosphate, sodium silicate, caustic soda, or the like.

paint vehicle. The liquid portion of paint, composed of the film-forming component (binder) and volatile solvent or thinner. See paint.

"Palacet." ⁴⁴⁰ Trademark for a series of organic pigments used for dyeing and printing on acetate, polyamide and polyester fibers.

"Palanil." ⁴⁴⁰ Trademark for a series of organic pigments used for dyeing and printing on polyester fibers.

"Palanthrene." ⁴⁴⁰ Trademark for a series of vat dyestuffs, mainly anthraquinonoid types.

"Palatine." ³⁰⁷ Metallized acid dyestuffs approaching the fastness of chrome colors.

"Palatone." ²³³ Proprietary brand of maltol, 3-hydroxy-2-methyl-4-pyrone. A white crystalline solid, soluble in ethanol, propylene glycol, water, phenethyl alcohol and other synthetic aromatics, solid material has caramel-butterscotch odor, whereas alcohol solution has a definite pineapple character with a slight indication of strawberry.

palau. A palladium-gold alloy sometimes used by laboratory workers as a platinum substitute.

"Palconate." ¹²⁶ Trade name for the sodium salt of phenolic acids extracted from redwood bark.

Properties: Brown-black powder or fine granules, density 33-35 lbs/cu ft; soluble in water and 1% caustic soda; insoluble in alcohol and ether, ash 31-32%; pH 10-11.

Uses: Drilling mud conditioner, ore flotation; battery expander, dispersing agent; replacement for phenol, ceramic binder.

"Palcotan." ¹²⁶ Trade name for sodium salt of sulfonated complex organic acids extracted from redwood bark.

Properties: Dark brown powder or fine granules, density 37-39 lbs/cu ft; soluble in water and 1% caustic soda; insoluble in alcohol and ether; ash 31-33%; pH 7-8.

Containers: 50-lb paper bags.

Uses: Drilling mud conditioner; water

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

treatment; ore flotation; battery expander; leather tanning; dispersing agent; ceramic binder; rubber industry.

pale chrome. See chrome yellows.

pale oxide of iron. Red pigment consisting essentially of ferric oxide. See iron oxide reds.

palladium Pd. Element of atomic number 46, one of the triad ruthenium, rhodium, palladium.

Properties: Silver-white ductile metal.

Does not tarnish in air, but on heating to about 600°C, becomes coated with an oxide which decomposes about 800°C, leaving the metal bright again. Absorbs large volumes of hydrogen. Insoluble in cold sulfuric acid and hydrochloric acid but is attacked somewhat by the hot acids; soluble in nitric acid; insoluble in organic acids. Readily soluble in aqua regia and fused alkalis.

Constants: Sp. gr. 12.0; m. p. 1554°C;

Brinell hardness, hard 109, annealed 46 (i. e., slightly harder than platinum).

Derivation: Occurs in nature along with platinum in gold, nickel, and copper ores. The final refining of the platinum metals is done by chemical methods.

Grades: Chemically pure (99.99%), technical (99.0%).

Containers: Wooden or plastic boxes.

Uses: Catalyst, especially in hydrogenation processes; resistance wires; electroplating; component of alloys used for electrical contacts, jewelry, dentistry, aircraft spark plugs, non-magnetic watch parts, hydrogen "valves."

Shipping regulations: None.*

palladium chloride (palladous chloride, palladium dichloride) (a) PdCl_2 (b) $\text{PdCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Dark brown, deliquescent powder or crystals, soluble in water, hydrochloric acid, alcohol and acetone. M. p. (a) 501°C (decomposes).

Derivation: By solution of palladium in aqua regia and evaporation.

Grades: Technical, reagent.

Containers: Glass bottles; tins.

Uses: Medicine, analytical chemistry; photography on porcelain, manufacture of indelible inks, electroplating with palladium; detecting carbon monoxide gas; ingredient of metal scouring compositions; starting point in the manufacture of photographic toning agents, textile mordant; manufacture of stearin, porcelains, germicides.

Shipping regulations: None.*

palladium dichloride. See palladium chloride.

palladium iodide (palladous iodide) PdI_2 .

Properties: Black powder; sp. gr. 6.003 (18°C); soluble in a solution of potassium iodide; insoluble in alcohol and water. Decomposes above 100°C.

palladium monoxide. See palladium oxide.

palladium nitrate (palladous nitrate) $\text{Pd}(\text{NO}_3)_2$.

Properties: Brown salt, deliquescent; decomposed by heat; soluble in water with turbidity;

soluble in dilute nitric acid.

Grades: Technical.

Use: Analytical reagent.

palladium oxide (palladium monoxide) PdO .

Properties: Black-green or amber solid; sp. gr. 8.31; m. p. (dec) 750°C; soluble in dilute acids.

Derivation: Careful ignition of the nitrate or prolonged heating of the finely divided metal at about 800°C.

Use: Reduction catalyst in organic synthesis.

palladium-potassium chloride (palladous-potassium chloride; potassium-palladium chloride) $\text{PdCl}_2 \cdot 2\text{KCl}$.

Properties: Reddish-brown crystals; soluble in water.

Uses: Reagent for carbon monoxide determination.

palladium-silver alloy. Used as means of purifying hydrogen to a very high degree of purity.

palladium-sodium chloride (palladous-sodium chloride, sodium-palladium chloride) $\text{PdCl}_2 \cdot 2\text{NaCl} \cdot 3\text{H}_2\text{O}$.

Properties: Brown salt; hygroscopic; soluble in alcohol and water.

Grades: Technical.

Use: Analysis (testing for carbon monoxide, ethylene, illuminating gas, iodine).

"Palladon." ¹⁶⁹ Trademark for para-nitrosodimethylaniline used in the colorimetric determination of palladium and platinum.

palladous chloride. See palladium chloride.

palladous iodide. See palladium iodide.

palladous nitrate. See palladium nitrate.

palladous-potassium chloride. See palladium-potassium chloride.

palladous-sodium chloride. See palladium-sodium chloride.

"Pall Ring." ³²⁶ Trade name for tower filling material. Similar in design to a Raschig ring but with sections of the wall stamped and bent inward. Made in metals, plastics and ceramics.

palma christi. See ricinus.

palmarosa oil (Indian grass oil, Rusa oil; East Indian geranium oil, geranium oil, Turkish).

Properties: Colorless or light yellow, volatile oil, occasionally colored green by copper. Pleasant rose-like odor, sp. gr. 0.885-0.897 (15°C); optical rotation -2° to +3°C; refractive index (n_D 20/D) 1.4730-1.4775; soluble in 2 volumes of 70% alcohol, benzyl benzoate, fixed oils, propylene glycol, mineral oil, insoluble in glycerine.

Chief known constituent: Geraniol.

Derivation: By distilling Cymbopogon martini, var. motia, found in the East Indies and Java. The name Turkish geranium oil was formerly applied to this oil because it was usually shipped from India to Red Sea ports. Then it was sent by land to Constantinople

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

where it was distributed to other markets. This practice has now been replaced by direct shipments from India.

Adulterants: Kerosene, coconut oil, gurjun balsam oil, cedar oil, and turpentine.

Their presence is indicated by the insolubility of the oil in 70% alcohol.

Containers: Cans.

Uses: Perfumery; manufacture of geraniol.

Shipping regulations: None. *

palm butter (palm oil, palm grease).

Properties: A fixed, reddish-yellow fatty oil of butter-like consistency, faint violet odor, which is conveyed to the soap made from the oil. Soluble in alcohol, ether, chloroform, and carbon disulfide.

Chief constituents: Free palmitic acid (12% in fresh oil to 55% in older oil), stearic acid, and glycerides of palmitic and oleic acids.

Constants: Sp. gr. 0.920-0.927; m. p. 27-42.5°C; iodine number 51.5, saponification number 202, Reichert number 0.5.

Derivation: By expression from the putrefied or fermented pulp of the fruit of a palm, *Elaeis guineensis*.

Occurrence: West coast of Africa; West Indies; South America.

Containers: Wooden barrels; casks; steel drums.

Uses: Manufacture of soaps and candles, emollient; coating iron plates; used in tinplate industry, lubricants, coloring butter substitutes.

Shipping regulations: None. *

See also palm-nut oil.

palm cake. See palm-nut cake.

"Palmex." ¹⁵² Trade name for a series of metal processing oils used for cold rolling of steel and aluminum, hot dip tinning and pickling.

Containers: Drums; tank trucks; tank cars.

palm grease. See palm butter.

palmitic acid (hexadecanoic acid; palmitinic acid, cetylic acid) $\text{CH}_3(\text{CH}_2)_{14}\text{COOH}$.

One of the more common fatty acids. It occurs in natural fats and oils and in tall oil, and in large amounts in most commercial grade stearic acid.

Properties: White crystals; soluble in alcohol and ether, insoluble in water, sp. gr. 0.8414 (80/4°C), m. p. 62.9°C, b. p. 351.5°C (760 mm), 271.5°C (100 mm), 139.0°C (1 mm); refractive index 1.4309 (70°C).

Derivation: From spermaceti by saponification; hydrolysis of natural fats.

Method of purification: Crystallization.

Grades: Technical, 99.8%.

Containers: Wooden barrels; bags; boxes.

Uses: Starting point in manufacture of various metallic palmitates; soaps; lube oils; waterproofing.

Shipping regulations: None. *

palmitic acid cetyl ester. See cetin.

palmitin. See tripalmitin.

palmitinic acid. See palmitic acid.

palmitoleic acid (cis-9-hexadecenoic acid)

$\text{CH}_3(\text{CH}_2)_5\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$. An unsaturated fatty acid found in nearly every fat, but largest amount in marine oils (15-20%).

Properties: Colorless liquid; m. p. 1.0°C;

b. p. 140-141°C (5 mm). Insoluble in water; soluble in alcohol and ether.

Grade: Purified product 99%.

Uses: Organic synthesis; medical research; chromatographic standard.

palmitoyl chloride (hexadecanoyl chloride; palmityl chloride, so-called)

$\text{CH}_3(\text{CH}_2)_{14}\text{COCl}$.

Properties: Colorless liquid; very soluble in ether, decomposes in water or alcohol; m. p. 11-12°C; b. p. 194.5 (17 mm).

palmityl alcohol. See cetyl alcohol.

palmityl chloride. Used, confusingly, as a synonym for palmitoyl chloride, the acid chloride $\text{C}_{15}\text{H}_{31}\text{COCl}$. It might also mean the alkyl chloride, $\text{C}_{15}\text{H}_{31}\text{CH}_2\text{Cl}$.

palm-kernel cake. See palm-nut cake.

palm-kernel oil. See palm-nut oil.

palm-nut cake (palm-kernel cake; palm cake).

The cakes formed in the press when the seeds are subjected to hydraulic pressure in order to express the palm-nut oil. Contains various useful constituents, such as unexpressed oil, carbohydrates, proteins, and salts. Typical analysis: proteins 30.4%, fats 8.4%, fiber 41.0%; water 9.5%; ash 10.6%.

Containers: Bags; bulk.

Uses: Cattle-food, fertilizer ingredient.

palm-nut meal. The mealy form assumed by palm nuts after the crushing and heating operations preparatory to the expression of the oil in either the hydraulic presses or the expeller. If the oil cake be ground the product again is in this mealy form. Uses are similar to those of palm-cake (q. v.).

palm-nut oil (palm-kernel oil, palm oil).

Properties: A yellowish, fatty oil, free of fatty acids when fresh; rapidly becoming rancid in air. Soluble in alcohol, ether, chloroform, and carbon disulfide.

Chief constituents: Triolein (15-25%), triglycerides of stearic, palmitic and myristic acids (33%) and triglycerides of lauric, capric, caprylic and caproic acids (45-55%).

Constants: Sp. gr. 0.952, m. p. 26-30°C; iodine number 13.4-13.6; saponification number 247.6.

Derivation: By crushing the nuts of *Elaeis guineensis* and pressing, or extracting with solvents.

Method of purification: Filtration.

Grades: Crude; refined.

Containers: Wooden kegs; steel drums; tank cars.

Uses: Manufacture of soaps and chocolate products; pharmacy; margarine manufacture, coloring butter substitutes; candles; illuminant; cutting tool lubricant, tin plating;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cosmetics; softening and finishing cotton goods.

Shipping regulations: None.*

See also palm butter.

palm oil. See palm butter and palm-nut oil.

"Paludrine." ²⁰⁷ Trademark for proguanil or chloroguanide hydrochloride (q. v.). A synthetic antimalarial drug.

PAM. Abbreviation for 2-pyridine aldioxime methiodide; stated to be an antidote for nerve gas.

"Pamak." ²⁶⁶ Trademark for a series of fatty acids derived from tall oil.

Properties: Very light-colored liquids; having rosin content ranging from 1.3% to 25%.

Uses: Production of alkyd resins for protective coatings; soaps and detergents, core oils; flotation of nonmetallic and metallic minerals; metallic driers; floor coverings, rubber compounding; vinyl stabilizer-plasticizers.

pamaquine naphthoate $C_{42}H_{45}N_3O_7$. 6-Methoxy-8-(1-methyl-4-diethylaminobutylamino)-quinoline 1,1'-methylene-bis(2-hydroxy-3-naphthoate).

Properties: Yellow to orange yellow odorless almost tasteless powder. Insoluble in water, soluble in alcohol and acetone.

Use: Medicine.

"Pamine" Bromide. ³²⁷ Trademark for methscopolamine bromide, scopolamine methyl bromide ($C_{18}H_{24}BrNO_4$).

Properties: Colorless crystals, m. p. 218°C , very soluble in water, less so in alcohol and acetone, insoluble in ether and benzene.

Derivation: Synthetic.

Use: Medicine.

"Pamisyl." ³³⁰ Trademark for para-aminosalicylic acid.

"Panaflex." ²¹⁶ Trademark for liquid hydrocarbon plasticizers used as secondary plasticizers in compounding polyvinyl chloride, in vinyl plastisols; and in molded and extruded products.

Panama bark. See quillaja.

"Panapol." ²¹⁶ Trademark for hydrocarbon liquid polymers derived from petroleum sources, produced by the polymerization of olefins and diolefins; available in a wide color range with different physical properties.

Containers: Tank cars or 55-gal drums.

Uses: As a partial replacement or extender for drying oils, or where a low cost resinous product is desirable.

"Panarez." ²¹⁶ Trademark for hydrocarbon resins derived from petroleum sources, produced by the polymerization of olefins and diolefins; available in color grades ranging from pale lemon to dark brown with a normal softening point of $200-220^\circ\text{F}$. Higher softening grades can also be produced. Available as solid resin, solution, or flaked material.

Uses: Paints and varnishes; rubber compounding; floor tile; etc.

"Panasol." ²¹⁶ Trademark for petroleum aromatic solvents available in a variety of boiling ranges. Used as solvents in paint and varnish applications, and in the formulation of insecticides.

pancreatic deoxyribonuclease. See pancreatic dornase.

pancreatic dornase (pancreatic deoxyribonuclease; deoxyribonuclease). Stabilized preparation of deoxyribonuclease.

Derivation: Prepared by fractional precipitation of aqueous acid extracts of beef pancreas followed by dialysis, sterilization by filtration and lyophilization.

Grade: N. N. D.

Use: Medicine.

pancreatin. A substance containing enzymes, principally pancreatic amylase, trypsin, and pancreatic lipase. Obtained from the pancreas of hog or ox.

Properties: Cream-colored amorphous powder; characteristic odor; acts upon starch and proteins. Soluble in water; insoluble in alcohol.

Derivation: Pancreas gland is extracted by macerating with chloroform, water, dilute boric acid, glycerol, or alcohol, filtered and evaporated.

Grades: N. F. XI.

Containers: Glass bottles, fiber cans.

Use: Medicine, as an emulsifying agent, and as a ferment.

Shipping regulations: None.*

"Pandrinox." ⁴⁰¹ Trade name for a combination liquid insecticide-fungicide seed treatment material containing methylmercury dicyandiamide (0.75%) and heptachlor (24.5%).

Containers: 160-oz bottles; 6-, 30-gal drums.

Uses: For treatment of cereal grain and sorghum seeds for protection against soil insects such as wireworms and seed corn maggots and for control of fungi.

Warning! Poisonous when inhaled, swallowed, or absorbed through skin.

"Panobrome." ⁴⁰¹ Trademark for a fumigant consisting of methyl bromide.

Containers: 1-lb cans; 10-, 100-, 175- and 375-lb cylinders.

Uses: For fumigation of grain or other stored products to control insects. For soil fumigation to control fungi, weeds and soil insects.

Danger! Vapor extremely hazardous. Highly volatile. Causes burns.

"Pano-drench." ⁴⁰¹ Trademark for a soil treatment concentrate containing 0.6% cyano(methylmercuri)guanidine.

Containers: 4 and 16-oz bottles.

Use: As a soil drench in nurseries and greenhouses to control damping-off fungi.

Warning! This liquid is poisonous when inhaled, swallowed or absorbed through the skin. Do not breathe vapors. Do not get in eyes, on skin or on clothing. Handle carefully.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Panogen 15." ⁴⁰¹ Trademark for a liquid seed treatment material containing methylmercury dicyandiamide.

Containers: 1-qt, ½ gal and 160-oz. bottles; 6-, 30-, 54-gal drums.

Uses: Seed treatment of cereal grain seeds, flax, cotton, sorghum, rice, peanuts and safflower.

Warning! Poisonous when inhaled, swallowed or absorbed through the skin. Do not breathe vapors. Do not get in eyes, on skin or on clothing. Handle carefully.

"Panogen Turf Spray." ⁴⁰¹ Trade name for a liquid containing methylmercury dicyandiamide (2.2%).

Containers: 8-, 16-, 32- and 160-oz bottles.

Uses: Diluted with water for spraying turf areas for control of fungus diseases such as melting out, fading out, dollar spot, copper spot, etc.

"Panoram 75." ⁴⁰¹ Trade name for a seed treatment material containing 75% thiram. Sold as a wettable powder in 25- or 100-lb fiber drums.

Use: For seed treatment of corn, legumes, grasses and vegetables for control of fungi.

Caution! May cause irritation of eyes, nose, throat, and skin. May be harmful if inhaled or swallowed. Avoid contact with eyes, skin or clothing.

"Panoram D-31." ⁴⁰¹ Trade name for a combination fungicide and insecticide consisting mainly of thiram (56%) and dieldrin (18%). Sold as a wettable powder in 25- and 100-lb fiber drums.

Use: As a seed treatment material for control of fungi and insects on corn, peas and beans.

Caution! Hazardous if swallowed, inhaled or absorbed through the skin. Avoid breathing dust. Avoid contact with eyes, skin or clothing, feed and foodstuffs.

"Panotectant." ⁴⁰¹ Trade name for a liquid containing aldrin (about 42%).

Containers: 6-, 30-, 54-gal drums.

Uses: As a seed treatment insecticide on small grains, sorghum, cotton, rice and corn. For protection against soil insects such as seed corn maggots, wireworms, rice water weevil, etc.

Warning! Hazardous if swallowed, inhaled, or absorbed through skin.

panthethine $C_{22}H_{42}N_4O_8S_2$. The disulfide form of N-pantothénylthioethanolamine.

Lactobacillus bulgaricus growth factor (LBF). A fragment of coenzyme A, a pantothenic acid derivative.

Use: Biochemical research.

panthenol. See pantothenol.

"Pantholin." ¹⁰⁰ Trademark for racemic calcium pantothenate, U. S. P.

pantolactone $HC(OH)C(CH_3)_2CH_2OCO$.

Properties: Crystals; sp. gr. (20/20°C), 1.180, m. p. 79.2°C, soluble in water.

Grades: 80% aqueous solution.

Use: Preparation of pantothenic acid.

pantothenic acid [N-(alpha, gamma-dihydroxy-beta, beta-dimethyl butyryl)-beta-alanine] $HOCH_2C(CH_3)_2CHOHCONH(CH_2)_2COOH$. A member of the vitamin B complex; it is a component of coenzyme A (q. v.), and may be considered a beta-alanine derivative with a peptide linkage. It is involved in the release of energy from carbohydrate utilization, and is necessary for synthesis and degradation of fatty acids, sterols and steroid hormones, it also functions in the formation of porphyrins. It is distributed in all living cells and tissues.

Properties: Yellow viscous oil; soluble in water and most organic solvents; insoluble in benzene and chloroform; dextrorotatory; stable to moist heat, oxidizing and reducing agents; unstable to dry heat, acid or alkaline media, hydrophilic.

Units: Amounts are usually expressed in milligrams or micrograms of pantothenic acid.

Sources: Food sources: liver, kidney, yeast, crude molasses, milk, whole grain cereals, rice. Commercial sources: produced synthetically from alpha, gamma-dihydroxy-beta, beta-dimethyl butyric acid and beta-alanine. Sold as the calcium salt.

Containers: Glass vials and bottles.

Uses: Medicine, nutrition.

See also calcium pantothenate.

pantothenol [D(+)-pantothényl alcohol; panthenol] $HOCH_2C(CH_3)_2CHOHCONH(CH_2)_2CH_2OH$. alpha, gamma-Dihydroxy-N-(3-hydroxypropyl)-beta, beta-dimethylbutyramide. The alcohol corresponding to pantothenic acid, with vitamin activity.

Properties: A viscous liquid, soluble in water, ethanol, methanol, specific rotation +28.36° to 30.7° in water (c = 5); refractive index 1.497 (20°C).

Use: Biochemical research; vitamin supplement.

pantothényl alcohol. See pantothenol.

papain (papayotin, vegetable pepsin).

Properties: White or gray slightly hygroscopic powder, soluble in water and glycerine, insoluble in other common organic solvents. The most thermostable enzyme known.

Derivation: Obtained as dried and purified latex of Carica papaya, source: tropical regions.

Grades: Technical, purified. Technical grade is susceptible to decomposition in storage.

Containers: Glass bottles; lined fiber drums.

Uses: Meat tenderizer; other food industries (mainly beer stabilizer); tobacco, pharmaceutical, cosmetic, leather and textile industries.

papaver (poppy heads; poppy capsules).

Derivation: Capsules and seeds of Papaver somniferum.

Occurrence: Europe and Asia.

Grade: Technical.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

papaverine $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}_2\text{C}_9\text{H}_4\text{N}(\text{OCH}_3)_2$.
6, 7-Dimethoxy-1-veratrylisoquinoline.
An alkaloid.

Properties: White crystalline powder; poisonous! Soluble in chloroform, hot benzene, aniline, glacial acetic acid, and acetone; slightly soluble in alcohol and ether; insoluble in water. M. p. 147°C .

Derivation: From opium.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine, as such or as the hydrochloride which is soluble in water.

Shipping regulations: None.*

papaverine hydrochloride $\text{C}_{20}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$.

Properties: White crystals or white crystalline powder; odorless, slightly bitter taste, soluble in water, alcohol, and chloroform; practically insoluble in ether. Solutions acid to litmus.

Derivation: The hydrochloride of an alkaloid obtained from opium or prepared synthetically.

Grade: U. S. P. XVI.

Containers: Cans.

Use: Medicine.

papaw. Same as pawpaw.

papaya.

Derivation: Fruit of *Carica papaya*, a tropical tree. Not to be confused with the pawpaw of central United States, which is *Asimina triloba*.

Grades: Technical.

Containers: Bags.

Use: Manufacture of carpine and papain.

Shipping regulations: None.*

papayotin. See papain.

paper board. A general term used to designate papers which range from 0.006" to 0.012" or more in thickness. Can be made from either chemical or mechanical fibrous pulps. See wood pulp.

paper chromatography. See chromatography.

paper clay. One suitable for mixing with paper pulp in order to give body, weight and finish to some grades of paper; also used in coating paper. Whiteness of color, plasticity, and freedom from sand are essential characteristics of these clays. The best paper clays come from England and Georgia.

paper pulp. The main raw material of paper, made from wood, rags, straw, bagasse. See wood pulp, and cellulose.

"PAPI." Trademark for polymethylene polyphenylisocyanate.

papier-maché. A tough, plastic material made: (a) from paper pulp admixed with size, paste, oil, resin or other substances; (b) from sheets of paper glued and pressed together.

Use: Molded into boxes, trays, utensils,

architectural ornaments and the like.

Shipping regulations: None.*

"Papricol." ³⁴² Trademark for a brand of oleoresin of paprika for food coloring and flavoring.

paprika. A sweetish condiment made from the fruit of the common red pepper, *Capsicum annum*; much used by Hungarians.

Types: Bulgarian, Hungarian; Spanish; Yugoslav.

Containers: Bags.

para-. A prefix. For definition of para-compounds, see under ortho-. For para-compounds, see specific compound; thus para-cresol will be found under cresol.

para-acetaldehyde. See paraldehyde.

paracasein. See casein.

paracetaldehyde. See paraldehyde.

"Paracol." ²⁶⁶ Trademark for a series of stabilized water dispersions of petroleum waxes and wax-resin mixtures used in surface and internal sizing of paper and paper-board.

"Paracort." ³³⁰ Trademark for prednisone.

"Paracortol." ³³⁰ Trademark for prednisolone.

"Paracril." ²⁴⁸ Trademark for a group of synthetic rubbers of the Buna-N or nitrile type. They are produced by the copolymerization of butadiene and acrylonitrile. The "Paracril" rubbers resist deterioration by aliphatic hydrocarbon, mineral and vegetable oils, and animal fats and oils and are particularly suited for applications involving contact with petroleum products. "Paracril" is also used as a plasticizer for vinyls as well as other thermoplastic and thermosetting resins.

"Paracril OZO." ²⁴⁸ Trademark for a nitrile rubber and vinyl blend with excellent ozone resistance and good color stability. Used in wire and cable insulation, molded and extruded mechanicals and oil resistant shoe soles.

"Paradene." ²¹ Brand name for low-priced, dark, thermoplastic, coal-tar resins available in low to high softening point ranges; used in natural and synthetic rubber compounding.

"Paradi." ³⁰⁶ Trademark for para-dichlorobenzene.

paradichlorobenzene. See dichlorobenzene, para isomer.

"Paradione." ³ Trademark for paramethadione (q. v.).

"Paradone." ²³² Brand name for a series of vat dyestuffs.

"Paradors." ¹² Trademark for a series of masking agents for use in different rubber formulations. Soluble, stable and compatible under conditions of use providing masking or odor modification. Mixtures of synthetic, heat-resistant aromatic chemicals.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Paradow." ²³³ Trade name for para-dichlorobenzene.

"Paradyne." ²⁹ Trademark for a group of chemical additives designed to improve the qualities of fuels. Includes additives for improvement of anti-icing, carburetor detergent, and deposit modification qualities of gasoline; storage ability and pour qualities of heating oils. Available in bulk and drum quantities.

paraffin. See paraffin wax.

paraffin, chlorinated. See chlorinated paraffin.

paraffin, fluorinated. See fluorinated paraffin.

paraffin hydrocarbons. See paraffins.

paraffin, liquid. See petrolatum, liquid.

paraffin, native. See ozocerite.

paraffin oils. Lubricating oils made by the dry distillation method.

Properties: The color range is from pale yellow, through yellowish-brown to reddish-brown to dark green but it is customary to decolorize them. In certain countries and localities kerosene is known as paraffin oil. Petrolatum, liquid (q. v.) is also known as paraffin oil.

Constants: Gr. 20° to 30° B_e, flash point (Cleveland open cup) 300° to 450°F, cold test 0° to 40°F; Saybolt viscosity 40 to 600 (70°F).

Method of purification: Filtration.

Containers: Metal cans, tank cars.

Uses: Lubricant, leather dressing, medicine.

Shipping regulations: None.*

paraffin oil, white. See petrolatum, liquid.

paraffins (paraffin hydrocarbons). A group of compounds with the empirical formula C_nH_{2n+2} varying from colorless gases through water-white liquids to low-melting point solids.

paraffin scale. See paraffin wax.

paraffin wax (a) Hard; (b) Soft (paraffin scale; ceresin wax; paraffin).

Properties: White translucent, waxy, tasteless; odorless solid; consisting of a mixture of solid hydrocarbons chiefly of the methane series obtained from petroleum. Before purification it is known as paraffin scale. Soluble in benzene, ligroin, warm alcohol, chloroform, turpentine, carbon disulfide and olive oil; insoluble in water and acids, sp. gr. 0.880-0.915; m. p. 42-60°C.

Derivation: (a) Paraffin oil is chilled and filter-pressed to remove the heavy oil; the remaining solid is paraffin wax. It is also made from paraffin oil by solvent extraction. (b) Treatment of ozocerite with sulfuric acid and bleaching.

Grades: Yellow crude scale; white scale; refined wax; N. F. XI.

Containers: 100-, 200-lb kegs; 200-lb cases (slabs); tank cars.

Uses: Manufacture of paraffin candles, waxed paper, etc; waterproofing wood,

cork, etc; impregnating matches; stearin candles; lubricants; preserving eggs; oil crayons; pharmacy (to stiffen ointments); surgery; stoppers for acid bottles; preservative covers for food products; electrical insulation; laundering; preservative for railroad ties; phonograph records; floor polishes; extraction of perfumes from flowers; cosmetics; photography; anti-frothing agent in sugar refining; packing tobacco products; coating interior of wine casks, protecting rubber products from sun-cracking.

Shipping regulations: None.*

"Paraflow." ²⁹ Proprietary name for a mixture of synthetic organic compounds of high molecular weight, which are added to lubricating oils to reduce their pour points.

"Para-Flux." ⁹⁴ Trademark for an asphaltic resin.

Properties: Sp. gr. < 1.06; carbon disulfide insolubles < 1%, flash point above 350°F; viscosity (Saybolt Furol at 122°F) 625-875 seconds; moisture < 0.5%; free sulfur < 0.1%, volatile content 1.5%; no effect on cure.

Containers: Drums and tank cars.

Uses: Rubber plasticizer to be used to replace pine tar, mineral oil, mineral rubber etc., in tires, mechanicals, footwear, heels and soles, tapes, etc.

paraform. See paraformaldehyde.

paraformaldehyde (paraform, polyoxymethylene; polyformaldehyde) (HCHO)_n or HO(CH₂O)_nH. A polymer of formaldehyde in which n equals 6 plus. Not to be confused with the tri-polymer, sym-trioxane (q. v.).

Properties: White solid with slight odor of formaldehyde; insoluble in alcohol and ether. Soluble in strong alkali solution. The higher polymers are insoluble in water.

Derivation: By evaporating an aqueous solution of formaldehyde.

Forms: Granular, powder, ground.

Grade: 91%, 96%.

Containers: Fiber drums; multiwall paper sacks (carloads).

Uses: Disinfectant; fumigant; fungicide, resins, including artificial horn and ivory; waterproofing animal and casein glues.

Warning: Causes irritation of skin, eyes, nose, and throat. MCA warning label.

"Paragon" Clay. ²⁸⁵ Proprietary brand name for a group of hydrous aluminum silicates (sedimentary kaolins) from South Carolina.

Properties: Sp. gr. 2.60; bulk density aerated 18-20 lbs/cu ft, packed 35-40 lbs/cu ft; creamy white; pH 4.5-5.5; airfloated; particle size 50-60% minus 2 microns.

Containers: 50-lb multiwall bags or bulk.

Uses: As a "soft" clay in rubber compounding to produce low modulus and tensile and a soft uncured compound; paper filler; in sodium silicate and other adhesives to impart body, retard silica migration, speed up setting and produce firmer glue lines; to condition (prevents caking) crushed or extruded resins. As filler in paint

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and ink. See "Suprex" Clay for a "hard" rubber clay.

"Paralac." ²⁰⁶ Brand name of proprietary line of synthetic resins for use in durable air drying and stoving finishes, paint, varnish and printing ink industries.

"Paralate." ²⁴⁴ Trademark for a product consisting of highly alkaline sodium silicates, complex phosphates, soda ash and soap. Also sold in "Paralate S" modification.

Properties: A white powder, soluble in water. Total alkali as Na_2O 50.7%.

Containers: 300-lb net drums.

Uses: Laundry break compound and builder; high pH type.

paraldehyde (para-acetaldehyde; paracetaldehyde; 2,4,6-trimethyl-1,3,5-trioxane) $\text{C}_6\text{H}_{12}\text{O}_3$. A polymer (trimer) of acetaldehyde.

Properties: Colorless liquid. Disagreeable taste; agreeable odor. Not so flammable as acetaldehyde. Decomposes on standing. Paraldehyde is not as reactive as acetaldehyde. It does not react with alkali disulfite, will not reduce silver solutions to form a mirror, nor does it unite with ammonia or hydroxylamine. It is stable toward alkalies, but is slowly decomposed to acetaldehyde when treated with a trace of mineral acid. Miscible with most organic solvents, volatile oils, soluble in water. Constants: Sp. gr. 0.9960 at $20^\circ\text{C}/20^\circ\text{C}$, b. p. 124.5°C ; m. p. 12.6°C , vapor pressure 25.3 mm (20°C), flash point 111.2°F , specific heat 0.434; refractive index 1.40 to 1.42 (20°C), wt 8.27 lbs/gal (20°C).

Typical specifications, technical grade: Paraldehyde 98% min, acetaldehyde 2% max; acidity (as acetic) 0.5% max, boiling range 100 to 127°C , water-white, sp. gr. 0.991-0.993 (20°C), wt 8.27 lbs/gal (20°C).

Typical specifications, U. S. P. XVI grade: Paraldehyde 99% min; acetaldehyde 0.4% max; acidity (as acetic) 0.5% max; water white; boiling range $120-126^\circ\text{C}$; freezing point 11.0°C min, residue 0.06% max; dilution test, passes test; sulfates, chlorides, none; sp. gr. 0.99 at 25°C , wt 8.25 lbs/gal (25°C).

Derivation: Action of hydrochloric or sulfuric acid upon acetaldehyde.

Grades: Technical; U. S. P. XVI.

Containers: Technical: 7-lb jugs, 35-lb cans; 435-lb drums; tank cars. U. S. P. XVI grade: 50-lb cans, 875-lb drums.

Uses: Substitute for acetaldehyde; rubber accelerators, rubber antioxidants; making synthetic organic chemicals; dyestuff intermediates; medicine; solvent for fats, oils, waxes, gums, resins, leather; solvent mixtures for cellulose derivatives.

Caution: Vapor harmful, use with adequate ventilation. MCA warning label.

Shipping regulations: None.*

"Para Lube." ⁹⁴ Trademark for a proprietary petroleum-base softener for rubber compounding.

Properties: Sp. gr. 1.00 ± 0.05 ; viscosity (Saybolt Univ.) 85 ± 10 ; flash point (open cup) 235°F min.

Containers: 50-gal steel drums; tank cars.

Use: In manufacture of GR-S molded goods, extruded goods, and hard rubber products.

paramethadione $(\text{C}_2\text{H}_5)(\text{CH}_3)\text{COC}(\text{O})\text{N}(\text{CH}_3)\text{CO}$. 3,5-Dimethyl-5-ethyloxazolidine-2,4 dione.

Properties: A clear, colorless liquid with esterlike odor; refractive index 1.449-1.501; freely soluble in alcohol, benzene, chloroform and ether; sparingly soluble in water.

Grade: N. F. XI.

Use: Medicine.

"Paramine." ²³² Brand name for a series of direct cotton dyestuffs.

"Paramine." ³⁰⁰ Trademark for a cationic finishing agent which imparts softness and surface finish to textile fabrics. Amino-fatty condensation product solubilized with a volatile acid.

"Paramins." ²⁹ General designation for the chemical additives marketed by Enjay Chemical Company.

"Paramul 115." ⁵⁷ Trademark. A water-repellent of the retreatable or non-durable type, an emulsion of wax and aluminum salts.

"Paramul" Water Repellent DC-1." ⁵⁷ Part of a two-package water repellent finish to be used with "Paramul" Water Repellent DC-2. These two compounds when mixed produce a water repellent finish on various fabrics. This finish is semidurable to washing and dry cleaning. These products can be applied by padding or exhaustion.

paranitraniline. See nitroaniline, para-.

paranitraniline red. See para red.

"Paranox." ²⁹ Trademark for a series of additives compounded for use in lubricating oils. Several types composed of metallo-organic compounds characterized by the presence of one or more of the following: barium, calcium, zinc, sulfur and phosphorus. Imparts high temperature detergency, low temperature sludge inhibition and anti-wear characteristics to oils compounded for lubrication of automobile and diesel engines and for automatic transmission fluids. Several grades available in bulk and drum quantities.

para-oxon (diethyl para-nitrophenyl phosphate) $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{OC}_6\text{H}_4\text{NO}_2$. The oxygen analog of parathion. The name has been accepted as generic by the Ent. Soc.

Properties: Odorless, reddish-yellow oil, b. p. $148-151^\circ\text{C}$ (1 mm); sp. gr. 1.269 ($25/25^\circ\text{C}$); refractive index 1.5060 (25°C).

Slightly soluble in water, soluble in most organic solvents. Decomposes rapidly in alkaline solutions.

Uses: Insecticide; nerve poison.

"Parapastels." ¹⁸⁸ Brand name for a group of perfume and color combinations designed

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

to impart, in one operation, agreeable fragrance and pleasing color to products made of para-dichlorobenzene or naphthalene.

"Paraplex." ²³

"Paraplex" Plasticizers for Coatings. Trademark for polymeric plasticizers for resinous coatings. Primarily polyester, but some grades also epoxides which impart heat and light stability. Supplied as viscous liquids, 100% solids or solutions in petroleum hydrocarbons. Most grades compatible with nitrocellulose, ethyl cellulose, polyvinyl butyral, and other high polymer film formers to produce tough, flexible, durable, abrasion- and water-resistant surface coatings.

Use: Coatings for wood, metal, fabrics, paper, and rubber. Also used in formulation of free films, caulking and sealing compounds.

"Paraplex" Plasticizers for PVC. Trademark for high- and intermediate-molecular-weight polymeric plasticizers for poly vinyl chloride and other high polymers. Supplied as viscous liquids. Primarily polyesters, but some grades also epoxides which impart heat and light stability. Excellent permanence and resistance to extraction and migration.

Use: Manufacture of film, sheeting, insulation, tape, and foam products. Also used in the formulation of plastisols and organosols for slush molding and coating.

"Paraplex" P resins. ²³ Trademark for unsaturated polyesters that cure to a cross-linked structure. Supplied as light-colored, 100%-reactive solutions in styrene; some grades acrylic modified. Various grades differ in flexibility, toughness or hardness of final product. Produce tough chemically resistant plastics by laminating, casting or molding processes.

Use: Manufacture of reinforced plastic table tops, trays, boat bodies, awnings, automobile ducts, buttons, and other commercial and industrial products, potting of coils.

"Parapoid." ²⁹ Proprietary name of extreme-pressure additives, especially for inclusion in automotive gear oils and the like.

"Parapol." ²⁹ Trademark for a synthetic plastic prepared by copolymerization of isobutylene and styrene. This material is useful as a free film, as a supported film, and as a modifier for paraffin.

"Parapon." ³⁰⁰ Trademark for a highly sulfated fatty ester dyeing assistant and leveling agent for dyed fabrics. Also imparts softening and is a dispersing agent for acetate dyes.

para red (paranitraniline red)

$C_{10}H_6(OH)NNC_6H_4NO_2$. A pigment color formed by coupling diazotized para-nitroaniline with beta-naphthol. The term is also used to refer to a group of lakes based on this dye. See para toners.

"Para-Resin" 2457. ⁹⁴ Trademark for a dark colored petroleum base resin.

Properties: Sp. gr. 1.09; softening point 200-220°F; carbon disulfide insolubles < 0.5%; carbon tetrachloride insolubles < 0.5%.

Containers: Drums.

Use: Rubber compounding.

para-rosolic acid. See rosolic acid.

"Parasepts." ¹³⁸ Trademark for group of neutral esters of para-hydroxybenzoic acid; includes the methyl, ethyl, propyl, benzyl, and butyl esters.

Properties: White powder.

Grade: Purified; technical.

Uses: In parenteral solutions, pharmaceuticals and cosmetics for inhibiting the growth of mold and bacteria. Technical grade for use in glues and other industrial applications.

"Paratac." ²⁹ Trademark for a high molecular weight isobutylene polymer used as an additive for both lubricating oils and greases. Particularly applicable in producing the so-called "non-drip," "non-spatter" oils.

"Paratex." ³⁰⁰ A water softener used in textile processing.

parathion (O,O-diethyl-para-nitrophenylthiophosphate) $(C_2H_5O)_2PSOC_6H_4NO_2$.

Properties: Deep brown to yellow liquid, often but not always with characteristic odor. Refractive index (n 25/D) 1.5367; sp. gr. 1.26; b. p. 157-162°C, vapor pressure 0.003 mm (24°C); very slightly soluble in water (20 ppm); completely soluble in esters, alcohols, ketones, ethers, aromatic hydrocarbons, animal and vegetable oils; insoluble in petroleum, ether, kerosene, spray oils. Stable in distilled water and in acid solution. Hydrolyzed in the presence of alkaline materials; slowly decomposes in open air.

Purity: Technical grade is about 95% pure. Also supplied diluted with inert carriers of various types, and in various proportions.

Derivation: From sodium ethylate, thiophosphoryl chloride and sodium para-nitrophenate.

Containers: 1-, 5-, and 10-gal tins, 55-gal steel drums.

Uses: Insecticide and acaricide.

Danger! Poisonous by skin contact, inhalation or swallowing. Rapidly absorbed through skin. Repeated exposure may, without symptoms, be increasingly hazardous. MCA warning label.

Shipping regulations: (liquid and dry): Poison, class B. Poison label.*

"Paratone." ²⁹ Trademark for additives designed to improve viscosity index of lubricating oils. All grades are organic compounds. Some grades are multifunctional, with sludge dispersant and pour improvement qualities. One grade designed specifically for automatic transmission fluids and other oils requiring high shear stability. Available in bulk and drum quantities.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para toners. Insoluble red pigments derived from beta-naphthol and para-nitroaniline. The former is sometimes partly replaced by mono-acid F, 2-naphthol-7-sulfonic acid. Through varying the conditions of temperature and acid concentration, different shades may be obtained.

Containers: Barrels.

Uses: Pigments in paint trade, printing industry; making of para lakes.

"Par Clay." ⁶⁹ Trademark for a proprietary product, a hard kaolin.

Properties: Cream; sp. gr. $2.62 \pm .03$; fineness (through 325 mesh) 99.5%.

Uses: Filler for rubber.

"Parco Lubrizing." ³⁴³ Trademark for an anti-friction coating process.

"Paredrine." ⁷¹ Trademark for hydroxy-amphetamine (q. v.).

pareira (pareira brava).

Derivation: Dried root of Chondodendron tomentosum or C. platphyllum.

Occurrence: Brazil and Peru.

Grades: Technical.

Containers: Bags.

Use: Medicine. Source of curate and curine.

Shipping regulations: None.*

See also Chondodendron tomentosum extract.

pareira brava. See pareira.

parent element. See daughter element.

parethoxycaine hydrochloride. See beta-diethylaminoethyl-para-ethoxybenzoate hydrochloride.

"Parez" Resins. ⁵⁷ Trademark for a series of melamine-formaldehyde and urea-formaldehyde paper resins.

Uses: Used to provide wet and dry strength to paper, improved foldability and printability. May be used as pulp additives or incorporated into paper coating. They are also used to anchor top coats to cellophane.

Parian cement. See gypsum cements.

"Paricin." ²⁰² Trademark for various alkyl hydroxystearates (soft, low melting point waxes useful as firming agents in cosmetics and specialty inks and as coupling agents for incompatible mixtures of polar and non-polar materials in hot melt applications) and acetoxystearates (plasticizers for nitrocellulose, cellulose acetate butyrate, ethylcellulose, and vinyl resins.)

"Pariflux." ²⁵⁰ Trade name for custom sized high purity ground calcium fluoride for use in welding electrode coatings.

"Parigran." ¹⁴⁷ Brand name for a granular product containing 10% Paris green.

Containers: 35-lb bags.

Uses: As a larvicide in mosquito control.

"Paris Black." ¹³³ Trademark for a regular color impingement carbon black for paper and phonograph records. Available as:

"Paris Black." 21 millimicron carbon used for photograph paper, wrappers, boards and

other paper stocks. Powdered.

"Paris II." 25 millimicron carbon. A paper black showing unusual ease of dispersion and wetting with good color value and high strength. Available in powdered and semi-compressed forms.

"Paris Beads." 25 millimicron carbon. A paper and phonograph black in the form of a very soft bead showing unusual dispersion properties.

Containers: 25-lb bags.

Paris blue. A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues. Also used to designate a coal tar dye.

Paris green. See copper acetoarsenite.

Paris white. See whitening.

Paris white cliffstone. See cliffstone Paris white.

Paris yellow. See chrome yellows.

parity. A quantitative characterization of the manner in which a system differs from its mirror image. The concept is important in the quantum-mechanical interpretation of nuclei and their reactions, but does not have a simple analogy in ordinary mechanics. Loosely it is the "handedness" of a nucleus or a nuclear process, and is in general conserved, as is momentum. It has just recently been discovered that parity may not be conserved in some nuclear interactions, upsetting an assumption that had been taken as law of physics for three decades.

"Parkerizing." ³⁴³ Trademark. Inhibition of rust formation on iron or steel by coating surface with a phosphate layer, achieved by dipping in acid phosphate solution.

Parkes process. A standard process for the separation of silver from lead. From 1-2% molten zinc is added to the lead-silver mix, heated to above the melting point of zinc. A scum containing most of the silver and zinc forms on the surface. This is separated and the silver recovered. The separation of silver is not complete and the process is repeated several times.

park lily. See convallaria.

"Parlodion." ³²⁹ Trademark for a shredded form of pure, concentrated collodion.

"Parlon." ²⁶⁶ Trademark for a white, odorless, nonflammable granular powder, a chlorinated natural rubber; 4 viscosity grades, used as a film former in paints for alkaline surfaces and corrosion-resistant industrial and maintenance paints.

"Parmo." ⁵¹ Trademark for petrolatums meeting U. S. P. or N. F. requirements and having melting points, consistencies and colors suitable for pharmaceuticals and cosmetics.

"Parnol." ⁷⁸ Trademark for an alkyl aryl sulfonate used in textile scouring and dyeing operations, and in synthetic detergents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Parolite." ¹⁵⁹ $\text{Zn}(\text{HSO}_2 \cdot \text{CH}_2\text{O})_2$. Trademark for soluble zinc sulfoxylate formaldehyde.

Use: As a reducing agent, particularly for removing color from dyed woolen materials. (Used at boiling temperature with addition of acetic or formic acid).

paromomycin sulfate. Antibiotic from a strain of *Streptomyces*.

Properties: Creamy white, odorless, hygroscopic powder. Soluble in water; insoluble in chloroform and ether.

Use: Medicine (antibiotic).

parrot green. See copper acetoarsenite.

parsley camphor. See apiole.

parsley oil.

Properties: A colorless or pale greenish-yellow liquid; strong odor of parsley. Soluble in alcohol, ether, and chloroform. Sp. gr. 1.07.

Derivation: Distilled from the fruit of *Petroselinum sativum*.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-, 5-lb bottles.

Use: Medicine.

Shipping regulations: None.*

partial pressure. The pressure due to one of the several components of a gaseous or vapor mixture. In general this pressure cannot be measured directly but is obtained by analysis of the gas or vapor and calculation by use of Dalton's law. See also Raoult's law.

partial accelerator. Any device used for increasing the speed of charged particles such as electrons, protons, deuterons, alpha particles, etc. The high speed particles are used as projectiles in nuclear bombardment and other similar processes.

"Parvex." ³²⁷ Trademark for a betaine of 1-piperazine carbodithioic acid ($\text{C}_5\text{H}_{10}\text{N}_2\text{S}_2$).

Properties: Pale greenish-yellow powder, almost insoluble in water, alcohol, ether, and chloroform; soluble in caustic soda.

Derivation: Synthetic.

Use: Veterinary medicine.

"Parvo." ⁵⁷ Trademark for folic acid feed supplement.

"Parzate." ²⁸ Trademark for agricultural and horticultural fungicides based on zineb (dry formulation) and nabam (liquid formulation used in combination with zinc sulfate).

Use: For control of various fungous diseases on potatoes, celery, tomatoes, tobacco, cucurbits, peaches, and ornamentals.

PAS. Abbreviation for para-aminosalicylic acid. See 4-aminosalicylic acid.

PASA. Another abbreviation for para-aminosalicylic acid. See 4-aminosalicylic acid.

passiflora. See passion flower.

passion flower (passiflora).

Derivation: Dried flowering and fruiting top of *Passiflora incarnata*.

Occurrence: Southern United States.

Containers: Barrels.

Use: Medicine.

passivity. Term applied to the property shown by iron, chromium and related metals, in that they lose their normal chemical activity after treatment with strong oxidizing agents like nitric acid, and when oxygen is evolved upon them during electrolysis.

paste.

1. An adhesive composition of semisolid consistency, usually water dispersible. The common pastes are based upon starch, dextrin, or latex, often with the addition of gums, glue, and antioxidants. They are widely employed for the adhesion of paper and paperboard.

2. More generally, a soft, viscous mass.

paste resins. Finely divided resin mixed with plasticizer to form fluid or semifluid mixtures, without use of low boiling solvents or water emulsions.

paste solder. A paste containing flux, cleaner, tinning agent and powdered metallic solder.

pasteurization. Partial sterilization of organic liquids, particularly milk and fruit juices, by heating at 65°C for not less than 30 minutes.

PAT. Abbreviation for polyaminotriazoles.

patchouli oil.

Properties: Yellow-greenish brown or brown liquid having a strong penetrating camphoraceous odor, sp. gr. (15°C) 0.950-0.995; refractive index ($n_{20/D}$) 1.5070 to 1.5200; optical rotation -48° to -68°; soluble in 10 volumes of 90% alcohol, usually with opalescence. Acid value, not more than 5; saponification number not more than 18; soluble in ether, chloroform, benzyl benzoate, fixed oils, mineral oil; partially soluble in propylene glycol, insoluble in glycerine.

Derivation: Direct steam distillation of the dried leaves of *Pogostemon patchouli*, purified by rectification.

Chief constituents: Patchouli alcohol, eugenol, cinnamic aldehyde, cadinene.

Containers: Glass bottles; tins.

Use: Perfuming of toilet preparations.

Shipping regulations: None.*

patent alum. See aluminum sulfate.

pâtgreen. See copper acetoarsenite.

pathfinder elements. Elements, generally metallic in nature, associated with ore deposits at the time of formation. Mapping of the concentration variation of the selected element serves to locate the main ore deposit. Examples are zinc as the "pathfinder" for lead, copper and silver ores and molybdenum associated with porphyry copper deposits. As such elements are present in small proportions (less than 1%), variations in the ore bodies are more easily identified.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Pathibamate." ⁵⁷ Trademark for tridihexethyl chloride and meprobamate.

"Pathon" Chloride. ³¹⁵ Trademark for tridihexethyl chloride (q. v.).

patina. Various used to refer to an ornamental and/or corrosion-resisting film on the surface of copper, copper alloys, including bronzes especially, and also sometimes of iron and other metals. Such a film is formed in some cases by exposure to the air, and in other cases by a suitable chemical treatment.

See also verdigris.

patronite. A mixture of vanadium-bearing substances with the approximate formula VS_4 , found in Peru.

Pattinson process. Process for the removal of silver from lead. The silver-lead mixture is melted in one of a series of pots and allowed to cool slowly. The lead which is free from silver or poorer in silver separates out as crystals which are removed, leaving the silver-rich lead in the molten state. From a number of such operations in series a lead rich in silver is obtained, collected, and the silver recovered. See also Parkes process.

"Paveril Phosphate." ¹⁰⁰ Trademark for dioxyline phosphate (q. v.).

paving brick clay. Usually impure shales and fire clays are used for this purpose. Desirable qualities in a paving brick clay are a fair degree of plasticity, good tensile strength, and suitable temperature viscosity characteristics.

Occurrence: United States (Ohio, Pennsylvania, Indiana, Illinois, New York, Maryland, Colorado).

pawpaw. See explanation under papaya.

Pb. Symbol for lead.

PBAA. Abbreviation for polybutadiene-acrylic acid copolymer.

PBD. See 1,3,4-phenylbiphenyloxadiazole.

PBPB. Abbreviation for pyridinium bromide perbromide.

PC. Abbreviation for paper chromatography. See chromatography.

"PC-1244." ⁵⁸ Trademark for a defoamer for non-aqueous systems. Soluble in benzene, toluene, kerosene, petroleum ether, carbon tetrachloride, isopropanol, tertiary amyl alcohol, butyl "Cellosolve" and ethyl acetate, insoluble in water, alcohol, methanol and methyl "Cellosolve."

PCNB. Abbreviation for pentachloronitrobenzene.

"PCON." ²³³ Trademark for a chloronitroaniline, $C_6H_3ClNO_2NH_2$, a dye and pigment intermediate.

Properties: Orange, crystalline powder, m. p. 116.3°C; insoluble in water; soluble in methanol and ether.

pcu. Abbreviation for pound centigrade unit, the amount of heat needed to raise one pound of water from 15 to 16°C. See also chu.

Pd. Symbol for palladium.

PDB. Abbreviation for para-dichlorobenzene.

PE. Abbreviation for pentaerythritol; also for polyethylene.

peach aldehyde. See gamma-undecalactone.

peach kernel oil. See persic oil.

peacock blue. A blue organic pigment used especially in inks for multicolor printing. It is the blue pigment most extensively used for this purpose and is also the organic pigment manufactured in greatest quantity in flushed form. It is a lake of acid glaucine blue dye (Color Index No. 671) on alumina hydrate. Structurally, the dye is alpha, alpha-bis[N-ethyl-N-(4-sulfo benzyl)-aminophenyl]-alpha-hydroxy-ortho-toluene-sulfonic acid sodium salt, $HSO_3C_6H_4COH[C_6H_4N(C_2H_5)CH_2C_6H_4SO_3Na]_2$, and is prepared from aniline, ethanol, benzyl chloride, ortho-chlorobenzaldehyde, sulfuric acid, and sodium bisulfite.

Containers: 250-lb barrels.

The term, peacock blue, is sometimes applied to other pigments of similar color, such as Prussian blue which has been treated with phosphotungstic acid.

peanut (ground nut, earth nut).

Varieties: White Spanish, most common in commercial use in America. Usually two well-rounded seeds to a pod. Seed coats pink to red. Also Red Spanish, Tennessee Red, Virginia Bunch, Jumbo Spanish, Carolina Runner; Virginia Runner.

The hulls: The fruit of the peanut plant which contains the seeds.

Properties: Cream-white to gray to dark brown depending upon variety. Composed mostly of cellulose. Contains pentose and some tannin and oils. Odorless, no taste, crisp. Contains whitish lining and considerable mucilaginous substances. Several varieties contain different amounts of carbohydrates, etc.

Grades: One grade, different varieties.

Containers: Shipped in box cars in bulk.

Uses: Preparation of cellulose for paper stock and other cellulose products, fertilizer, cattle feed; manufacture of furfural and xylose; base or synthetic plastics.

Shipping regulations: None.*

The skins:

Properties: Pink to brownish in small Spanish; red, in red Spanish, dull red, in Tennessee red; light brown in jumbo. Bitter, acrid, alkaloidal taste. Little oil, small percentage carbohydrates, alkaloids, large

* amount of protein.

Chief constituents: Protein and pigment.

Grades: Technical.

Containers: Cloth bags.

Uses: Cattle feed; source of protein, source of dyes; pigments.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: None.*

The seeds:

Properties: White to cream color; sweet taste, degrees of sweetness dependent upon varieties of peanuts; oily. Small white Spanish has sweetest taste and most oil. Contain the embryo or peanut hearts.

Chief constituents: Protein; 40% oil average; small amount of carbohydrates.

Grades: No. 1, best; No. 2, etc.

Containers: Bags; sacks.

Uses: Confections; roasted as a food, to make peanut butter by grinding in own oil, manufacture of oil by pressing.

Shipping regulations: None.*

The oil (arachis oil; peanut oil, earth-nut oil, ground-nut oil).

Properties: Yellow to greenish yellow.

Typical non-drying oil of olive oil type.

Soluble in ether, petroleum ether, carbon disulfide and chloroform; insoluble in alkalies, but saponified by alkali hydroxides with formation of soaps; insoluble in water; slightly soluble in alcohol.

Chief known constituents: Principally glycerides of oleic and linoleic acids, with lesser amounts of the glycerides of palmitic, stearic, arachidic, behenic, and lignoceric acids.

Constants: Sp. gr. 0.917-0.926; solidifying point -5 to +3°C, saponification value 186-194, iodine number 88-98; Hehner's number 95; refractive index (n_{40/D}) 1.463.

Derivation: By pressing ground peanut meats or by extraction with hot or cold solvents. Latter method more prominent.

Method of purification: Bleaching with fuller's earth or carbon. Hot pressed oil is frequently allowed to stand to deposit stearin (which it will do even at ordinary temperatures) and then filtered.

Grades: U. S. P. XVI, crude; refined, edible.

Containers: 5-gal tins; 50-gal drums, tank cars.

Uses: Substitute for olive oil, edible oils, both hydrogenated and unhydrogenated, soaps, vehicle for medicines.

Shipping regulations: None.*

peanut cake (ground nut cake, goober cake, earth nut cake). The press cake resulting from the extraction of oil from the peanut. See peanut oil meal.

peanut oil. See peanut.

peanut oil meal. The crushed form of peanut cake resulting from the extraction of oil from the peanut seed. This is prepared with or without the shells and the oil meal of commerce contains between 39-45% crude protein and is sold on that basis. A typical analysis of the 39% protein meal is 39.1% crude protein; 5.3% crude fiber; 34.3% nitrogen free extract, 6.2% ether soluble (fats); 5.3% ash and with the total digestible nutrient of approximately 80%.

Containers: Bulk or bags.

Uses: Animal feeds, fertilizer ingredient.

Shipping regulations: None.*

pearl alum. See aluminum sulfate.

pearl ash. See potassium carbonate.

"Pearlescent Pigment." ³⁰⁴ Trade name for a lead monohydrogen phosphate (PbHPO₄) pigment.

Properties: Soft white powder, sp. gr. 5.6, refractive index 1.85.

Containers: 50-, 300-lb fiber board drums.

Uses: Imparts pearlescence in a wide range of plastic products. Resists heat and finds direct use in flexible or rigid applications.

pearl essence. See nacreous pigment.

pearlite (perlite). During the process of slowly cooling steel from higher temperatures cementite (q. v.) and ferrite (q. v.) are liberated and form, at about 700°C, a mechanical mixture made up of definite amounts of each and in the proportion of about 7 parts of ferrite to 1 part of cementite, so that the resulting conglomerate contains approximately 0.85% carbon. It exists in the form of interstratified layers or bands of ferrite and cementite and is called pearlite. While pearlite commonly occurs in slowly cooled steels in the lamellar formation, composed of alternate layers of ferrite and cementite, it may, under different rates of cooling and dependent on the relative amounts of ferrite and cementite present, exist in other formations, or phases, of which some authorities have recognized at least four, making five modifications in all. Normal pearlite has a maximum tensile strength of about 105,000 lbs, and an elongation of about 10% in two inches. It is regarded as a separate and distinct constituent of steel because it forms masses or "grains," always contains this same percentage of carbon and, in slowly cooled carbon steel, is always formed at a definite temperature.

See also carbon, combined and carbon, graphite.

pearl moss. See chondrus.

pearl pigment. See nacreous pigment.

pearl white. See bismuth oxychloride; bismuth subnitrate.

pear oil. See amyl acetate.

peat.

Derivation: Partly decayed vegetable matter which has accumulated in marshes. Essentially the first stage in the development of coal from vegetable matter.

Typical analysis of partly dried material:

	Per Cent
Water	25
Ash	3
Woody fiber	50
Humus acids	22
Ammonia	2-3
Phosphoric acid and potash	0.10-0.20

Uses: Dried in blocks or briquetted and used as fuel; fertilizer material.

Shipping regulations: None.*

peat moss. See sphagnum.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pectic acid. Made from pectin by treating the latter with sodium hydroxide solution, washing with isopropyl alcohol, adding alcoholic hydrogen chloride and finally washing again with isopropyl alcohol and drying. Mentioned for use as an acidulant in pharmaceuticals.

pectinase. An enzyme present in most plants. It catalyzes the hydrolysis of pectin to sugar and galacturonic acid.

Use: Biochemical research; juice and jelly industry.

Pectinase "Takamine." ²¹² Trademark for a standardized combination of pectic enzymes which hydrolyze and depolymerize pectins.

Properties: Dry, off-white powder containing filter aid, non-hazardous, non-flammable. Optimum pH 3.5-4.5; optimum temperature range 80-125°F.

Grade: For food products.

Containers: All quantities; bulk orders, 100- and 150-lb fibre drums.

Uses: For the hydrolysis of pectins in fruit and fruit juices to speed processing and to make fruit juices sparkling clear for consumer appeal.

"Pectinol." ²³ Trademark for formulated enzyme concentrates, of fungal origin, with varying degrees of pectinase activity which hydrolyze pectic substances.

Use: Clarification of wines and fruit juices and processing of jellies.

pectinose. See arabinose.

pectins. A group of high-molecular-weight substances, polyuronides, related to carbohydrates and found in varying quantities in fruits and plants. Pectin consists chiefly of partially methoxylated galacturonic acids joined in long chains.

Properties: White powder or syrupy concentrates. Commonest characteristic of pectins is their property of jelling or "setting" under suitable conditions, as on addition of sugar to fruit juices in the preparation of jams or jellies. Soluble in water, insoluble in organic solvents.

Derivation: By dilute-acid extraction of the inner portion of the rind of citrus fruits, or of fruit pomaces, usually apple.

Method of purification: Following decolorization, the extracts are concentrated by evaporation or the pectins precipitated with alcohol or acetone.

Grades: Pure (N. F. XI) containing not less than 7% methoxyl groups and not less than 78% galacturonic acid, 150-, 200-, 250-jelly grades, containing various diluents.

Containers: Bottles, plastic bags, 30-lb tins, 100-lb drums, 200-lb barrels.

Uses: Jellies, foods, cosmetics, drugs, protective colloids; emulsifying agents, dehydrating agents.

pectin sugar. See arabinose.

"Peerless." ¹³³ Standard "flow" black for the printing ink, carbon paper, and typewriter ribbon industries. Available in four types:

"Standard Peerless." A long flow black with low oil absorption, good mass tone, high strength and loading capacity, and easy grinding characteristics. Used in lithographic, halftone and letter press inks, carbon papers and typewriter ribbons.

"Peerless Mark II." Equal to "Standard Peerless" in strength and shows even greater loading capacity and flow; for use where high concentrations of carbon black are required.

"Peerless Mark IIA." Same as "Peerless Mark II" except in denser form. Less dust; easier mixing. Containers 12.5-lb bags.

"Peerless Beads." Beaded form of the long flow "Peerless" type carbon black. Containers 12.5-lb bags; 50- and 75-lb cartons.

"Peetal." ⁵¹ Trademark for black greases made in a wide range of consistencies for use on steel mill roll necks whose housings are cooled externally with water.

"Pee Vee Cee." ⁴¹ Trade name for synthetic-resin, high-impact, rigid sheet and also pipe and fittings of the Type II unplasticized polyvinyl chloride type used to fabricate structures where optimum resistance to impact as well as corrosion is required.

PEG. Abbreviation for polyethylene glycol.

"Peg 42." ⁷³ Trademark product. Polyoxyethylene stearate.

Properties: White soft-solid, sp. gr. 1.00, m. p. 28-31°C, iodine value <2, free fatty acid <4%, soluble in alcohol and hydrocarbons, dispersible in hot water.

Containers: 425-lb drums, 40-, 8-lb containers.

Uses: Anti-staling and softening agent in baking.

pegmatite (giant granite). A rock consisting of the same constituents as ordinary granite, namely, quartz, feldspar and mica, but irregular in texture and composed of the constituent minerals in such large size that they can be differentiated. In addition to its use as a building stone, pegmatite is often a source of lithia, zircon, tin, tungsten, tantalum, tourmaline, uranium, etc.

"Peladow." ²³³ Trademark for calcium chloride, 94-97%, in pellet form.

"Pelargol." ¹⁸⁸ Trademark for a perfume base for soap perfumes of the geranium and rose types.

pelargonic acid (n-nonoic acid, n-nonanoic acid; n-nonylic acid) $\text{CH}_3(\text{CH}_2)_7\text{COOH}$.

Properties: Colorless or yellowish oil with slight characteristic odor, sp. gr. 0.9052 (20/4°C), m. p. 12.5°C, b. p. 255.6°C (760 mm), 162.4°C (32 mm); refractive index 1.4322 (20°C), soluble in alcohol, ether, and organic solvents; insoluble in water.

Derivation: By the oxidation of nonyl alcohol or nonyl aldehyde; the oxidation of oleic acid, especially by ozone.

Grades: Technical, 99%.

Containers: Hardwood barrels; kegs, drums;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tank cars.

Uses: Organic synthesis; lacquers; plastics; production of hydrotropic salts; pharmaceuticals; synthetic flavors and odors; as a flotation agent; esters for turbojet lubricants; vinyl plasticizer.

Shipping regulations: None. *

See also nonoic acids.

pelargonic aldehyde. See nonanal.

pelargonyl chloride (n-nonanoyl chloride)

$\text{CH}_3(\text{CH}_2)_7\text{COCl}$.

Properties: B. p. 80-85°C (5 mm), min assay 97%; soluble in hydrocarbons and ethers; decomposes in water.

Containers: Bottles, carboys, drums.

Uses: Intermediate in organic synthesis.

"Pelaspan." ²³³ Trademark for an expandable polystyrene in bead or pellet form. Each bead contains its own expanding agent, which is activated by heat.

Pellogot's salt. See potassium chlorochromate.

"Pelletex." ²⁷⁵ Trade name for semi-reinforcing furnace (SRF) carbon blacks for use in rubber goods. Pelleted form of "Gastex."

pelletierine $\text{C}_5\text{H}_{11}\text{N}(\text{CH}_2)_2\text{CHO}$. beta-(2-Piperidyl) propionaldehyde.

Properties: Liquid alkaloid from the root of the pomegranate. Soluble in water, alcohol, ether, chloroform, benzene. Sp. gr. 20/4°C 0.988; b. p. 195°C.

Use: Medicine (in form of its salts, sulfate, tannate, valerate).

Shipping regulations: None. *

pellitory. See pyrethrum root.

"PEM." ¹⁹⁵ Trade name for a finely-ground, portland cement-base compound for application over manufactured block, brick, concrete, stucco, or artificial stone.

"Penchlor." ²⁰⁴ Trademark for cold setting silicate-type acid-resistant cements.

Completely stable in dry storage.

Grades: Acid-Proof, S-25, Fireproof, and FCC.

Containers: Cement powder available in 100-lb bags, solution in 50-lb and 600-lb steel drums.

Use: Quick setting cement mortar used with acidproof brick to resist acids and strong oxidizing agents, except hydrofluoric acid, up to 2000°F.

"Penco." ²⁰⁴ Trademark for an entire line of agricultural chemical products, including many insecticide formulations in addition to the following:

"Penco" De-Fol-Ate. A herbicide-defoliant containing 41.5% sodium chlorate and 27.5% magnesium chloride.

"Penco" Dimite E-2. An emulsifiable insecticide concentrate containing 2-lb DMC per gal.

"Penco" D-Phos 38-6. A wettable insecticide spray powder containing 38% DDT and 6.25% parathion.

"Penco" Endothal Harvest Aid. A defoliant-desiccant containing 6.3% disodium endothal.

"Penco" Endothal Weed Killer. A herbicide containing 19.2% disodium endothal.

"Penco" Pencal. An insecticide dust containing tricalcium arsenate (low lime).

"Penco" Kryocide. An insecticide dust containing 90% sodium fluoaluminate.

"Penco" Kryocide Super-Seventy. An insecticide dust containing 72% sodium fluoaluminate.

"Penco" Penite-6x. A herbicide containing 9 1/2 lb arsenic trioxide per gal.

"Penco" Penite-35. A herbicide containing 4 1/2 lb arsenic trioxide per gal.

"Penco" Sytam. A systemic emulsifiable insecticide concentrate containing 42% OMPA.

"Penco" Pentrete. A fungicide liquid seed treater containing 7% phenyl mercuric ammonium acetate.

"Pencogel." ³⁴² Trademark for extract of Irish gums.

"Pendane." ³⁴² Trademark for lindane insecticide concentrates.

"Penetone." ³³ Proprietary, mildly alkaline detergent composed of neutral soaps and synthetic water softening compounds. Containers: 5-, 15-, 30-, and 55-gal drums. Uses: General maintenance and industrial cleaning.

penetrants. Any compounds used to increase the speed and ease with which a bath or liquid permeates a material being processed by effectively reducing the interfacial tension between the solid and liquid. Penetrants are widely used in the textile, tanning and paper industries for improving dyeing, finishing, etc., operations. Sulfonated oils, soluble pine oils and soaps are popular among the older penetrants while the salts of sulfated higher alcohols are typical of the synthetic organics developed for this purpose. See also wetting agents.

"Penex" Process. ⁴¹⁶ Patented process for isomerization of normal pentane and normal hexane to corresponding branched-chain hydrocarbons in an environment of hydrogen over a platinum-containing catalyst of high activity. Preferably, the charge should be either predominantly normal pentane or normal hexane, but mixtures can be processed. Process is used in preparing high octane gasoline blending stock from the lower quality normal paraffin stocks. Commercial installations of both C₅ and C₆ Penex are in operation.

"Pen-Gleam." ²⁰⁴ Trademark for a mildly alkaline powdered cleaning compound used for manual washing of painted surfaces. Commercially available in 125-lb fiber drums; 125-, and 350-lb steel drums.

"Pen-Glo." ²⁰⁴ Trademark for a powdered, inhibited acidic material used for the removal of soil and oxides from railroad car bodies without damaging paint.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Commercially available in 400-lb fiber drums with polyethylene liners.

"Penglo 65." ⁷⁹ Trade name for a pale maleic modified pentaerythritol ester of a special tall oil in mineral spirits.

Properties: Acid value (on solids) 9; concentration (total solids) 65%; color (Hellige) 6; viscosity (Gardner Holdt) 0; ash (on solids) 0.07%.

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish.

"Penglo A." ⁷⁹ Trade name for a pale pentaerythritol ester of a special tall oil in mineral spirits.

Properties: Acid value (on solids) 9; concentration (total solids) 70%; color (Hellige) 6; viscosity (Gardner Holdt) H; ash (on solids) 0.07%.

Containers: 55-gal drums, tank cars.

Uses: Paint and varnish.

penicillin ($\text{CH}_3)_2\text{C}_5\text{H}_7\text{NSO}(\text{COOH})\text{NHCOR}$ (bicyclic). A group of isomeric and closely related antibiotic compounds with outstanding antibacterial activity, obtained from the liquid filtrate of the molds, *Penicillium notatum* and *Penicillium chrysogenum*, or also, more recently, by a synthetic process which includes fermentation.

The principal penicillins include:

G. R = benzyl, $\text{C}_6\text{H}_5\text{CH}_2-$.

O. R = allylmercaptomethyl, $\text{CH}_2\text{CHCH}_2\text{SCH}_2-$.

V. R = phenoxyethyl, $\text{C}_6\text{H}_5\text{OCH}_2-$.
alpha-phenoxyethyl. R = $\text{C}_6\text{H}_5\text{OCH}(\text{CH}_3)-$.
Other varieties exist.

Derivation: The mold is grown in a nutrient solution such as corn steep liquor and lactose. Beginning in the second or third week of cultivation the mold excretes penicillin into its liquid culture medium. This liquid is then filtered off and the penicillin extracted and purified by counter-current extraction with amyl acetate, adsorption on carbon, or other methods. Different varieties of penicillin are produced biosynthetically by adding the proper precursors to the nutrient solution.

dl-alpha-Phenoxyethylpenicillin is produced synthetically from alpha-phenoxypropionic acid and 6-aminopenicillic acid, the latter derived from a fermentation process. The following varieties are in common use.

aluminum penicillin G ($\text{C}_{16}\text{H}_{17}\text{N}_2\text{O}_4\text{S}_2\text{Al}$). The trivalent aluminum salt of penicillin G.

Properties: A light yellow powder with a characteristic odor and taste. It is only slightly soluble in water.

Grade: N. N. D.

benzathine penicillin G (N,N'-dibenzylethylenediamine dipenicillin G).

$2\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_4\text{S} \cdot \text{C}_{16}\text{H}_{20}\text{N}_2 \cdot 4\text{H}_2\text{O}$.

Properties: White, odorless, crystalline powder; slightly soluble in alcohol, practically insoluble in water, pH of a saturated solution is 4.5-7.5.

Grade: U. S. P. XVI.

potassium penicillin G (benzylpenicillin potassium) $\text{C}_{16}\text{H}_{17}\text{KN}_2\text{O}_4\text{S}$.

Properties: Colorless or white crystals, or powder; odorless; moderately hygroscopic solutions dextrorotatory; relatively stable to air and to light; very soluble in water, in saline, and in dextrose solutions; moderately soluble in alcohol; pH of solution (30 mg/ml) is 5.0-7.5; m. p. 214-217°C (dec.).

Grade: U. S. P. XVI.

procaine penicillin G

$\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_4\text{S} \cdot \text{C}_{13}\text{H}_{20}\text{N}_2\text{O}_2 \cdot \text{H}_2\text{O}$.

Properties: White, fine crystals or powder; odorless; relatively stable to air and light; solutions dextrorotatory; sparingly soluble in water; slightly soluble in alcohol; fairly soluble in chloroform; pH of saturated solution is 5.0-7.5.

Grade: U. S. P. XVI.

sodium penicillin G (benzylpenicillin sodium)

$\text{C}_{16}\text{H}_{17}\text{NaN}_2\text{O}_4\text{S}$.

Properties: Identical to potassium penicillin G (q. v.).

Grade: U. S. P. XVI.

chloroprocaine penicillin O (crystalline salt of 2-chloroprocaine and penicillin O)

$\text{C}_{13}\text{H}_{18}\text{N}_2\text{O}_4\text{S}_2 \cdot \text{C}_{13}\text{H}_{19}\text{ClN}_2\text{O}_2$.

Properties: White, crystalline powder; stable at room temperature for three years; practically insoluble in water.

Grade: N. N. R.

sodium penicillin O (sodium allylmercaptomethyl penicillin) $\text{C}_{13}\text{H}_{17}\text{NaN}_2\text{O}_4\text{S}_2$.

Properties: White, crystalline powder; onion-like taste and odor, freely soluble in water; stable for three years in dry form at room temperature, solutions stable for three days with refrigeration.

Derivation: Biosynthetically by growing the mold in a medium containing allylmercaptosuccinic acid.

Grade: N. N. D.

penicillin V (phenoxymethylpenicillin)

$\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_5\text{S}$.

Properties: White, odorless, crystalline powder, very slightly soluble in water, soluble in alcohol and acetone, insoluble in fixed oils, pH of saturated solution is 2.5-4.0.

Grade: U. S. P. XVI.

potassium penicillin V (potassium phenoxy-methylpenicillin) $\text{C}_{16}\text{H}_{17}\text{KN}_2\text{O}_5\text{S}$.

Properties: White, odorless, crystalline powder, very soluble in water; soluble at all pH levels; slightly soluble in alcohol; insoluble in acetone; pH of solution (30 mg/ml) is 4.0-7.5.

Grade: U. S. P. XVI.

hydrabamine penicillin V (hydrabamine phenoxy-methylpenicillin)

$2\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_5\text{S} \cdot \text{C}_{42}\text{H}_{64}\text{N}_2$.

Properties: A water-insoluble mixture of crystalline phenoxy-methylpenicillin salts consisting chiefly of the salt of N,N'-bis-(dehydroabietyl)ethylenediamine, with smaller amounts of the salts of the dihydro and tetrahydro derivatives.

Grade: N. N. D.

potassium alpha-phenoxyethylpenicillin (potassium penicillin 152; phenethicillin)

$\text{C}_{17}\text{H}_{19}\text{KN}_2\text{O}_5\text{S}$. Synthetically prepared;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

a mixture of two stereoisomers.

Properties: White, crystalline solid; moderately hygroscopic; decomposes above 220°C. Very soluble in water; resistant to acid decomposition.

Preparation: By N-acylation of alpha-phenoxypionic acid and 6-amino-penicillanic acid (produced by fermentation using Penicillium chrysogenum).

dimethoxyphenylpenicillin sodium. Synthetic penicillin which resists inactivation by Staphylococci penicillinase; active against strains of staphylococci resistant to other penicillins.

penicillinase. A term applied to enzymes which antagonize the anti-bacterial action of penicillin. Such enzymes are found in many bacteria.

Grade: N. N. D.

Use: Pharmaceutical, biological research.

Penicillinase "Takamine." ²¹² Trademark for a special enzyme system for destroying penicillin.

penicillin G. See penicillin.

penicillin O. See penicillin.

penicillin V. See penicillin.

"Penicklor." ³⁴⁴ Trademark for chlordane insecticide concentrates.

"Pennclean." ²⁰⁴ Trademark for a liquid milk-stone remover containing an inhibitor and wetting agent.

Use: For the softening and removal of milk-stone and dried milk solids from farm dairy utensils, flash pasteurizers and other dairy plant equipment.

"Penncoat No. 101." ²⁰⁴ Trademark for an oxidized asphalt, hot-applied compound used as a sealing membrane beneath acid-proof brickwork on concrete floors and tanks. Applied with or without glass cloth membrane to thickness of $\frac{1}{4}$ " or $\frac{3}{8}$ ". Resists acids and mild alkalis. Shipped in 100-lb drums.

"Pennex." ⁵¹ Trademark for dark colored cutting oils, including sulfurized fatty oil-mineral oil blends, sulfurized mineral oils and high film strength oils for difficult machining operations.

"Pennolox." ²⁰⁴ Trademark for a specially prepared solution for use in bleaching cellulose and synthetic fibers. Bleaching solutions can be used safely and are noncorrosive in the equipment customarily used. They are effective at temperatures below the "set" point of the synthetics. It is shipped in rubber or polyethylene lined drums and can be handled in polyethylene or rubber containers. It has also found a valuable use in the removal of metallic impurities from wet twisted cotton yarns prior to their bleaching in package machines.

"Pennply No. 101." ²⁰⁴ Trademark for an asphalt-coated glass cloth for use with

hot-applied asphalt to form and strengthen the membranes. Shipped in 450 square foot rolls.

"Pennprime No. 101." ²⁰⁴ Trademark for a cut-back asphalt primer for priming concrete surfaces prior to application of hot-applied asphaltic membranes. Shipped in 5-gal drums.

"Pennsalt Asplit Cement." ²⁰⁴ Trademark for a cold-setting phenolic resin cement used with acidproof brick or tile for dilute and moderately concentrated acid service, except for strong oxidizing agents, up to 375°F.

"Pennsalt Cleaner A-27." ²⁰⁴ Trademark for a mildly alkaline powdered cleaning compound used for removing marking inks, oils, and soils from aluminum. Highly inhibited to prevent attack on the base metal. Commercially available in 250-lb steel or fiber drums.

"Pennsalt Cleaner AE-16." ²⁰⁴ Trademark for a highly alkaline powdered compound used to provide an attractive etched finish on aluminum. Strongly inhibited against sludging. Commercially available in 300-lb steel drums.

"Pennsalt Cleaner EC-10." ²⁰⁴ Trademark for a concentrated emulsifiable solvent used alone or in conjunction with alkalis to soften and remove heavy organic soils. Commercially available in 346-lb steel drums.

"Pennsalt Cleaner EC-51." ²⁰⁴ Trademark for an emulsifiable solvent used alone or in conjunction with alkalis to remove heavy organic soils from metal. Inhibited to provide temporary rust protection. Commercially available in 342-lb steel drums.

"Pennsalt Cleaner EC-54." ²⁰⁴ Trademark for an emulsifiable solvent used alone or in conjunction with alkalis for the removal of heavy organic soils. Very high flash point and low volatility as well as temporary rust protection. Commercially available in 345-lb steel drums.

"Pennsalt Cleaner K-8." ²⁰⁴ Trademark for a strongly alkaline powdered cleaning compound used with direct current for the cleaning of copper and steel prior to electroplating. Commercially available in 350-lb steel or fiber drums.

"Pennsalt Cleaner MC-1." ²⁰⁴ Trademark for a mildly alkaline powdered cleaning compound of many applications. Widely used as a pre-etch cleaner for aluminum. Commercially available in 125-lb and 350-lb steel or fiber drums.

"Pennsalt Cleaner PB-1." ²⁰⁴ Trademark for an alkaline powder used in water wall paint spray booth to avoid sticking of the paint. Commercially available in 400-lb steel drums.

"Pennsalt Corlok Cement." ²⁰⁴ Trademark for a cold-setting potassium silicate cement

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

for use with acid-proof brick and tile to resist all acids, except hydrofluoric, up to 2000°F. For use especially with high temperature chlorinations and sulfuric acid processing. Exceptional bond strength to ceramic surfaces. Powder shipped in 100-lb bags, solution in 50-lb drums.

"Pennsalt Furan Cement." ²⁰⁴ Trademark for a cold setting furfural ketone resin cement, for use with acid-proof brick or tile to resist acid, alkaline, and solvent conditions. Powder "S" grade, with a siliceous filler, resists dilute and moderately concentrated acids, except strong oxidizing agents and hydrofluoric acid, also alkalis up to 50% caustic and most solvents. Powder "C" grade, with a carbon filler, resists hydrofluoric and phosphoric acids and other acids, except strong oxidizing agents, also strong alkalis and most solvents. Powder "S" shipped in 150-lb drums, Powder "C" in 100-lb drums, and Furan solution in 45- and 50-lb drums.

"Pennsalt HF Cement." ²⁰⁴ Trademark for a cold setting carbon-filled, phenolic resin cement for use with acid-proof brick or tile to resist acids, especially phosphoric, hydrofluoric and organic chlorinators, up to 375°F.

"Pennsalt HFK Cement." ²⁰⁴ Trademark for a HFK grade used for quicker setting requirements. Carbon powder shipped in 20- and 100-lb drums, resin solution in 10- and 50-lb drums.

"Pennsalt LockPrime." ²⁰⁴ Trademark for a synthetic resin primer for use with most synthetic coating materials, including neoprenes, vinyls, styrenes, alkyls, and furans. Exceptional bond strength and resistance to solvents. Shipped in 1- and 5-gal cans.

"Pennsalt PRF Cement." ²⁰⁴ Trademark for a cold setting modified phenolic resin cement, carbon filled, for use with acid-proof brick or tile to resist dilute and concentrated acids, including strong oxidizing agents, alkalis and most solvents, up to 375°C. Has exceptionally low shrinkage and high bond strengths.

"Pennsalt PRFK Cement." ²⁰⁴ Trademark for a grade of "PRF" used for quicker setting requirements. Carbon powder shipped in 20- and 100-lb drums; resin solution in 10- and 50-lb drums.

"Pennsalt Sulfur Cements." ²⁰⁴ Trademark for hot-pouring, plasticized sulfur cements for use in acid service, including strong oxidizing agents. Available with siliceous filler for normal use; Carbon-Sulfur grade for hydrofluoric service; and Double-Plasticized Sulfur grade for bell and spigot pipe connections.

"Pennsalt Thick-Coat." ²⁰⁴ Trademark for a high-build chlorinated hydrocarbon resin coating for application to steel, concrete,

and wood surfaces as a general purpose maintenance type protective coating. Resistant to atmospheric corrosive conditions. Shipped in 1- and 5-gal cans.

pennyroyal oil, American. See hedeoma oil.

pennyroyal oil, European.

Properties: Yellowish to reddish-yellow essential oil, sometimes with bluish or greenish fluorescence; aromatic mint-like odor. Soluble in 4 to 7 vols. and more of 60% alcohol; in 1.5 to 2.5 vols. and more of 70%.

Chief constituents: Pulegone, limonene, dipentene, menthol, menthone.

Constants: Sp. gr. 0.930-0.950 (15°C); optical rotation +15° to +25°; refractive index 1.483-1.486.

Derivation: By distillation of *Mentha pulegium*.

Adulteration: Turpentine; sometimes eucalyptus oil.

Containers: 5-, 10-lb bottles; 25-, 50-lb tins.

Uses: Medicine; insectifuge, perfumery; manufacture of pulegone and its derivatives.

Shipping regulations: None. *

"Pen-o-led." ⁵¹ Trademark for extreme-pressure lubricants for gears and bearings operated under heavily loaded or overloaded conditions. Used extensively in metal working mills.

"Penolene 643." ³³ Trade name for a purified grade of 1,1,1-trichloroethane (methyl chloroform). See also "Inhibisol."

Properties: Sp. gr. 1.324, boiling range 72-76°C; flash point none; fire point none.

Containers: 55-gal drums.

Uses: Electrical instrument cleaner; general degreasing, often as replacement for carbon tetrachloride.

Hazard: One of least toxic chlorinated solvents. Maximum allowable concentration: 500 ppm.

"Penozone." ²⁰⁴ Trademark for a hydrogen peroxide type bleach recommended for laundries and dry cleaners.

"Pensal." ²⁰⁴ Trademark for a detergent and soap builder.

"Pensuds." ²⁰⁴ Trademark for a powdered synthetic detergent promoted with complex phosphates for use in laundries and wet cleaning departments of dry cleaning establishments.

pentaborane B₅H₉ (boron hydride).

Properties: Liquid; m. p. -46.6°C; b. p. 48°C, sp. gr. 0.61; vapor pressure (0°C) 66 mm; decomposes at 150°C; ignites spontaneously in air. Toxic!

Derivation: Hydrogenation of diborane.

Uses: Fuel for air-breathing engines; propellant.

Shipping regulations: Flammable liquid. Red label. Not accepted by express. *

6, 13-pentacenequinone. See 2, 3, 6, 7-dibenzanthraquinone.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Pent-Acetate." ²⁰⁴ Trademark for synthetic amyl acetate available in two grades based on acetate content (85% and 92% min).

Uses: Lacquer solvent; extractant for penicillin and other antibiotics; solvent.

pentachloroethane (pentalin) $\text{CHCl}_2\text{CCl}_3$.

Properties: Dense, high-boiling colorless liquid; sp. gr. 1.685 (15/4°C); b. p. 159.1°C, f. p. -22°C; refractive index 1.503 (24°C). Insoluble in water.

Derivation: By chlorination of trichloroethylene, which is obtained by a two-step process involving chlorination of acetylene to obtain tetrachloroethane, and removal of hydrochloric acid from this by action of alkali.

Method of purification: Distillation.

Containers: 700-lb drums; tank cars.

Uses: As solvent for oil and grease in metal cleaning. See tetrachloroethane for other uses. Also used for separation of coal from impurities by density difference.

Shipping regulations: None. *

pentachloronitrobenzene (PCNB) $\text{C}_6\text{Cl}_5\text{NO}_2$.

Properties: Cream crystals; musty odor; sp. gr. 1.718 (25/4°C), m. p. 142-145°C; b. p. 328°C (some decomposition). Practically insoluble in water, slightly soluble in alcohols, somewhat soluble in carbon disulfide, benzene, chloroform.

Derivation: Prepared by treating pentachlorobenzene with fuming nitric acid.

Grades: Dust; emulsion concentrate; wettable powder.

Containers: Casks or drums.

Uses: Intermediate; soil fungicide, slime preventative in industrial waters; herbicide.

Precautions: Avoid inhaling dust and spray. Wash hands and face thoroughly after using.

pentachlorophenol $\text{C}_6\text{Cl}_5\text{OH}$.

Properties: White powder or crystals, m. p. 190°C; b. p. 310°C with decomposition, sp. gr. 1.978 (22/4°C). Insoluble in water; soluble in dilute alkali, alcohol, acetone, ether, pine oil, benzene, "Carbitol," and "Cellosolve", slightly soluble in hydrocarbons.

Derivation: Chlorination of phenol.

Containers: Fiber drums; multiwall paper sacks.

Uses: Fungicide; bactericide; algicide; herbicide; starting material for synthesis of such compounds, wood preservative.

Warning: Harmful dust. MCA warning label.

Shipping regulations: None. *

pentacites. Alkyd resins formed by use of pentaerythritol as the polyhydric alcohol. Used in protective coatings and printing inks.

"Pentacresol." ³²⁷ Trademark for a mixture of secondary amyl tricresols ($\text{C}_{12}\text{H}_{18}\text{O}$).

Derivation: Synthetic.

Use: Medicine.

pentadecane $\text{C}_{15}\text{H}_{32}$ and $\text{CH}_3(\text{CH}_2)_{13}\text{CH}_3$.

Properties: Colorless liquid; soluble in

alcohol; insoluble in water. Sp. gr. 0.776; b. p. 270.5°C; m. p. 10°C.

Grades: Technical.

Use: Organic synthesis.

n-pentadecanoic acid (pentadecylic acid)

$\text{CH}_3(\text{CH}_2)_{13}\text{COOH}$. A saturated fatty acid normally not found in vegetable fats, but produced synthetically.

Properties: Colorless crystals; sp. gr. 0.8423 (80/4°C); m. p. 51.8-52.8°C; b. p. 339.1°C (760 mm), 212°C (16 mm); refractive index 1.4529 (60°C). Insoluble in water; soluble in alcohols and ethers.

Available as 99% pure product for organic synthesis, medical research and reference standard in gas chromatography.

pentadecanolide. See "Thibetolide."

pentadecylic acid. See n-pentadecanoic acid.

1,3-pentadiene. See piperylene.

pentaerythrite. See pentaerythritol.

pentaerythritol (PE, pentaerythrite)

$\text{C}(\text{CH}_2\text{OH})_4$.

Properties: White, crystalline powder. Can be readily esterified by the common organic acids. Unaffected when boiled with dilute caustic alkali. Soluble in water; slightly soluble in alcohol; insoluble in benzene, carbon tetrachloride, ether, and petroleum ether.

Constants: B. p. 276°C (30 mm); m. p. 262°C; refractive index (20°C) 1.54 to 1.56. Sp. gr. 1.35.

Typical specifications (technical grade):

Approximately 88% monopentaerythritol and 12% dipentaerythritol, sp. gr. 1.38 (25/4°C); m. p. 240°C, purity 99.5%.

Typical specifications (C. P. grade): M. p. 250°C min, color creamy white, chlorides trace; sulfates none; ash 0.05% max, solution 1 g in 12 cc water, clear.

Derivation: By reaction of acetaldehyde with an excess of formaldehyde in an alkaline medium.

Grades: Technical, nitration; C. P.

Containers: 5-, 25-, 50-lb fiber cartons; 50-, 80-lb multiwall bags; 25-, 100-, 125-, 250-, 300-lb drums.

Uses: Alkyd resins; rosin and tall oil esters, molding resins, special varnishes; organic synthesis such as pharmaceuticals; plasticizers, insecticides; synthetic drying oils, explosives.

Shipping regulations: None. *

pentaerythritol chloral. See petrichloral.

pentaerythritol tetraacetate $\text{C}(\text{CH}_2\text{OOCCH}_3)_4$.

Properties: White, crystalline powder. Non-flammable; extremely stable to sunlight. Soluble in water, alcohol and ether.

Constants: M. p. 84°C; b. p. 225°C (30 mm).

Typical specifications: Pentaerythritol tetraacetate 99% min; free acidity (as acetic) 0.4% min; m. p. 74°C min; color white; chlorides, sulfates, metals, none.

Derivation: By the esterification of pentaerythritol with acetic acid.

Grades: Technical.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pentaerythritol tetranitrate (PETN, penthrite)
 $C(CH_2ONO_2)_4$.

Properties: White crystalline material; sp. gr. 1.75; m. p. 138-140°C; decomposes above 150°C; explodes at 205-215°C.

Very soluble in acetone; slightly soluble in alcohol and ether; insoluble in water.

Derivation: Esterification of pentaerythritol with nitric acid.

Containers: Specially lined 300-lb steel drums.

Use: Explosive, medicine.

Shipping regulations: Explosive, class A.

Initiating explosive label. Not accepted by express.*

pentaglycerine. See trimethylolethane.**pentahydroxycyclohexane.** See quercitol.**3, 5, 7, 3', 4'-pentahydroxyflavone-3-rutinoside.**
See rutin.**"Pentalarm No. 86."** ²⁰⁴ Trademark for a warning agent for fuel gas.

Properties: Color, red, sp. gr. (20/20°C), 0.83-0.84, distillation not less than 95% below 266°F, amyl mercaptan content, 90% (min), flash point (open cup), 50°F, soluble in most organic solvents; insoluble in water.

Shipping regulations: Flammable liquid. Red label.*

"Pentalarm No. 1004." ²⁰⁴ Trademark for a fuel gas warning agent for liquid-injection odorization.

Properties: Color, blue, mercaptan sulfur, 34% (min); sp. gr. (68°F), 0.835-0.845, distillation 93% between 122-260°F; flash point < 0°F, average molecular weight 88, viscosity (77°F), 0.57 centistokes.

Shipping regulations: Flammable liquid. Red label.*

"Pentalene." ²⁰⁴ Trademark for mixed amyl-naphthalenes, available in distilled (No. 195) and crude (No. 95) grades. Used as intermediates for anionic surface-active agents.**pentalin.** See pentachloroethane.**"Pentalyn."** ²⁶⁶ Trademark for a series of pentaerythritol esters of rosin and modified rosin.

Uses: Varnishes and enamels, primarily, where they contribute adhesion, hardness, flexibility, high gloss, and exterior durability. Also, they are used in printing inks, adhesives, and modifiers for waxes, and floor coverings.

pentamethonium salts. Similar to hexamethonium salts; see hexamethonium bromide, chloride.**1, 1, 3, 3, 5-pentamethyl-4, 6-dinitroindane.**
See "Moskene."**pentamethylene.** See cyclopentane.**pentamethyleneamine.** See piperidine.**pentamethylenediamine.** See cadaverine.**pentamethylene dibromide (1,5-dibromopentane)**

Properties: Colorless, aromatic liquid; m. p. -35°C, b. p. 224°C; insoluble in water. Containers: Bottles.

pentamethylene glycol. See 1,5-pentanediol.**pentamethylene tetrazole.** See pentylene-tetrazol.**pentanal.** See n-valeraldehyde.**n-pentane (amyl hydride)** $CH_3(CH_2)_3CH_3$.

Properties: A colorless, mobile, flammable liquid; pleasant odor, freezing point

-129.723°C, b. p. 36.074°C; refractive

index (n_{20/D}) 1.35748; sp. gr. (20°C)

0.62624; soluble in hydrocarbons, oils,

and ether; very slightly soluble in alcohol,

insoluble in water. Flash point -45°F.

Typical specifications for a technical grade:

Distillation range 94-100°F; sp. gr. of

liquid (60/60°F) 0.631; A. P. I. gravity

(60°F) 92.8, density of liquid (60°F) 5.25

lbs/gal; vapor pressure (70°F) 8.8 psi

absolute; refractive index (n_{20/D}) 1.357;

principal impurity approx. 4% isopentane;

sulfur content 0.005% max; contains not less

than 95 mole % normal pentane.

Derivation: Fractional distillation from pe-

troleum, purified by rectification.

Grades: Pure; technical, commercial.

Containers: Pure: 1-qt bottle, gal bottle;

55-gal drum. Technical and commercial

grade: 55-gal drums; tank cars.

Uses: Anesthetic, artificial ice manufacture,

low-temperature thermometers; solvent

for use in solvent extraction processes,

general solvent.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

pentanedinitrile. See glutaronitrile.**pentanedioic acid anhydride.** See glutaric anhydride.**1, 5-pentanediol (pentamethylene glycol)**

Properties: Colorless liquid, b. p. 242.5°C;

f. p. -15.6°C; sp. gr. 0.9921 (20/20°C);

wt/gal 8.2 lbs (20°C); flash point (open cup)

265°F. Miscible with water.

Grades: Technical.

Containers: 5-, 55-gal drums, tank cars.

Uses: Polyester and urethane resins; hydraulic fluid, lube oil additive, anti-freeze.

2, 3-pentanedione. See acetyl propionyl.**2, 4-pentanedione.** See acetylacetone.**pentanepentol.** See xylitol.**pentanethiol.** See amyl mercaptan.**pentanoic acid.** See n-valeric acid.**1-pentanol.** See n-amyl alcohol, primary.**2-pentanol (sec-n-amyl alcohol, sec-amyl**

alcohol, active; methyl propyl carbinol)

Properties (racemic form): Colorless liquid,

b. p. 119.3°C, sp. gr. (20/20°C) 0.811;

wt/gal (20°C) 6.75 lbs, refractive index

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

(n 25/D) 1.4041; flash point (open cup) 105°F. Slightly soluble in water; miscible with alcohol and ether.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and hydrolysis of pentanes.

Grades: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Solvent for paints and lacquers; pharmaceutical intermediate.

Shipping regulations: None.*

3-pentanol (sec-n-amy alcohol; 1-ethyl-1-propanol; diethyl carbinol)
 $\text{CH}_3\text{CH}_2\text{CHOHCH}_2\text{CH}_3$.

Properties: Colorless liquid, sp. gr. 0.82 (20°C); freezing point less than -75°C, b. p. 115.6°C; wt/gal 6.81 lbs; refractive index 1.41 (20°C). Soluble in alcohol and ether; slightly soluble in water.

Containers: 1-gal cans; (approx net contents 6.5 lbs), 5-gal cans (approx net contents 34 lbs), 55-gal drums (approx net contents 353 lbs), tank-car capacity (approx net contents 8000 gals).

Uses: Solvent; flotation agent; pharmaceuticals.

Fire hazard: Fire point (open cup) 100°F.

Shipping regulations: None.*

tert-pentanol. See tert-amy alcohol.

2-pentanone. See methyl propyl ketone.

3-pentanone. See diethyl ketone.

penta resin. Ester gum made from rosin and pentaerythritol.

"Pentaryl A." ²⁰⁴ Trade name for amyl biphenyl, $\text{C}_5\text{H}_{11}\text{C}_6\text{H}_4\text{C}_6\text{H}_5$.

Properties: Light straw color, boiling range, 305-337°C; sp. gr. (20/20°C) 0.952-0.965, refractive index 1.555-1.567; viscosity 21 cps (25°C).

Use: Raw material for the manufacture of surface-active agents.

"Pentaryl B." ²⁰⁴ Trademark for diamyl biphenyl $\text{C}_5\text{H}_{11}\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_5\text{H}_{11}$.

Properties: Straw color; boiling range, 355-385°C; sp. gr. (20/20°C) 0.932-0.945, refractive index, 1.540-1.552.

Uses: Raw material for the manufacture of surface active agents.

pentasodium triphosphate. See sodium tripolyphosphate.

"Pentasol." ²⁰⁴ Trademark for synthetic amyl alcohols.

"Pentasol" #26. A special esterification grade amyl alcohol for organic synthesis.

"Pentasol" #27. A mixture of synthetic isomeric amyl alcohols, primaries, secondaries and some tertiaries. Used as a solvent for nitrocellulose lacquers, urea-formaldehyde resins, and many organic compounds, flotation agent for concentration of non-ferrous ores; intermediate; hydraulic fluid.

"Pentasol" #258. A special blend of alcohols for lacquer solvents.

"Pentasol" Frother #124. A special amyl alcohol blend for the mining industry.

n-pentatriacontane $\text{C}_{35}\text{H}_{72}$ or $\text{CH}_3(\text{CH}_2)_{33}\text{CH}_3$.

Properties: Crystals; sp. gr. 0.782 at 75°C; b. p. 331°C at 15 mm; m. p. 75°C.

Grades: Technical.

Containers: Fiber cans; glass bottles.

Use: Organic synthesis.

"Pentecat L." ²³⁰ Trademark for a 50% aqueous solution of lithium naphthenate.

Use: As alcoholysis catalyst in alkyl varnish cooking.

"Pentek." ¹³⁸ Trade name for pentaerythritol, technical.

Containers: 50-lb multiwall bags.

Uses: Alkyd resins, rosin esters, in situ varnishes, synthetic drying oils, and tall oil esters. Particularly useful in medium and long oil alkyds for architectural enamels, flat wall paints, trim paints, metal decorating paints and primers, marine paints.

1-pentene. See alpha-n-amylyene.

cis-2-pentene $\text{H}_3\text{CCH:CHCH}_2\text{CH}_3$.

Properties: B. p. 37°C; sp. gr. 0.656 (20/4°C); refractive index 1.3820 (n 20/D); flash point -45°C.

Grade: 95%.

Containers: Bottles.

Shipping regulations: Flammable liquid.

Red label.*

Note: The properties of the trans isomer are given under beta-n-amylyene.

2-pentene (mixed isomers) $\text{H}_3\text{CCH:CHCH}_2\text{CH}_3$.

Properties: Flash point -45°C.

Grades: 95%, 99%.

Containers: Bottles and drums.

Shipping regulations: Flammable liquid.

Red label.*

"Pentex." ²⁴⁸ Trademark for tetrabutylthiuram monosulfide.

Properties: Brown, free-flowing liquid; sp. gr. 0.99, soluble in acetone, benzol, gasoline, and ethylene dichloride, insoluble in water.

Uses: Accelerator for mechanicals and inner tubes. When mixed with 87.5% clay, it is used for sponge rubbers and called "Pentex Flour."

penthienate bromide $\text{C}_{18}\text{H}_{30}\text{BrNO}_3\text{S}$. Diethyl (2-hydroxyethyl)methylammonium bromide alpha-cyclopentyl-2-thiopheneglycolate; 2-diethylaminoethyl-2-cyclopentyl-2-(2-thienyl)-hydroxyacetate methobromide.

Properties: White, odorless, crystalline powder; soluble in water and in alcohol; slightly soluble in chloroform; practically insoluble in acetone and in ether; melting range 122-128°C.

Grade: N. F. XI.

Use: Medicine.

penthrite. See pentaerythritol tetranitrate.

"Pentite." ³⁰⁶ Trademark for $[(\text{C}_6\text{H}_5\text{O})_2\text{POCH}_2]_4\text{C}$. A low melting (30-60°C) white, waxy solid

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with slight phenolic odor. Sp. gr. 1.24 (25/15.5°C), refractive index ($n_{25/D}$) 1.5823.

Use: Resin stabilizer.

pentlandite (Fe, Ni)₃S.

Properties: Light bronze-yellow mineral; metallic luster. Contains 35.57% of nickel. Soluble in nitric acid. Sp. gr. 4.6-5. Hardness 3.5-4.

Occurrence: Canada (Ontario), Norway.

Use: Important nickel ore.

pentobarbital C₁₁H₁₈O₃N₂. 5-Ethyl-5-(1-methylbutyl)barbituric acid.

Properties: White, granular powder; m. p. 126-130°C, freely soluble in alcohol, chloroform, ether and in solutions of alkali hydroxides, slightly soluble in water.

Grade: N. N. D.

Containers: Drums.

Use: Medicine.

pentobarbital calcium (C₁₁H₁₇N₂O₃)₂Ca.

Calcium 5-ethyl-5-(1-methylbutyl)barbiturate.

Properties: Very fine white powder; sparingly soluble in alcohol and water; practically insoluble in ether.

Grade: N. N. D.

Use: Medicine.

pentobarbital sodium C₁₁H₁₇N₂O₃Na. Sodium 5-ethyl-5-(1-methylbutyl)barbiturate.

Properties: White, crystalline granules or white powder, odorless with slightly bitter taste. Very soluble in water, freely soluble in alcohol but practically insoluble in ether. Solutions decompose on standing.

Grades: U. S. P. XVI.

Containers: 100-lb drums.

Uses: Same as barbiturates.

pentolinium tartrate C₂₃H₄₂N₂O₁₂. Pentamethylene-1,1-bis-(1-methylpyrrolidinium bitartrate).

Properties: White to light cream-colored, crystalline powder, slightly soluble in alcohol, insoluble in ether, chloroform, very soluble in water, pH of 1% solution in water is 3.0-4.0. Decomposes 203°C.

Grade: N. N. D.

Use: Medicine.

pentolite. A mixture of equal parts of pentaerythritol tetranitrate and trinitrotoluene (q. v.).

Shipping regulations: Explosives, Class A. High explosive label.*

"Penton."²⁶⁶ Trademark for a thermoplastic resin. Derived from 3,3-bis(chloromethyl)oxetane (CH₂Cl)₂CCH₂OCH₂.

Properties: A linear polymer, of crystalline character, extremely resistant to chemicals, and to thermal degradation at molding and extrusion temperatures, sp. gr. 1.4, rated self-extinguishing in flammability tests, dimensionally stable; has very low water absorption, outstanding chemical resistance. Natural, black, or olive green molding powder. Finely divided powder for coatings.

Uses: "Penton" can be fabricated on

conventional plastics equipment by injection molding or extrusion, or machined from tube, rod, or block stock to precision parts held to close tolerances. "Penton" is used both in solid form or as a metal liner in valves, pipe and fittings, pumps, meters and other components in chemical processing equipment. Tank linings are applied by the use of adhered sheet and conventional gas welding techniques. A variety of dry coating, water suspension, and organic dispersion spray coating systems are employed to provide tough, pinhole free protective coatings to metal substrates.

pentosans. Complex carbohydrates (hemicelluloses) present with the cellulose in many woody plant tissues, particularly cereal straws and brans; characterized by hydrolysis to give five-carbon-atom sugars (pentoses). Thus the pentosan xylan yields the sugar xylose (HOH₂C·CHOH·CHOH·CHOH·CHO) which is dehydrated with sulfuric acid to yield furfural (C₅H₄O₂).

pentoses. General term for sugars with five carbon atoms per molecule.

"Pentothal" Sodium.³ Trademark for thio-pental sodium.

"Pent-Oxol."¹²⁵ Trademark for a high boiling (IBP 163.8°C) glycol-ether type solvent, 4-methoxy-4-methylpentanol-2, (CH₃)₂C(OCH₃)CH₂CHOHCH₃.

Properties: Liquid, sp. gr. 0.894 (20/20°C); ASTM distillation, IBP 163.8°C, 50% v 166.7°, DP 167.0°C, flash point (Tag open cup) 140°F.

Containers: 1-, 5-, 55-gal pails and drums; 4500 to 10,000-gal tank cars, tank trucks.

Caution! May cause skin and eye irritation.

Uses: Solvent for nitrocellulose, acrylic, epoxy resins.

"Pent-Oxone."¹²⁵ Trademark for a high boiling (IBP 147.0°C) keto-ether solvent, 4-methoxy-4-methylpentanone-2, (CH₃)₂C(OCH₃)CH₂COCH₃.

Properties: Liquid, sp. gr. 0.910 (20/20°C); ASTM distillation, IBP 147°C, 50% v 159°, DP 163°C, flash point (Tag open cup) 141°F.

Containers: 1-, 5-, 55-gal pails or drums; 4500-10,000-gal tank cars; tank trucks.

Caution! May cause skin and eye irritation.

Uses: Solvent for nitrocellulose, acrylic, vinyl and epoxy resins.

Shipping regulations: None.*

"Pentrox."²⁰⁴ Trademark for an emulsifier for solvents and greasy soils in industrial laundry washing.

pentyl. Synonym for the amyl radical, C₅H₁₁·.

pentyl acetate. See amyl acetate.

pentylamine. See n-amylamine.

alpha-pentylcinnamaldehyde. See "Buxine."

pentylene tetrazol (pentamethylenetetrazole) C₆H₁₀N₄.

Properties: White, odorless crystals with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

slightly pungent, bitter taste; m. p. 57-59°C; freely soluble in water and alcohol; soluble in ether, chloroform, and carbon tetrachloride.

Grade: N. F. XI.

Use: Medicine.

pepo (pumpkin seed; cucurbita).

Derivation: Ripe seed of Cucurbita pepo.

Occurrence: Southern Asia, Europe, and North America.

Grades: Technical.

Containers: Bags.

Uses: Medicine, extraction of oil.

Shipping regulations: None.*

pepper, African. See capsicum.

pepper, bird. See capsicum.

pepperidge bush. See barberry.

pepper, Jamaica. See pimenta.

peppermint (brandy mint; lamb mint). Dried leaves and flowering tops of *Mentha piperita*.

Occurrence: Asia, Europe and North America, especially Michigan, Oregon and Washington (Yakima valley).

Constituents: Volatile oil, tannin, resin, gum.

Grades: Technical, U. S. P. XVI.

Containers: Bales; drums.

Uses: Medicine; peppermint oil, menthol.

Shipping regulations: None.*

peppermint-camphor. See menthol.

peppermint oil.

Properties: Colorless or slightly yellowish, volatile, essential oil, darkening in color and thickening in consistency on being exposed to the air for some time, very strong, aromatic, minty odor and taste, the latter being followed by a sensation of coolness. Soluble in alcohol, ether and chloroform.

Chief constituent: Menthol, varying in amount from 45 to 91% according to place of origin.

Other constituents: esters of menthol, cineole, menthone, pinene, limonene, etc.

Constants: Sp. gr. 0.895-0.921; refractive index 1.4590-1.4650 (20°C); optical rotation -6° to -43° (constants differ according to species).

Derivation: By distilling the leaves and flowering tops of the peppermint plant, *Mentha piperita*, and from other *Mentha* species.

Method of purification: Rectification.

Grades: Technical; U. S. P. XVI.

Containers: Cans; bottles; drums.

Uses: Medicine (similar to menthol), tooth powders and pastes; mouth washes; manufacture of liqueurs, raw material for production of menthol; confectionery; flavoring, perfumery (soap).

Shipping regulations: None.*

pepsin (pepsinum).

Properties: White or yellowish-white powder or lustrous transparent or translucent scales; should have no odor, converts proteins into albumoses and peptones. Stable,

when dry, to 100°C; soluble in water; insoluble in alcohol, chloroform and ether.

Derivation: Proteolytic ferment or enzyme from the glandular layer of fresh hogs' stomachs.

Grades: Technical; N. F. XI.

Containers: 1-, 5-lb bottles; 10-, 25-lb tins.

Uses: Medicine (as a digestive ferment); substitute for rennet in cheese making.

pepsinum. See pepsin.

peptidase. See protease.

"Pepton" 22 Plasticizer. ⁵⁷ Proprietary name for 2,2'-dibenzamido-diphenyl disulfide.

A chemical peptizer for use in the breakdown of natural rubber or butadiene-styrene copolymer.

peptone.

Properties: (a) From albumin: White or pale yellow, amorphous powder. (b) From meat: Light brown, amorphous powder.

(c) From milk: Light brown powder.

Soluble in water; insoluble in alcohol or ether.

Derivation: (a) By digestion of egg albumin by pepsin and a small quantity of dilute hydrochloric acid at 38-40°C (body temperature). (b) By digestion of red meat with pancreatin at body temperature. (c) By digestion of casein.

Grades: Technical; reagent.

Containers: Boxes, glass bottles.

Use: Preparation of nutrient media in bacteriology; nutrient.

Shipping regulations: None.*

para-peptone. See syntonin.

per-. A prefix signifying complete or extreme, and specifically denoting: (1) a compound containing an element in its highest state of oxidation, as perchloric acid, (2) presence of the peroxy group, -O-O-, as peracetic and perchromic acids; (3) exhaustive substitution or addition, as perchloroethylene.

"per." Slang for perchloroethylene.

peracetic acid (peroxyacetic acid) CH_3COOOH .

Properties: Available as a 40% solution in acetic acid, containing also water, hydrogen peroxide, and sulfuric acid. Colorless liquid, strong odor, b. p. 105°C, f. p. (approx.) -30°C, sp. gr. (20°C) 1.15; flash point (open cup) 105°F. Solubility similar to acetic acid. Decomposes with evolution of oxygen at elevated temperatures. Pure peracetic acid is reported to decompose explosively at about 110°C.

Derivation: (a) By reaction of acetic acid and hydrogen peroxide in the presence of sulfuric acid catalyst; (b) acetaldehyde, air and ethyl acetate react to form acetaldehyde monoperacetate (AMP). AMP is subjected to pyrolysis that produces peracetic acid, acetic acid, and acetaldehyde.

Grade: Technical; 40%.

Containers: 65-lb glass carboys; 250-lb aluminum drums.

Uses: Bleaching textiles, paper, oils,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

waxes, starch; polymerization catalyst; bactericide and fungicide, especially in food processing; epoxidation of fatty acid esters and epoxy resin precursors; oxidant in organic synthesis.

Shipping regulations: Oxidizing material. Yellow label.*

per-acids. Derivatives of hydrogen peroxide, the molecules of which contain one or more directly linked pairs of oxygen atoms, -O-O- (see per-, second meaning). Examples are persulfuric, perchromic, peracetic, or perboric acids. Permanganic, perchloric, and periodic acids are not per-acids in this sense (see per-, first meaning).

"Perandren." ³⁰⁵ Trademark for testosterone. Use: Medicine.

"Perazil." ³⁰¹ Trademark for chlorcyclizine hydrochloride; an antihistamine.

perchloric acid (Fraude's reagent) HClO_4 .

Properties: Clear, colorless, hygroscopic liquid. The pure concentrated acid is not stable. In dilute solution the acid is stable. The more concentrated solutions are dangerously explosive if allowed to come in contact with oxidizable materials. Sp. gr. 1.764; m.p. -112°C ; b.p. 16°C (8 mm). Soluble in water; forms a maximum boiling point mixture containing 71.6% acid. This is quite stable when other materials are absent.

Derivation: By distilling potassium perchlorate with strong sulfuric acid (96%), under reduced pressure in an oil bath at 140 - 190°C .

Method of purification: Rectification.

Grades: Technical, C.P., strength of solution 6 to 20%; 60%; 70-72%.

Containers: 1-, 5-lb glass bottles; 2-, 5-, 10-gal carboys.

Uses: Medicine; analytical chemistry, catalyst, manufacture of various esters, ingredient of the electrolytic bath in the deposition of lead; electro-polishing; explosives.

Danger! Strong oxidant. Contact with other material may cause fire or explosion, especially if heated. Causes severe burns. MCA warning label.

Shipping regulations: Corrosive liquid. White label. (Not in excess of 72%. In excess of 72% must not be shipped.) Special regulations.*

perchlorobenzene. See hexachlorobenzene.

perchlorocyclopentadiene. See hexachlorocyclopentadiene.

perchloroethane. See hexachloroethane.

perchloroethylene ("per"; tetrachloroethylene) $\text{Cl}_2\text{C}=\text{CCl}_2$.

Properties: Colorless liquid; ether-like odor. Non-flammable. Nonexplosive. Toxicity is lower than that of most organic solvents. Extremely stable. Resists hydrolysis. Sp. gr. (20/20°C) 1.625; b.p. 121°C ; f.p. -22.4°C ; weight 13.46 lbs/gal (26°C);

refractive index 1.5029 (25°C); flash point, none; fire point, none; heat of vaporization 50.1 cal/g (b.p.); specific heat 0.21 cal/g/°C; dielectric constant 2.20 (1000-cycle); dielectric strength >30,000 volts (0.1 in. gap); power factor 0.02% (1000-cycle); specific resistivity 1.8×10^{13} ohms/cm; viscosity 0.84 cps (25°C). Miscible with alcohol, ether, and oils, in all proportions. Very slightly soluble in water.

Derivation: (a) Carbon tetrachloride is vaporized and passed into a carbon-loaded furnace (800-900°C) where it decomposes into hexachloroethane and perchloroethylene. (Chlorine and unreacted carbon tetrachloride are recycled). (b) Thermal decomposition of pentachloroethane in the presence of aluminum chloride catalyst. (c) Treatment of pentachloroethane with milk of lime. (d) Chlorination of propane (LPG).

Method of purification: Distillation.

Grades: Purified; technical, U.S.P. XVI.

Containers: 5-, 10-, 55-gal drums, 8000- and 10,000-gal tank cars.

Uses: Dry cleaning solvent, vapor-degreasing solvent; drying agent for metals and certain other solids; vermifuge; solvent for rubber, waxes, tar, paraffin, gums; heat transfer medium; chemical synthesis.

Warning: Vapor harmful. MCA warning label.

Shipping regulations: None.*

perchloromethane. See carbon tetrachloride.

perchloromethyl mercaptan (trichloromethyl-sulfenyl chloride) ClSCCl_3 .

Properties: Yellow, oily liquid. Disagreeable odor. Mildly decomposed by moist air.

Subject to the action of chemical agents, such as oxidizing agents, reducing agents, chlorine, etc. Caution! Irritant!

Constants: Sp. gr. 1.722 (0°C); b.p. 148 - 149°C (decomposes); vapor density 6.414; volatility 18,000 mg/cu m (20°C).

Derivation: Chlorination of any of the following: carbon disulfide, thiophosgene, or methyl thiocyanate.

Grades: Technical.

Containers: Steel bottles.

Uses: Organic synthesis, dye intermediate; military poison gas; fumigant for granary weevils, lady-bird beetles; suggested as diesel fuel additive.

Shipping regulations: Poison, Class B. Poison label.*

"Perchloron." ²⁰⁴ Trademark for a high-test calcium hypochlorite. Contains not less than 70% available chlorine.

Containers: 55 1/2-lb cases (9 cans/case). 109-lb drums (net wt 100 lbs).

perchloropropylene. See hexachloropropylene.

perchloryl fluoride ClFO_3 .

Properties: Oxidizing agent; fluorinating and perchlorylating agent; m.p. -146°C ; b.p. -46.8°C ; sp. gr. (liq.) 1.434 (20°C).

Containers: Usually stored in cylinders as liquid under pressure. Is stable in storage

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

under anhydrous conditions.

Uses: In organic synthesis to introduce fluorine into the molecule, as oxidant in rocket fuels.

Caution: Very strong oxidant, especially dangerous with benzene and other materials whose resulting products can explode.

perchromic acid. Probably $(\text{HO})_4\text{Cr}(\text{OOH})_3$ or $\text{H}_3\text{CrO}_8 \cdot 2\text{H}_2\text{O}$.

Properties: A very unstable acid formed when a solution of chromic acid is added to hydrogen peroxide. Below -15°C , forms deep blue crystals; the blue color can be extracted from solutions by ether. Decomposes in acid solution to form chromic salts and in alkaline solution to form chromates. The blue color of perchromic acid can be used as a sensitive test for chloride or chromate.

"Perclene." ²⁸ Trademark for dry cleaning grade and technical grade perchloroethylene. Boiling range $120.5^\circ\text{--}122.0^\circ\text{C}$, wt/gal. 13.55 lb at 20°C .

Containers: 700-lb (55-gal) tank trucks, tank cars.

"Percorten." ³⁰⁵ Trademark for deoxycorticosterone U.S.P.

Use: Medicine.

"Perdiox." ²⁸ Trademark for sodium borate perhydrate $(\text{NaBO}_2 \cdot \text{H}_2\text{O}_2)$ (q.v.).

"Peregal." ³⁰⁷ Trademark for a series of textile chemicals.

"Peregal O." Polyoxyethylated fatty alcohol, nonionic.

Properties: Clear, yellow liquid, sp.gr. 1.02, soluble in water, ethanol, ethylene glycol, butyl "Cellosolve", stable to acid, alkali, and metallic ions.

Uses: Dyeing assistant for use with basic and direct colors, assistant for dyeing, leveling or stripping of vat dyes, leveling agent in printing trade.

"Peregal OK." Methyl polyethanol quaternary amine; cationic.

Properties: Cloudy, amber liquid, sp.gr. 1.03, soluble in water, ethanol, and ethylene glycol.

Uses: Retarding, leveling and stripping agent for vat dyestuffs, dyeing assistant for vat blues.

"Peregal ST." Aqueous solution of polyvinyl pyrrolidone, cationic.

Properties: Pale yellow liquid, sp.gr. 1.00, soluble in water, stable to dilute acid and dilute alkali.

Uses: Stripping assistant for vat, sulfur, and direct color dyed or printed cotton and rayon; suitable for use in long liquors, package machines or jigs. Rag stripping assistant, used by the printing industry to prevent tinting of white grounds during soaping.

"Peregal TW." Alkyl polyoxyethylene glycol amine; cationic.

Properties: Cloudy, amber liquid, sp.gr. 1.005-1.015, soluble in water; stable to acid, alkali and metallic ions.

Uses: Leveling agent for wool raw stock,

yarn and piece goods in dyeing with acid or chrome colors; recommended especially to overcome tippy dyeing effects. Dispersing agent for basic and acid dyestuffs used in the same bath for dyeing blends of wool and polyacrylonitrile fiber.

"Perfecta." ⁴⁵ Trademark for petrolatum, U.S.P., of high melting point and medium consistency.

Properties: M.p. $128\text{--}135^\circ\text{F}$; Saybolt viscosity 55-75 (210°F); odorless.

Use: Pharmaceutical and cosmetic preparations.

"Perfection." ¹⁷² Brand name for sodium acid pyrophosphate, $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$.

Properties: White, crystalline material. Purity complies with all Food and Drug laws.

Containers: 100-lb paper bags.

Uses: Baking acid for prepared mixes and commercial baking powders; manufacture of instant puddings, formulation of acid-type metal cleaners; conditioning agent for oil well drilling muds.

"Perflow." ¹³⁴ Trademark for brightener for nickel plating solutions.

perfluorobutyric acid. See heptafluorobutyric acid.

"Perfluoro Carboxylic Acids." ¹⁵⁸ A group of acid products (perfluoropropionic acid, perfluorobutyric acid and perfluorooctanoic acid) that are of commercial significance because of their unusual acid strength, chemical stability, surface activity and salt solubility characteristics.

Containers. $6\frac{1}{2}$ -gal glass carboy in wooden drum and perfluorooctanoic in 3-pt glass jar in wooden box.

perfluoroethylene. See tetrafluoroethylene.

perfluoropropane (octafluoropropane) C_3F_8 .

A gaseous electrical insulator.

Typical specifications. Purity 99.0% min; specific volume (70°F) 2.9 cu ft/lb, moisture 20 ppm max., non-condensable gases in vapor phase 2.0% max.

Containers. Cylinders.

performic acid (peroxyformic acid; permethanoic acid, formyl hydroperoxide) HCOOOH .

Properties. Colorless liquid. Explodes on contact with metals, their oxides, reducing substances or on distillation. Miscible with water, alcohol, ether, soluble in benzene, chloroform. Solutions are unstable. **Derivation.** Mixture of formic acid, peroxide and sulfuric acid is allowed to interact for 2 hours and then distilled.

Grade 90% solution.

Use: Oxidation, epoxidation and hydroxylation reactions.

perfumes. Pleasant smelling substances, usually in the form of blends of natural odor concentrates and components from synthetic sources. Due to their esthetic appeal they are used as alcoholic solutions (perfumes, toilet waters) or as additions to produce an agreeable aroma (soaps,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cosmetics). Sources of components are from steam distillation of flowers (flower oils, such as rose oil, geranium oil); steam distillation of plant tissue (essential oils, such as lemon oil, pine oil); extracts of animal tissue (musk); and synthetic organic chemicals not occurring in nature but desirable in perfumes (heptaldehyde; gamma-undecalactone). For perfumes too volatile or delicate to stand distillation, solvent extraction is sometimes used.

See concrete (2).

"Perglow." ¹³⁴ Trademark for brightener for nickel plating solutions.

perhydrosqualene. See squalane.

peri acid. See 1-naphthylamine-8-sulfonic acid.

periclase MgO. Natural magnesium oxide, found in some marbles. Easily alters to brucite.

Properties: Colorless to grayish white, yellow, brown, green to black, luster vitreous, hardness 5.5; sp.gr. 3.56.

Occurrence: California, New Mexico; Europe.

Use: Refractories (specially prepared grade).

peridot. See olivine.

perilla oil.

Properties: Light yellow liquid. Soluble in alcohol, ether, chloroform, benzene, and carbon disulfide. Sp.gr. 0.932-0.945, saponification value 191-193; iodine value 187-202; refractive index 1.4841.

Derivation: From the seeds of *Perilla ocimoides*, a mint grown commonly in Japan and Korea.

Impurities: Sometimes adulterated with cottonseed oil.

Grades: Technical.

Containers: 75-lb cases (2 tins); 375-lb barrels.

Uses: Substitute for linseed oil in printer's ink, varnish, etc; edible oil in Japan, China, India, etc; manufacture of cheap varnishes, artificial leather.

Shipping regulations: None.*

periodic acid $\text{HIO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; loses $2\text{H}_2\text{O}$ at about 100°C . Soluble in water, alcohol; slightly soluble in ether.

Derivation: By the interaction of iodine and concentrated perchloric acid; by low temperature electrolysis of concentrated iodic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Use: Oxidizing material.

periodic table. A systematic classification of the elements according to atomic number (nearly the same order as by atomic weights) and by physical and chemical properties. Credited to Mendeleev and summarized as a periodic law: The properties of the chemical elements and

their compounds are a periodic function of their atomic weights.

peristerite. A variety of feldspar showing a play of colors and used as a gem.

perlite (rock). A form of glassy rock similar to obsidian. Usually contains 65-75% SiO_2 , 10-20% Al_2O_3 , 2-5% H_2O , and smaller amounts of soda, potash, and lime. When perlite is heated to the softening point, it expands to form a light fluffy material similar to pumice (q.v.).

Occurrence: California, Colorado, New Mexico, Nevada, Oregon.

Use: Light weight concrete aggregate, plaster aggregate, acoustic and heat insulation; as insulation for liquid fuels; catalyst support, filtering. "Popped" perlite is also used as a packing.

perlite (eutectic). See pearlite for the iron-carbon eutectic present in certain carbon steels.

"Perluxe." ⁵⁶ Trademark for a dry-cleaning solvent consisting of perchloroethylene or tetrachloroethylene.

"Permachlor Red." ¹⁴¹ Trade name for azo pigments made from para-chlor-ortho-nitraniline and beta-naphthol.

Properties: Good durability; especially in tints.

Uses: In bright, light red and pink house paints.

"Permachrom Red." ¹⁴¹ Trade name for permanent red azo pigments derived from beta-hydroxynaphthoic acid.

Properties: Excellent light resistance, good heat resistance, non-bleeding in water and organic solvents. May be used with light reds to give intermediate shades which are bright and permanent.

Grades: Medium red; dark red; maroon.

Uses: Printing inks, paints, enamels, lacquers, plastics.

permafils. Mixtures in which the liquid completely undergoes polymerization and hardens without the necessity of any evaporation. Anerobic permafils harden out of contact with air.

"Permal." ¹⁸⁸ Brand name for a special type of aldehyde top note used in perfuming. This material retains the light, original character throughout the perfume's full range of evaporation.

permalloys. Nickel-iron alloys containing from 40-80% nickel and having high magnetic permeability and electrical resistivity.

"Permalume." ⁷² Trade name for a semi-bright (or dull) nickel plating process with good ductility and low tensile stress characteristics. Excellent mechanical properties, corrosion resistance when used as an undercoating in a two-deposit system. Plating bath composed of nickel sulfate, nickel chloride, boric acid and nickel acetate; sulfur free organic addition agents produce a deposit with <0.003% sulfur.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Permalux."** ²⁸ Trademark for a di-orthotolylguanidine salt of dicatichol borate, $(\text{HOC}_6\text{H}_4\text{O})_2\text{BN}(\text{NHC}_6\text{H}_4\text{CH}_3)_2$.
 Properties: Light grayish brown powder; sp. gr. 1.27; f. p. not lower than 165°C.
 Containers: 125-lb drums.
 Use: To accelerate and improve the vulcanization of neoprene. A non-discoloring antioxidant for natural and synthetic rubbers.
- permanent white.** See barium sulfate.
- permanent yellow.** See chrome yellows.
- "Permanickel."** ²⁸³ Trademark for a wrought, age-hardenable nickel alloy containing approximately 98.5% nickel.
- "Permanite."** ²⁵⁰ Trademark for purified natural magnetic iron ore for use in radio cores, shields, etc.
- "Permansa."** ¹⁴¹ Trade name for organic color pigments.
 Grades:
 "Permansa" Yellow: Hansa yellows.
 "Permansa" Orange: Dinitraniline orange.
 "Permansa" Red: Chlorinated para red.
 "Permansa" Green: Pigment green B.
 Uses: Printing inks, paints, wallpaper, textiles.
- "Permel Plus."** ⁵⁷ Trademark for composition for treating textiles.
- "Permel" Resin B.** ⁵⁷ A water-repellent aqueous resin dispersion that can be used on cotton, rayon, wool and synthetics. It gives a soft finish and increases the tear strength and sewability of fabrics.
- permenorm.** Nickel iron alloy produced by magnetic annealing and drastic cold reduction, and used for mechanical rectifiers and low frequency amplifiers. This alloy has a rectangular hysteresis loop that eliminates arcing at the contacts of mechanical rectifiers, as well as other desirable properties.
- permethanoic acid.** See performic acid.
- "Permigels."** ⁵⁷ Trademark based on U.S. Bureau of Mines standards. A line of permissible explosives approved for mining of coal. This line recommended where wet conditions are encountered.
- "Permolite."** ³⁰⁰ Trademark for a solubilized alkyd resin used as a slip-proof finish for low-count viscose and acetate fabrics.
- "Permolith."** ¹⁴¹ Trade name for lithopone.
 Grades:
 "Permolith" 10N: Low paint consistency.
 "Permolith" 20L: Low paint consistency.
 "Permolith" 40M: Medium paint consistency.
 "Permolith" 60H: High paint consistency.
 "Permolith" 60J: Quick dispersion in oils.
 "Permolith" W-320: Water wetting, high dry hiding.
 "Permolith" W-420: Water dispersible, medium water absorption.
 "Permolith" W-421: Water dispersible, low water absorption.
- "Permolith" W-560:** Water dispersible, medium water absorption.
 Uses: Paint pigment, printing ink, rubber, leather, plastics, wallpaper, textiles, floor coverings, face powders, cosmetics, paper coatings, linoleum, oil cloth and window shade cloth.
- "Permutit."** ¹⁸⁴ Trademark for a line of cation and anion exchangers.
 "Permutit" T. Treated precipitated potassium aluminosilicate cation exchanger.
 "Permutit" Q. High capacity, sulfonated, acid resistant, styrene type resin cation exchanger.
 "Permutit" Z. High capacity ammonium cation exchanger.
 "Permutit" H-70. Weakly acidic carboxylic acid type resin cation exchanger.
 "Permutit" A. Tertiary amine, moderately basic type anion exchanger.
 "Permutit" W. Weakly basic, polystyrene base, polyamine type resin anion exchanger.
 "Permutit" S-1. Trimethyl amine, strongly basic polystyrene quaternary amine type resin anion exchanger.
 "Permutit" S-2. Strongly basic, dimethyl ethanol amine type resin anion exchanger.
 "Permutit" SK. Highly porous, medium basic, high capacity resin type anion exchanger.
 "Permutit" SM. Strongly basic, high capacity resin type anion exchanger.
 "Manganese Permutit." Permanganate-regenerated glauconite cation exchanger.
 "Permutit" DR (ASMIT). Specially prepared decolorizing resin, prepared from bone char.
- "Permutit Wisprofloc-20 Coagulant Aid."** ²¹⁰ Coagulant aid used in conjunction with coagulation in the clarification of both potable and industrial waters.
- pernambuco extract.** See brasilin.
- "Perone."** ²⁸ Trademark for hydrogen peroxide, 35 and 50% solutions.
- peronine** (morphine benzylether hydrochloride) $\text{C}_{17}\text{H}_{17}\text{NO}(\text{OH})\text{OC}_7\text{H}_7 \cdot \text{HCl}$.
 Properties: White prismatic crystalline powder, odorless, bitter taste; poisonous! Precipitated from its solutions by usual alkaloid reagents but differs from morphine and codeine in its solubilities and reactions toward special reagents. Soluble in boiling water, less so in alcohol (95%), sparingly soluble in hot water.
 Containers: Glass bottles.
 Use: Medicine.
 Shipping regulations: None.*
- perosmic acid, anhydride or oxide.** See osmic acid, anhydride.
- peroxidase.** An enzyme found in nearly all plant cells which acts upon a large number of phenols, aromatic amines, etc., in the presence of hydrogen peroxide to produce water and an oxidation product of the substrate.
 Use: Biochemical research.
- peroxide.** See hydrogen peroxide.

peroxyacetic acid. See peracetic acid.

peroxydol. See sodium perborate.

peroxyformic acid. See performic acid.

peroxysulfuric acid. See Caro's acid.

perphenazine $C_{21}H_{26}ClN_3OS$. 2-Chloro-10-(3-[4-(beta-hydroxyethyl)piperazinyl]propyl)-phenothiazine.

Properties: Crystals; sensitive to light; m.p. 97-100°C; insoluble in water, soluble in ethanol and acetone.

Grade: N.N.D.

Use: Medicine.

Persian bark. See cascara sagrada bark.

Persian insect flowers. See pyrethrum flowers.

Persian pellitory. See pyrethrum flowers.

Persian red. The term sometimes refers to red pigments derived from basic lead chromate, and at other times to red pigments whose chief compound is ferric oxide. See iron oxide reds.

persic oil (peach kernel oil; apricot kernel oil)

Properties: A pale yellow to colorless liquid, bland odor and taste similar to almond oil. Soluble in ether, chloroform and carbon disulfide; partly soluble in alcohol.

Constants: Sp.gr. 0.915; saponification value 191; iodine value 93-109.

Derivation: By expressing the blanched seeds of the peach, *Prunus persica*, or apricot, *Prunus armenica*.

Grades: Technical, N.F.XI.

Containers: Tins; drums.

Uses: Nutrient similar to almond and olive oils, flavoring; medicine.

Shipping regulations: None.*

persicol. See gamma-undecalactone.

persio. See cudbear.

Persoz's reagent. A reagent for the detection of silk in presence of wool. 10 g zinc chloride is dissolved in 10 cc water, 2 g zinc oxide is added and the whole shaken. If this solution is warmed to 45°C, it will dissolve silk, but not wool.

persulfate of iron. See ferric sulfate.

persulfuric acid. See Caro's acid.

"Perthane." ²³ Trademark for an agricultural insecticide based on diethyl diphenyl dichloroethane (see 1,1-dichloro-2,2-bis-(para-ethylphenyl)dichloroethane) and supplied as a wettable powder or emulsifiable concentrate.

Use: Controls insects on plants and livestock. Also for moth protection of textiles.

Peru apple. See stramonium.

Peru balsam. (Peruvian balsam; Indian balsam, China oil; Chinese oil, black balsam).

Properties: Dark, molasses-like liquid; pleasant aromatic odor; warm bitter taste. Soluble in alcohol and ether; miscible in acetone, glacial acetic acid, chloroform, and benzene; nearly insoluble in water.

Constants: Sp.gr. 1.150-1.170.

Derivation: Obtained from *Myroxylon pereirae*.

Constituents: Esters of cinnamic and benzoic acid; also resins; and vanillin.

Occurrence: San Salvador.

Method of purification: Rectification.

Grades: Technical; N.F. XI.

Containers: Iron drums.

Uses: Medicine; perfumery; chocolate manufacture.

Shipping regulations: None.*

Peruvian balsam. See Peru balsam.

Peruvian bark. See cinchona bark, calisaya.

"Pest-B-Gon." ²⁵³ Brand name for a type of insecticide liquid containing DDT.

pesticide. A descriptive term used to encompass all materials used for the control of animal or plant pests. These include insecticides, fungicides, herbicides and rodenticides.

"Pestmaster" Fumigant 37. ⁴²⁶ Trademark for 30% ethylene dibromide, 70% methyl bromide.

Containers: 1-lb cans, cylinders to 400 lbs.

Uses: Space and grain fumigant.

Shipping regulations: Class B poison.

Poison label.*

"Pestmaster" Fumigant 73. ⁴²⁶ Trademark for 70% ethylene dibromide, 30% methyl bromide.

Properties: Liquid.

Containers: 6-oz cans.

Uses: Bulk grain fumigant.

Shipping regulations: Poison, Class B.

Poison label.*

"Pestmaster" Methyl Bromide. ⁴²⁶ Trademark for methyl bromide, CH_3Br .

Properties: A colorless liquefied gas, b.p. 3.2°C. Sp.gr. (0°/0°C) 1.732.

Grades: Pure.

Containers: 1-lb cans, steel cylinders to 400 lbs net.

Uses: Space and grain fumigant.

Shipping regulations: Class B poison.

Poison label.*

"Pestmaster" Soil Fumigant-1. ⁴²⁶ Trademark for methyl bromide 98%, chloropicrin 2%.

Properties: A colorless liquefied gas with a sharp pungent odor.

Containers: 1-lb cans; steel cylinders to 400-lb net.

Uses: Control insects, weeds, nematodes, and certain fungi in the soil.

Shipping regulations: Class B poison. Poison label.*

"Pestmaster" Spot Shot. ⁴²⁶ Trademark for 70% ethylene dibromide, 30% methyl bromide.

Containers: 1 1/2-fl oz cans.

Uses: Fumigant of food handling equipment.

Shipping regulations: Class B poison.

Poison label.*

petalite $LiAl(Si_2O_5)_2$ or $Li_2O \cdot Al_2O_3 \cdot 8SiO_2$.
Properties: Colorless, white, gray or

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

occasionally pink mineral, white streak, vitreous luster. Resembles spodumene (q.v.) in appearance. Contains 4.9% lithia, sometimes with partial replacement by sodium or, less often, by potassium. Insoluble in acids.

Constants: Sp.gr. 2.39-2.46; hardness 6-6.5.

Occurrence: United States (Massachusetts, Maine); Sweden.

Use: As a source of lithium salts; in ceramics and glass.

pethidine hydrochloride. See meperidine hydrochloride.

petitgrain citronier oil. See petitgrain oil.

petitgrain oil (petitgrain citronier oil).

Properties: Yellowish liquid; odor similar to neroli oil. Soluble in 70% alcohol, ether, chloroform and carbon disulfide. Sp.gr. 0.887-0.900.

Derivation: From various citrus species especially in Paraguay.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-, 5-, 10-lb bottles; 20-, 25-lb cans, drums.

Use: Perfumery (soaps, synthetic neroli; skin creams).

Shipping regulations: None.*

PETN. Abbreviation for pentaerythritol tetrantrate.

"Petrex." ²⁶⁶ Trademark for a series of terpene-derived alkyd resins.

Properties: They vary from soft and tacky to hard and tack-free. They show high grease resistance and are practically insoluble in petroleum solvents. Acid number range, 9-500, color range (U.S.D.A. rosin scale) WW to WG; softening point range (Hercules drop method °C) 50-105, viscosity range (Gardnes-Holdt, 70-75% in ethanol or toluene) V to Z.

Uses: Lacquers, inks, adhesives and other products.

petrichloral (pentaerythritol chloral)

$C_{13}H_{16}Cl_{12}O_8$.

Properties: Crystals.

Grade: N.N.D.

Use: Medicine.

"Petrobase." ²⁵ Brand name for a series of proprietary, emulsifying and rust preventive bases. On dilution with suitable petroleum oils or light distillates the proper concentrate provides soluble cutting and grinding oils; solvent emulsion cleaners; preservative, slushing and household oils, and water displacing fluids.

"Petro Bond." ²³⁶ Trademark for a bonding agent in the preparation of waterless foundry sands used with oil and catalyst. Fine sands giving excellent reproduction of detail can be used since high permeability of the foundry sand is not required with this binder.

Containers: 50-lb multiwall paper bags.

petrochemicals. Chemicals for which petroleum or natural gas has served as the

ultimate raw material. Thus, cracking of petroleum produces ethylene which is converted to ethylene glycol, the latter being a typical petrochemical. The term is also applied to substances such as ammonia, because the hydrogen used to form the ammonia is a product of petroleum refining. At least 175 substances are designed as petrochemicals. The common paraffin, olefin, naphthene, and aromatic hydrocarbons (methane, ethane, propane, ethylene, propylene, butenes, cyclohexane, benzene, toluene, naphthalene, etc) and their derivatives are referred to as petrochemicals. The term is often applied to such chemicals even though some of their commercial production is from sources other than petroleum.

petrol. A name used in the British Commonwealth (except Canada) to designate gasoline.

petrolatum (mineral fat; petroleum jelly; petroleum ointment; mineral jelly).

Properties: Almost colorless to amber-colored, gelatinous, oily, translucent, semi-solid, amorphous mass whose consistency varies with the temperature. Soluble in chloroform, ether, benzene, carbon disulfide, benzene and oils; very slightly soluble in alcohol; insoluble in water.

Chief constituents: Hydrocarbons of the methane series, ($C_{16}H_{34}$ up to $C_{32}H_{66}$), and of the olefin series, ($C_{16}H_{32}$, etc.).

Constants: Sp.gr. 0.815-0.880 at 60°C; m.p. 38-60°C.

Derivation: By fractional distillation of still residues from the steam distillation of paraffin-base petroleum, or from steam-reduced amber crude oils (oils from which the light fractions have been removed).

Grades: Natural petrolatum produced as above, artificial petrolatums made by mixing heavy petroleum lubricating oil with a low m.p. paraffin wax, U.S.P. XVI (white petrolatum); N.F. XI (yellow petrolatum).

White petrolatum is made from the ordinary material by bleaching or additional treatment with decolorizing carbon.

Containers: Glass bottles, tins; drums.

Uses: Medicine and pharmacy (as a protective dressing and as a substitute for fats in ointments), modeling clay; shoe polishes; lubricating greases; metal polishes; leather grease; rust preventive; perfume extractor; insect repellents.

Shipping regulations: None.*

petrolatum, liquid (white mineral oil; paraffin, liquid; paraffin oil, white).

Properties: A colorless transparent oily liquid, almost tasteless and odorless even when warm; sp.gr. 0.828-0.880 (light), 0.860-0.905 (heavy); soluble in ether, chloroform, carbon disulfide, benzene, boiling alcohol, and fixed or volatile oils; insoluble in water, cold alcohol, glycerine.

Derivation: Distillation of high boiling (330-390°C) petroleum fractions.

Method of purification: Treatment with sulfuric acid, caustic soda, filtration through decolorizing carbon, and crystallization to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

remove waxes.

Grades: Technical; U.S.P. XVI (heavy); N.F. XI (light).

Containers: Wooden barrels; tins; glass bottles; tank cars.

Use: Medicine, cosmetics; dispersants, diluents, etc. in plastics manufacture; compressor and textile lubricants; dispersants for reactive compounds such as metal hydrides; catalyst carriers.

"Petrolene." ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white, initial boiling point 140-145°F, 95% distills between 195 and 200°F, sp.gr. 0.701 (60°F); flash point (TCC) -16°F, mild, non-residual odor.

Use: In rubber cements; sealers, fast-drying lacquers; lacquer dopes, roto inks used on high speed presses.

Caution! Fire hazard, keep lights and fire away.

Shipping regulations: Flammable liquid. Red label.*

petroleum (crude oil, earth oil, Lima oil, Seneca oil, rock oil). All petroleum are complex mixtures of paraffin, naphthene, and aromatic hydrocarbons with small amounts of organic sulfur and very small amounts of nitrogen and oxygen compounds. The terms paraffin base crude, naphthene or asphalt base crude, and aromatic base crude are used to indicate the most prevalent constituents of crudes from various localities.

Properties: A thick, heavy, flammable liquid, varying in color from yellow to dark reddish-brown or black according to its place of origin. It has a peculiar distinct heavy odor also varying with its place of origin and composition. It usually shows a distinct greenish fluorescence. Sp.gr. 0.780-0.970, usually 0.85-0.95. The major petroleum fractions in approximate order of decreasing volatility are natural gas, ligroin, gasoline, naphtha, kerosene, fuel oil, gas oil, lubricating oil, paraffin wax, road oil, asphalt, and coke. See these individual topics for further products and uses. Petroleum and certain of its fractions are also a major raw material for chemicals of wide variety. See petrochemicals.

Shipping regulations: May be flammable liquid. Red label.*

petroleum asphalt. Asphalt obtained from petroleum.

petroleum benzin. A special grade of petroleum ether or ligroin (q.v.).

Properties: A clear, colorless, nonfluorescent, volatile liquid, with an ethereal or petroleum-like odor; insoluble in water, soluble or miscible with most organic solvents and most oils. Sp.gr. 0.634-0.660 (25/25°C), distillation range 35-80°C.

Derivation: By distillation from petroleum. Use. Solvent or extraction medium,

especially for drugs.

Caution: Flammable. Vapor may be explosive if mixed with air and ignited.

Shipping regulations. Flammable liquid. Red label.*

petroleum chemicals. Those used in making gasoline, lubricants and other products of the petroleum industry. They include tetraethyl lead, oil-soluble dyes, metal deactivators, catalysts, antioxidants, etc. See for example, under "Ethyl." They are distinct from petrochemicals, which are made from petroleum.

petroleum coke. See coke, petroleum.

petroleum dyes. Hydrocarbon soluble dyes for coloring gasoline, etc. See Oil Blue A, Oil Bronze, Oil Orange, Oil Red, and Oil Yellow N.

Containers: 100-lb fiber drums.

petroleum ether. See ligroin.

Note Term is misleading and should not be used.

petroleum jelly. See petrolatum.

petroleum naphtha. See naphtha, petroleum.

petroleum ointment. See petrolatum.

petroleum resins. Obtained as a byproduct of petroleum refining. Used mainly in "asphalt" floor tile.

petroleum spirits. See naphtha, painters'. In Great Britain the term "petroleum spirits" refers to a very volatile hydrocarbon mixture having a flash point below 32°F.

petroleum sulfonates. Compounds usually made as by-products of white oil manufacturing and lube stock refining, usually by addition of sulfur trioxide to oils. They are often encountered as the metallic salts. Molecular weights vary from 475-600. Uses are lubricating oil additives, cutting oil emulsifiers, rust preventives; fat-splitting agents, antifreeze agents, and emulsifiers in textile processing oils.

Containers. Drums, tank cars.

petroleum tailings. See residual oils.

petroleum thinner. See naphtha, painters'.

petroleum waxes. Waxes derived from petroleum and usually divided into three groups: the paraffin waxes, the micro-crystalline waxes, and the petrolatums. All three are made mostly by solvent dewaxing, although pressing and sweating processes are still used in some instances. Paraffin waxes are obtained by dewaxing light lubricating oil stocks, petrolatum waxes by dewaxing heavy lubricating oil stocks, and micro-crystalline waxes by deoiling and cutting the petrolatums or from pipe still bottoms. The use for petrolatums is limited to cosmetics and pharmaceuticals, and occasionally as plasticizers in wax formulations. The largest use of petroleum waxes is in the production of paper, candles, electrical items, chlorinated paraffins, textiles,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and polishes.

See also waxes, microcrystalline.

"Petrolite." ¹²⁸ Trademark for a line of microcrystalline petroleum waxes.

"Petromix." ⁴⁵ Trademark for a soluble oil base, made from petroleum sulfonates.
Uses: Emulsifying agent for oils and solvents.

"Petronates." ⁴⁵ Trademark for salts of petroleum sulfonic acids varying in molecular weight and color.
Uses: Emulsifying agent, dispersing agent, wetting agents, corrosion-preventive.

"Petronauba." ¹²⁸ Brand name for a series of emulsifiable petroleum microcrystalline waxes.
Properties: Color yellow, amber or cream, m.p. 180-185°F, saponification no. 50-60; emulsifiable.
Containers: 10-lb slabs, 8/carton or 168/pallet.
Uses: Water-emulsion type floor polishes; carbon paper.

"Petrosene." ⁴⁵ Trademark for a series of fuel oil additives available as:
"Petrosene A": Sludge dispersant; rust inhibitor; soot destroyer and combustion improver for distillates and residual fuel oils.

"Petrosene B": Refinery fuel oil additive to improve storage stability of distillate fuels.

"Petrosene C": Sludge dispersant; peptizing agent and rust inhibitor for use primarily with residual fuels.

"Petrosene D": Corrosion inhibitor for residual fuels containing a high content of vanadium, sodium and sulfur, and can also be used to reduce super-heater slag deposits in marine boilers.

"Petrosul." ²⁵ Brand name for a proprietary line of highly purified natural petroleum sulfonate products available in high, medium and low molecular weight ranges. Useful in applications requiring the surface active functions of foaming, detergency, emulsibility, dispersion, solubilization, spreading and rust protection.

"Petrotect." ²⁵ Brand name for a proprietary series of rust preventive and hydraulic fluids in general meeting military specifications. The rust preventives are classified as solvent cut backs, petrolatum barriers, general purpose preservatives, and engine preservative lubricants. Hydraulic fluids include both preservative and operational types.

"Petrothene." ¹⁹² Trademark for a line of polyethylene resins available in various grades. The 100 series are film-grade resins for tubular and sheet film extrusion and blow molding; the 200 series are for general purpose extrusion, injection, compression molding and paper coating; the 300 series are especially adapted to wire covering and electrical insulation applications.

"Petrowet." ²⁸ Trademark for wetting and penetrating agents used in acid solutions.

"Petrowet" R. Saturated hydrocarbon sodium sulfonates.

Properties: Light yellow liquid.

Use: A wetting and penetrating agent effective in high concentrations of electrolytes and especially for use in 15% hydrochloric acid for oil-well acidizing.

"Petrowet" WN. Fatty alcohol sodium sulfate.

Properties: Light yellow liquid.

Use: For wetting and penetrating in acid solution.

pettymorrel. See aralia.

petzite Ag_3AuTe_2 . A natural telluride of silver and gold.

Properties: Color steel gray to iron black; luster metallic; hardness 2.5-3; sp.gr. 8.7-9.0.

Occurrence: Colorado, California, Australia, Canada.

pewter. Tin alloys with 5-15% antimony, 0-3% copper, and 0-15% lead. White metal (q.v.) and britannia metal are also of this general composition.

"Pexol." ²⁶⁶ Trademark for fortified rosin sizes based on modified rosins; available as pastes and dry products in both pale and dark types; paste products are at 70 and 77% solids.

PF resins. Abbreviation for phenol-formaldehyde resins (q.v.).

"PG"-16. ²⁰² Trademark for butyl acetyl polyricinoleate, used in vinyls and synthetic rubbers to impart low temperature flexibility.

PGA. Abbreviation for pteroylglutamic acid. See folic acid.

pH. A means of expressing the degree of acidity or basicity of a solution. Thus at normal temperature a neutral solution such as pure distilled water has a pH of about 7, a tenth-normal solution of hydrochloric acid (approximately 3.65 g HCl/liter) has a pH near 1 and a normal solution of a strong alkali such as sodium hydroxide has a pH of nearly 14. Originally pH was defined as the logarithm of the reciprocal of the hydrogen ion concentration in gram equivalents per liter of solution,

$$\text{pH} = \log \frac{1}{(\text{H}^+)}$$

and this is in many cases approximately correct. In some cases it is seriously in error. Actually pH values are obtained by measuring the potentials E of galvanic cells of the type (Pt) H_2 ; solution x, saturated KCl; reference electrode; and using the value of E in the equation

$$\text{pH} = \frac{E - E_0}{2.306 RT/F}$$

In this equation, E_0 is a constant depending upon the nature of the reference electrode, and R, T and F are respectively the

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fundamental gas constant, the absolute temperature and the faraday. Commercial pH meters, however, are calibrated to read pH directly and no calculation is necessary.

phagocyte. See bacteriophage.

phalaris. Canary seed.

"Phaltan." ²⁵³ Brand name for fungicide formulations containing n-trichloromethylthiophthalimide.

"Phanadorn" Calcium. ¹⁶² Trademark for cyclobarbitol calcium.

"Phantolid." ¹⁰⁵ Trademark for a synthetic aromatic ketone, $C_{17}H_{24}O$. (1, 1, 2, 3, 3, 5-Hexamethylindan-6-methyl ketone). Properties: Waxy, white solid, m.p. 35-40°C, odor between natural and synthetic musk. Uses: Perfumery, as musk fixative.

"Pharmasorb." ⁹⁹ Trademark for pharmaceutical grades (regular and colloidal) of activated attapulgites. Have high adsorptive capacities as a result of specific thermal treatment of the natural mineral. For typical analysis, see "Attasorb." Properties: Tamped bulk density (regular grade) 12-18 lbs/cu ft, (colloidal grade) 25-37 lbs/cu ft; sp. gr. (regular grade) 2.47, (colloidal grade) 2.36; average particle size (regular grade) 2.9 microns, (colloidal grade) 0.14 microns. Containers: 25-lb polyethylene bags.

"Phemerol." ³³⁰ Trademark for benzethonium chloride U. S. P.

phenacaine hydrochloride

$C_2H_5OC_6H_4NHC(CH_3)NC_6H_4OC_2H_5 \cdot HCl \cdot H_2O$. N, N'-bis(para-ethoxyphenyl) acetamidine hydrochloride.

Properties: Small, white crystals; odorless; faintly bitter taste. Incompatible with alkalies. M.p. 190°C. Soluble in alcohol, boiling water and chloroform, less so in cold water, insoluble in ether.

Grade: N.F. XI; technical.

Use: Medicine.

phenacemide (phenylacetyl urea)

$C_6H_5CH_2CONHCONH_2$.

Properties: White to creamy white, odorless, tasteless crystalline solid; m.p. 212-216°C, slightly soluble in alcohol, benzene, chloroform and ether; very slightly soluble in water.

Grade: N.N.D.

Use: Medicine.

phenacetin. See acetophenetidin.

phenacite Be_2SiO_4 . A natural beryllium silicate.

Properties: Colorless or yellow, red or brown in color. White streak, vitreous luster.

Constants: Sp. gr. 2.5-2.8; hardness 5-6.5.

Occurrence: United States (Colorado, Montana, New Hampshire); Russia; France; Norway; Mexico; Brazil.

Use: Gem stones.

phenacyl chloride. See chloroacetophenone.

phenacyl fluoride. See fluoroacetophenone.

phenaglycodol $(CH_3)_2C(OH)C(CH_3)(OH)C_6H_4Cl$ (2-para-chlorophenyl-3-methyl-2, 3-butanediol).

Properties: White to cream colored, crystalline powder; m.p. 77.5-80.5°C; soluble in alcohol, chloroform and ether; insoluble in water, and dilute acids or alkalies.

Grade: N.N.D.

Use: Medicine.

"Phenamine." ³⁰⁷ Brand name of line of direct dyestuffs. Used for the dyeing of cotton and paper.

phenanthraquinone. See phenanthrenequinone.

phenanthrene (phenanthrin) $C_{14}H_{10}$. A tricyclic hydrocarbon.

Properties: Small, colorless, shining crystals. Soluble in alcohol, ether, benzene, carbon disulfide and acetic acid, insoluble in water.

Constants: Sp. gr. 1.063; m.p. 100.35°C, b.p. 340°C.

Derivation: Fractional distillation of high-boiling coal-tar oils, with subsequent recrystallization from alcohol.

Method of purification: Fractional oxidation (chromic or nitric acid) to remove anthracene.

Impurities: Anthracene.

Grades: Technical (90%).

Containers: Tins, glass bottles; fiber drums.

Uses: Dyestuffs, explosives, synthesis of drugs; phenanthrenequinone.

Shipping regulations: None.*

phenanthrenequinone. (Erroneously: phenanthraquinone) $C_{14}H_8O_2$.

Properties: Yellow-orange, needle-like crystals. Soluble in sulfuric acid, benzene, glacial acetic acid and hot alcohol, slightly soluble in ether; insoluble in water.

Constants: Sp. gr. 1.4045; m.p. 206-207°C; b.p. sublimes above 360°C.

Derivation: By oxidation of a boiling solution of phenanthrene of glacial acetic acid with chromic acid, solution in sodium disulfite, precipitation by means of hydrochloric acid and recrystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Organic synthesis; dyes.

phenanthrin. See phenanthrene.

1, 10-phenanthroline (4, 5-phenanthroline; ortho-phenanthroline) $C_{12}H_8N_2 \cdot H_2O$.

Properties: White crystalline powder; m.p. 93-94°C, anhydrous 117°C. Slightly soluble in water; soluble in alcohol, benzene.

Derivation: Made by heating ortho-phenylenediamine with glycerin, nitrobenzene and concentrated sulfuric acid; or in like manner from 8-aminoquinoline.

Uses: Forms a complex compound with ferrous ions which is used as an indicator; used as a drier catalyst in coatings industry.

phenarsazine chloride (adamsite, diphenylaminechlorarsine; DM)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Properties: Canary-yellow crystals. Very poisonous; irritant to skin and respiratory tract. Sublimes readily. Sp.gr. 1.65; m.p. 195°C, b.p. 410°C (dec); insoluble in water; soluble in benzene, xylene, carbon tetrachloride.

Derivation: By heating diphenylamine with arsenic trichloride.

Uses: Dispersed in air as a poison gas; tear gas; wood treating.

Shipping regulations. Gas, liquid or solid form: Poison class C. Tear gas label.* Legal label name, diphenylaminechlorarsine.

phenarson sulfonate. Sodium 3-amino-4-hydroxyphenylarsonate-N-formaldehyde sulfonate.

Properties: White, odorless, amorphous powder; soluble in water, dilute acids, alkalis and alkali carbonates; slightly soluble in methanol, insoluble in alcohol and ether, 5% solution has pH of 7.0-7.4.

Derivation: From 3-amino-4-hydroxybenzenearsonic acid and sodium formaldehyde sulfonate.

Use: Medicine.

phenazine (azophenylene) $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4$. A tricyclic ring.

Properties: Yellow crystals; m.p. 170-171°C; b.p. >360°C, very slightly soluble in water, soluble in alcohol and ether.

Use: Organic synthesis, manufacture of dyes.

phenazocine (2'-hydroxy-5,9-dimethyl-2-(2-phenethyl)-6,7-benzomorphan) hydrobromide $\text{C}_{22}\text{H}_{27}\text{NO} \cdot \text{HBr}$. Colorless crystals, m.p. 166-170°C, used in medicine.

phenazone. See antipyrine.

phenelzine dihydrogen sulfate (beta-phenylethylhydrazine dihydrogen sulfate) $\text{C}_6\text{H}_5(\text{CH}_2)_2\text{NHNH}_2 \cdot \text{H}_2\text{SO}_4$.

Use: Medicine.

"Phenergan" Hydrochloride. ²⁴ Trademark for promethazine hydrochloride [N-(2'-dimethylamino-2'-methyl) ethyl phenothiazine hydrochloride]; an antihistamine.

phenethicillin. See potassium alpha-phenoxyethyl penicillin, under penicillin.

phenethyl alcohol (phenylethyl alcohol; 2-phenylethanol; benzyl carbinol) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; light rose odor, sharp burning taste, sp.gr. 1.017-1.020 (25°C), refractive index (n_D 20) 1.5310-1.5330, m.p. -27°C, b.p. 219°C. Soluble in 50% alcohol; soluble 1 part in 50 parts of water; soluble in fixed oils, alcohol, and glycerol; slightly soluble in mineral oil.

Derivation: (a) By reduction of phenylacetic ethyl ester by sodium in absolute alcohol.

(b) By the action of ethylene oxide on phenylmagnesium bromide and subsequent hydrolysis.

Method of purification: Rectification.

Grades: Technical, N.F. XI.

Containers: Tin cans and glass bottles; drums.

Uses: Organic synthesis; perfumery; synthetic rose oil; cosmetics; soaps; flavors; antibacterial, preservative; medicine.

Shipping regulations: None.*

sec-phenethyl alcohol. See styralyl alcohol.

phenethylamine. See beta-phenylethylamine.

ortho-phenetidine (2-aminophenetole)

Properties: Oily liquid; rapidly becomes brown on exposure to light or air. Solidifies below -20°C; b.p. 228-230°C. Soluble in alcohol and ether; insoluble in water.

Derivation: Prepared by reduction of ortho-nitrophenetole with iron filings and hydrochloric acid.

Containers: 475-lb drums.

Use: Manufacture of dyes.

Warning: Hazardous liquid and vapor; absorbed through skin! MCA warning label.

para-phenetidine (4-aminophenetole)

Properties: Colorless oily liquid; becomes red to brown on exposure to air and light. Sp.gr. 1.0613 (15°C); m.p. 2-4°C; b.p. 253-255°C. Insoluble in water; soluble in alcohol.

Derivation: Prepared by ethylating para-nitrophenol with ethyl sulfate or chloride in presence of sodium hydroxide followed by reduction with iron filings and hydrochloric acid.

Grades: Technical (98%).

Containers: 5-, 10-, 55-gal drums.

Uses: Dyestuffs intermediate, pharmaceuticals, medicine.

Warning: Hazardous liquid and vapor; absorbed through skin! MCA warning label.

phenetidine amygdalate. See amygdophenine.

phenetidine citrate. See citrophen.

phenetole (phenyl ethyl ether) $\text{C}_6\text{H}_5\text{OC}_2\text{H}_5$.

Properties: A colorless liquid, b.p. 172°C; sp.gr. 0.967 (20/4°C), insoluble in water; soluble in alcohol and ether.

para-phenetolecarbamide. See dulcin.

phenetsal. See para-acetylaminophenyl salicylate.

"Phenex." ⁹⁴ Trademark for a rubber accelerator, composed of selected salts of alpha-ethyl-beta-propylacrylaniline.

Properties: A clear, dark amber colored liquid, sp.gr. 1.01, stable in storage; insoluble in water, soluble in acetone, benzol, and gasoline, disperses readily.

Containers: 400-lb drums.

Uses: Recommended for molded mechanical goods, heels and soles, hose, wire insulation, hard rubber, tubes, tires, tire repair stocks and cement, effective with reclaimed rubbers; can be used in bright colored stocks, but not in white stocks.

Hazards: No health hazards when used in rubber in the amounts recommended.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phenindamine tartrate (2-methyl-9-phenyl-tetrahydro-1-pyridindene bitartrate)
 $C_{19}H_{19}N \cdot C_4H_4O_6$.

Properties: Creamy white powder with very faint odor. Solutions are acid to litmus. Soluble in water; slightly soluble in alcohol; practically insoluble in chloroform, ether and benzene. M.p. 160-162°C; re-solidifies at 163°C, melts with decomposition at 168°C.

Grades: U.S.P. XVI.

Use: Medicine.

phenindione (2-phenyl-1,3-indanedione)

$C_{15}H_{10}O_2$. A synthetic anticoagulant.

Properties: Pale yellow crystalline material; practically odorless; insoluble in water; soluble in methanol, alcohol, ether, acetone, benzene. Solutions in alkalis are red; in concentrated sulfuric acid blue.

Grade: N.N.D.

Use: Medicine.

pheniramine (prophenpyridamine)

$C_6H_5CH(C_2NH_4)CH_2CH_2N(CH_3)_2$. 1-Phenyl-1-(2-pyridyl)-3-dimethylaminopropane.

Properties: Oily liquid; slightly yellow color, insoluble in water; soluble in dilute acids, alcohol, benzene, chloroform and ether; b.p. 135°C (0.5 mm), 181°C (13 mm), sp.gr. 1.008.

Use: Medicine.

pheniramine maleate (prophenpyridamine maleate) $C_{16}H_{20}N_2 \cdot C_4H_4O_4$. 1-Phenyl-1-(2-pyridyl)-3-dimethylaminopropane maleate).

Properties: White crystalline powder with faint amine-like odor. M.p. 104-108°. Very soluble in alcohol and water, only slightly soluble in benzene and ether. 1% solution has pH between 4.5-5.5.

Grade: N.F. XI.

Use: Medicine.

phenmetrazine hydrochloride $C_{11}H_{15}NO \cdot HCl$. (2-Phenyl-3-methyltetrahydro-1,4-oxazine hydrochloride, 3-methyl-2-phenyl-morpholine hydrochloride).

Grade: N.N.D.

Use: Medicine.

phenobarbital (phenylbarbital; 5-ethyl-5-phenylbarbituric acid; phenobarbitone)
 $C_{12}H_{11}N_2O_3$.

Properties: White, shining, crystalline powder, odorless, stable. Toxic unless properly used. M.p. 174°-178°C. Soluble in alcohol, ether, chloroform, benzene, alkali hydroxides, alkali carbonate solutions; sparingly soluble in water.

Derivation: Condensation of phenylethyl-malonic acid derivatives and urea.

Grade: U.S.P. XVI.

Containers: Glass bottles; fiber cans, drums.

Use: Medicine.

Shipping regulations: None.*

phenobarbital sodium (phenobarbital, soluble; phenobarbitone, soluble) $C_{12}H_{11}N_2O_3Na$.

Properties: Flaky crystals, white, crystalline granules, or white powder; odorless, with a bitter taste; hygroscopic. It is very

soluble in water; soluble in alcohol; but practically insoluble in ether and chloroform.

Grade: U.S.P. XVI.

Use: Medicine.

phenobarbital, soluble. See phenobarbital sodium.

phenobarbitone. See phenobarbital.

phenobarbitone, soluble. See phenobarbital sodium.

phenocoll acetate (aminoacetyl-para-phenetidine acetate; aminophenacetin acetate)

$C_2H_5OC_6H_4NHCOCH_2NH_2 \cdot CH_3COOH$.

Properties: White powder; soluble in water.

Derivation: By the action of glycocoll upon phenetidine and acidifying.

Use: Medicine.

phenocoll hydrochloride (aminoacetyl-para-phenetidine hydrochloride; aminophenacetin hydrochloride) $C_2H_5OC_6H_4NHCOCH_2NH_2 \cdot HCl$.

Properties: Fine, white crystalline powder; soluble in water and warm alcohol; slightly soluble in chloroform, ether and benzene.

M.p. 95°C.

Derivation: By the action of glycocoll upon phenetidine and acidifying.

Containers: Glass bottles; fiber cans.

Use: Medicine.

Shipping regulations: None.*

"Pheno" Direct Color Dyes. ⁵⁷ Trademark for a group of direct dyes used for coloring paper.

"Phenoform." ³⁰⁷ Trademark for a line of dyestuffs and pigments. Used for the coloring of phenol-formaldehyde resins.

phenol.

1. A class of aromatic organic compounds in which one or more hydroxy groups are attached directly to the benzene ring. Examples are phenol itself (benzophenol), the cresols, xylenols, resorcinol, naphthols.

2. Phenol (carbolic acid; phenylic acid; benzophenol, hydroxybenzene) C_6H_5OH .

Properties: White, crystalline mass which turns pink or red if not perfectly pure or if under influence of light; absorbs water from the air and liquefies, distinctive odor; sharp burning taste; poisonous! When in very weak solution it has a sweetish taste; sp.gr. 1.07; m.p. 42.5-43°C, b.p. 182°C; flash point 172.4°F. Soluble in alcohol, water, ether, chloroform, glycerol, carbon disulfide, petrolatum, fixed or volatile oils and alkalies.

Derivation: (a) Classical method not now in much use: Treating the coal-tar oil fraction boiling 170-230°C with caustic soda to form phenolate, adding acid and distilling. (b) Converting benzene into the sulfonic acid and fusing the latter with caustic soda. On treating the sulfonate with acid, phenol is liberated and may be distilled off. (c) Raschig process (q.v.) from benzene and hydrogen chloride. (d) Chlorination of benzene and subsequent heating under pressure with caustic soda solution. The

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phenol is set free with acid. (e) Cumene is oxidized to form phenol and acetone. (f) Solvent extraction of refinery wastes recovers phenol. (g) Most recent: oxidation of toluene to benzoic acid, its conversion by copper catalyst to phenylbenzoate, and hydrolysis to phenol.

Method of purification: Dissolved in water, crystallized out, centrifuged and redistilled.

Grades: Fused, crystals or liquid, all as technical (82%, 90%, 95%; other components mostly cresols), C.P. and U.S.P. XVI.

Containers: Bottles; tins; 25- and 55-gal drums; tank cars; tank trucks.

Uses: (in approximate order of volume): Phenolic resins; epoxy resins (bisphenol-A); nylon-6 (caprolactam); 2,4-D weed killers; selective solvent for refining lubricating oils, salicylic acid; pentachlorophenol; acetophenetidine; picric acid; germicidal paints; pharmaceuticals.

Danger! Rapidly absorbed through skin.

Causes severe burns. MCA warning label.

Shipping regulations: Solid, or liquid if containing over 50% benzophenol: Poison, class B. Poison label.*

phenolate process. A process for removing hydrogen sulfide from gas by the use of sodium phenolate, which reacts with the hydrogen sulfide to give sodium hydrosulfide and phenol. The reaction can be reversed by steam heat in order to regenerate the sodium phenolate.

phenolbismuth. See bismuth phenate.

phenol coefficient. Method used to determine the effectiveness of a disinfectant using phenol as a standard of comparison. The phenol coefficient is obtained by dividing the highest dilution of the test disinfectant by the highest dilution of phenol which sterilizes a given culture of bacteria under standard conditions of time and temperature.

See also disinfectants.

phenoldisulfonic acid $C_6H_3OH(SO_3H)_2$.

Properties: Deliquescent, colorless needles. Soluble in water and alcohol.

Derivation: By the interaction of phenol and sulfuric acid with sulfurous acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Iron drums.

Uses: Intermediates, synthesis of drugs.

Shipping regulations: None.*

phenol-formaldehyde resins (PF resins).

Synthetic resins formed from the compounds named. They were the first synthetic thermosetting plastics, then known as "Bakelite." Limited amounts of cresols, xyenols and other substituted phenols are used in such resins, but phenol itself, C_6H_5OH , is by far the most important starting material. Water is eliminated by the reaction of the carbonyl oxygen of formaldehyde with the active hydrogens

the phenols.

In the presence of a basic catalyst such as sodium carbonate or ammonia, and excess formaldehyde, the condensation goes through three more or less distinct stages designated as A, B, and C or resol, resitol, and resite, respectively. The A-stage resin is thermoplastic and completely soluble in alcohol; the B-stage resin softens but does not melt on heating and swells without dissolving in alcohol. The fully cured C-stage resin is thermosetting and completely insoluble in all solvents. In the presence of an acid catalyst and excess phenol, the condensation proceeds much more rapidly and yields a thermoplastic product known as novolak. Novolak and B-stage resins can be cured to the thermosetting form by the addition of formaldehyde and an alkaline catalyst or with hexamethylenetetramine, which furnishes both the formaldehyde and ammonia to serve as a basic catalyst. The insoluble C-stage resin is cross-linked and can be formed only from phenolic compounds which have three active hydrogens, such as phenol, meta-cresol, and 3,5-xylenol. The 2,4- and 2,6-xylenols have only one active hydrogen and do not polymerize. The other cresols and xylenols form only thermoplastic polymers with formaldehyde. Thus, the properties of the resins depend largely on the starting materials and processing conditions used. The properties are further modified by the addition of fillers, plasticizers, and other monomers or polymers. Strength and shock resistance of the cured resin are greatly increased by the incorporation of fillers such as wood flour, cotton linters, canvas, asbestos, and mica. Electrical properties depend upon how thoroughly water and catalyst are removed from the product and upon the nature of the filler.

Phenol-formaldehyde resins are noted for good resistance to moisture, acids, solvents, and heat (up to 205°C), they are nonflammable and dimensionally stable over a wide temperature range. They have poor color stability, fair resistance to alkali, and are decomposed by oxidizing acids. An interesting property is sound-deadening, because the resins do not transmit and amplify sound.

Uses: Molded and cast plastic articles; ion exchange resins, laminating and impregnating resins; adhesives for sandpaper, plywood, etc; paints and baked enamel coatings. The resins have good ablative properties, so that when suitably compounded and filled with glass fiber they can withstand temperatures in the thousands of degrees for short exposure, and so are used for missile nose cones. More specifically, important uses include chemical equipment, machine and instrument housings, bottle closures, machine parts, pump impellers, electrical devices, handles, knobs, photographic equipment. See also resins, synthetic.

phenol-furfural resins. See phenolic resins.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phenolic resins. Synthetic thermosetting resins obtained by the condensation of phenol or substituted phenols with aldehydes such as formaldehyde, acetaldehyde, and furfural. Phenol-formaldehyde resins (q.v.) are typical and constitute the chief class of phenolics. Phenol-furfural resins exhibit a somewhat sharper transition from the soft, thermoplastic stage to the cured, infusible state and can be fabricated by injection molding since they have little tendency to harden before the actual curing conditions are reached.

1, 2-phenolmethylol. See salicyl alcohol.

phenolphthalein ($C_6H_4OH)_2C_2O_2C_6H_4$ (an approximation). 3, 3-bis(para-Hydroxyphenyl)-phthalide.

Properties: A pale yellow, crystalline powder; forms an almost colorless solution in neutral or acid solution and a bright purple-carmine solution in presence of alkali, but colorless in the presence of large amounts of alkali. Soluble in alcohol, ether, and alkalies; insoluble in water. Sp. gr. 1.2765; m.p. 261°C.

Derivation: Fused phenol is added to phthalic acid anhydride dissolved in concentrated sulfuric acid (cooled) and the whole heated 10 to 12 hours, then poured hot into boiling water and boiled with repeated changes of water. The residue is dissolved in warm dilute caustic soda and precipitated with acetic acid.

Method of purification: Recrystallization from absolute alcohol after filtering through animal charcoal.

Impurities: Phenol; phthalic acid.

Grades: Technical, pure reagent; N. F. XI.

Containers: 1-lb bottles; 1-lb tins; 5-, 25-lb cans; 50-, 100-, 250-lb drums.

Uses: Dyes; acid-base indicator in volumetric analysis (see indicators), medicine, proprietary laxatives.

phenol red. See phenolsulfonphthalein.

phenols, high boiling. See high boiling phenols.

phenolsulfonic acid (sulfocarbolic acid)
 $HOC_6H_4SO_3H$.

Properties: Yellowish liquid, becoming brown on exposure to air. A mixture of ortho- and para-phenolsulfonic acids. Soluble in water and in alcohol.

Derivation: By the action of sulfuric acid on phenol.

Grades: Technical, reagent.

Containers: Iron drums.

Uses: Water analysis; starting point in manufacture of intermediates and dyes; pharmaceutical (disinfectant, drugs, starting point in manufacture of various products).

phenolsulfonphthalein (phenol red)
 $(C_6H_4OH)_2COSO_2C_6H_4$ (an approximation). 3, 3-bis(para-Hydroxyphenyl)-2, 1, 3H-benzoxathiole 1-dioxide. The names are also applied to the water-soluble sodium salt.

Properties: Bright to dark red crystalline powder. Stable in air. Slightly soluble in

water, alcohol, and acetone; almost insoluble in chloroform and ether; soluble in alkali hydroxides and carbonates.

Derivation: Reaction of phenol with sulfobenzoic acid anhydride. Differs from phenolphthalein in containing an SO_2 group in place of CO.

Grades: U.S.P. XVI; technical; reagent.

Uses: Acid-base indicator in chemical analysis; diagnostic reagent in medicine.

See indicators.

phenol trinitrate. See picric acid.

"Phenoplast." ²⁹ A cold-setting liquid phenolic resin-coating.

phenothiazine (thiodiphenylamine) $C_{12}H_9NS$ (tricyclic).

Properties: Grayish-green to greenish-yellow powder, granules or flakes. Tasteless; slight odor. Soluble in ether, benzene; slightly soluble in alcohol; insoluble in water. M.p. 175-185°C; b.p. 371°C; sublimes 130°C (1 mm).

Derivation: By reaction of diphenylamine and sulfur in presence of an oxidizing catalyst.

Grades: Technical, N. F. XI.

Containers: 175-lb wooden barrels; fiber drums.

Uses: Insecticide; vermifuge in livestock; manufacture of dyes.

Caution! May cause skin irritation. MCA warning label.

Shipping regulations: None.*

phenoxyacetic acid $C_6H_5OCH_2COOH$.

Properties: Light tan powder; b.p. 285°C; m.p. 98°C; soluble in ether, water, methanol, carbon disulfide, glacial acetic acid.

Uses: Intermediate for dyes, pharmaceuticals, pesticides, other organics; fungicides.

phenoxybenzamine hydrochloride (N-(2-chloroethyl)-N-(1-methyl-2-phenoxyethyl)benzylamine hydrochloride)

$C_6H_5OCH_2CH(CH_3)N(CH_2C_6H_5)(CH_2)_2Cl \cdot HCl$.

Properties: Crystals; m.p. 137.5-140°C; soluble in alcohol, propylene glycol; slightly soluble in water.

Grade: N.N.D.

Use: Medicine.

phenoxydihydroxypropane. See phenoxypropanediol.

alpha-phenoxyethylpenicillin. See penicillin.

phenoxyethyl penicillin. See penicillin.

phenoxypropanediol (1-phenoxypropanediol-2, 3; glyceryl alpha-monophenyl ether)
 $C_6H_5OCH_2CHOHCH_2OH$.

Properties: White crystalline solid; m.p. 53°C, b.p. 150-155°C (4 mm); soluble in water, alcohol, glycerine, carbon tetrachloride, warm benzene; insoluble in gasoline.

Derivation: Phenol and glycerol.

Uses: Medicine; plasticizer; resins; lacquers.

phenoxypropylene oxide $C_6H_5OCH_2\text{CHCH}_2O$.

Properties: Practically colorless liquid with characteristic odor. Very slightly soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in water; sp.gr. 1.1110 (20/20°C); b.p. 244.2°C (760 mm); vapor pressure less than 0.1 mm (20°C); f.p. 2.8°C; viscosity 6.93 cps (20°C).

2-phenoxyquinizarin-3,4'-disulfonic acid.

Reagent for the spectrophotometric determination of beryllium. Forms a stable violet complex. The reaction has been applied to the spectrophotometric determination of beryllium in beryl, copper alloys, aluminum metal, and spiked samples of bronze and steel.

phensuximide (N-methyl-2-phenylsuccinimide)

$C_6H_5C_4H_3O_2NCH_3$.

Properties: White crystalline solid, m.p. 71-73°C. Slightly soluble in water; readily soluble in methanol, ethanol.

Derivation: Prepared by the action of methylamine on phenylsuccinic acid.

Grade: N.N.D.

Use: Medicine.

phentolamine hydrochloride (tolylhydroxy-

phenylaminomethylimidazoline hydrochloride) $C_{17}H_{19}N_3O \cdot HCl$. 2-[N-(meta-Hydroxyphenyl)-para-toluidino methyl]-2-imidazoline hydrochloride.

Properties: White or slightly off-white, odorless, bitter, crystalline powder, m.p. 238-242°C, slightly soluble in alcohol and water, very slightly soluble in chloroform and ether; practically insoluble in acetone and ethyl acetate, aqueous solutions unstable.

Grades: N.F. XI.

Use: Medicine.

phentolamine methanesulfonate

$C_{17}H_{19}N_3O \cdot CH_3SO_3$.

Properties: White, odorless, bitter, crystalline powder, m.p. 175-180°C, freely soluble in water; soluble in alcohol, very slightly soluble in acetone and chloroform, practically insoluble in ethyl acetate, stable when protected from moisture.

Grade: U.S.P. XVI.

Use: Medicine.

"Phenurone." ³ Trademark for phenacemide (q.v.).

phenylacetaldehyde (ethylalbenzene, hyacinthin, alpha-toluic aldehyde) $C_6H_5CH_2CHO$.

Properties: Colorless liquid; very strong hyacinth-like odor. Soluble in 2 parts of 80% alcohol, soluble in ether, very slightly soluble in water. Sp.gr. 1.023 to 1.030; m.p. below -10°C; b.p. 193 to 194°C, refractive index 1.520-1.530. Due to the ease with which this product polymerizes, these constants may not hold true after a period of shelf life following manufacture and purchase.

Derivation: From phenyl-alpha-chloroacetic acid, by action of alkalis; by heating phenyl lactic acid with dilute sulfuric acid, by oxidation of phenylethyl alcohol.

Method of purification: Rectification.

Grades: Technical; 50% solution in benzyl alcohol.

Containers: 1-, 5-lb bottles.

Use: Perfumes.

phenylacetaldehyde dimethylacetal. See "Viridine."

phenylacetamide (alpha-phenylacetamide)

$C_6H_5CH_2CONH_2$.

Properties: White crystals; b.p. 280-290°C (decomposes); m.p. 156-160°C; soluble in hot water and alcohol; very slightly soluble in cold water and ether.

Derivation: Partial hydrolysis of benzyl cyanide; dehydration of ammonium phenyl acetate; Willgerodt reaction with acetophenone or styrene.

Method of purification: Crystallization.

Containers: Fiber drums.

Use: Organic synthesis; pharmaceuticals; penicillin precursors.

N-phenylacetamide. See acetanilide.

phenyl acetate (acetyl phenol) $C_6H_5OOCCH_3$.

Properties: Water-white liquid; infinitely soluble in alcohol and ether, very slightly soluble in water. Sp. gr. 1.073 (25/25°C); boiling point 195-196°C.

Derivation: (a) From phenol and acetyl chloride. (b) By heating triphenyl phosphate with potassium acetate and alcohol. (c) By heating lead acetate and phenol with carbon disulfide.

Method of purification: Fractional distillation.

Containers: Glass bottles; carboys.

Uses: Solvent; organic synthesis.

Shipping regulations: None.*

phenylacetic acid (alpha-toluic acid)

$C_6H_5CH_2CO_2H$.

Properties: Shiny, white plate crystals; sp.gr. 1.0809, congealing point 74.5-76.5°C, b.p. 262°C, soluble in alcohol and ether.

Derivation: From benzyl cyanide.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-, 5-lb bottles; 5-, 25-lb tins.

Uses: Perfume, medicine; manufacture of penicillin, plant hormones.

Shipping regulations: None.*

phenylacetic acid nitrile. See benzyl cyanide.

phenyl acetylsalicylate (acetylsalol)

$CH_3COOC_6H_4COOC_6H_5$.

Properties: Tasteless, odorless, white powder, decomposed by alkalis, insoluble in water; soluble in alcohol and ether.

M.p. 97°C.

Use: Medicine.

Shipping regulations: None.*

phenylacetylurea. See phenacemide.

beta-phenylacrylic acid. See cinnamic acid.

phenylalanine (alpha-amino-beta-phenyl-propionic acid) $C_6H_5CH_2CH(NH_2)COOH$. An essential amino acid. Occurs as a racemic mixture of its optical isomers.

Properties: L(-)-phenylalanine: Plates and leaflets from concentrated aqueous solutions; hydrated needles from dilute aqueous solutions; decomposes 283°C; soluble in water; slightly soluble in methanol and ethanol.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

D(+)-phenylalanine: Leaflets from water; decomposes 285°C; soluble in water; slightly soluble in methanol.

DL-phenylalanine: Leaflets or prisms from water or alcohol; sweet tasting; decomposes 318-320°C; soluble in water.

Sources: L(-)-Phenylalanine is isolated commercially from proteins (ovalbumin, lactalbumin, zein, and fibrin). DL-Phenylalanine is synthesized from the azlactone of alpha-benzoylamino cinnamic acid or from alpha-acetaminocinnamic acid.

Containers: Glass bottles; fiber cans.

Use: Biochemical research.

Available commercially as DL-dihydroxy-phenylalanine and as DL-phenylalanine.

phenylallylic alcohol. See cinnamic alcohol.

phenylamine. See aniline.

phenylamine acetate. See aniline acetate.

phenylamino cadmium dilactate.

Use: Seed disinfectant.

phenyl-2-amino-5-naphthol-7-sulfonic acid

(phenyl J acid, 6-anilino-1-naphthol-3-sulfonic acid) $\text{HOC}_{10}\text{H}_5(\text{NHC}_6\text{H}_5)(\text{SO}_3\text{H})$.

Properties: Slate-colored crystals, soluble in alkali.

Derivation: Is prepared from H acid and aniline (condensation with heat).

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None.*

phenyl-2-amino-8-naphthol-6-sulfonic acid

(phenyl gamma acid, 7-anilino-1-naphthol-3-sulfonic acid) $\text{HOC}_{10}\text{H}_5(\text{NHC}_6\text{H}_5)(\text{SO}_3\text{H})$.

Properties: Gray crystals; soluble in alkali.

Derivation: Is prepared from gamma acid and aniline (condensation with heat).

Method of purification: Recrystallization

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None.*

phenyl-2-aminopropane. See amphetamine.

phenyl para-aminosalicylate

$\text{C}_6\text{H}_5\text{CO}_2\text{C}_6\text{H}_4\text{OHNH}_2$. Colorless crystals, m.p. 153°C.

N-phenylaniline. See diphenylamine.

ortho-phenylaniline. See ortho-aminobiphenyl.

phenylarsonic acid $\text{C}_6\text{H}_5\text{AsO}(\text{OH})_2$.

Properties: Crystalline powder, m.p. 160°C with decomposition; soluble in water and alcohol; insoluble in chloroform.

Preparation: The Bart reaction between the diazonium salt and sodium arsenite.

Use: Analytical reagent for tin.

phenylazoaniline. See aminoazobenzene.

phenylbarbital. See phenobarbital.

phenylbenzamide. See benzanilide.

phenylbenzoylcarbinol. See benzoin.

phenylbiphenyloxadiazole. See 1,3,4-phenylbiphenyloxadiazole.

1,3,4-phenylbiphenyloxadiazole (PBD; phenylbiphenyloxadiazole) $\text{C}_{20}\text{H}_{14}\text{N}_2\text{O}$.

Properties: Crystals; m.p. 166-168°C.

Grade: Purified.

Uses: As primary fluors or as wave length shifters in solution scintillators.

phenylbis[1-(2-methyl)aziridinyl]-phosphine oxide (phenyl "MAPO") $\text{C}_6\text{H}_5(\text{C}_2\text{H}_4\text{N})_2\text{PO}$.

Properties (technical): Straw-colored liquid; limited solubility in water; soluble in most organic solvents. The pure material is a low-melting solid.

Containers: 5- and 55-gal containers.

Uses: Polymerization additive.

phenylboric acid $\text{C}_6\text{H}_5\text{B}(\text{OH})_2$.

Properties: White solid; m.p. 214-216°C.

Derivation: Reaction of phenylmagnesium bromide with boron esters.

phenyl bromide. See bromobenzene.

2-phenylbutane. See sec-butylbenzene.

phenylbutazone (4-butyl-1,2-diphenyl-3,5-

pyrazolidinedione, butazolidine) $\text{C}_{19}\text{H}_{20}\text{N}_2\text{O}_2$.

A synthetic pyrazolone derivative.

Properties: White or very light yellow powder, slightly bitter taste and very slight aromatic odor, m.p. 103-106°C; freely soluble in acetone, ether and ethyl acetate; very slightly soluble in water; stable if stored at room temperature in closed containers in absence of moisture.

Grade: N.N.D.

Use: Medicine.

Also available as sodium salt.

1-phenylbutene-2 $\text{C}_6\text{H}_5\text{CH}_2\text{CH}=\text{CHCH}_3$.

Properties: Boiling range 174-176°C; sp.gr. 0.888 (60/60°F); refractive index 1.511 (n_D 20/D), flash point 71°C.

Grades: 95%.

Containers: Bottles.

Shipping regulations: Red label not required.*

phenylbutynol (3-phenyl-1-butyne-3-ol)

$\text{HC}.\text{CC}(\text{C}_6\text{H}_5)(\text{OH})\text{CH}_3$.

Properties: Crystals, camphor odor; m.p.

51-52°C; b.p. 217-218°C, sp.gr. 1.0924

(20/20°C); slightly soluble in water; soluble in acetone, benzene, most organic solvents.

Uses: Acid inhibitor, organic synthesis.

2-phenylbutyric acid. See phenylethylacetic acid.

1-phenyl-3-carbethoxy-pyrazolone-5

$\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_3$.

Properties: White to light buff powder, stable in aqueous solution. M.p. 182-188°C.

Containers: Drums.

Use: Dyestuff intermediate.

phenyl carbimide. See phenylisocyanate.

phenylcarbinol. See benzyl alcohol.

phenylcarbylamine chloride $\text{C}_6\text{H}_5\text{NCCl}_2$.

Properties: Pale-yellow, oily liquid; onion-like odor. Mildly volatile. Caution! Very irritant! Soluble in alcohol, benzene,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ether; insoluble in water. Sp.gr. 1.30 at 15°C; b.p. 208-210°C; vapor density 6.03; coefficient of thermal expansion 0.000895; volatility 2100 mg/cu m (20°C).

Derivation: Chlorination of phenylisothiocyanate.

Grades: Technical.

Uses: Organic synthesis; military poison gas.

Shipping regulations: Poison, class A.

Poison gas label. Not accepted by express.*

phenyl "Cellosolve." ²¹⁴ Trademark for ethylene glycol monophenyl ether, $C_6H_5OC_2H_4OH$ (q.v.).

phenyl chloride. See chlorobenzene.

phenyl chloroform. See benzotrichloride.

phenyl chloromethylketone. See chloroacetophenone.

phenylcinchoninic acid. See cinchophen.

phenyl cyanide. See benzonitrile.

phenylcyclohexane (cyclohexylbenzene) $C_6H_5C_6H_{11}$. 1, 2, 3, 4, 5, 6-Hexahydrobi-phenyl.

Properties: Colorless, oily liquid, slight pleasant odor; sp.gr. 0.938 (25/15°C), m.p. 5°C; b.p. 237.5°C; refractive index (n 25/D) 1.523, flash point 210°C; insoluble in water, glycerine; very soluble in alcohol, acetone, benzene, carbon tetrachloride, castor oil, hexane, xylene.

Uses: High boiling solvent; penetrating agent; intermediate.

2-phenylcyclohexanol $HOCH(CH_2)_4CH(C_6H_5)$.

Properties: Colorless to pale, straw-colored liquid; pour point -18°C; b.p. 276-281°C, sp.gr. 1.033 (25/25°C); refractive index 1.536 (n 25/D); flash point 280°F; very slightly soluble in water; soluble in methanol, ether.

Uses: Solvent; intermediate.

phenyldichloroarsine $C_6H_5AsCl_2$.

Properties: Liquid; microcrystalline mass at the m.p. Decomposed by water. Caution! Very irritant! Soluble in alcohol, benzene, and ether; insoluble in water. Sp.gr. 1.654 (20°C); b.p. 255-257°C, m.p. -20°C, vapor tension 0.014 mm (15°C), volatility 404 mg/cu m (20°C); coefficient of thermal expansion 0.00073.

Derivation: Arsenic trichloride and phenylmercuric chloride are heated together for 4 to 5 hours at 100°C.

Grades: Technical.

Containers: Steel bottles.

Uses: Military poison gas, solvent for diphenylcyanoarsine.

Shipping regulations: Poison, class B. Poison label.*

phenyl diethanolamine $C_6H_5N(C_2H_4OH)_2$.

Constants: M.p. 58°C; b.p. 190°C (1 mm), vapor pressure <0.01 mm (20°C); wt 10.0 lbs/gal (20°C); sp.gr. 1.1203 at 60/20°C; viscosity 1.19 poise (20°C).

Slightly soluble in water; soluble in ethyl alcohol and acetone.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Organic synthesis; dyestuffs.

1-phenyl-2-diethylamino-1-propanone hydrochloride. See diethyl propion.

phenyl diglycol carbonate [diethylene glycol bis(phenyl carbonate)] $C_{18}H_{18}O_7$.

Properties: Colorless solid; sp.gr. 1.23 (20/4°C); m.p. 40°C; b.p. 225-229°C (2 mm); viscosity 1810 cps (supercooled) at 20°C; refractive index (n 20/D) 1.525; evaporation rate 0.026 mg/sq cm/hr at 100°C; insoluble in water (very stable to hydrolysis); widely soluble in organic solvents; compatible with many resins and plastics.

phenyl dihydrogen phosphate, disodium salt (disodium phenyl phosphate) $C_6H_5OPO_3Na_2$. This will release phenol quantitatively in the presence of phosphatase, so can be used to analyze for the latter.

phenyldimethylisopyrazolone. See antipyrine.

1-phenyl-2, 3-dimethyl-5-pyrazolone-4-methylaminosulfonate sodium. See dipyrone.

3-phenyl-1, 1-dimethylurea (fenuron)

$C_6H_5NHCON(CH_3)_2$.

Properties: White crystalline solid; almost insoluble in water (3850 ppm at 25°C); sparingly soluble in hydrocarbon solvents. Stable towards oxidation and moisture. M.p. 127-129°C.

Use: Weed and brush killer.

phenylenediamine (diaminobenzene)

$C_6H_4(NH_2)_2$.

(a) ortho-: (orthamine, ortho-diaminobenzene).

Properties: Colorless monoclinic crystals, darkens in air; m.p. range 102-104°C; b.p. 252-258°C, soluble in alcohol, ether, water, and chloroform, somewhat toxic.

Uses: Manufacture of dyes, photographic developing agent; organic synthesis.

(b) meta-:

Properties: Colorless needles; unstable in air; usually in the form of the stable hydrochloride; sp.gr. 1.1389, m.p. 63°C; b.p. 282-287°C, soluble in alcohol, ether, and water.

Uses: Dyestuff manufacture; reagent for detecting nitrous acid; textile developing agent.

(c) para-: (para-diaminobenzene).

Properties: White to light purple crystals (oxidizes on standing in air to purple and black); m.p. about 147°C; b.p. 267°C; soluble in alcohol, ether; slightly soluble in cold water and chloroform; affected by light.

Uses: Azo dyestuff intermediate; photographic developing agent; used in hair and fur dyes and in photochemical measurements, accelerator for vulcanization; chemical analysis.

Caution! May cause skin irritation. MCA warning label. (meta and para isomers).

Derivation: Reduction of ortho-, meta-, or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para-dinitrobenzenes or nitroanilines with iron and hydrochloric acid. Purified by crystallization.

Grades: Technical.

Containers: Drums (steel or fiber) (100 lbs net; 114 lbs gross); bottles.

Shipping regulations: None.*

phenylephrine hydrochloride (1-(1-(meta-hydroxyphenyl)-2-methylaminoethanol hydrochloride)

$\text{HOC}_6\text{H}_4\text{CH}(\text{OH})\text{CH}_2\text{NHCH}_3 \cdot \text{HCl}$.

Properties: White or nearly white crystals, odorless; has bitter taste; solutions are acid to litmus paper, freely soluble in water and in alcohol; m.p. 140-145°C, levorotatory in solution.

Grade: U.S.P. XVI.

Use: Medicine.

phenylephrine tartrate (para-methylamino-ethanolphenol tartrate).

Properties: White crystals; freely soluble in water; m.p. 182-185°C.

Use: Medicine.

phenylethane. See ethylbenzene.

2-phenylethanol. See phenethyl alcohol.

phenylethanolamine $\text{C}_6\text{H}_5\text{NHCH}_2\text{CH}_2\text{OH}$.

Constants: Sp.gr. 1.0970 (20/20°C), b.p. (760 mm) 285.2°C; vapor pressure <0.01 mm (20°C); wt 9.1 lbs/gal (20°C), f.p. 10.6°C, viscosity 1.01 poise (20°C).

Typical specifications: Sp.gr. 1.094-1.099 (20/20°C), boiling range 280-290°C (760 mm).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Net content 9, 45, 490 lbs.

Uses: Organic synthesis; dyestuffs.

phenyl ether. See diphenyl oxide.

phenylethyl acetate $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{OOCCH}_3$.

Not the same as sec-phenylethyl acetate.

Properties: Colorless liquid; peach-like odor. Soluble in alcohol and ether. Sp.gr. 1.030-1.033; refractive index 1.497-1.498, b.p. 226°C.

Derivation: (a) Interaction of ethyl acetate and aluminum phenyl ethylate. (b) Interaction of acetic anhydride and phenylethyl alcohol in the presence of sodium acetate.

Grades: Technical.

Containers: Glass bottles.

Use: Perfumery.

sec-phenylethyl acetate. See styralyl acetate.

phenylethylacetic acid (2-phenylbutyric acid) $\text{C}_2\text{H}_5\text{CH}(\text{C}_6\text{H}_5)\text{COOH}$.

Properties: White crystals with aromatic odor; m.p. 41.0°C (min); insoluble in water, soluble in alcohol, ketones, and esters.

Use: Synthesis.

phenylethyl alcohol. See phenethyl alcohol.

beta-phenylethylamine (phenethylamine; 1-amino-2-phenylethane) $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Liquid with a fishy odor, absorbs carbon dioxide from the air; strong base; sp.gr. 0.9640; b.p. 194.5°C, soluble in

water, alcohol, and ether.

Derivation: From phenylethyl alcohol and ammonia under pressure.

Containers: Drums.

phenylethyl anthranilate $\text{H}_2\text{NC}_6\text{H}_4\text{COOC}_2\text{H}_4\text{C}_6\text{H}_5$.

Properties: A colorless liquid which yellows with age, and has an odor of grape and orange; sp.gr. 1.14 (25/25°C).

Uses: Perfume; flavoring.

phenylethyl carbinol. See phenylpropyl alcohol.

phenylethylene. See styrene.

N-phenylethylethanolamine $\text{C}_6\text{H}_5\text{N}(\text{C}_2\text{H}_5)_2\text{CH}_2\text{OH}$.

Properties: A solid with m.p. 37.2°C; b.p. 268°C (740 mm); sp.gr. 1.04 (20/20°C); very slightly soluble in water. Flash point 270°F (Cleveland open cup). Soluble in alcohol, acetone, benzene.

Containers: Drums.

Uses: Solvents; chemical intermediates; preparation of dyes for acetate rayons.

phenyl ethyl ether. See phenetole.

5-phenyl-5-ethylhydantoin

$(\text{C}_6\text{H}_5)(\text{C}_2\text{H}_5)\text{C}(\text{NHCONHCO})$.

Properties: Colorless, odorless crystalline powder; m.p. 199°C; insoluble in water.

Use: Medicine.

beta-phenylethylhydrazine dihydrogen sulfate.

See phenelzine dihydrogen sulfate.

phenylethyl isobutyrate $(\text{CH}_3)_2\text{CHCOOC}_2\text{H}_4\text{C}_6\text{H}_5$.

Properties: A colorless liquid; pleasant fragrance, resembling a somewhat fruity tearose odor; sp.gr. 0.988 (25/25°C); refractive index (n 20/D) 1.488; soluble in alcohol and ether.

Use: Perfumes.

phenylethylmalonylurea. See phenobarbital.

alpha-phenylethyl mercaptan $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{SH}$.

Properties: Boiling range 193-225°C; sp.gr. 1.0264 (60/60°F), refractive index 1.5582 (n 20/D), flash point 71°C.

Containers: Bottles.

Shipping regulations: Flammable liquid.

Red label not required.*

phenylethyl phenylacetate

$\text{C}_6\text{H}_5(\text{CH}_2)_2\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: White crystals, hyacinth odor.

Sp.gr. 1.080-1.082; congealing point 27°C.

Containers: Bottles.

Uses: Perfumery; flavors.

phenylethyl propionate $\text{C}_2\text{H}_5\text{COOC}_2\text{H}_4\text{C}_6\text{H}_5$.

Properties: A synthetic colorless liquid having a flower-fruit odor, miscible with alcohols and ether, sp.gr. 1.012 (25/25°C).

Uses: Perfumes, flavors.

phenylethyl salicylate.

Properties: Snow-white crystals, very faint aromatic odor. Soluble in 14 parts of 95% alcohol. Congealing point 41.5°C.

phenyl fluoromethylketone. See fluoroacetophenone.

phenylformamide. See formanilide.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phenylformic acid. See benzoic acid.

phenyl gamma acid. See phenyl-2-amino-8-naphthol-6-sulfonic acid.

phenylglucosazone $C_{18}H_{22}N_4O_4$.

Properties: Thin, yellow, needle-like crystals; soluble in alcohol; very slightly soluble in water. M.p. 217°C.

Derivation: By condensation of phenylhydrazine hydrochloride and glucose with subsequent crystallization.

phenylglycolic acid. See mandelic acid.

phenylhydrazine (hydrazinobenzene) $C_6H_5NHNH_2$.

Properties: Pale yellow crystals or oily liquid; becomes red-brown on exposure to air; poisonous! Soluble in alcohol, ether, chloroform, benzene, and dilute acids. Very slightly soluble in water. Sp.gr. 1.0978; m.p. 19.35°C; b.p. 243.5°C, with decomposition.

Derivation: Aniline is diazotized and then reduced producing diazobenzene hydrochloride, which is decomposed by caustic soda and dissolved in ether. The ethereal solution is dried, and the ether evaporated.

Method of purification: Vacuum distillation.

Grades: Commercial, C.P.; reagent.

Containers: Glass bottles, tins; drums.

Uses: Analytical chemistry (reagent for detecting aldehydes, sugars, etc.), organic synthesis (intermediates, dyestuffs, pharmaceuticals).

Shipping regulations: None.*

phenylhydrazine hydrochloride

$C_6H_5NHNH_2 \cdot HCl$.

Properties: Colorless, crystalline scales, sublimable, if cautiously heated. Soluble in water, alcohol, and ether. M.p. 243-246°C with slight brown coloration.

Derivation: Reduction of benzene diazonium chloride with stannous chloride and hydrochloric acid.

Method of purification: Recrystallization.

Grades: Technical, reagent.

Containers: Glass bottles.

Uses: Analytical chemistry for differentiation of sugars, organic synthesis.

Caution! Avoid inhalation and exposure of skin.

Shipping regulations: None.*

alpha-phenylhydroxyacetic acid. See mandelic acid.

phenylic acid. See phenol.

2-phenyl-1,3-indanedione. See phenindione.

phenyl isocyanate (phenyl carbimide; carbanil) C_6H_5NCO .

Properties: Liquid, b.p. 165°C; density 1.095 (20/4°C), refractive index (n_D¹⁹) 1.53684; decomposes in water and alcohol, very soluble in ether.

Use: Test reagent for identifying alcohols, and amines.

phenyl isothiocyanate. See phenyl mustard oil.

phenyl J acid. See phenyl-2-amino-5-naphthol-7-sulfonic acid.

phenylmagnesium bromide C_6H_5MgBr . A

Grignard reagent available as a solution in ether; sp.gr. 1.14.

Derivation: From magnesium and bromobenzene.

Containers: Glass bottles; 5-, 55-gal drums.

Uses: Arylating agent in organic synthesis.

Shipping regulations: Flammable liquid.

Red label.*

phenyl "MAPO." ²⁹³ Trademark for phenylbis-[1-(2-methyl)aziridinyl]phosphine oxide (q.v.).

phenylmercuric acetate $C_6H_5HgOCOCH_3$.

Properties: White to cream prisms; m.p. 148-150°C. Slightly soluble in water;

soluble in alcohol, benzene, and glacial acetic acid. Slightly volatile at ordinary temperatures.

Derivation: Action of heat on benzene and mercuric acetate.

Grades: C.P.; technical; commercial.

Containers: Fiber drums, 50 lbs net, 58 lbs gross; bottles.

Uses: Antiseptic, fungicide, herbicide.

Warning! Poisonous if inhaled or swallowed. May cause skin irritation. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

phenylmercuric borate $(C_6H_5Hg)_2HBO_3$.

Properties: White crystalline powder; m.p. 120-130°C. Slightly soluble in water; soluble in alcohol.

Derivation: Reaction of phenylmercuric acetate with boric acid.

Uses: Antiseptic, mildewproofing agent; fungicide.

Danger! Poisonous by inhalation or swallowing. May cause skin irritation.

phenylmercuric chloride C_6H_5HgCl .

Properties: White satiny crystals; m.p. 251°C. Insoluble in water; slightly soluble in hot alcohol; soluble in benzene, ether, pyridine.

Derivation: Reaction of phenylmercuric acetate and sodium chloride.

Uses: Antiseptic; fungicide, germicide.

Warning! Poisonous by inhalation or swallowing. May cause skin irritation.

phenylmercuric hydroxide C_6H_5HgOH .

Properties: Fine white to cream crystals; m.p. 197-205°C; slightly soluble in water; soluble in acetic acid; alcohol.

Typical specifications: Mercury content 68.71% (theory, 68.1%); ash 0.5% max; moisture content 5%.

Grades: Technically pure.

Containers: Bottles, fiber drums.

Uses: Manufacture of phenylmercuric salts; fungicide and germicide. Principal compound in manufacturing organic mercury derivatives; denaturant for alcohol.

Caution! Dust or strong solution causes blistering of skin unless washed off immediately.

Shipping regulations: Poison, class B. Poison label.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

phenylmercuric naphthenate

Prepared by interaction of phenylmercuric acetate and naphthenic acid, producing a colored solution. Used as a wood preservative and as a mildewproofing agent for paints and adhesives.

Danger! (Oil solution or oil-water emulsions 1% and over). Poisonous by swallowing or skin contact. May cause skin irritation or delayed chemical burns. Absorbed through skin. MCA warning label.

phenylmercuric nitrate (basic)

$C_6H_5HgNO_3 \cdot C_6H_5HgOH$.

Properties: Fine white crystals, or grayish powder; mercury content 63-65% (theory, 63.2%); melting range 175-185°C, with decomposition; ash 0.1% max; very slightly soluble in water; slightly soluble in alcohol; insoluble in ether; moderately soluble in glycerin.

Grades: N.F. XI.

Containers: Bottles; fiber drums.

Uses: Germicide, fungicide, antiseptic; denaturant for alcohol; mildew-proofing agent; preservative.

Caution! Dust or strong solution causes blistering of skin unless washed off immediately.

Shipping regulations: Poison, class B.
Poison label.*

phenylmercuric oleate

$C_6H_5HgOOC(CH_2)_7CH:CHC_6H_5$.

Properties: White crystalline powder, m.p. 45°C, insoluble in water; soluble in organic solvents and some oils.

Derivation: Prepared by reaction of phenylmercuric acetate with oleic acid.

Uses: Principally as mildewproofing agent for paints; generally as fungicide and germicide.

Danger! (Oil solution or oil-water emulsions 1% and over). Poisonous by swallowing or skin contact. May cause skin irritation or delayed chemical burns. Absorbed through skin. MCA warning label.

phenylmercuric propionate $C_6H_5HgOCOCH_2CH_3$.

Properties: Technical grades: White to off-white waxlike free flowing powder, m.p. 149-158°F; stable to 392°F for short periods; 57% min Hg content.

Containers: 1/2-lb container to 50-lb fiber drums.

Caution! Handle with care associated with all organic mercury compounds (dust mask, goggles, gloves).

Uses: Fungicide and bactericide for paints and industrial finishes.

Shipping regulations: Poison, class B.
Poison label.*

phenylmercuric salicylate

$C_6H_4(OH)(COOHgC_6H_5)$. Toxic!

Uses: Seed disinfectant.

phenylmercuritriethanolammonium acetate

$[(HOC_2H_4)_3NH_2(C_6H_5Hg)]OOCCH_3$.

Properties: White crystalline solid; soluble in water.

Derivation: Reaction of phenylmercuric acetate with monoethanolamine.

Use: As eradicator fungicide on fruit. Formulated as liquid, dust or soluble powder.

Warning: Poisonous if swallowed. May cause skin irritation.

phenylmercuritriethanolammonium lactate

$[tris(2-hydroxyethyl)(phenylmercuri)ammonium lactate]$

$[(HOC_2H_4)_3NHgC_6H_5]OOCCHOHCH_3$.

Properties: White crystalline solid; soluble in water.

Derivation: Reaction of phenylmercuric acetate with triethanolamine and lactic acid.

Uses: As turf fungicide and as eradicator fungicide for fruit trees.

Warning: Poisonous if swallowed. May cause skin irritation.

phenylmercury formamide $HCONHHgC_6H_5$.

Toxic!

Uses: Seed disinfectant.

phenylmercury urea $C_6H_5HgNHCONH_2$. Toxic!

Uses: Disinfectant and fungicide for seed treatment.

phenylmethane. See toluene.**phenylmethyl acetate.** See benzyl acetate.**1-phenyl-2-methylaminopropane hydrochloride.**

See methamphetamine hydrochloride.

1-phenyl-2-methylaminopropanol. See ephedrine.**1-phenyl-2-methylaminopropanol hydrochloride.**

See ephedrine hydrochloride.

1-phenyl-2-methylaminopropanol sulfate. See ephedrine sulfate.**phenylmethyl carbinol.** See styralyl alcohol.**phenylmethyl carbonyl acetate.** See styralyl acetate.**N-phenylmethylethanolamine**

$C_6H_5N(CH_3)C_2H_4OH$.

Properties: Liquid which sets to a glass at -30°C, b.p. 192°C (100 mm); sp. gr. 1.0661 (20/20°C), slightly soluble in water; flash point 280°F (Cleveland open cup).

Uses: Solvents; chemical intermediate; preparation of dyes for acetate fibers.

phenyl methyl ketone. See acetophenone.**1-phenyl-3-methyl-5-pyrazolone (3-methyl-1-phenyl-5-pyrazolone)**

$C_6H_5NN:C(CH_3)CH_2CO$.

Properties: White powder or crystals; soluble in water; slightly soluble in alcohol or benzene; insoluble in ether.

Constants: B.p. 287°C (205 mm); m.p. 127°C; vapor pressure <0.01 mm (20°C).

Derivation: By condensation of phenylhydrazine with ethylacetacetate.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Fiber drums.

Uses: Intermediate for drugs and dyes.

Shipping regulations: None.*

phenyl alpha-methylstyryl ketone. See dyppnone.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

N-phenylmorpholine $C_6H_5NCH_2CH_2OCH_2CH_2$.

Properties: White solid. Soluble in water.
 Constants: B.p. (760 mm) 268°C; m.p. 57°C; vapor pressure <0.1 mm (20°C).
 Grades: Technical.

Use: Chemical intermediate in manufacture of dyestuffs, rubber accelerators, corrosion inhibitors and photographic developers.

phenyl mustard oil (thiocarbamil; phenyl isothiocyanate; phenylthiocarbonylimide) C_6H_5NCS .

Properties: A pale yellow or colorless liquid; penetrating, irritating odor; readily volatilized with steam. Soluble in alcohol and ether; insoluble in water.

Constants: Sp.gr. 1.1382; m.p. -21°C; b.p. 221°C.

Derivation: (a) By action of concentrated hydrochloric acid on sulfocarbamilide; (b) by reaction of thiophosgene with aniline.

Method of purification: Rectification.

Grades: Technical.

Containers: Tins; glass bottles.

Uses: Medicine; organic synthesis.

Shipping regulations: None.*

N-phenyl-alpha-naphthylamine $C_{10}H_7NHC_6H_5$.

Properties: Crystallizes in prisms; white to slightly yellowish. Soluble in alcohol, ether, and benzene.

Constants: M.p. 62°C, b.p. 335°C (260 mm).

Derivation: From alpha-naphthylamine and aniline.

Method of purification: Distillation.

Grades: Technical.

Containers: Wooden barrels, fiber cans.

Uses: Dyes and other organic chemicals; rubber antioxidant.

Shipping regulations: None.*

phenyl-beta-naphthylamine $C_{10}H_7NHC_6H_5$.

Properties: "Pure grade": Light gray powder; set point 107°C (min); purity 99.25% min; sp.gr. 1.20; ash 0.25% max. Insoluble in water; soluble in alcohol, acetone, benzene, monochlorobenzene, isopropyl acetate and gasoline.

phenyl-1-naphthylamine-8-sulfonic acid

$C_{16}H_{13}NO_3S$.

Properties: Greenish-gray needles. Rather insoluble in water, soluble in alcohol.

Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with aniline.

Grades: Technical; mostly as sodium salt.

Containers: Barrels or steel drums.

Use: Azo colors.

Shipping regulations: None.*

ortho-phenylphenol (ortho-hydroxydiphenyl; ortho-xenol) $C_6H_5C_6H_4OH$.

Properties: Nearly white or light buff crystals; m.p. 56-58°C; b.p. 280-284°C.

Soluble in alcohol, sodium hydroxide solution; insoluble in water.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressure.

Method of purification: Distillation.

Grades: Technical; C.P.

Containers: Barrels; drums.

Uses: Intermediate for dyes; germicide; fungicide; rubber industry; food packaging.

Shipping regulations: None.*

para-phenylphenol (para-hydroxydiphenyl; para-xenol) $C_6H_5C_6H_4OH$.

Properties: Nearly white crystals; m.p. 164-165°C; b.p. 308°C. Soluble in alcohol, also in alkalis and most organic solvents; insoluble in water.

Derivation: From reaction of chlorobenzene and caustic soda solution at elevated temperatures and pressure.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Bags, 100-lb barrels and drums.

Uses: Intermediate for dyes; resins; rubber chemicals; fungicide.

Shipping regulations: None.*

N-phenyl-para-phenylenediamine. See para-aminodiphenylamine.**phenylphosphinic acid.** See benzenephosphinic acid.**phenylphosphonic acid.** See benzenephosphonic acid.**N-phenylpiperazine** $C_6H_5NCH_2CH_2NHCH_2CH_2$.

Properties: Pale yellow oil; insoluble in water; soluble in alcohol and ether; sp.gr. 1.0621 (20/4°C), b.p. 286.5°C (760 mm), 156-7°C (10 mm), m.p. 18.8°C; flash point 285°F.

Uses: Intermediate for pharmaceuticals, anthelmintics, surface active agents, synthetic fibers.

Shipping regulations: Poison class B. Poison label.*

phenylpropanolamine hydrochloride (dl-norephedrine hydrochloride, alpha-(1-aminoethyl)-benzyl alcohol hydrochloride) $C_6H_5CH(OH)CH(CH_3)(NH_2) \cdot HCl$.

Properties: White crystalline powder with odor similar to benzoic acid; m.p. 190-194°C, freely soluble in alcohol and water, insoluble in benzene, chloroform, and ether; aqueous solution neutral to litmus.

Use: Medicine.

1-phenylpropanone-1. See propiophenone.**3-phenylpropenal.** See cinnamic aldehyde.**3-phenylpropenol.** See cinnamic alcohol.**phenylpropionic acid** $C_6H_5C_2H_4COOH$.

Properties: Colorless needles. Keep dark. (Used in the form of sodium phenylpropionate). Soluble in alcohol and ether; insoluble in water.

Constants: M.p. 136-137°C; b.p. sublimes.

Derivation: By heating ethylcinnamic dibromide with alcoholic potash.

Method of purification: Crystallization.

phenylpropyl acetate (hydrocinnamyl acetate) $C_6H_5CH_2CH_2CH_2OOCCH_3$.

Properties: Soluble in 70% alcohol.

Constants: Sp.gr. 1.012-1.016; refractive index 1.497.

Grades: Technical.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Glass bottles.

Use: Perfumery.

Shipping regulations: None.*

phenylpropyl alcohol (hydrocinnamic alcohol; phenylethyl carbinol) $C_6H_5CH_2CH_2CH_2OH$.

Properties: Colorless liquid with sweet floral odor; b.p. $219^{\circ}C$. Soluble in 70% alcohol; insoluble in water.

Constants: Sp.gr. 0.998-1.000; refractive index 1.524-1.528.

Containers: Glass bottles.

Use: Perfumery.

Shipping regulations: None.*

phenylpropyl aldehyde (hydrocinnamic aldehyde) $C_6H_5CH_2CH_2CHO$.

Properties: Colorless liquid, with floral odor of hyacinth. Soluble in 50% alcohol.

Constants: Sp.gr. 1.010-1.020; refractive index 1.520-1.532.

Grade: Chlorine-free.

Containers: Glass bottles; copper flasks.

Uses: Perfumery; flavors.

Shipping regulations: None.*

phenylpropylmethylamine (N, beta-dimethylphenylethylamine) $C_6H_5CH(CH_3)CH_2NHCH_3$.

Properties: A colorless to pale yellow liquid; 98% distills between $205-210^{\circ}C$; very soluble in alcohol, benzene, and ether; 1.2 parts dissolve in 100-parts water, aqueous solutions alkaline to litmus.

Grade: N.N.D.

Use: Medicine.

phenylpropylmethylamine hydrochloride $C_6H_5CH(CH_3)CH_2NHCH_3 \cdot HCl$. N, beta-Di-methylphenylethylamine hydrochloride.

Properties: Not available in dry state.

Solution is clear, colorless and nearly odorless; pH between 5.5 and 6.5.

Grade: N.N.D.

Use: Medicine.

1-phenyl-3-pyrazolidone $C_6H_5NNHC(O)CH_2CH_2$.

Properties: Crystals; m.p. $121^{\circ}C$.

Use: Photographic developer.

2-phenylquinoline-4-carboxylic acid. See cinchophen.

phenyl salicylate. See salol.

phenylsulfonic acid. See benzenesulfonic acid.

4-phenyl-1,4-thiazane $SCH_2CH_2N(C_6H_5)CH_2CH_2$.

Properties: White powder. Soluble in hot toluene. M.p. $108-111^{\circ}C$.

Derivation: Interaction of dichlorodiethyl sulfide and an aliphatic amine in the presence of alcohol and sodium carbonate.

phenylthiocarbonimide. See phenyl mustard oil.

phenyltrichlorosilane $C_6H_5SiCl_3$.

Properties: Colorless liquid. B.p. $201^{\circ}C$; sp.gr. 1.321 ($25/25^{\circ}C$); refractive index (n $25/D$) 1.5240; flash point (Cleveland open cup) $185^{\circ}F$. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride; reaction of benzene with trichlorosilane; of

chlorobenzene, silicon and copper.

Grades: Technical.

Containers: $\frac{1}{2}$ -, 1-, 10-lb bottles; 100-lb drums.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid.

White label.*

phenylurethane. See ethyl phenylcarbamate.

phenyl valerate $C_6H_5COOC_6H_5$. Colorless liquid; slightly soluble in water; soluble in alcohol and ether. Used in flavors and odorants.

phenytoin, soluble. See diphenylhydantoin sodium.

"Philback A." ³⁰³ Trademark for fast extrusion oil furnace carbon black, a reinforcing ingredient in natural and synthetic rubbers, contributing to processing of unvulcanized rubbers and to abrasion resistance, tensile and tear strength. Disperses heat and is non-staining.

Containers: 50-lb paper bags or hopper cars. Pelleted.

Uses: In inner tubes, molded and extruded goods, tire treads, sidewalls, carcass and tread rubber.

"Philback E." ³⁰³ Trademark for super abrasion oil furnace carbon black.

Containers: 50-lb paper bags or hopper cars. Pelleted.

Uses: In synthetic or natural rubber goods requiring high tensile strength and extreme abrasion resistance, such as tires, tread rubber, conveyor belts, and ability to withstand cracking, cutting and chipping. Good electrical conductivity.

"Philback I." ³⁰³ Trademark for intermediate super abrasion oil furnace carbon black.

Containers: 50-lb bags or hopper cars. Pelleted.

Uses: In natural and synthetic rubber goods for high tensile, tear and abrasion resistance properties. For tire treads, conveyor belts and mechanical goods. Good electrical conductivity. Excellent flex life and hot tensile. Easy processing.

"Philback O." ³⁰³ Trademark for high abrasion oil furnace carbon black. Pelleted.

Uses: In natural and synthetic rubber tires, conveyor belts, industrial hoses.

Philippine copal. A class of soft copal (q.v.) of semi-recent origin, obtained from the Philippines.

Containers: Bags.

Philippine physic nut oil (physic nut oil).

Properties: Sp.gr. 0.9820 ($30/4^{\circ}C$); refractive index 1.4665; iodine value (Hanus) 94.8; saponification value 192.4; unsaponifiable matter 0.45; acid value 5.1; saturated acids (corr), 16.82%; unsaturated acids (corr), 78.0%; iodine value, unsaturated acids 110.0; the composition of the mixed fatty acids is oleic, 61.86; linoleic, 18.65; myristic, 0.45; palmitic, 11.84; stearic, 5.07%.

Derivation: From the kernels of the nut of

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

the small tree (*Jatropha curcas*) which is grown in the Philippines as hedge plant.

Containers: Steel drums.

Uses: Soap making; medicine.

"Philprene." ³⁰³ Trademark for a series of styrene-butadiene type synthetic rubbers, hot and cold, oil-extended, pigmented and non-pigmented, including special types for specific needs. Produced by emulsion polymerization of butadiene and styrene. Staining and non-staining types.

Containers: 70-90-lb bales.

Uses: Tire carcasses and treads, molded and extruded goods, sporting goods, footwear, coated fabrics, wire and cable jackets, hospital goods, floor tile, insulation.

"Phi-O-Sol WA." ³²⁸ Trademark for a light amber liquid compatible with mildly acid or alkaline solutions and hard water up to 75 ppm, and readily soluble in water in all proportions. It is the sodium salt of the sulfonated ester of butyl oleate and is a very effective wetting, penetrating and rewetting agent. Shipped in 55-gal drums.

phlogopite (magnesium mica, amber mica) $\text{KMg}_3\text{AlSi}_3\text{O}_{10}(\text{OH})_2$. A silicate mineral of the mica group (q.v.).

Properties: Color yellow to dark brown; luster pearly; hardness 2.5-3; sp.gr. 2.86. Occurrence: New York, New Jersey, Canada, Europe.

Use: Insulators in electrical apparatus; as heat insulation.

phloridzin (phlorizin; phlorrhizin)

$\text{C}_{21}\text{H}_{22}\text{O}_9 \cdot 2\text{H}_2\text{O}$. A glycoside.

Properties: Light, white, small, silky needles; sweet taste and a bitter after-taste, poisonous! Soluble in alcohol and hot water; very slightly soluble in ether. Constants: Sp.gr. 1.4298; m.p. 109°C; solidifies and then does not melt until a temperature of 170°C is reached.

Derivation: By extraction of the glycoside from the root-bark of apple, pear, plum, and cherry trees.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine; biochemical experimentation.

Shipping regulations: None.*

phlorizin. See phloridzin.

phloroglucine. See phloroglucinol.

phloroglucinol (phloroglucine; 1,3,5-trihydroxybenzene) $\text{C}_6\text{H}_3(\text{OH})_3 \cdot 2\text{H}_2\text{O}$.

Properties: White to yellowish crystals, odorless, m.p. 212-217°C if rapidly heated; 200-209°C, if slowly heated; b.p. sublimes with decomposition. Soluble in alcohol, ether, and pyridine; slightly soluble in water.

Derivation: By fusion of resorcinol with caustic soda; by reduction of trinitrobenzene.

Method of purification: Crystallization.

Impurities: Resorcinol; diresorcinol.

Grades: Technical; C.P.

Containers: Tins; glass bottles; fiber drums.

Uses: Analytical chemistry (reagent for pentoses and with vanillin for determining the presence of free hydrochloric acid); medicine; decalcifying agent for bones; preparation of pharmaceuticals and dyes, resins; preservative for cut flowers.

phlorrhizin. See phloridzin.

phonochemistry. Chemistry dealing with reactions influenced by sound waves.

"Phoresin." ¹⁷² Trade name for diallyl benzenephosphonate $\text{C}_6\text{H}_5\text{PO}(\text{OCH}_2\text{CHCH}_2)_2$. Properties: Clear, mobile liquid, soluble in common inert solvents. Polymerized by heating out of contact with air. Polymer is hard, clear, flameproof, and thermosetting. Containers: Carboys.

Uses: Flameproofing resins; cross-linking agent.

phorone $(\text{CH}_3)_2\text{CCHCOCH}(\text{CH}_3)_2$. Diisopropylidene acetone.

Properties: Yellow liquid or yellowish green prisms.

Constants: Sp.gr. 0.8791 at 20/20°C; b.p. (760 mm) 197.9°C; freezing point 28.0°C; vapor pressure 0.38 mm (20°C); flash point 185°F, wt 7.3 lbs/gal (20°C).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Net content 7-, 35-, 400-lbs.

Uses: Solvent for nitrocellulose; lacquers; coating compositions; stains, intermediate (organic synthesis).

Shipping regulations: None.*

"Phorwite BUP." ⁴²² Trade name for a stilbene derivative used for brightening papers and other fibrous materials.

"Phorwite K 2002." ⁴²² Trade name for an optical brightener for thermoplastic and thermosetting materials.

"Phosdrin." ¹²⁵ Trademark for an insecticide which contains not less than 60% w of the alpha isomer of 2-carbomethoxy-1-methylvinyl dimethyl phosphate, $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3)\text{CHCOOCH}_3$, and not more than 40% w of insecticidally active related compounds, it is 100% active.

Properties: Yellow to orange liquid; b.p. 210-218°F (0.03 mm); miscible with water, alcohols and aromatic and chlorinated hydrocarbons. Slightly soluble in aliphatic hydrocarbons.

Containers: 18-gauge, lined 30-gal steel drums (290-lbs).

Danger! (technical "Phosdrin" insecticide and formulations above 2%): Poisonous if swallowed, inhaled, or absorbed through skin.

Warning! (formulations 2% or less): Poisonous if swallowed, inhaled, or absorbed through skin.

Shipping regulations: (solids over 10%, all liquids): Poison, Class B. Poison label.*

"Phos-Feed." ¹⁹⁶ Trademark for a brand of dicalcium phosphate used as a mineral supplement for animal and poultry feeds.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Phosflake." ¹⁷⁷ Trademark for a uniform blend of caustic soda and trisodium phosphate prepared in flake form, especially for bottle-washing use. Characterized by rapid solubility, sanitizing and rinsing properties, and ease of handling. Available in 450-lb drums.

"Phosfon." ⁴⁰ Proprietary name for tributyl-2,4-dichlorobenzylphosphonium chloride. Properties: White, crystalline solid with a mild aromatic odor; inversely soluble in water; soluble in acetone, ethanol, isopropanol and hot benzene; insoluble in hexane and ether; technical grade material melts 114-120°C.

Uses: Active ingredient for "Phosfon-D"; a chemical height retardant for potted and garden chrysanthemums, for potted Ace, Croft and Georgia Easter Lilies and certain other ornamental plants.

phosgene (carbonyl chloride; carbon oxychloride; chloroformyl chloride) COCl_2 .

Properties: Colorless, very volatile liquid or easily liquefied gas; extremely poisonous! Sp. gr. 1.392; m.p. -104°C ; b.p. 8.2°C . Slightly soluble in water and slowly hydrolyzed by it; soluble in benzene and toluene; specific volume (70°F) 3.9 cu ft/lb.

Derivation: By passing a mixture of carbon monoxide and chlorine over activated carbon.

Containers: Steel cylinders; special one-ton containers.

Uses: Lethal gas for warfare, bleaching sand for glass manufacture; chlorinating agent; dye manufacture (methyl violet); organic synthesis, especially of isocyanates, polyurethane and polycarbonate resins, carbamates, organic carbonates and chloroformates.

Shipping regulations: Poison, class A. Poison gas label. Not accepted by express.*

"Phos Kil." ⁵⁵ Trade name for parathion-based insecticidal dusts and sprays.

phosphatase, alkaline. An enzyme which is excreted into the bile by the normal liver and found in the blood. It is concerned with bone formation, probably being produced by osteoblasts. It hydrolyzes phosphoric acid esters at an optimum pH 9.0, liberating phosphate ions.

Use: Biochemical research.

phosphate glass. A type of glass containing phosphorus pentoxide as a major ingredient. Aluminum metaphosphate is frequently the basic material. Many of these glasses have properties not attainable in silicate glasses; e.g., resistance to hydrofluoric acid.

phosphate of lime. See calcium phosphate.

phosphate rock (phosphorite). A natural rock consisting largely of calcium phosphate and used chiefly as a raw material for manufacture of phosphate fertilizers, phosphoric acid, and phosphorus, and therefore

indirectly for practically all commercial phosphorus chemicals. A large amount is ground and applied directly to the soil. It is also a primary source of superphosphate for use in fertilizers. This is prepared by treatment of the pulverized rock with sulfuric acid (superphosphate having 16-18% P_2O_5) or by acidifying with phosphoric acid (triple superphosphate having 40-48% P_2O_5). Important deposits are in Florida, Tennessee, Wyoming, Utah, Idaho and North Africa.

See also apatite, land pebble, brown rock.

phosphate slag. Glassy calcium silicate by-product of electric furnace phosphorus manufacture.

Properties: Lumps; loose bulk density approximately 85 lbs/cu ft.

Containers: Hopper cars, gondolas.

phosphatic feed solution.

Properties: Clear, colorless, mobile liquid; density 13.1 lbs/gal.

Containers: 8000-gal tank cars, tank wagons.

Use: Fortification of animal feeds.

phosphatic fertilizer solution.

Grades: 75% and 78% grades of clear, colorless, mobile liquid miscible with water in all proportions.

Use: Manufacture of mixed liquid fertilizers.

phosphatide. See phospholipid.

phosphatidyl choline. See lecithin.

"Phosphen." ²³³ Trademark for certain aryl phosphates.

phosphine (hydrogen phosphide; phosphuretted hydrogen; phosphoretted hydrogen) PH_3 .

Properties: Colorless; spontaneously flammable gas; disagreeable, garlic-like odor; exceedingly poisonous! Soluble in alcohol, ether and cuprous chloride; slightly soluble in cold water; insoluble in hot water.

Constants: Sp. gr. 1.185; m.p. -133.5°C ; b.p. -85°C .

Derivation: By action of nascent hydrogen or of caustic potash on phosphorus.

Use: Organic preparations.

Fire hazard: Dangerous.

Shipping regulations: Poison gas. Not usually shipped.*

Note: There is also a synthetic dye, chrys-aniline yellow, which is sometimes called phosphine.

phosphocozymase. See nicotinamide adenine dinucleotide phosphate.

phospholeum (superphosphoric acid)

Properties: A clear liquid containing approximately 76% P_2O_5 and equivalent to 105% H_3PO_4 . It is an azeotropic mixture of orthophosphoric and polyphosphoric acids which on dilution with water hydrolyze to orthophosphoric acid. Sp. gr. 1.90 (approx) (75°F); viscosity 800 cps (75°F); temperature rise, 60°F on dilution to 75% H_3PO_4 ; f.p. less than -50°C .

Grade: Technical.

Containers: Tank cars and tank trucks.

Uses: High analysis liquid fertilizer

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

formulation; metal phosphatizing and aluminum bright dip bath component; desiccant; sequestrant for common trace minerals.

phospholipid. A group of lipid compounds that yield on hydrolysis phosphoric acid, an alcohol, fatty acid, and a nitrogenous base. They are widely distributed in nature and include such substances as lecithin, cephalin, and sphingomyelin.

phospholutein. See lecithin.

phosphomolybdic acid (PMA)

$\text{H}_3\text{PO}_4 \cdot 12\text{MoO}_3 \cdot x\text{H}_2\text{O}$.

Properties: Yellowish crystals. Soluble in water, alcohol, and ether.

Derivation: By heating ammonium phosphomolybdate with aqua regia.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: 1-lb bottles.

Uses: Reagent for alkaloids; pigments.

See phosphomolybdic pigments.

phosphomolybdic methyl violet complex.

Properties: Dark-colored powder.

Derivation: Reaction of methyl violet with phosphomolybdic acid.

Uses: Color lakes and toners for inks, water colors, crayons etc.

phosphomolybdic pigments (molybdenum lakes).

Basic organic dyes, precipitated by phosphomolybdic acid or a mixture of phosphomolybdic and phosphotungstic acids. See also phosphotungstic pigments.

phosphonium iodide (iodophosphonium) PH_4I .

Properties: Colorless or slightly yellowish crystals.

Constants: Sp. gr. 2.86; m. p. 61.8°C (sublimes); b. p. 80°C ; decomposed by water or alcohol.

Derivation: Action of phosphine upon hydrogen iodide.

Grades: Technical.

Use: Chemical synthesis.

phosphor. Any material which has been prepared artificially and has the property of luminescence is called a phosphor, regardless of whether it exhibits phosphorescence. Phosphors are either of the sulfide type (by far the most common is highly purified zinc sulfide, with or without admixed cadmium sulfide, but always with a trace of activator such as silver, copper, or manganese) or of the oxygen-dominated type. The latter group are used in common fluorescent light tubes, and most of these materials are excited by the mercury radiation at 2537 Å characteristic of a mercury arc. Silicates, borates, phosphates, and tungstates of zinc, beryllium and other metals are common examples. Phosphates and halophosphates and magnesium tungstate are widely used in fluorescent tubes. Television and radar tubes use the sulfide-type phosphors.

phosphor bronzes. Tin bronzes (see brass and bronze) which have been deoxidized by the

addition of up to 0.5% phosphorus. They are relatively hard, strong, and corrosion resistant.

Grades: Grade A (5% tin), grade C (8% tin), grade D (10% tin), grade E (1.25% tin).

Uses: Springs, electrical switches, contact fingers, chains, etc.

phosphorescence. Fluorescence that continues for more than a very short time (10^{-6} seconds) after the exciting radiation is stopped.

phosphoretted hydrogen. See phosphine.

phosphoric acid. See the items which follow.

See also pyrophosphoric acid; polyphosphoric acid; phospholeum.

phosphoric acid (orthophosphoric acid) H_3PO_4 .

Properties: Phosphoric acid is a clear colorless, sparkling liquid or a transparent crystalline solid depending on the concentration and the temperature. At ordinary atmospheric temperature (20°C) the 50% and 75% strengths are mobile liquids, the 85% is of a syrupy consistency while the 100% acid is in the form of crystals; sp. gr. 1.884; m. p. 42.35°C ; b. p. 260°C ; soluble in water, very corrosive to ferrous metals and alloys.

Derivation: (a) Action of sulfuric acid on pulverized phosphate rock (Dorr strong-acid process, wet process); (b) by heating phosphate rock, coke, and silica in an electric or blast furnace, burning the elemental phosphorus produced, and then hydrating the phosphoric oxide (furnace acid); (c) action of aqueous hydrochloric acid on phosphate rock followed by solvent extraction. Acid purified by distillation.

Grades: Commercial (64 and 72%); technical (50, 75, 85, 90, 100%); food (50, 75, 85%); N. F. XI (85-88%) (Polyphosphoric acid is sometimes called 115% phosphoric acid).

Containers: 1-, 5-lb bottles; 5-, $6\frac{1}{2}$ -, 13-gal carboys, 15-, 55-gal drums and barrels; tank trucks; tank cars.

Uses: Fertilizers, inorganic phosphates; picking and rust-proofing metals, soft drinks and flavoring syrups; pharmaceuticals, sugar refining, gelatin manufacture; water treatment; animal feeds; electropolishing, lakes in cotton dyeing, yeasts; soil stabilizer; waxes and polishes; binder for ceramics; activated carbon production. Caution: Causes skin irritation; avoid contact with skin or eyes. MCA warning label. Shipping regulations: None.*

phosphoric acid, anhydrous. See phosphoric anhydride.

phosphoric acid, glacial. See phosphoric acid, meta-.

phosphoric acid, meta- (phosphoric acid, glacial) HPO_3 .

Properties: Transparent, highly deliquescent, glassy mass; sp. gr. 2.2-2.488. Soluble in water, slowly forming the ortho-acid; soluble in alcohol.

Derivation: By heating phosphoric acid to redness; by treating phosphorus pentoxide

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with the calculated quantity of water; by heating diammonium phosphate.

Grades: Technical; C.P.

Containers: 2-lb glass bottles; 13-gal carboys.

Use: Phosphorylating agent; dehydrating agent; manufacture of dental cements; analytical chemistry.

Shipping regulations: None.*

phosphoric acid, ortho-. See phosphoric acid.

phosphoric acid, reverted. A term used in connection with the solubility and availability to plants of calcium acid phosphate fertilizers.

The phosphoric acid, i.e. the phosphorus content, in calcium acid phosphate may be divided into three parts: (1) water-soluble, (2) insoluble in water but soluble in neutral ammonium citrate, and (3) insoluble in both water and neutral ammonium citrate.

When acid phosphate is first made nearly all of the phosphoric acid except that insoluble in neutral ammonium citrate solution is water-soluble. As the acid phosphate cures, the water-soluble usually decreases, the citrate-soluble portion increases and the citrate insoluble decreases.

This is referred to as reversion, and the phosphorus content of the fertilizer is referred to as reverted phosphoric acid.

phosphoric anhydride (phosphorus pentoxide, phosphoric oxide, phosphoric acid, anhydrous) P_2O_5 .

Properties: Soft, white powder. Caution! Keep well stoppered! Phosphoric anhydride absorbs moisture from the air with avidity thus forming meta-, pyro-, or orthophosphoric acid, depending upon the amount of water absorbed and upon conditions under which absorption takes place, sp. gr. 2.387.

Derivation: By burning phosphorus in a current of dry air.

Grades: Technical.

Containers: Glass bottles, 10-lb cans, 60-, 375-lb drums.

Uses: Preparation of phosphoric acids, dehydrating agent; organic synthesis, medicine; sugar refining, analysis (dehydrating agent).

Warning! Causes burns. Avoid contact with skin or eyes. MCA warning label.

Shipping regulations: Flammable solid. Yellow label.*

phosphoric bromide. See phosphorus pentabromide.

phosphoric chloride. See phosphorus pentachloride.

phosphoric oxide. See phosphoric anhydride.

phosphoric perbromide. See phosphorus pentabromide.

phosphoric perchloride. See phosphorus pentachloride.

phosphoric sulfide. See phosphorus pentasulfide.

phosphorite. See phosphate rock.

phosphorodifluoridic acid. See fluophosphoric acids.

phosphorofluoridic acid. See fluophosphoric acids.

phosphorous acid, ortho- H_3PO_3 .

Properties: White, or yellowish, crystalline mass. Very hygroscopic. Absorbs oxygen very readily with formation of orthophosphoric acid. Caution! Keep well stoppered! Soluble in alcohol, water.

Constants: Sp. gr. 1.651; b.p. 200°C (dec); m.p. 70°C (approx).

Grades: Reagent; technical; 70%.

Containers: Casks.

Uses: Analysis (testing for mercury); chemical (reducing agent); phosphite salts.

Shipping regulations: None.*

phosphorous bromide. See phosphorus tribromide.

phosphorous chloride. See phosphorus trichloride.

phosphorous iodide. See phosphorus triiodide.

phosphorous sulfide. See phosphorus trisulfide.

phosphorus P. Element of atomic number 15, group V of periodic system. A non-metallic element that exists in several allotropic forms (white, red and black).

Properties: White phosphorus (yellow phosphorus): White or yellow, soft, waxy solid. Darkens on exposure to light by conversion to the red form. B.p. 280°C, vapor density corresponds to formula P_4 ; m.p. 44.1°C; sp. gr. (solid, 20°C) 1.82, (liquid, 44.5°C) 1.745. Insoluble in water and alcohol; moderately soluble in chloroform and benzene, very soluble in carbon disulfide. At room temperature it exhibits phosphorescence (slow, luminous oxidation) in air; it ignites spontaneously in moist air at about 30°C. Stored and shipped beneath water to avoid ignition. It is very poisonous and causes severe burns.

Red phosphorus: Violet-red, amorphous powder obtained from white phosphorus by heating at 240-250°C in the presence of a catalyst, such as iodine. Sublimes 416°C; sp. gr. 2.34. Insoluble in all solvents. Non-poisonous and much less reactive than the white form. Ignites in air at about 260°C.

Black phosphorus: Black, lustrous crystals resembling graphite. Obtained by heating white phosphorus under high pressure. Insoluble in all solvents.

Occurrence and derivation: Phosphorus is present in nature in phosphate rock [impure $Ca_3(PO_4)_2$], in apatite [$Ca_5(PO_4)_3F$], in bones, teeth, and in organic compounds of living tissue. Phosphorus is produced by an electric furnace containing phosphate rock, sand and coke. The phosphorus vapor is driven off and condensed beneath water.

Grades: Technical; electronic grade, 99.9999%.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: .380-lb drums; tank cars.

Uses: Manufacture of phosphoric acid and its derivatives (about 50% of this goes into detergents, sanitizers, soaps; 17% into fertilizers; remainder into gasoline additives, animal feeds and miscellaneous chemicals); phosphor bronzes and metallic phosphides; additive to semiconductors, and in electroluminescent coatings; incendiaries, pyrotechnics, and smoke bombs. White phosphorus is used to a small extent in rat poisons and red phosphorus is used in the manufacture of matches.

Danger! Must be kept under water. Causes severe burns; do not get on skin or in eyes. MCA warning label.

Shipping regulations: White and yellow phosphorus: Flammable solid. Yellow label. Not accepted by express. White or yellow phosphorus, in water: Flammable solid. Yellow label. Red phosphorus: Flammable solid. Yellow label.*

phosphorus 32. Radioactive phosphorus of mass number 32.

Properties: Half-life, 14.3 days, radiation, beta; radiotoxicity, moderately hazardous. Derivation: Pile irradiation of potassium dihydrogen phosphate or sulfur and sulfur compounds.

Forms available: Phosphate ion in weak hydrochloric acid solution; solid potassium dihydrogen phosphate; P-32 sterile solution, in tagged compounds such as hexaethyltetraphosphate, ribonucleic acid, triphenylphosphine, etc.

Grades: N.N.D. (as sodium radio-phosphate, $\text{NaH}_2\text{P}^{32}\text{O}_4$ and $\text{Na}_2\text{HP}^{32}\text{O}_4$ in solution).

Uses: Medical treatment of polycythemia vera, leukemia, skin lesions; for the measurement of coverage and thickness of printing inks and paint films, for micro-radiography, as a tracer in assessing the effectiveness and utilization of fertilizers, in determining the amount of and location of phosphorus in steel, in determining the efficiency of phosphorus removal by slag, in tire tread wear tests, in studying the diffusion of plasticizers in rubber production, in locating water leaks, in detecting dye migration in textile dyeing, in studying phosphorus metabolism by plants and animals, in chemical analysis, in studying chemical reaction mechanisms, in locating brain tumors, in studying mosquito flight patterns, etc.

Shipping regulations: Poison, class D radioactive material. Red or blue label.*

phosphorus nitride P_3N_5 .

Properties: Amorphous white solid; insoluble in cold water; decomposes in hot water; soluble in common organic solvents.

phosphorus oxychloride (phosphoryl chloride) POCl_3 .

Properties: Colorless, fuming liquid; pungent odor. Sp.gr. 1.86 (20/20°C); m.p. 1.25°C; b.p. 107.2°C. Decomposed by water and alcohol.

Derivation: (a) From phosphorus trichloride and chlorates; (b) by distilling phosphorus

pentoxide with phosphorus pentachloride.

Grades: Technical.

Containers: 200-, 650-lb steel-jacketed lead cylinders; 40-, 85-, 175-lb carboys; 15-, 55-gal barrels and drums.

Uses: Manufacture of organic phosphates for use as plasticizers, gasoline additives, hydraulic or similar fluids; also as a chlorinating agent and catalyst in organic synthesis.

phosphorus pentabromide (phosphoric bromide; phosphoric perbromide) PBr_5 .

Properties: Yellow, crystalline mass.

Caution! Keep hermetically sealed! Soluble in water (dec). B.p. 106°C (dec).

Grades: Technical.

Use: Organic synthesis.

phosphorus pentachloride (phosphoric chloride; phosphoric perchloride) PCl_5 .

Properties: Slightly yellow, crystalline mass, irritating odor, fuming in moist air; strong irritating effect on the eyes.

Constants: Sp.gr. 3.60; m.p. (under pressure) 148°C. Ordinarily sublimes without melting; b.p. 160-165°C. Soluble in carbon disulfide; decomposed by water.

Derivation: By action of chlorine on phosphorus or phosphorus trichloride.

Grades: Technical, reagent.

Containers: 25-, 50-lb crocks; bottles; 500-lb drums.

Uses: Chlorinating agent in organic chemistry, catalyst.

Warning! Hazardous dust. Causes burns. MCA warning label.

Shipping regulations: Flammable solid. Yellow label.*

phosphorus pentasulfide (phosphoric sulfide; phosphorus persulfide; thiophosphoric anhydride) P_2S_5 .

Properties: Light-yellow or greenish-yellow crystalline masses. Peculiar odor; similar to hydrogen sulfide. Caution! Keep in sealed containers. Very hygroscopic. Burns in air forming P_2O_5 and SO_2 . Decomposed by moist air. Ignites by friction. Soluble in solutions of alkali hydroxides; slightly soluble in carbon disulfide. M.p. 280-283°C, b.p. 515°C (ignites in air at about 300°C); sp.gr. 2.03; vapor pressure 1 mm (300°C).

Derivation: By reaction of phosphorus and sulfur.

Grades: Technical, distilled.

Containers: 100-, 150-, 200-lb drums.

Uses: Intermediate for lube oil additives, insecticides, flotation agents, rubber additives.

Warning! Harmful dust. Contact with water or acids slowly liberates poisonous and flammable hydrogen sulfide gas. MCA warning label.

Shipping regulations: Flammable solid. Yellow label.*

phosphorus pentoxide. See phosphoric anhydride.

phosphorus persulfide. See phosphorus pentasulfide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phosphorus salt. See sodium ammonium phosphate.

phosphorus sesquisulfide (tetraphosphorus trisulfide) P_4S_3 .

Properties: Yellow, crystalline mass; very flammable. Soluble in carbon disulfide; insoluble in cold water; decomposed by hot water. Sp.gr. 2.00, m.p. 172°C ; b.p. 407.8°C .

Derivation: By gently heating phosphorus and sulfur.

Grades: Technical.

Containers: 105-lb cases; drums.

Uses: Organic synthesis; manufacture of matches.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label.*

phosphorus sulfide. See phosphorus trisulfide.

phosphorus tribromide (phosphorous bromide) PBr_3 .

Properties: Fuming, colorless liquid; very penetrating odor, soluble in acetone, alcohol, carbon disulfide, hydrogen sulfide, water (decomposes). Sp.gr. 2.925 at 0°C , b.p. 175°C , m.p. -40°C .

Grades: Technical.

Containers: Glass bottles.

Use: Analysis (testing for sugar and oxygen), catalyst, synthesis.

Shipping regulations: Corrosive liquid.

White label.*

phosphorus trichloride (phosphorous chloride) PCl_3 .

Properties: Clear, colorless fuming liquid, decomposes rapidly in moist air. Soluble in ether, benzene, carbon disulfide and carbon tetrachloride; decomposed by water. Sp.gr. 1.574; m.p. -111.8°C , b.f. 76°C .

Derivation: By passing a current of dry chlorine over gently heated phosphorus which ignites. The trichloride, admixed with some pentachloride, distills over. A small amount of phosphorus is added and the whole distilled.

Grades: Technical, 99.9%.

Containers: 85-, 175-lb carboys; 200-, 650-lb cylinders; tank cars.

Uses: Intermediate for surfactants, phosphites (reaction with alcohols and phenols), gasoline additives, plasticizers, dyestuffs, chlorinating agent.

Danger: Causes severe burns. Vapor extremely irritating. Contact with water may cause flash fire. MCA warning label.

Shipping regulations: Corrosive liquid.

White label.*

phosphorus triiodide (phosphorous iodide) PI_3 .

Properties: Red crystals; hygroscopic.

Soluble in alcohol, carbon disulfide, water (dec). M.p. 61°C (dec), sp.gr. 4.18.

Grades: Technical, reagent.

Use: Organic synthesis.

phosphorus trisulfide (phosphorous sulfide; phosphorus sulfide; tetraphosphorus hexasulfide; thiophosphorous anhydride) P_2S_3 , or P_4S_6 .

Properties: Grayish-yellow masses; tasteless; odorless. Caution! Keep well stoppered! Burns in air. Decomposed in moist air. Soluble in alcohol, carbon disulfide, ether.

Constants: B.p. 490°C ; m.p. 290°C .

Grades: Technical.

Use: Organic chemistry (reagent).

phosphoryl chloride. See phosphorus oxychloride.

phosphotungstic acid (phosphowolframic acid; PTA) $H_3PO_4 \cdot 12WO_3 \cdot xH_2O$.

Properties: Heavy, greenish crystals.

Soluble in water, alcohol and ether.

Derivation: By heating ammonium phosphotungstate with aqua regia.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Glass bottles.

Uses: Reagent for alkaloids; phosphotungstic pigments.

Shipping regulations: None.*

phosphotungstic pigments (tungsten lakes).

Usually greens or blues which are manufactured by precipitating basic dyestuffs such as malachite green or Victoria blue with solutions of phosphotungstic acid, or phosphomolybdic acid, or mixtures of both. The pigments made from phosphomolybdic acid are also known as molybdenum lakes or phosphomolybdic pigments.

Uses: Chiefly in printing inks, the whitening of white paper, and in interior paints and enamels.

phosphowolframic acid. See phosphotungstic acid.

phosphuretted hydrogen. See phosphine.

"Phos-Trode." ⁴⁰⁷ Trademark for a phosphor bronze Grade C electrode and filler rod for joining like and dissimilar metals and overlaying surfaces resistant to wear and corrosion.

photochemistry. The branch of chemistry that deals with the effect of light in causing or modifying chemical changes. The most important examples are in natural photosynthesis, in the production of a photographic image, and in the reaction of chlorine on hydrocarbons and other organic compounds.

photo-glycin. See para-hydroxyphenylglycine.

photolysis. Breaking down of molecules into simpler units by use of light.

photon. A unit (quantum) of electromagnetic radiation. Light waves, gamma rays, x-rays, etc. consist of photons.

See fundamental particle.

photophor. See calcium phosphide.

phbtopolymer. A polymer or plastic that is made so that it is sensitive to and undergoes some kind of change on exposure to light. Such materials can be used for printing and lithography plates, for photographic prints and microfilm copying.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

The effect of the light may be to cause further polymerization or crosslinking, or may cause degradation. One application involves the use of esters of polyvinyl alcohol which crosslink and so become insoluble, whereas unexposed portions of the material remain soluble.

photosynthesis. The natural process by means of which carbon dioxide and water are converted into carbohydrates in growing plants in sunlight. Chlorophyll (q.v.) is necessary as a catalyst. In the presence of light certain electrons in the chlorophyll molecule are displaced and the resultant unbalanced positive charge (hole) causes water to liberate its hydrogen and oxygen to other molecules present. In a subsequent reaction part of the oxygen is released to the air, the corresponding hydrogen is used in the synthetic cycle, while the remaining hydrogen and oxygen recombine with the liberation of energy for the synthesis cycle. It is now thought that the carbohydrate synthesis proceeds through addition of carbon dioxide in a complex cycle involving ribulose diphosphate (a five-carbon compound), phosphoglyceraldehyde (three carbons), sedoheptulose phosphate (seven carbons) and finally glucose phosphate (six carbons). The recent synthesis of chlorophyll is a long step forward in settling the details of photosynthesis.

photoxylin. See celloidin.

"PH-Plus." ⁸⁴ Trademark for a special moisture-free alkali for water treatment. Fused at 2200°C and cast in 1/2-lb conical cakes. For treatment of swimming pool water and for general industrial water treatment.

"Phthalamquin." ³⁴² Trademark for a brand of aureoquin preparation.

phthalamide $C_6H_4(CONH_2)_2$. The double acid amide of phthalic acid.

Properties: Colorless crystals; m.p. 200–210°C (decomposes into phthalimide and ammonia). Very slightly soluble in water and alcohol; insoluble in ether.

Derivation: By stirring phthalamide with cold concentrated ammonia solution; by the reaction of phthalyl chloride and ammonia; or from the addition of ammonia to phthalic anhydride under pressure.

Containers: Barrels.

Use: Intermediate in organic synthesis.

phthalic acid (ortho-phthalic acid, naphthalic acid; ortho-benzene dicarboxylic acid) $C_6H_4(CO_2H)_2$.

Properties: Colorless crystals, soluble in alcohol; sparingly soluble in water and ether. Sp.gr. 1.585; m.p., decomposes at 191°C.

Derivation: From phthalic anhydride; or by direct oxidation of mixed alkyl aromatics, with heavy metal salts and bromine as catalysts.

Method of purification: Crystallization.

Grades: Technical; reagent.

Containers: 1-lb bottles; 50-lb cases; 100-lb barrels.

Uses: Dyes (synthesis of indigo, manufacture of phthaleins, various fluorescein and eosin dyes, rhodamines and pyronine dyes); medicine; phenolphthalein; phthalimide; anthranilic acid; synthetic perfumes.

Shipping regulations: None.*

meta-phthalic acid. See isophthalic acid.

ortho-phthalic acid. See phthalic acid.

para-phthalic acid. See terephthalic acid.

phthalic anhydride $C_6H_4(CO)_2O$ (acid phthalic anhydride).

Properties: White, crystalline needles, sublimes below b.p.; characteristic mild odor. Sp.gr. 1.527 (4°C); m.p. 130.8°C; b.p. 285°C. Soluble in alcohol; slightly soluble in ether and hot water.

Derivation: By air oxidation of naphthalene using vanadium pentoxide as a catalyst; also from ortho-xylene by a somewhat similar process.

Method of purification: Sublimation.

Grades: Pure.

Containers: 80-, 175-, 200-lb barrels; tank trucks, tank cars.

Uses: Alkyd resins; plasticizers; polyesters; synthesis of phenolphthalein and other phthaleins, many other dyes; chlorinated products; pharmaceutical intermediates; insecticides; diethyl phthalate; dimethyl phthalate.

Caution! May cause skin irritation. MCA warning label.

ortho-phthalimide $C_6H_4(CO)_2NH$.

Properties: White, crystalline leaflets.

Slightly soluble in ether; insoluble in benzene; soluble in boiling benzene and in aqueous alkalis.

Constants: M.p. 233–238°C; b.p., sublimes.

Derivation: By dissolving phthalic anhydride in ammonium hydroxide, evaporating to dryness and using the residue.

Method of purification: Sublimation.

Grades: Technical, 97–98%.

Containers: Barrels, tins.

Uses: Production of indigo, via anthranilic acid; fungicide, organic synthesis.

Shipping regulations: None.*

phthalocyanine blue. See phthalocyanine pigments.

phthalocyanine green. See phthalocyanine pigments.

phthalocyanine pigments. A series of organic pigments having as a structural unit four isoindole groups $(C_6H_4)_2C_2N$, linked by four nitrogen atoms so as to form a conjugated chain. There are four commercially important modifications, including the basic compound: (1) phthalocyanine (metal-free), $(C_6H_4C_2N)_4N_4$, blue-green; (2) copper phthalocyanine $(C_6H_4C_2N)_4N_4Cu$, in which a copper atom is held by secondary valences of the isoindole nitrogen atoms; sp.gr. 1.59; (3) chlorinated copper phthalocyanine, green, in which 14 to 16 hydrogen atoms are

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

replaced by chlorine; and (4) sulfonated copper phthalocyanine, water-soluble, green, in which two hydrogen atoms are replaced by sulfonic acid (HSO_3) groups.

Properties: Extreme lightfastness and stability to acids, alkalies, and heat. The pigments are non-bleeding in the usual paint vehicles and have high tinctorial strength but are relatively expensive.

Derivation: (copper phthalocyanine, blue)

- (a) By reaction of phthalic anhydride, urea, and cuprous chloride at about 200°C .
- (b) reaction of ortho-chlorocyanobenzene with cuprous cyanide and copper powder.

Containers: Barrels.

Uses: Decorative enamels, automotive finishes, linoleum, plastics, roofing granules, printing inks, wallpaper, rubber goods, and similar applications where light fastness and chemical stability are required.

phthalonitrile $\text{C}_6\text{H}_4(\text{CN})_2$.

Properties: Buff-colored crystals; m.p. 138°C ; insoluble in water, soluble in acetone and benzene.

Derivation: Vapor phase reaction of ammonia and phthalic anhydride over alumina catalyst at high temperature.

Grades: Technical; purified.

Containers: Bags; bottles.

Uses: Intermediate in organic synthesis, especially for pigments and dyes; base material for high temperature lubricants and coatings.

meta-phthalyl dichloride. See isophthaloyl chloride.

phthalylsulfacetamide (N^1 -acetyl- N^4 -phthalyl-sulfanilamide) $\text{C}_{16}\text{H}_{14}\text{N}_2\text{O}_6\text{S}$ or $\text{C}_6\text{H}_4(\text{COOH})\text{CONHC}_6\text{H}_4\text{SO}_2\text{NHCOCH}_3$.

Properties: White or creamy white crystals or crystalline powder. Slight odor, decomposes with liquefaction between 186 - 202°C . Very slightly soluble in water; soluble in acetone, freely soluble in solutions of alkali hydroxides.

Grade: N.F. XI.

Containers: Drums.

Use: Medicine.

phthalylsulfathiazole $\text{C}_{17}\text{H}_{13}\text{N}_3\text{O}_5\text{S}_2$.

4'-(2-Thiazolylsulfamyl) phthalanilic acid.

Properties: White or faintly yellowish-white crystalline powder; bitter taste, odorless. May darken slowly on long exposure to light. Practically insoluble in water and chloroform; slightly soluble in alcohol; very slightly soluble in ether; readily soluble in solutions of alkali hydroxides and their carbonates, and in hydrochloric acid. M.p. 272 - 277°C (dec).

Derivation: By condensing sulfathiazole with phthalic anhydride.

Grade: U.S.P. XVI.

Use: Medicine.

phthiolcol ($\text{C}_{11}\text{H}_9\text{O}_3$). The principal pigment isolated from the lipids of *Mycobacterium tuberculosis*. It was the first identified form of vitamin K and is an antibiotic substance.

Properties: Yellow prisms from ether-petroleum ether; m.p. 173 - 174°C ; sublimes; steam volatile; slightly soluble in water; soluble in organic solvents except petroleum ether.

Derivation: By treating 2-methylnaphthoquinone with bleaching powder and acidifying with sulfuric acid.

Use: Medicine.

"Phygon." ²⁴⁸ Trademark for a line of fungicides and seed protectants based on dichlone.

Uses: Fungicide for apple scab, brown rot of stone fruits, potato and tomato early blight; blue-green algae control in industrial water systems, ponds, irrigation canals. Formulated as "Phygon XL," a 50% wettable powder.

"Phyllicin." ⁹ Trademark for theophylline-calcium salicylate.

physic nut oil. See Philippine physic nut oil.

physostigma (calabar bean; ordeal bean; chop nut; split nut).

Derivation: Seed of *Physostigma venenosum*.

Occurrence: West Africa; India; Brazil.

Grades: Technical.

Containers: Bags.

Uses: Medicine; source of the alkaloid physostigmine or eserine.

Shipping regulations: None.*

physostigmine (eserine; calabarine)

$\text{C}_{15}\text{H}_{21}\text{O}_2\text{N}_3$. An alkaloid.

Properties: Colorless or pinkish crystals.

Poisonous! Slightly soluble in water; soluble in alcohol and diluted acids. M.p. 86 - 87°C and 105 - 106°C (unstable and stable forms).

Derivation: By solvent extraction from the seeds of *Physostigma venenosum*.

Uses: Medicine.

Available as the salicylate and sulfate.

physostigmine salicylate $\text{C}_{15}\text{H}_{21}\text{O}_2\text{N}_3 \cdot \text{C}_7\text{H}_5\text{O}_3$.

Properties: Colorless crystals, m.p. 182 - 183°C ; soluble in water and alcohol.

Very poisonous!

Grade: U.S.P. XVI.

Use: Medicine.

physostigmine sulfate $(\text{C}_{15}\text{H}_{21}\text{O}_2\text{N}_3)_2 \cdot \text{H}_2\text{SO}_4$.

Properties: White, deliquescent crystals; m.p. 150 - 151°C . Poisonous! Soluble in water and alcohol.

Use: Medicine.

phytic acid (inositohexaphosphoric acid)

$\text{C}_6\text{H}_6[\text{OPO}(\text{OH})_2]_6$. Occurs in nature in the seeds of many cereal grains, generally as the insoluble calcium-magnesium salt (see "Phytin.") In the body, phytic acid inhibits the absorption of calcium in the intestine.

Properties: A typical product is a white to pale yellow liquid; odorless with acid

*taste; pH less than 1.0 (in 1% solution);

soluble in water and alcohol; sp. gr. 1.58; wt/gal 13.1 lbs.

Derivation: From corn steep liquor.

Grades: Technical (as a 70% solution).

Containers: (solution) 1-, 5-, 10-lb glass

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

containers; 70-lb carboys.

Uses: Chelation of heavy metals in processing of animal fats and vegetable oils; rust inhibitor; preparation of phytate salts; metal cleaning; treatment of hard water.

"Phytin." ³⁰⁵ Trademark for calcium-magnesium salt of inositol hexaphosphoric acid (phytic acid).

Use: Medicine (dietary supplement).

phytol $C_{20}H_{40}O$ or

An alcohol obtained by the decomposition of chlorophyll.

Properties: Odorless liquid; b.p. 202-204°C (10 mm); sp.gr. 0.8497 (25/4°C); soluble in the common organic solvents, insoluble in water.

Use: Synthesis of vitamins E and K.

phytolacca (poke root; garget).

Derivation: Dried root of *Phytolacca americana* or *decandra*.

Occurrence: North America; southern Europe.

Grades: Technical.

Containers: Bags; bales.

Use: Medicine.

Shipping regulations: None.*

phytonadione (2-methyl-3-phytyl-1,4-naphthoquinone; vitamin K_1) $CH_3C_{10}H_{19}O_2C_{20}H_{39}$.

Properties: Clear yellow, viscous, odorless liquid, sp.gr. 0.967 (25/25°C), refractive index 1.5230-1.5252 (25°C), stable in air. Protect from sunlight! Insoluble in water, soluble in benzene, chloroform and vegetable oils; slightly soluble in alcohol.

Derivation: Synthetically, from 2-methyl-1,4-naphthoquinone and phytol.

Uses: Medicine, food supplement.

phytosterols. See sterols.

"Picco Aromatic Plasticizers." ¹⁴⁰ Trade name for a series of alkylated, aromatic plasticizers.

Properties: Semi-liquids with softening point of 10° and 25°C, color coal tar 2-5; ash 0.2% max, sp.gr. 0.97-0.99.

Containers: 18 gauge, oil-type steel drums.

Uses: Plasticizers and tackifiers. Improve processing and permit higher filler loading. Good electrical properties make them useful in friction tapes.

"Picco Aromatic Plasticizing Oils." ¹⁴⁰

Trade name for a series of alkylated, aromatic hydrocarbons useful as plasticizers and softeners.

Piccocizer R: Liquid with color coal tar 2 1/2; sp.gr. 0.930-0.960.

Piccocizer 30: Liquid with color coal tar 4; sp.gr. 0.995-1.010.

Dipolymer Oil: Liquid with color coal tar 4+; sp.gr. 0.990-1.005.

Pictar: Dark liquid; sp.gr. 0.980-1.000.

Containers: 18 gauge, oil-type, steel drums. Uses: Plasticizers and softeners, impart low temperature flexibility.

"Piccoflex." ¹⁴⁰ Trade name for a series of thermoplastic modified styrene copolymers

with good grease resistance and color stability, flexibility and toughness. Available in ball and ring softening points of 100°, 115°, 120°C.

Properties: Color coal tar 3 max; sp.gr. 1.05, refractive index 1.58.

Containers: All grades shipped as solid in light gauge rust resistant, metal coated steel drums. All, except 100°C softening point material, also available in flaked form and shipped in multiwall paper bags.

Uses: Floor tile; molded goods; mats; traffic strips.

"Piccolastics." ¹⁴⁰ Trade name for five series of thermoplastic polystyrene resins. "A" series includes the softer, more fluid materials, "C" series is intermediate in properties; "D" and "E" series are higher molecular weight resins; the "F" series, being highest in molecular weight, is available only in aromatic petroleum solvents. Solutions of some grades are also available.

Properties (depending on grade): Color 2 to 6 Gardner; softening point 5°-135°C; sp.gr. 1.020-1.065, refractive index 1.562-1.600; solvents include aromatic hydrocarbons, chlorinated solvents, methyl ethyl ketone, carbon disulfide, ethyl acetate, and turpentine. Compatible with "Chlorowax," "Aroclors," ester gums, some "Pentalyns," rosin, rosin oil and high styrene-butadiene polymers.

Containers: Grades above 50°C softening points in light gauge, rust resistant, metal coated steel drums. Grades below 50°C and Piccolastic solutions in 18 gauge, oil-type steel drums. Grades above 100°C softening points are also available in flaked form and are shipped in multiwall paper bags.

Uses: Adhesives, coatings, saturants for paper and fabrics; waterproofing.

"Piccolyte." ¹⁴⁰ Trade name for a hydrocarbon thermoplastic terpene resin, composed essentially of polymers of pinene, especially beta-pinene. Piccolyte emulsions and solutions are also commercially available.

Properties: Ring and ball softening point varies from 10° to 135°C depending upon grade. Color very pale amber; sp.gr. 0.93-0.99; refractive index 1.507-1.533; ash 0.1% max. Soluble in low cost petroleum solvents, coal tar solvents, mineral oil, chlorinated hydrocarbons, long chain alcohols, long chain ketones. Compatible with waxes, oils, bituminous materials, resins such as rosin, ester gums, coumarone-indene, and phenolics.

Containers: Resins above 55°C softening point are shipped in light rust resistant, metal coated steel drums. Softening point grades above 100°C are also shipped in multiwalled bags. Piccolyte solutions are shipped in 18 gauge, oil-type steel drums. Emulsion grades are packed in lined fiber drums. Solutions and emulsions can also be shipped in tank cars or trucks.

Uses: Paint and varnish, printing inks, rubber compounding, paper coating,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

adhesives, leather, textiles. Emulsified grades can be used as latex extenders.

"Piccopale." ¹⁴⁰ Trade name for a thermoplastic hydrocarbon resin produced by the polymerization of unsaturates derived from the deep cracking of petroleum. Considerable cyclic but no aromatic structure is present. Available in ring and ball softening points of 70°, 85°, 100° and 110°C. Piccopale 100 is available in mineral spirits solution at 60 or 70% solids. A variety of cationic, anionic and nonionic emulsions is also produced.

Properties: Color - Gardner 11; sp.gr. 0.96 to 0.97; refractive index 1.53; soluble in aromatic and chlorinated solvents and in C₇ and higher aliphatic hydrocarbons; ash 0.1% max.

Containers: Solid grades are packed in light gauge, rust resistant, metal coated steel drums, in tank trucks, or in tank cars. Flaked Piccopale 100 or 110 can also be shipped in multiwall paper bags. Solutions are shipped in 18 gauge, oil type steel drums; also in tank trucks or tank cars.

Uses: Emulsion paints, hot-melt saturation of felt and paper, floor coverings, carpet backing, textile sizings, protective coatings, rubber compounding and fiberboard.

"Picco Piccopale Emulsions." ¹⁴⁰ Trade name for a series of anionic, cationic, and nonionic emulsions. The emulsified resin is Piccopale, a petroleum hydrocarbon derivative.

Properties (depending upon emulsion): Total solids 45-50%, particle size 1 micron; viscosity 30-1400 cps; sp.gr. 0.97-1.00; good storage and mechanical stability. Degree of ion tolerance is dependent upon specific emulsion.

Uses: Water based paints, carpet backings, adhesives, pressure sensitive adhesives, binders for fiber boards.

"Picco Reclaiming Agents." ¹⁴⁰ Trade name for a series of resinous aromatic oils identified as follows:

Identification	Color-Coal Tar	Specific Gravity
D-4	4 - 4½	0.88-0.92
D-12	2½ - 4	0.89-0.91
C-42	23	1.04-1.07
C-33	---	0.96-0.98
76-56	3½ - 4½	0.96-0.97

Containers: 18 gauge, oil type, steel drums having a gross weight of 450 pounds and net of 400 pounds.

Uses: Used primarily in the rubber industry as reclaim oils for whole tires, either by the pan or digestion process.

"Picco Resins." ¹⁴⁰ Trade name for a series of thermoplastic aromatic hydrocarbons of coal tar or petroleum origin.

Properties: Coal Tar Type: Ball and ring softening points of 10°-120°C; color, coal tar ½-3; sp.gr. 1.05-1.10; refractive index 1.617-1.636. Soluble in aromatic hydrocarbon solvents, higher ketones,

chlorinated solvents, aniline, diethyl aniline, morpholine, ethyl ether, ethyl acetate, and diethyl "Carbitol." Aromatic Petroleum Type: Ball and ring softening points of 10°-130°C; color, coal tar - 1½-9. Soluble in aromatic hydrocarbon solvents, benzyl alcohol, higher ketones, chlorinated solvents, aniline, diethylaniline, morpholine, ethyl ether, ethyl acetate, diethyl "Carbitol."

Picco Resins Solutions: Gardner viscosity D-Z2. Color, coal tar 1½-9.

Containers: Resins melting above 50°C are shipped in light gauge, rust resistant, metal coated steel drums. Softer grades and solutions packed in 18 gauge, oil-type steel drums.

Uses: Protective coatings, rubber compounding, floor coverings, adhesives. Low softening point materials used as plasticizers, tackifiers, and softeners.

"Picco 480 Resins." ¹⁴⁰ Trade name for a series of styrenated, thermoplastic hydrocarbon resins.

Properties: Color 2½ to 4 coal tar; softening point 115° to 145°C, sp.gr. 1.032 to 1.040; benzene insolubles 0.5% max; ash 0.5% max.

Containers: Solid resins in light gauge, rust resistant, metal coated steel drums. Material is also available in flake form and is shipped in multiwall bags.

Uses: Floor tile and rubber compounding. Used extensively for their reinforcing value and as a method of incorporating styrene.

"Piccotex." ¹⁴⁰ Trade name for a hard, color stable, substituted styrene copolymer resin available in ring and ball softening points of 100° and 120°C. Both grades are available in low odor mineral spirits solution at 50% solids; the 120°C grade is also available at 55% solids in the same solvent.

Properties: Color < 1 Gardner; sp.gr. 1.04 to 1.06; refractive index 1.58; ash < 0.1%. Soluble in mineral spirits, aromatic hydrocarbon solvents, ethyl and higher ethers, ethyl acetate and higher acetate esters, aniline, diethylamine, chlorinated hydrocarbons, carbon disulfide, and methyl ethyl ketone. Compatible with many chemical plasticizers such as DBP, DOP, TCP; with china wood oil, acrylics, some waxes, cellulose derivatives; with Piccolytes, Piccolastics, Piccoflexes, and other Picco resins.

Containers: Steel drums.

Uses: Textile applications, rubber compounding, and coatings.

pickle alum. See aluminum sulfate.

pickling acid. Sulfuric acid, usually 60° Bé.

Used for treating iron and steel wire, plates, etc. in order to remove scale and rust.

"Pickling Compound No. 53." ¹⁷⁵ Brand name for an acid solution of inhibitive coal-tar bases; dark-colored liquid; approximate wt/gal 10.16 lb.

Containers: 50-55-gal nonreturnable steel drums.

Uses: Retards excessive consumption of metal and evolution of fumes during

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

removal of rust and scale from iron and steel products in acid pickling baths.

pico- Prefix meaning 10^{-12} unit (symbol = p).
1 pg = 1 picogram = 10^{-12} gram.

alpha-picoline (2-methyl pyridine; 2-picoline)
 $C_5H_4N(CH_3)$, or $NC(CH_3)CHCHCHCH$.

Properties: Colorless liquid; odor resembling pyridine; sp. gr. 0.952; b. p. $129^\circ C$; m. p. $-69.9^\circ C$; miscible with water and alcohol.

Derivation: Dry distillation of bones or coal.
Containers: Drums; tank cars.

Uses: Organic intermediate for pharmaceuticals, dyes, rubber chemicals; solvent; source for vinyl pyridine.

Caution: Flammable.

Shipping regulations: None.*

beta-picoline (3-methyl pyridine; 3-picoline)
 $C_5H_4N(CH_3)$.

Properties: A colorless liquid; b. p. $143.5^\circ C$; m. p. $-18.3^\circ C$; sp. gr. 0.9613 ($15/4^\circ C$); refractive index 1.5060 ($n_{20/D}$); soluble in water, alcohol, and ether.

Derivation: Dry distillation of bones and coal.
Containers: Drums; tank cars.

Uses: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides; in preparation of nicotinic acid, and nicotinic acid amide, waterproofing agents for fabrics.

gamma-picoline (4-methyl pyridine; 4-picoline)
 $C_5H_4N(CH_3)$.

Properties: Liquid; sp. gr. 0.957 ($15/4^\circ C$); b. p. $144.9^\circ C$; refractive index 1.5050 ($n_{20/D}$); m. p. $3.8^\circ C$; soluble in water, alcohol, and ether.

Derivation: Dry distillation of bones or coal.
Containers: Drums; tank cars.

Uses: Solvent in synthesis of pharmaceuticals, resins, dyestuffs, rubber accelerators, insecticides, waterproofing agents for fabrics.

Shipping regulations: None.*

picoline-N-oxide $N(O)C(CH_3)CHCHCHCH$.
(2-picoline-N-oxide).

Properties: Crystals, very soluble in water. M. p. (2-isomer) $49.5^\circ C$; (3-isomer) $40.5^\circ C$; (4-isomer) $186.3^\circ C$.

Use: Chemical synthesis.

"**Picragol**." ²⁴ Trademark for silver picrate (q.v.), for medicinal use.

picramic acid (picraminic acid; 2-amino-4,6-dinitrophenol; dinitroaminophenol)
 $C_6H_2(NO_2)_2(NH_2)OH$.

Properties: Red crystals. Soluble in alcohol, benzene, glacial acetic acid, aniline, and ether; sparingly soluble in water. M. p. $168^\circ C$.

Derivation: By partial reduction of picric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 100-lb kegs; 300-lb barrels.

Use: Azo dyes; indicator; reagent for albumin.

Fire hazard: Dangerous.

Shipping regulations: None.*

picraminic acid. See picramic acid.

picric acid (picronitric acid; trinitrophenol; nitroxanthic acid; carbazotic acid; phenol-trinitrate) $C_6H_2(NO_2)_3OH$.

Properties: Yellow crystals; very poisonous! Explosive especially in contact with metals or metallic oxides. Soluble in water, alcohol, chloroform, benzene, and ether. Very bitter taste. Sp. gr. 1.767; m. p. $122^\circ C$.

Derivation: By the nitration of phenolsulfonic acid, obtained by heating phenol with concentrated sulfuric acid.

Grades: Technical; reagent.

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 300-lb barrels.

Uses: Explosives; medicine (external); dyes (starting point in manufacture of nigrosine and induline dyes, as well as substantive cotton dyes); textiles (dye producing bright yellow shades on the animal fibers, silk and wool); matches; electric batteries; etching copper; dyeing and printing textile fabrics with compound dyes which contain also such dyes as benzaldehyde green, methyl violet and indigo carmine; picrates.

Fire hazard: Dangerous; explosive; oxidizing material.

Shipping regulations: Various, according to whether dry or wet, type of packaging, and amounts.*

picrolonic acid $NO_2C_6H_4NNC(CH_3)C(NO_2)COH$.
3-Methyl-4-nitro-1-(para-nitrophenyl)-5-pyrazolone.

Properties: Yellow leaflets; m. p. $116-117^\circ C$; decomposes $125^\circ C$, slightly soluble in water, soluble in alcohol.

Use: Reagent for alkaloid identifications, for tryptophan and phenylalanine; for the detection and estimation of calcium.

picronitric acid. See picric acid.

picrotoxin (cocculin) $C_{30}H_{34}O_{13}$. A glucoside.

Properties: Flexible shining, prismatic crystals or microcrystalline powder; odorless; very bitter taste; stable in air; affected by light; m. p. $200^\circ C$. Soluble in boiling water, boiling alcohol, diluted acids and alkalies; sparingly soluble in ether and chloroform.

Derivation: Derived from the fruit of *Anamirta paniculata* or *cocculus indicus*, fish-berries.

Grades: N.F. XI.

Use: Medicine.

"**Pictol**." ³²⁹ Trademark for monomethyl para-aminophenol sulfate, photo-developer.

"**Pictone**." ³²⁹ Trademark for a universal, "Pictol" hydroquinone developer, suitable for paper, press-type films and lantern slides. It produces neutral and cold-tone images on cold-tone types of papers.

Pidgeon process (ferrosilicon process; silico-thermic process). Process for the production of high purity magnesium metal

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

from dolomite by reduction with ferro-silicon at 1150°C under high vacuum.

piezochemistry. Study of reactions occurring at very high pressure, e.g., in interior of the earth's crust.

piezoelectricity. The property exhibited by certain crystals, of acquiring opposite electrical charges on different surfaces when subjected to mechanical stresses. Conversely, the property of expansion along one axis and contraction along another when subjected to an electrical field.

"Pigmentar." ²⁹⁶ Trademark for tar products derived from the distillation and decomposition of oleoresinous southern pine. Produced to various viscosity grades including thin, medium, heavy, extra heavy, and tar oil. Used primarily in rubber compounding and reclaiming, also in marine paints and roof coatings.

pigment E. See barium potassium chromate pigment.

pigments. A general term used for the various inorganic and organic, natural and synthetic chemical substances and mixtures that are used to confer color in manufacturing paints, printing inks, floor coverings of various types, rubber and many plastic compositions, leather, wax, chalk, crayons, cosmetics, etc. Pigments ordinarily impart color by the absorption of light but luminescent pigments, which emit colored light, are increasingly important. Examples are mentioned below and details are given under the various individual entries. Organic pigments generally are inferior to inorganic types as to light-fastness, heat resistance, and tendency to dissolve or "bleed" in oils and solvents but are available in brighter and more varied colors. Of the luminescent pigments the organic colors are much more intense than the inorganic types but are rapidly degraded by exposure to light. In paint applications, red lead and the chromate pigments, especially chrome yellow, are important for protection against corrosion of metal surfaces. Most commercial pigments are manufactured products. See under name of individual pigment.

A pigment is always a finely divided solid powder, insoluble but wettable under the circumstances of use. The pigment usually imparts opacity and body or consistency to the medium in which it is used. The distinction between pigments and dyes is not sharp, but pigments are almost without exception insoluble, while dyes are almost always organic substances for use in coloring textiles or other fibrous and plastic substances.

White pigments: Titanium dioxide is used where its whiteness and hiding power are required, especially in paints and printing inks; zinc oxide is used in compounding of rubbers where sulfur is a problem; calcium carbonate is used as an extender or pigment

where a grey white is acceptable; barite, silica and china clay are used as extenders to control the cost of the final product. Lead white is used as a white pigment where sulfur is not present.

Black pigments: All of the black pigments used, with the exception of manganese black and iron oxide black, are carbonaceous in nature. These are seven distinct classes of such pigments, namely, lampblack, impingement carbon black, furnace black, thermal decomposition black, animal or bone black, vegetable or vine black and the miscellaneous carbon pigments of which graphite and mineral blacks are outstanding examples. As each of these vary somewhat in physical characteristics, their use is directed by the properties required for the final formulation.

Colored pigments: The natural and manufactured mineral pigments and the organic pigments have almost an unlimited range of hues. Many have been known and used for a great many years. Typical examples are the hydrated ferric oxide and manganese dioxide mixtures with clays (yellowish brown or sienna to dark brown or umber are obtained by heat treatment); Venetian red, Prussian blue, chromic oxide, chrome green, and copper or cobalt blues and blue greens. The organic pigments comprise a long list of insoluble colors derived from natural and synthetic dyestuffs. The natural products such as carmine (insect extract), alizarine and purpurin from extracted madder root and the like have become too costly to be largely used and synthetic products have replaced them. The synthetic product is used as a pure pigment or in precipitated form as a lake. Typical examples are the beta-hydroxynaphthoic pigments; the benzidine yellows; the triphenylmethane group; the metal-organic pigments using calcium, strontium, magnesium and manganese lakes with beta-naphthol; and the phosphotungstic - phosphomolybdic lake of methyl violet known as permanent violet.

Other types of pigments which produce color by luminescence rather than absorption are becoming more widely used. These are of the "daylight fluorescent" type based on zinc sulfide and cadmium sulfide with a metallic activator or organic compounds which emit radiation at a wave length in the visible range to produce the desired color such as the rhodamines and auramines.

pig-wrack. See chondrus.

pilchard oil. An oil expressed from the pickled fish, a member of the herring family.

Properties: Pale yellow oil; deposits stearin on long standing; sp. gr. 0.931-0.933; saponification value 186-189.6; refractive index 1.4751 (40°C).

Use: Making potash soft soap, paints.

pile. See nuclear reactor.

pill-bearing spurge. See euphorbia.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pilocarpine $C_{11}H_{16}N_2O_2$.

Properties: Colorless or yellow, hygroscopic, needle-like crystals or oil; very poisonous! Soluble in water, alcohol and chloroform; slightly soluble in ether. M.p. 34°C ; b.p. 260° (5 mm).

Derivation: Alkaloid from the leaves of *Pilocarpus jaborandi* or *Pilocarpus microphyllus*.

Method of purification: Crystallization.

Grades: Technical.

Containers: Vials.

Uses: Medicine; hair pomades and tonics.

Usually used in the form of the hydrochloride, nitrate or other salt.

Shipping regulations: None.*

pilocarpine hydrochloride $C_{11}H_{16}N_2O_2 \cdot \text{HCl}$.

The hydrochloride of the alkaloid pilocarpine.

Properties: Colorless, translucent, odorless, faintly bitter crystals, hygroscopic; affected by light, solutions acid to litmus; very soluble in water; soluble in alcohol; nearly insoluble in chloroform, insoluble in ether. M.p. $200\text{--}203^\circ\text{C}$ (?). Various authorities give values ranging from $195\text{--}205^\circ\text{C}$.

Grade: U.S.P. XVI.

Use: Medicine.

pilocarpine nitrate $C_{11}H_{16}N_2O_2 \cdot \text{HNO}_3$.

Properties: Shining, white crystals, stable to air, affected by light, m.p. $170\text{--}173^\circ\text{C}$. Soluble in water and alcohol, insoluble in chloroform and ether. Solutions acid to litmus.

Grades: U.S.P. XVI.

Use: Medicine.

pilocarpus (*jaborandi*).

Properties: Yellowish-green leaflets, bitterish, slightly salty, aromatic taste.

Chief constituent. Pilocarpine, a volatile oil, jaborine, and pilocarpidine.

Derivation: The dried leaflets of *Pilocarpus jaborandi* or *P. microphyllus*.

Occurrence: Brazil and Paraguay.

Grades: Pernambuco; Maranham.

Containers: Boxes, bales.

Uses: Medicine, source of pilocarpine.

Shipping regulations: None.*

pilocarpus oil. See *jaborandi* oil.

pimelic acid (1,7-heptanedioic acid)

$\text{HOOC}[\text{CH}_2]_5\text{COOH}$. Is found in castor oil.

Properties: Crystals, m.p. $105\text{--}106^\circ\text{C}$, slightly soluble in water; soluble in alcohol and ether; nearly insoluble in cold benzene.

Use: Biochemical research, polymers, plasticizers.

pimelic ketone. See cyclohexanone.

pimenta (pimento; Jamaica pepper, allspice).

Properties: Dark brown berries or powder.

The odor is thought to resemble that of a mixture of cinnamon, cloves and nutmeg, hence the name allspice.

Derivation: The dried, nearly ripe fruit of *Pimenta officinalis*.

Occurrence: East Indies; West Indies; Central America; South America.

Grades: Jamaican; Mexican.

Containers: Bags.

Uses: Perfumery; condiment.

Shipping regulations: None.*

pimenta oil (pimento oil, allspice oil).

Properties: Yellow to brownish-colored essential oil; agreeable, spicy, somewhat clove-like odor; pungent taste. Darkens with age; is affected by light. Phenol content: 65–80%. Soluble in 1 to 2 vols. and more of 70% alcohol (sometimes with opalescence and even turbidity upon dilution).

Chief known constituents: Eugenol, cineol, phellandrene, caryophyllene, eugenol methyl ether, palmitic acid.

Constants: Sp.gr. 1.018–1.048; optical rotation -0° to -4° , refractive index 1.5270–1.5400.

Derivation: By the distillation of the fruit of *Pimenta officinalis*, L.

Grade: N.F.XI.

Containers: Drums; cans.

Uses: Medicine; flavoring.

Shipping regulations: None.*

pimento. See *pimenta*.

pimento oil. See *pimenta* oil.

pi meson. See fundamental particle.

pinang. See *areca* nut.

alpha-pinene $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine in which it is the chief constituent.

Properties: Colorless, transparent liquid of characteristic terpene odor, sp.gr. 0.8620–0.8645 ($15.5/15.5^\circ\text{C}$); refractive index (n 20/D) 1.4655–1.4670, boiling range 95% between $156\text{--}160^\circ\text{C}$; occurs in d-, l-, and racemic forms.

Containers: Tank cars and galvanized drums.

Uses: Solvent for protective coatings, polishes, and waxes, synthesis of camphene, camphor, terpin hydrate, terpineol, synthetic pine oil, terpene esters and ethers, lube oil additives, synthetic resins, and their derivatives.

beta-pinene (nopinene) $C_{10}H_{16}$. A terpene hydrocarbon derived from sulfate wood turpentine in which it is a lesser constituent.

Properties: Colorless, transparent liquid of characteristic terpene odor; sp.gr. 0.8740–0.8770 ($15.5/15.5^\circ\text{C}$), refractive index (n 20/D) 1.4775–1.4790; boiling range 95% between $164\text{--}169^\circ\text{C}$, laevo rotatory.

Containers: Tank cars and galvanized drums.

Uses: Used primarily in polymer (Friedel-Crafts) resins, may be substituted for alpha-pinene.

pine-needle oils (firwood oil; douglas-fir oil).

Derived from Douglas fir.

Properties: Greenish-yellow essential oil; limonene-like odor.

Chief known constituents: Terpenes.

Constants: Sp.gr. 0.8680 (23°C); optical rotation -62.5° ; acid value 0; saponification value 86.6 (=30.3% bornyl acetate); after acetylation, 92.1 (=27.2% borneol).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

The Douglas fir is found in the coniferous forests of North America.

Derived from *Pinus mugo* (dwarf pine needle oil).

Properties: Colorless to yellow liquid; pleasant aromatic odor; bitter pungent taste; soluble in alcohol; sp. gr. 0.853-0.871; optical rotation -5° to -15.5° ; refractive index 1.4750-1.4800; boiling range, less than 10%, 165°C .

Grades: N. F. XI.

Containers: Glass bottles; drums.

Uses: Perfumery; medicine.

Shipping regulations: None.*

pinene hydrochloride. See bornyl chloride.

"Pine Oil 150 and 230." ²⁹⁶ Trade name for synthetic pine oils of various gravities consisting largely of terpineol and other monocyclic terpene alcohols. Used principally in disinfectants and soaps though is particularly well adapted for other uses where high alcohol content, light color, and odor are of prime importance.

pine oil, N. F. XI.

Properties: Colorless to light amber liquid having a characteristic pinaceous odor, miscible with alcohol in all proportions, sp. gr. 0.927-0.940, refractive index 1.4780-1.4820 (20°C) distilling range 200-225 $^{\circ}\text{C}$.

Derivation: From *Pinus palustris* by extraction and fractionation, or by steam distillation.

Grade: N. F. XI.

Uses: Deodorant; disinfectant.

"Pine Oil No. 220." ⁷⁹ Trade name for a white pine oil.

Properties: Sp. gr. (15.5°C) 0.921, refractive index (20°C) 1.481, polymerization residue 0.6%; flash point (open cup) 150°F , Engler distillation 5%, 194°C , 50%, 207°C , 95%, 218°C .

Containers: 55-gal drums, tank cars.

Uses: Mining flotation; textile dyeing and cleaning; laundries, deodorants, cleaning compounds, paint and varnish.

pine oils. A somewhat loosely-defined term which covers a variety of volatile oils with characteristic pinaceous odors, consisting principally of isomeric tertiary and cyclic terpene alcohols, with variable quantities of terpene hydrocarbons, ethers, ketones, phenols and phenolic ethers. For example, some are obtained by the distillation of the cones and needles of the various species of pines; others are obtained from the stumps of the longleaf yellow pine trees; steam-distilled pine oils are obtained by the extraction of chipped stumps by means of solvents and hot steam. The pine stumps yield a pine oil known as destructively distilled pine oil or tar oil, wood (q.v.). Other commercial forms are steam distilled pine oil (obtained from pine wood by steam distillation or by solvent extraction followed by steam distillation) and synthetic pine oil (obtained by chemical hydration of terpene

hydrocarbons to form terpene alcohols, or by dehydration of terpin hydrate).

Uses: Solvent for gums, resins, oils, cellulose ethers, other products; emulsifying agent; deodorizer; germicide; insecticide; chemicals (source of terpineol, terpene hydrate, fenchyl alcohol); alcohol denaturant; flotation agent; metal polishes; cutting oils; liquid soaps; emulsions of fats; greases and oils; paints and varnishes; fungicides, wax preparations; textile processing; other solvents, in the rubber industry; dyes; as antifoaming agents, wetting agents.

Shipping regulations: None.*

pine oleoresin. A blend of rosin and turpentine, usually encountered as a fused mass similar to rosin.

pine resin. See rosin.

pine tar. See tar, pine.

pine-tar oil. See tar oil, wood.

pine-tar pitch. The residue after distillation of practically all the volatile oils from pine tar. Similar to coal-tar pitch.

pinite. A variety of muscovite (q.v.) used in ceramics.

pink root. See spigelia.

pink salts. See rare earth salts.

pion. A pi meson, one of the fundamental particles (q.v.).

"Pipanol" Hydrochloride. ¹⁶² Trademark for trihexiphenidyl hydrochloride.

pipe clay. Usually of a ball clay nature but the term is rather wide in its application and may embrace almost any fine-grained, plastic clay.

2-pipecoline. See 2-methylpiperidine.

alpha-pipecoline. See 2-methylpiperidine.

3-(alpha-pipecolino)-1-propanol

Properties: A clear, colorless liquid.

Refractive index 1.4740-1.4775.

pipenzolate methylbromide (1-ethyl-3-piperidylbenzilate methyl bromide) $\text{C}_{22}\text{H}_{28}\text{BrNO}_3$.

Grade: N. N. D.

Use: Medicine.

piperazidine. See piperazine.

piperazine (diethylenediamine; pyrazine hexahydrate, piperazidine; ethyleneamine)
 $\text{NHCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$.

Properties: Colorless, deliquescent, transparent, needle-like crystals, which absorb carbon dioxide from the air. Keep well stoppered. Soluble in water, alcohol, glycerol, and glycols.

Constants: M. p. $104-107^{\circ}\text{C}$; b. p. 145°C .

Derivation: Treatment of ethylene bromide or chloride with alcoholic ammonia at 100°C .

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Medicine; corrosion inhibitor; anthelmintic; insecticide. Piperazine derivatives are suggested for surfactants, synthetic fibers, agricultural chemicals, stabilizing agents, rubber chemicals.

Shipping regulations: None.*

piperazine calcium edathamil $C_{14}H_{24}N_4O_8Ca$.

A chelated compound produced by reacting edathamil with calcium carbonate and piperazine.

Grade: N.N.D.

Use: Medicine.

piperazine citrate $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot xH_2O$.

Properties: White crystalline powder; slight odor at most. Solutions acid to litmus. Soluble in water. Insoluble in alcohol and ether.

Grade: U.S.P. XVI.

Use: Medicine.

piperazine dihydrochloride $C_4H_{10}N_2 \cdot 2HCl$.

Properties: White needles. Soluble in water.

Uses: Fibers; insecticides; pharmaceuticals. The monochloride, $C_4H_{10}N_2 \cdot HCl$, is also commercially available.

piperazine estrone sulfate $C_4H_{10}N_2 \cdot C_{18}H_{22}O_5S$.

When marketed for use as a drug it is stabilized with a small amount of free piperazine.

Properties: Fine, white to creamy white, odorless, crystalline powder, m.p. 185–195°C (dec. 240–250°C). Slightly soluble in water and alcohol.

Grade: N.F. XI.

Use: Medicine.

piperazine hexahydrate $C_4H_{10}N_2 \cdot 6H_2O$.

Properties: White crystals; m.p. 44°C. Soluble in water and alcohol.

Uses: Fibers; insecticides; pharmaceuticals.

piperidine (hexahydropyridine; pentamethylenamine) $CH_2CH_2CH_2CH_2CH_2NH$.

Properties: Colorless liquid with odor of pepper; sp.gr. 0.862; b.p. 106°C; m.p. –7° to –9°C; solidifies at –13° to –17°C. Soluble in water, alcohol, and ether. It is a strong base.

Derivation: By the reduction of pyridine with acid and a metal such as tin, or by heating piperine with alkali.

Grades: 95% and 98% pure.

Containers: Drums.

Uses: Solvent and organic chemical intermediate; curing agent in epoxy resins; agent in the manufacture of rubber, ingredient in oils and fuels; pharmaceutical intermediate.

Caution: Toxic; avoid breathing the vapors or allowing it come in contact with the skin. **Shipping regulations:** Flammable liquid. Red label.*

2-piperidinoethanol (N-2-hydroxyethylpiperidine) $C_8H_{16}NCH_2CH_2OH$.

Properties: Sp.gr. 0.972–0.974 (20/4°C); b.p. 115–117°C (45 mm); refractive index (n_{20/D}) 1.478–1.480. Miscible with water and most organic solvents in all proportions.

Use: Intermediate.

3-piperidinopropiophenone hydrochloride

$C_6H_5CO(CH_2)_2NC_5H_{10} \cdot HCl$.

Properties: A white to pale yellow, crystalline powder. M.p. not below 187°C.

piperidolate hydrochloride (1-ethyl-3-piperidyl diphenylacetate hydrochloride)

$C_{21}H_{25}NO_2 \cdot HCl$.

Grade: N.N.D.

Use: Medicine.

piperidyl-1-cyclohexyl-1-phenyl-1-propanol hydrochloride. See trihexyphenidyl hydrochloride.

piperocaine hydrochloride $C_{16}H_{23}NO_2 \cdot HCl$.

3-(2-Methyl-1-piperidyl) propyl benzoate hydrochloride.

Properties: Occurs as small white crystals or as white crystalline powder; odorless and stable in air; m.p. 172–175°C; bitter taste plus sensation of numbness when placed on tongue. Solution (1 in 10) acid to litmus. Soluble in water, alcohol, and chloroform; almost insoluble in ether and fixed oils.

Grades: U.S.P. XVI.

Uses: Medicine.

piperonal. See heliotropin.

piperonyl aldehyde. See heliotropin.

piperonyl butoxide. Technical grade of 6-propylpiperonyl butyl diethylene glycol ether. Consists of 80% of the chemical and 20% of related compounds.

Properties: Light-brown liquid; mild odor; soluble in alcohol, benzene, petroleum hydrocarbons, "Freons." Sp.gr. 1.06 (25°C); refractive index 1.50 (20°C).

Containers: Glass bottles; tins, drums.

Use: Chiefly as a synergist in insecticides in combination with pyrethrins in oil solutions, emulsions, powders or aerosols.

piperonyl cyclonene. Technical grade of 3-isoamyl-5-(methylenedioxyphenyl)-2-cyclohexenone and its 6-carbethoxy derivative. Consists of 80% of the chemical and 20% of related compounds.

Use: As a synergist in insecticides in combination with rotenone, pyrethrins or rotenone-pyrethrins mixtures in oil solutions, emulsions, or powders.

piperoxan (benzodioxine) $C_{14}H_{19}NO_2$. 2-(1-Piperidylmethyl)-1,4-benzodioxan.

Properties: Usually encountered as the hydrochloride which melts at 232–234°C but darkens at slightly lower temperatures; it is also easily soluble in water, but the free base is not. The hydrochloride is soluble in isopropanol.

Use: Medicine.

piperylene (1,3-pentadiene) $CH_2:CHCH:CHCH_3$. Cis- and trans- forms.

Properties: Liquid; sp.gr. 0.693 (60/60°F); m.p. cis –141°C, trans –87°C; b.p. cis –44°C, trans –42°C; refractive index (n_{20/D}) cis 1.43634; trans 1.43008. Insoluble in water; soluble in alcohol and ether.

Uses: Polymers, maleic anhydride adducts; resins; intermediate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pipestone. See catlinite.

pipradol hydrochloride (alpha, alpha-diphenyl-2-piperidine-methanol hydrochloride, alpha-2-piperidylbenzhydrol hydrochloride) ($C_{18}H_{19}N$) \cdot HCl.

Properties: Small white crystals or crystalline powder. Odorless and stable in air. Soluble in water and in ethanol. Melting range 285-295°C; pH of 1% solution is between 5 and 7.

Grade: N.F. XI.

Use: Medicine.

pitchacia galls. See mastic gum.

pitayne. See quinidine.

pitch. Thick, tenacious, dark-colored bituminous substances, secured either as the result of industrial destructive distillation processes, or as deposits on the earth's surface.

Properties: They are usually insoluble in water; miscible with carbon disulfide and benzene; have characteristic "tarry" odors.

Shipping regulations: None.*

See pitches, artificial, and also asphalt, asphaltite; and asphaltic pyrobitumen.

pitchblende. A massive variety of uraninite (q.v.), or uranium oxide, found in metallic veins. Contains 55-75% UO_2 , up to 30% UO_3 ; usually a little water, and varying amounts of other elements. Thorium and the rare earths are generally absent.

Properties: Color black, streak brownish black; luster pitchy to dull, hardness 5.5; sp. gr. 6.5-8.5; radioactive.

Occurrence: Belgian Congo, Canada; Colorado; Europe.

Use: Most important ore of uranium, historical source of radium.

pitches, artificial. These pitches are usually named by the source from which derived. They may be divided into four general groups:

1. Residues from the distillation or oxidation of mineral oils. Blown asphalt (q.v.) is a representative of this class.

2. Residues from the distillation of tars. Coal-tar pitch, brown coal-tar pitch, coke-oven-tar pitch, blast-furnace-tar pitch, water-gas-tar pitch, generator-gas-tar pitch, wood-tar pitch, pine-tar pitch are representatives of this class.

3. Residues from the distillation of fusible organic substances, the process having been terminated before the actual formation of coke. Stearin and fatty acid pitches (q.v.) are a group which is representative of this class.

4. Various artificial mixtures having the general properties given in the definition of pitch (q.v.). Roofing pitch, brewer's pitch, and insulating pitch are representative of this class.

Shipping regulations: None.*

pitch, Jew's. See asphalt.

pitch, Judean. See asphalt.

pitch, mineral. See asphalt.

pitch, stearin. See stearin and fatty acid pitches.

"Pitocin." ³³⁰ Trademark for alpha-hyphamine.

"Pitressin." ³³⁰ Trademark for beta-hyphamine.

"Pitt Chem." ³²³ Trademark for a series of tar base protective coatings.

"Pitt Chem Hotline." ³²³ Trademark for a coal tar pipe enamel for high temperature conditions.

"Pittchlor." ¹⁷⁷ $Ca(OCl)_2$. Trademark for a stable, high-test (70% available chlorine) calcium hypochlorite, granular in form; white; non-caking; water-soluble. Available in 3 $\frac{3}{4}$ - and 5-lb cans; 100- and 130-lb drums. Used as a sanitizer, germicide, and bleach.

"Pittsburgh PX." ³²³ Trademark for a line of plasticizers.

pituitary (posterior pituitary). The dried, cleaned, powdered posterior lobe obtained from the pituitary body of domesticated animals which are used for food by man.

Properties: A yellow or grayish amorphous powder with characteristic odor; partially soluble in water.

Grade: U.S.P. XVI.

Use: In medicine.

pivalic acid. See trimethylacetic acid.

pix. See pitch.

pix pini. See pine tar.

pK. A measurement of the completeness of an incomplete chemical reaction. It is defined as the negative logarithm (to the base 10) of the equilibrium constant, K, for the reaction in question. The pK is most frequently used to express the extent of dissociation or the strength of weak acids, particularly fatty acids, and amino acids, and also complex ions, or similar substances. The weaker an electrolyte the larger its pK. Thus, at 25°C for sulfuric acid (strong acid), pK is about -3.0, acetic acid (weak acid), pK = 4.76; boric acid (very weak acid), pK = 9.24. The pK of a weak acid equals the pH of an equimolar solution of the acid and one of its salts. See pH.

"Placidyl." ³ Trademark for ethchlorvynol (q.v.).

plantago seed. The cleaned, dried ripe seed of *Plantago psyllium* or of *Plantago indica*, known in commerce as Spanish or French psyllium seed; or of *Plantago ovata*, known in commerce as blond psyllium or Indian plantago seed.

Properties: All varieties are nearly odorless and have a bland mucilaginous taste.

Grade: N.F. XI.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

plant hormones. Organic compounds, other than nutrients, which in small amounts promote, inhibit or modify any physiological process within the plant. Strict usage limits the term plant hormone to materials produced by growing plants. Similar substances of synthetic origin are usually referred to as growth regulators or growth substances. In many discussions the several terms are used synonymously and the term auxin includes all substances of this kind. An example which occurs naturally in the plant is 3-indoleacetic acid. This is responsible for cell elongation in the stem. Gibberellin, originally found in the fungus *Gibberella*, is known to exist in, and affect stem elongation in biennials. Other effects are to regulate root growth (indolebutyric acid, α -naphthalene acetic acid), fruit development in plants (indolebutyric acid); loss of leaves (α -naphthalene acetic acid); prevention of fall of fruit (2,4-D); killing of plants (2,4-D).

"Plaskon." ¹⁷⁵ See "Halon."

plasma.

1. The liquid part of the blood separated by centrifugation.
2. The mixture of electrons and gaseous ions (electrically charged atoms or parts of atoms), with or without neutral atoms, which forms when any substance is heated to very high temperatures (i.e., 10,000 to 50,000°F or higher). A plasma may be formed by an electric arc of sufficient power, by sonic shock waves, or by other very sudden releases of very large quantities of energy, as in nuclear processes of fission or fusion. Uses are for spraying heat resistant coatings on missile cone surfaces and rocket nozzles, and to study high temperature chemistry and physics. In some cases the term plasma is used for materials that are very hot but still below the temperature at which electrons and ions are formed in appreciable quantities.

plaster.

1. A paste made by mixing together varying proportions of lime, sand and water, together with hair or other binding material. Used as a surface coating for walls, ceilings and partitions in buildings.
2. Plaster of paris, usually used for ornamental or intricate parts of plaster work.

plaster, hard-finished. Plaster made from over-burnt gypsum, which is dipped in alum solution and calcined a second time. Keene's cement and Parian cement are examples. See gypsum cements.

plaster of Paris. See gypsum cements.

plaster retarders. Substances used to slow up the setting of plaster. Blood, glue, dextrin, and hair are among those used.

"Plastex." ¹⁶⁰ Trademark of wires and cables with oilproof and flameproof polyvinyl

chloride insulation which resists the action of oxygen, ozone, and sunlight; has high dielectric strength, high resistance to water, acids, and alkalies. It is firm, dense, and has a smooth finish. Supplied in several colors.

plastic. A material that contains as an essential ingredient an organic substance of large molecular weight, is solid in its finished state, and, at some stage in its manufacture, or in its processing into finished articles, can be shaped by flow (definition from ASTM D883-54T). The term is sometimes used to include inorganic materials of similar character. The terms plastic and resin (q.v.) are used in overlapping senses but resin applies more specifically to the more or less chemically homogeneous polymers used as starting materials in the production of molded articles while plastic signifies the final solid product, which may contain fillers, plasticizers, stabilizers, pigments, etc.

"Plasticizer 136." ¹⁷⁵ Brand name for an aryl alkyl hydrocarbon, used as a secondary plasticizer in vinyl formulations. Containers: 55-gal steel drums.

plasticizers. Materials added to a plastic to facilitate compounding and improve flexibility and other properties of the finished product. The first industrial plasticizer was camphor, used to make "Celluloid" from nitrocellulose. At present, the important plasticizers are nonvolatile organic liquids or low-melting solids, especially the phthalate, adipate and sebacate esters and aryl phosphate esters. Plasticizers are used principally in the vinyl and cellulosic resins.

"Plasticone Red." ¹⁴¹ Trade name for pyrazolone red color pigments.

Properties: Good light resistance and heat resistance. Good resistance to acid and alkali. Non-bleeding in water and organic vehicles.

Uses: Paints, enamels, lacquers, plastics, rubber, printing inks, textiles and floor coverings.

"Plastic Steel." ⁴⁴⁵ Trade name for a mixture of steel and plastic materials used for repairing broken machinery, and for making plastic and rubber molds, metal forming dies, etc.

"Plastimer." ²⁸² Trade name for a castor oil residue.

Typical properties: Dark brown color, acid value 108, iodine value 102; saponification value, 195; sp. gr. 0.94; refractive index 1.4795 (25°C).

Containers: Drums.

Uses: As plasticizer in dark colored compounds; can be sulfonated to form detergents.

plastisol. Liquid dispersion of finely divided resin in a plasticizer. It is usually 100% solid with no volatiles; when volatile content exceeds 5% of the total weight it is

*See "I. C. C. Shipping Regulations," page xlii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

called an organosol. When the plastisol is heated, the plasticizer solvates the resin particles, and the mass gels. With continued application of heat the mass fuses to become a conventional thermoplastic material.

Plastisols are useful for molding, casting films, or coating, or printing with synthetic resins, often without the use of volatile solvents or high processing temperatures.

"Plasto." ²⁴³ Trademark for a line of solvent-soluble dyes used for coloring plastics.

"Plastogen." ⁶⁹ Trademark for a plasticizing agent.

Properties: Liquid, amber to mahogany; sp.gr. 0.81-0.84; acid number 1.0-1.1.
Uses: Plasticizer and softener in all elastomers; effective in sponge rubber.

"Plastolein." ²⁴² Trademark for a line of plasticizers for vinyls, cellulose and synthetic rubbers. Primarily composed of esters and polyesters of azelaic and pelargonic acids.

plate glass. See glass.

"Platformate." ⁴¹⁶ Trademark for the catalytic reformat product produced by the Platforming process; i.e., an aromatic-rich hydrocarbon mixture. See "Platforming process."

"Platforming" Process. ⁴¹⁶ Patented process using special platinum-containing catalyst for making high octane gasoline and/or a highly aromatic fraction for subsequent recovery of pure aromatics. Reactions include aromatization, dehydrogenation, cyclization, isomerization and hydrocracking. Reaction product may contain up to 60% aromatics. By-product hydrogen also is produced.

platonic-ammonium chloride (ammonium chloroplatinate, platonic sal ammoniac; platinum-ammonium chloride) $(\text{NH}_4)_2\text{PtCl}_6$.
Properties: Orange-red crystals, or yellow powder. Slightly soluble in water; insoluble in alcohol.

Constants: Sp.gr. 3.06; m.p., decomposes.
Grades: Technical; C.P.
Containers: Glass bottles.
Uses: Plating; platinum sponge.
Shipping regulations: None.*

platonic chloride. See chloroplatonic acid; platinum chloride.

platonic sal ammoniac. See platonic-ammonium chloride.

platonic-sodium chloride (platinum-sodium chloride; sodium chloroplatinate; sodium platinichloride) $\text{Na}_2\text{PtCl}_6 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow powder. Soluble in alcohol, water.
Grades: Technical; C.P.
Containers: Glass bottles.
Uses: Etching on zinc; ink (indelible); microscropy; mirrors; medicine; photography; plating; catalyst; determination of potassium.

platonic sulfate. See platinum sulfate.

platinous-ammonium chloride (ammonium chloroplatinite; platinous sal ammoniac; platinum-ammonium chloride)
 $\text{PtCl}_2 \cdot 2\text{NH}_4\text{Cl}$.

Properties: Dark ruby-red crystals. Soluble in water; insoluble in alcohol.
Constants: M.p., decomposes; sp.gr. 2.94.
Grades: Technical.
Containers: Glass bottles.
Use: Photography.
Shipping regulations: None.*

platinous chloride. See platinum dichloride.

platinous iodide. See platinum iodide.

platinous-potassium chloride. See potassium chloroplatinite.

platinous sal ammoniac. See platinous-ammonium chloride.

platinous-sodium chloride (platinum-sodium chloride; sodium chloroplatinite; sodium platinichloride) $\text{Na}_2\text{PtCl}_6 \cdot 4\text{H}_2\text{O}$.

Properties: Dark red crystals. Soluble in water.

platinum Pt. Element of atomic number 78, group VIII of the periodic system. See also platinum black.

Properties: Silvery-white ductile metal. Does not tarnish at any temperature. Insoluble in mineral and organic acids; soluble in aqua regia. Attacked by fused alkalis.

Constants: Sp.gr. 21.45, m.p. 1773.5°C; Brinell hardness, hard 97, annealed 42 (i.e., harder than silver or gold).

Derivation: Occurs naturally in Russia, Colombia, Alaska, mined like gold in South Africa; main source is now as a by-product in electrolytic recovery of nickel from Canadian nickel ores. The natural material is generally admixed with the other platinum group metals and with gold, iron, etc. The pure metal is obtained by dissolving the crude material in aqua regia, precipitating the platinum by ammonium chloride as ammonium platinum chloride, igniting the precipitate to form platinum sponge. This is then melted in the oxyhydrogen flame or in an electric furnace.

Grades: Physically pure (99.99%); chemically pure (99.9%); crucible platinum (99.5%); commercial (99.0%).

Uses: Catalyst (nitric acid, sulfuric acid, etc.), laboratory ware of all kinds (dishes, crucibles, electrodes, wire, etc.), industrial equipment, spinnerets for rayon manufacture; jewelry; dentistry; electrical contacts; thermocouples; electroplating, high temperature furnace lining.

platinum-ammonium chloride. See platonic-ammonium chloride and platinous-ammonium chloride.

platinum (ous) barium cyanide (barium platino-cyanide; barium cyanoplatinite)
 $\text{BaPt}(\text{CN})_4 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow or green crystals; m.p.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

decomposes.

Grades: C.P.

Use: X-ray screens.

Shipping regulations: Poison, class B.
Poison label.*

platinum black (platinum Mohr). Finely divided metallic platinum.

Properties: Black powder; exhibits a metallic luster when rubbed. Soluble in aqua regia. Sp.gr. 15.8-17.6 (apparent).

Derivation: Reduction of solution of a platinum salt with zinc or magnesium.

Grades: Technical.

Containers: Glass bottles.

Uses: Catalyst; absorbent of gases (hydrogen, oxygen, etc.) which it again liberates at red-heat; gas ignition apparatus.

Shipping regulations: None.*

platinum chloride (platinum tetrachloride; platonic chloride) (a) PtCl_4 ; (b) $\text{PtCl}_4 \cdot 5\text{H}_2\text{O}$. The platinum (ic) chloride of commerce is usually chloroplatinic acid (q.v.).

Properties: (a) Brown solid; (b) red crystals. Soluble in water and alcohol.

Constants: (a) M.p., decomposes, (b) sp.gr. 2.43; m.p., loses $4\text{H}_2\text{O}$ at 100°C .

Derivation: By solution of platinum in aqua regia and evaporation.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Chemical reagent.

Shipping regulations: None.*

platinum dichloride (platinous chloride) PtCl_2 .

Properties: Greenish-gray powder which forms double salts with the chlorides of the alkali metals. Soluble in hydrochloric acid and ammonium hydroxide; insoluble in water.

Constants: Sp.gr. 5.87; m.p., is decomposed at red-heat, yielding platinum.

Derivation: (a) By heating platinum sponge in presence of dry chlorine, (b) by heating chloroplatinic acid to 200°C .

Grades: Technical.

Containers: Glass bottles.

Use: Platinum salts.

Shipping regulations: None.*

platinum difluoride. See platinum iodide.

platinum iodide (platinous iodide, platinum diiodide) PtI_2 .

Properties: Heavy, black powder. Slightly soluble in hydriodic acid, insoluble in alkalies, water.

Constants: Sp.gr. 6.4, m.p. $300-350^\circ\text{C}$ (dec).

platinum-iridium alloys. These are the most important of the platinum alloys. Commercial alloys contain 1-30% iridium. As the iridium is increased the hardness of the alloy increases, as does the resistance to chemical attack. The m.p. of platinum is raised by the addition of iridium.

Uses: Jewelry ("medium" platinum is 95% Pt, 5% Ir and "hard" platinum is 90% Pt, 10% Ir); electrical contacts (10-25% Ir),

fuse wire (10-20% Ir), hypodermic needles (20-30% Ir), and in general where hard non-corrodible material is needed.

platinum, liquid bright. See Liquid Bright Platinum.

platinum-lithium LiPt_2 . Brittle, metallic-looking solid, nonreactive with water, made by direct combination at 540°C . If the lithium and platinum are combined at 200°C , the product can be decomposed by water, hydrolyzing and dissolving the lithium, and leaving behind unusually active platinum catalyst.

platinum metals. A group of six metals, all members of group VIII of the periodic system. They include ruthenium, rhodium, palladium, osmium, iridium, and platinum.

platinum, Mohr. See platinum black.

platinum-potassium chloride. See potassium chloroplatinate; also potassium chloroplatinite.

platinum-rhodium alloys. These alloys are in commercial use up to 40% rhodium. They are harder than platinum, but not as hard as the corresponding platinum-iridium alloys. The addition of rhodium to platinum increases the resistance to attack by aqua regia. The melting points of the alloys are higher than that of platinum. Uses: Catalyst in nitric acid production; high temperature vessels; furnace resistors; thermocouples; spinnerets in the rayon industry.

platinum-sodium chloride. See platonic-sodium chloride and platinous-sodium chloride.

platinum sponge.

Properties: A grayish-black, porous mass of finely divided platinum. Soluble in aqua regia.

Derivation: By the ignition of platinum-ammonium chloride.

Grades: Technical.

Containers: Glass bottles.

Uses. Catalyst, ignition of hydrogen in Doebereiner lamps, illuminating gas, etc.

Shipping regulations: None.*

See also platinum black.

platinum sulfate (platonic sulfate) $\text{Pt}(\text{SO}_4)_2$.

Properties: Greenish-black mass. Hygroscopic. Soluble in acids (dilute), alcohol, ether, water.

Grades: Technical.

Use: Analysis (microtesting for bromine, chlorine, iodine).

platinum tetrachloride. See platinum chloride.

Plessy's green (chromium phosphate). Impure CrPO_4 with 2 to 6 H_2O .

Properties: A deep green pigment which is both stable toward chemical reagents and durable toward atmospheric influences. It consists of chromium phosphate mixed with variable amounts of chromium oxide and calcium phosphate.

Derivation: By boiling a solution of 1 part potassium bichromate in 10 parts water

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with 3 parts of a solution of acid calcium phosphate and 1 part sugar.

pleurisy root. See *asclepias*.

"Plexiglas" Molding Powders. ²³ Trademark for thermoplastic poly(methyl methacrylate)-type polymers in bead or granule form. Injection and compression molding grades, in a wide range of colors. Outstanding brilliance, optical properties, resistance to weathering, good dimensional stability.

Uses: Manufacture of lenses of automobile tail and stop lights, back-up lights, medallions, ornaments; molded parts for appliances, camera lenses, letters for signs; extruded sheet.

"Plexiglas" Sheet. ²³ Trademark for thermoplastic poly(methyl methacrylate)-type polymers in cast sheet. Solid sheets in wide range of sizes, thicknesses. Colorless, colored, transparent, translucent, fluorescent, pearlescent grades. Strong, lightweight, impact-resistant plastic. Readily formable to complex shapes, machineable. Certain grades flame-retardant, craze-resistant, or ultraviolet filtering.

Use: Aircraft canopies and windows, outdoor signs, light diffusers, industrial and architectural glazing, chalk-boards, boat windshields, and other industrial and commercial products.

"Plexol." ²³ Trademark for synthetic lubricants and additives for petroleum oils. Liquids. Most grades are diesters of dibasic acids, some are polyesters or polyether alcohols. The ester lubricants have very low freezing points, high flash points, little change of viscosity with temperature.

Uses: Aircraft engine lubricants, hydraulic systems, instrument oils, petroleum-base lubricant formulations.

"Plimasin." ³⁰⁵ Trademark for a compound containing triphenylamine hydrochloride U.S.P. and methylphenidate hydrochloride N.N.D.

"Pliobond." ²⁶⁵ Trademark for a general purpose adhesive which forms an excellent strong bond with all sorts of like and unlike surfaces. Adheres well to wood, glass, ceramics, metals, plastics, leather, rubber, concrete, and plaster. May be employed either as a wet adhesive, by solvent reactivation, or through the use of heat.

"Pliofilm." ²⁶⁵ Trademark product. It is said to be a rubber hydrochloride. Properties: It is available in sheet or roll form in thicknesses of 0.001 inch or more. In most usual forms it is transparent. Inherently resistant to moisture vapor and water. Also resistant to oils, greases and most solvents. Is heat sealable and very flexible. Used as packaging film.

"Plioflex." ²⁶⁵ Trademark for a series of staining and nonstaining vulcanizable

synthetic rubbers produced by the continuous polymerization of butadiene and styrene. They include hot, cold and oil-extended types, and lightcolored nonstaining polymers. Antioxidants are added to insure protection of the polymer during production and storage.

Properties: 23.5% styrene content, plus good stability in the raw polymer; good tensile strength, abrasion resistance, flexibility, and recovery in the cured polymer.

Uses: Tires, tubes, miscellaneous mechanical goods, proofed goods, hospital sheeting; wringer rolls; molded and extruded goods; shoe soles and heels; housewares, etc.

"Plioform." ²⁶⁵ Trademark for cyclized rubber, made by action of acid catalysts such as chlorostannic acid on natural rubber.

Properties: Tasteless, odorless, thermoplastic, resistant to solvents; requires no vulcanization.

Uses: In forms of lacquers, powder, and molded forms which may be machined.

"Pliolite." ²⁶⁵ Trademark for a series of butadiene-styrene copolymers or cyclized natural rubber resins produced primarily for coating and rubber compounding applications.

"Pliolite NR." A cyclized derivative of natural rubber. It is a hard, resinous material that has good solubility and produces films having excellent chemical resistance and excellent resistance to the transmission of water vapor.

Uses: Paper coatings, hot melts, vehicle for silk screen printing inks, rubber reinforcing, and paint vehicles in specialized coatings.

"Pliolite Resinous Latexes." A series of styrene-butadiene emulsion polymers recommended for paint, paper, and textile applications. They possess a uniform particle size, good film clarity, excellent mechanical stability, and alkali resistance.

Uses: Latex paints, paper impregnation, paper coating, wire insulation, dipped goods, adhesives, masonry cement additive, textile printing and dyeing, textile binders, sizes, finishes and saturants.

"Pliolite Rubber Latexes." A series of butadiene-styrene synthetic copolymers supplied in latex form. They vary in solids content from 24-60%, contain no residual styrene, and are essentially odorless.

Uses: Foam rubber, carpet backings, textile sizes, adhesives, tire cord dips, miscellaneous uses as textile binder and finishing agent.

"Pliolite S-3." A synthetic copolymer of butadiene and styrene. The resin has a specific gravity of 1.05, and is produced in the form of white friable granules. In a highly aromatic solvent system, the resin forms a gel at low concentrations. Small proportions of the resin impart desirable viscosity properties and control pigment settling in paints based on "Pliolite S-5." Uses: With "Pliolite S-5" in masonry and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

stucco paint formulations.

"Pliolite S-5." A thermoplastic resin available in the form of white, porous granules, odorless and tasteless. The pure resin produces films of unusual clarity, strength, hardness, and exceptional chemical resistance. The resin is particularly resistant to acids and alkalis making it extremely well suited for use as a paint vehicle in masonry paints.

Uses: Masonry and stucco paints, concrete floor enamels, sprayable industrial finishes, traffic marking paints, wall sealers, and aluminum paints.

"Pliolite S-7." A solution of a synthetic styrene copolymer resin in toluene. Specific gravity is 0.915, with a solids content of 30%. This solution grade resin is rigidly controlled in production to meet specific requirements of the moisture-proof packaging field.

Uses: Coatings for films, foils, glassine, bleached krafts, and paperboard.

"Pliolite S-6B." A styrene-butadiene copolymer of high styrene content. In rubber stocks, "Pliolite S-6B" upgrades physical properties of the rubber stock and aids processing.

Uses: Reinforcing resin for hot, cold and oil-extended rubbers; range of products includes shoe soles and heels, inner soles, leather-like goods, sporting equipment, rubber flooring, molded and extruded goods, and automotive parts.

"Plio-Tuf." ²⁶⁵ Trademark for a relatively new group of internally reinforced, high styrene resins. The resins are characteristically pale in color and light in weight. From these resins are produced rigid, stiff thermoplastic sheets with high impact strength even at low temperatures. Sheets made from "Plio-Tuf" resins are hard, tough, flexible, light, and unusually resistant to heat distortions. These sheets can be postformed economically by various methods into hundreds of useful products.

Uses: Tote boxes, advertising displays, lamp housings, serving tray, business machine housings, television masks, hoods, vents, luggage, toys, automotive parts, and athletic equipment.

"Pliovic." ²⁶⁵ Trademark for a group of vinyl chloride polymers, characterized by uniform particle size and porosity. The "Pliovic" resins are highly resistant to chemical attack and to the effects of heat and light. Supplied in the form of fine white powders, the resins are easily compounded for various forming operations including calendering, extruding, and injection molding. They are commonly available as dry blending resins. An electrical grade resin is available for specialized applications. "Pliovic AO" is a vinyl chloride copolymer dispersion resin available for organosols, plastisols, and plastigels. "Pliovic Latex 300" is a vinyl chloride copolymer, high solids latex, available for fabric sizing, fabric and paper

coating, and impregnating.

Uses: Film, sheeting, flooring, electrical insulation, hose, gaskets, tubing, toys, foams, paper and fabric coating, rug backing, felt impregnation, and fabric sizing.

"Plioweld." ²⁶⁵ Trademark for a process for adhering rubber to metal.

Properties: The process is used for building rubberlined tanks and similar installations where rubber, in all its modifications, can be bonded to metal.

plumbago. See graphite.

plumbic acid, anhydrous. See lead dioxide.

plumbo-plumbic oxide. See lead oxide, red.

"Plumb-O-Sil B & C." ³⁰⁴ Trademarks for coprecipitates of lead orthosilicate vinyl stabilizers.

Properties: Soft white powders; sp. gr. (B) 3.3, (C) 2.96; refractive index (B & C) 1.58.

Containers: Fiberboard drums containing 25-, 135- and 50-lbs.

Uses: Heat and light stabilizers for translucent and brightly colored vinyl film, sheeting, and upholstery stocks. Imparts resistance to plate-out.

plumbous oxide. See litharge.

plumbous sulfide. See lead sulfide.

plumbum. The Latin name for lead, hence the symbol Pb and the names plumbic and plumbous.

"Pluracol." ²⁰³ Trademark for a series of polyoxyalkylene glycols of relatively high molecular weights. Includes polyethylene and polypropylene glycols, also includes a 3000-molecular weight polyoxypropylene derivative of glycerol. Various members of the series are useful as raw materials for nonionic detergents, textile specialties, and other surface active agents. Used as lubricants for rubber molds and textile yarns, and as carriers for various thermoplastic agents for external preparations. Also used in the production of pre-polymer and one-shot flexible urethane foams.

"Pluronic." ²⁰³ Trademark for a series of nonionic surface-active agents prepared by the addition of ethylene oxide to polypropylene glycols. They are available in liquid, paste, flake, and powder form and all are 100% active agent. Major uses are as low foaming detergents, lime soap and pigment dispersing agents, emulsifying and demulsifying agents, wetting agents and plasticizers of resins.

"Pluto." ³⁰⁷ Trademark for direct dyestuffs. Used for the dyeing of cotton, rayon, leather, paper. Characterized by good fastness to acid.

plutonium Pu. A synthetic element with atomic number 94 first prepared as the 238 isotope by bombarding uranium with deuterons. Several isotopes have since

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

been made ranging in half-lives from 26 minutes to about 500,000 years and in mass numbers from 232-243. Plutonium 239 is of major importance since it is fissionable with slow neutrons. It is produced on a large-scale basis by bombarding uranium 238 with slow neutrons in a nuclear reactor. Plutonium 239 is used as a nuclear reactor fuel and as an explosive ingredient for nuclear weapons. Plutonium exists in nature in uranium-containing ores in very small concentrations. Pitchblende contains one part plutonium for 10^{14} parts uranium. Naturally occurring plutonium seems to consist only of the 239 isotope. For this reason it is not thought to be primeval but to form by the action of stray neutrons on uranium. Plutonium is similar chemically to uranium and neptunium, forming analogous compounds such as PuO_2 , PuF_3 , PuF_4 , PuOCl , etc.

plutonium 239. See plutonium.

"Plyac." ⁵⁰ Trademark for polyethylene spreader-sticker; non-oily and non-ionic.

"Plyacien." ³⁶ A protein base dust-free adhesive for use with the cold press no-clamp gluing process.

Use: Manufacture of interior grade plywood.

"Plyamine." ³⁶ A group of liquid water-soluble urea-formaldehyde adhesive resins used as binders in the manufacture of plywood, furniture, wood particle products, etc. Physical properties: nonvolatile 45-65%; volatile matter, water; stable in storage at 25°C, over 6 months, color, water-white.

"Plyophen." ³⁶ Trademark for a water soluble impregnating resin. Penetrates deeply and quickly into wood, canvas, asbestos, paper and other laminating and molding stocks. Confers water and chemical resistance. Can be diluted as much as 8-10 parts water to 1 part resin for spraying glass fiber or rock wool.

Pm. Symbol for promethium.

P.M. Abbreviation for Pensky-Martens, a type of flash point test procedure and apparatus.

PMA. Abbreviation for phosphomolybdic acid, and for pyromellitic acid.

PMAC. Abbreviation for polymethoxyacetal.

"PMAS." ⁴⁹ Trademark for a colorless, odorless, stable water solution containing phenylmercury derivatives, used as a fungicide, germicide and herbicide.

PMHP. Abbreviation for para-menthane hydroperoxide. A polymerization catalyst.

PMP. Abbreviation for 1-phenyl-3-methyl-5-pyrazolone.

PMTA. Abbreviation for a mixture of phosphomolybdic and phosphotungstic acids, used in making pigments. See phosphotungstic pigments.

pn. An abbreviation for propylenediamine, as used in formulas for coordination compounds. See also dien; en; py.

"P.N." ⁵⁷ Trademark for phenothiazine-nicotine.

Po. Symbol for polonium.

podophyllin (podophyllum resin).

Properties: Light yellow, green yellow, or light brown powder or small yellow, bulky, fragile lumps; bitter acrid taste; affected by heat and light. The dust is very irritating to the eyes and the mucous membranes. Soluble in alcohol, ether, ammonium hydroxide, chloroform, potassium hydroxide solution and sodium hydroxide solution; insoluble in water.

Chief known constituents: Podophyllotoxin, picropodophyllin, etc.

Derivation: Extraction of the rhizome or roots of *Podophyllum peltatum* with alcohol and subsequent precipitation from the extract with acidified water.

Grades: Technical; U.S.P. XVI.

Containers: 1-, 5-, 10-lb glass bottles; fiber cans; drums.

Use: Medicine.

Shipping regulations: None.*

podophyllum (May-apple; mandrake; devil's apple; Indian apple; vegetable calomel).

Derivation: Dried rhizome and roots of *Podophyllum peltatum*. Should yield not less than 5% podophyllum resin.

Occurrence: North America; China; Himalayas.

Grades: Technical, U.S.P. XVI.

Containers: Various size bags.

Use: Medicine.

Shipping regulations: None.*

podophyllum resin. See podophyllin.

POEMS. Abbreviation for polyoxyethylene monostearate (q.v.); see also polyoxyl 40 stearate.

POF. See *dl*-alpha-lipoic acid.

pogy oil. See menhaden oil.

poise. See centipoise.

poison.

1. In nuclear technology a poison is any material with a high capture probability for neutrons that may divert an undesirable number of neutrons from the fission chain reaction. A burnable poison is a material intentionally introduced into a nuclear reactor core intended to capture a determined fraction of the neutrons and be burned out by the nuclear reaction at the same rate that other poisons are formed in the fission process, thus maintaining a constant reactivity of the reactor core.
2. A substance that reduces or destroys the activity of a catalyst. Thus carbon monoxide, or phosphorus, arsenic, or sulfur compounds have this effect on the formation of ammonia from hydrogen and nitrogen gases, and the gases must be

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

highly purified to carry on a satisfactory plant production operation.

poison black cherry. See belladonna.

poison hemlock. See conium.

poison nut. See nux vomica.

poison parsley. See conium.

poison tobacco. See hyoscyamus.

poke root. See phytolacca.

"Polar." ¹⁷⁵ Trade name for naphthalene.

"Polaris Red." ¹⁴¹ Trade name for precipitated azo pigments derived from beta-hydroxynaphthoic acid.

Properties: Good resistance to light, good heat resistance, non-bleeding in water and organic solvents.

Grades: Medium and dark shades of red.

Uses: Printing inks, paints, enamels, lacquers, rubber, plastics, and floor coverings.

"Pollectron." ³⁰⁷ Trademark for a group of dielectric compounds.

"Pollectron" monomer: N-vinylcarbazole.

Properties: Colorless to yellowish crystalline or flake material; m.p. 61-65°C; soluble in methyl alcohol, ethyl alcohol, pentane, hexane, cyclohexane, carbon tetrachloride, ethyl acetate, tetralin, dioxane, chloroform, acetone, methylene dichloride and chlorbenzene.

Uses: A dielectric impregnant for stationary electrical assemblies, such as rolled and stacked condensers.

"Pollectron" polymer:

Properties: Grey to light brown solid varying in form from a powder to broken lumps. This material is not suitable for direct use in injection molding or for fibering purposes. Its excellent electrical properties are retained even at elevated temperatures and over a broad frequency range. May be molded by either compression or injection methods.

polianite MnO₂. A crystalline variety of pyrolusite (q. v.).

"Polidase." ⁹¹ Trademark for cultured vegetable enzyme product.

Properties: Shows activity through a range from pH 4-8.

Grades: "Polidase-S" (reagent grade);

"Polidase-C" (crude).

Uses: As a laboratory reagent; in experimental nutrition; for the recovery of silver from photographic film; as a component of leather bates; for the conversion of starch in mash used for alcohol production; as a low cost industrial enzyme.

polishing acids. See oxalic, hydrochloric, nitric or sulfuric acid.

polishing crocus. A form or grade of finely divided ferric oxide used for polishing. See iron oxide reds.

"Politol S," "Politol N." ²²⁹ Trademarks for combinations of "Indulin" and phosphates.

Properties: Brown, free-flowing powders. "S" is soluble in water; "N" is insoluble. Bulk densities 25-30 lbs/cu ft. Moisture 2-10%.

Containers: Packed in 50-lb MWP bags.

Uses: Degumming, clarifying and refining animal, vegetable, and fish oils and fats in accordance with U.S. Patent 2,654,766.

pollucite Cs₄Al₃Si₃O₂₆·H₂O. A natural cesium aluminum silicate found in pegmatites. Colorless; hardness 6.5; sp.gr. 2.9. Source of cesium.

polonium Po. Element of atomic number 84, a member of group VI of the periodic system. Polonium is the first element to be discovered by means of its radioactivity. It occurs naturally as a decay product of radium in pitchblende, 25,000 tons of pitchblende containing about 1 gram. Polonium has been prepared synthetically by bombarding bismuth with neutrons. No stable isotopes have been found. The properties of polonium, which have been studied essentially by tracer techniques, are similar to those of tellurium, and, to a lesser extent, to those of bismuth. Elementary polonium may be obtained by preparing polonium chloride and reducing it with zinc. It is volatile at about 1000°C. Compounds similar to those formed by other members of the family have been prepared.

poloxalkol (oxyethylene oxypropylene polymer) HO(C₂H₄O)_a(C₃H₆O)_b(C₂H₄O)_cH. Relatively tasteless, non-ionic, surface-active agent. Grade: N.N.D. Use: Medicine.

poly-. A prefix signifying many. For example, a polymer is an aggregate formed by combination of a number of single molecules.

"Polyac." ²⁸ Trademark for a butyl rubber conditioner containing 25% poly-para-dinitrosobenzene [C₆H₄(NO)₂]_x with an inert wax.

Properties: Dark brown waxy pellets; sp.gr. 0.96.

Containers: 100-lb drums.

Uses: A processing aid and accelerator of vulcanization for butyl rubber.

polyacetylenes. One type, a dark polymer made from acetylene by use of Ziegler-Natta catalysts, has a conjugated structure, -CH:CH-CH:CH-, and has been suggested as a semiconductor. Non-conjugated types have been synthesized, such as H-C:C[(CH₂)₄C:C]₈-H, or C₅₀H₄₆, which is a solid, and have been suggested as high-energy binders, and plasticizers for solid propellants.

polyacrylamide (CH₂CHCONH₂)_x. White solid; water-soluble high polymer.

Uses: Thickening agent; suspending agent; production of uranium; additive to adhesives. See also acrylate resins.

polyacrylic acid. A polymer of acrylic acid (q. v.) used as a sizing agent for nylon and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

other synthetic fabrics.
See also acrylate resins.

polyalcohols (polyhydric alcohols; polyols).
See alcohol.

polyamide resins. These are polymers made by condensation of diamines with dibasic acids, or by polymerization of lactams or amino acids. Polyamines or polybasic acids may also be used. The various kinds of nylon (q.v.) are the most important examples. See also "Versamids."

polyamine-methylene resin. A polyethylene polyamine methylene substituted resin of diphenylol dimethylmethane and formaldehyde in basic form.

Properties: Light amber, granular, freely flowing powder with appreciable odor. Insoluble in dilute acids and alkalies, alcohol, ether, and water.

Grade: N.N.D.

Use: Medicine, as an ion-exchange resin.

polyaminotriazoles (PAT). Synthetic polymers made from sebacic acid and hydrazine with small amounts of acetamide. Fibers have high tenacity, good elasticity and good dyeability. Polyoctamethylene-aminotriazole is a specific example.

polybasite $Ag_{16}Sb_2S_{11}$. A natural silver sulfantimonide.

Properties: Color steel gray to iron black, streak black; luster metallic; hardness 2-3; sp.gr. 6.0-6.2.

Occurrence: Nevada, Colorado, Idaho, Mexico, Chile, Europe.

Use: Ore of silver.

polybutadiene. Synthetic rubber made from butadiene, $H_2C=CH-CH=CH_2$. A number of different stereospecific polymer forms are possible and have been made and properties studied. Some of these are or will be in substantial production because of superior properties to older synthetic rubbers, particularly in those cases where synthetics were inferior to natural rubber, as in heat dissipation under heavy loads, and abrasion resistance. Cis-1,4-polybutadiene has the same stereospecific structure as natural rubber, and is referred to as a natural-synthetic type. It is stated to have improved properties but is harder to process. Commercial products of this type are known as "Budenene," "Diene," and "Cis-4." Ziegler, Alfin and other stereospecific catalysts are used to produce the desired stereospecific polymers; the exact nature of the catalyst and conditions determine whether cis-1,4-, trans-1,4- or other polymers are produced. Trans-1,4-polybutadiene has also been made on a semi-commercial basis, being designated by the trademark "Trans-4," and resembling natural trans-polyisoprene rubbers such as gutta-percha and balata, and also being similar to synthetic trans-polyisoprene rubbers (q.v.). Trans-1,4-polybutadiene is hard, crystalline, and resin-like at room temperature

but is thermoplastic at 180-280°F.

The designation 1,4- means that when the polymer molecules grow by union of simple monomer molecules of butadiene:

the No. 1 carbon atom of any one butadiene molecule is joined to the No. 4 carbon of another butadiene molecule so that in the large polymer molecule, all carbon atoms are in one long chain.

It is also possible to cause butadiene to polymerize 1,2- so that the No. 1 carbon of each butadiene molecule becomes attached to the No. 2 carbon of another molecule. When this occurs the main backbone of the resulting polymer contains only the No. 1 and No. 2 carbons, while all the No. 3 and No. 4 carbons are in vinyl side chains.

These 1,2-polybutadienes exist in isotactic, syndiotactic and atactic forms, but cannot have cis and trans forms.

See polymer, stereospecific.

cis-4-polybutadiene. A synthetic rubber which promises to be an economical and stable alternate and/or substitute for natural rubber in many of its uses. Has low heat build-up, superior abrasion resistance, high resilience. Blends with natural rubber. Produced by solution polymerization from butadiene.

Containers: 75-lb film-wrapped bales in cardboard cartons.

Uses: In heavy-duty truck and passenger car tire treads and other items usually requiring natural rubber.

trans-4-polybutadiene. A synthetic polybutadiene of high trans configuration having a high melting point, high hardness and superior abrasion resistance. Blends with natural and synthetic rubbers or gutta-percha.

Containers: Shipped in crumb form in cardboard cartons.

Uses: Golf ball covering; belting; footwear; floor tile; mechanical goods.

polybutadiene-acrylic acid copolymer. Binder now used in solid fuels for rockets.

polybutenes (polybutylenes). This term covers the polymers of isobutene of varying molecular weights that have been known since 1955 and before, and also the more recently developed polymers of butene-1 and butene-2, some of which are of the tactic type.

Butyl rubber is a polyisobutene, of relatively high molecular weight, having some

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

isoprene units present in the polymer chain. Isobutene alone can be polymerized to various degrees, so that as the molecular weight changes from about 10 isobutene units to 1000 units, the polymer materials change from oils to tacky waxes to crystalline waxes to rubbery solids. These materials have had some use as lubricant supplements, viscosity index improvers, and binding agents in calking compounds, sealing tapes, and impregnated paper, but utilization has been limited.

Polymers of butene-1 can form films and plastic pipe, and by use of Ziegler catalysts isotactic polybutene-1 can be produced, with properties somewhat similar to those of polypropylene.

polybutylenes. See polybutenes.

polycarbonate resin. The commercial variety of this resin is derived from bisphenol A and phosgene, and has the following structure and composition: $(-\text{COOC}_6\text{H}_4\text{C}(\text{CH}_3)_2\text{C}_6\text{H}_4\text{O}-)_n$. In general, a polycarbonate resin might be formed from any dihydroxy compound and any carbonate diester.

Properties: The available resin is transparent, noncorrosive, nontoxic, stain resistant, self-extinguishing, has low water absorption, high impact strength, good heat resistance, dimensional stabilities, and electrical properties.

Uses: Molded products that range from dentures to ball bearings. Metals can be replaced by these resins in numerous operations.

polycarboxylic acids. Organic acids with two or more -COOH groups on a molecule.

polychloronaphthalenes. See chloronaphthalene oils and waxes.

polychlorotrifluoroethylene. See chlorotrifluoroethylene resins.

"Polycin." ²⁰² Trademark for (1) an elastic, tacky, gel-like solid resulting from the complete oxidation of castor oil; used in rubber compounding, asphalt tile manufacture, and as a polymeric plasticizer, (2) a series of castor oil-derived polyols used in the preparation and curing of urethane polymers for protective coatings, foamed insulation and elastomers.

"Polycyco." ⁶⁵ Trademark for series of thermoplastic polymers in the form of water emulsions or solvent solutions. This name is applied to vinyl acetate polymers and copolymers, butadiene-styrene copolymer latices, polystyrenes, vinyl and vinylidene chloride copolymers, acrylic copolymers, and water-soluble polyacrylates.

Uses: Adhesives and coatings, in paint, leather, textiles, paper, cosmetics and construction fields.

polycrase $(\text{Y, Ca})(\text{Nb, Ta, Ti})_2\text{O}_6$. A natural oxide of rare earth metals, niobium, tantalum, titanium, calcium, and other metals.

May contain uranium and thorium.

Properties: Color black; luster submetallic to greasy or vitreous; streak yellowish to reddish brown; hardness 5.5-6.5; sp.gr. 5.0-5.9.

Occurrence: South Carolina, North Carolina, Texas, Europe.

"Polycryl." ⁶⁵ Trademark for a series of acrylic polymers and copolymers polymerized in solvent medium and supplied as solutions in toluene, methyl ethyl ketone or other solvent.

poly-1,1-dihydroperfluorobutyl acrylate.

Properties: A white, elastomeric gum rubber; sp.gr. 1.5; begins to degrade at 300°F; non-flammable; retains strength and elastomeric properties in contact with synthetic lubricants, solvents, hydraulic fluids, oils, etc., at temperatures in the range of 300-400°F; has limited flexibility at sub-zero temperatures.

Grades: Available in two grades; as a raw gum stock having the properties outlined above and as an aqueous latex containing 30% solids.

Containers: 1-, 2-, 5-, and 10-lb polyethylene bags inside fibreboard cartons; 25-lb polyethylene bags inside steel pails; larger quantities available.

Uses: In the fabrication of various rubber products, such as O-rings, seals, gaskets, diaphragms, hose, sheets, etc., as coating for fabric and other surfaces.

polyelectrolytes. High molecular weight electrolytes of either natural origin (proteins, polysaccharides) or of a synthetic nature (example - alkyl halide addition products to polyvinyl pyridine). They may be either weak or strong electrolytes. Since the polyelectrolytes in solution do not dissociate to give a uniform distribution of positive and negative ions, as do simple electrolytes, the ions of one sign are bound to the polymer chain. Thus for instance, the positive charges may be in the polymer chain, and only negative ions will be free to diffuse through the solvent.

polyester fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of an ester of a dihydric alcohol and terephthalic acid (Federal Trade Commission). See, for example, "Dacron."

polyester resins. A large group of synthetic resins, almost all produced by reaction of dibasic acids with dihydric alcohols. In a few cases trifunctional monomers such as glycerol or citric acid are used.

The term polyester resins applies especially to the products made from unsaturated dibasic acids such as maleic. Other types are discussed at the end of this article. The unsaturated polyester resins can be further polymerized through cross linking because they are unsaturated. Often another unsaturated monomer such as

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

styrene is added during this second stage of the polymerization, which can occur at ordinary temperature with suitable peroxide catalysts. In general the first stage of polymerization, i.e., the ester formation stage, is carried out at a chemical plant, while the second or vinyl polymerization can be carried out conveniently in the field. The most common applications involve the use of the unsaturated polyester resins plus a co-monomer to impregnate fabric, often glass fabric, which is then formed to the desired shape on a pattern or mold, followed by hardening of the resin to form a fabric-reinforced plastic item.

Properties: Reinforced polyester items are often lighter than aluminum and sometimes stronger than steel. They are resistant to corrosion, erosion, rusting, chemicals, solvents, detergents, salt water, weather, rot, and exhaust fumes. Addition of fireproofing agents is necessary to achieve non-flammable characteristics.

Derivation: Maleic anhydride and fumaric acid are the usual unsaturated acid components, while phthalic anhydride, or adipic or azelaic acid are the corresponding saturated materials. Commonly used glycols are ethylene, propylene, diethylene, dipropylene, and certain butylene glycols. The added polymerizable monomer is styrene, vinyltoluene, diallyl phthalate or methyl methacrylate.

Water is eliminated during the first stage combination of acid and glycol, but the second stage produces no gas or liquid products. This curing stage is exothermic but fast and relatively simple for field use.

Uses: Boat hulls; swimming pools; industrial glazing, awnings, partitions, panels, etc., automotive parts, heater housings, ducts, plates, moldings and frames, trays, boxes, luggage, radomes and other airplane structural parts. Also used as a pipe joint sealer, and as adhesive.

In addition to the unsaturated polyester resins, there are other important types. One large group are the alkyd resins. These are made from saturated acid and alcohol monomers with many types of modifications, usually the inclusion of an unsaturated fatty acid. Special groups of polyester resins are used in producing films and fibers, foams, and plasticizers. "Dacron" and "Mylar" are the outstanding examples. Some polyurethane resins incorporate polyesters.

polyester rubber. See polyurethane rubber.

polyether foams. This term refers to polyurethane foams that have been made by use of a polyether as distinct from a polyester or other resin component.

polyethylene (C_2H_4)_n Polymerized ethylene, available in various forms, but the white leathery resinous form is by far the most common.

Description: In general it is light weight, tasteless, odorless, and nontoxic. The

low molecular weight polymers are high grade lubricating oils or oil additives (See "A-C" polyethylenes). The medium weight polymers are waxy materials miscible with paraffin. The high molecular weight materials (molecular weight greater than 6000) are tough white, leathery, resinous materials. The term polyethylene usually refers to the latter. Copolymers of polyethylene are also widely used and are sometimes referred to as polyethylene even though it may comprise only 50% of the total material.

Properties: These resins have outstanding electrical characteristics and impermeability to water, as well as being generally resistant to organic solvents and chemicals (particularly acids, alkalis and oxygenated solvents). They are translucent and remain tough and flexible even at low temperatures. The molded material is essentially non-breakable, flexible, easily processed and colored.

Typical properties of film: M.P. 85 to 110°C; sp. gr. 0.92; tensile strength, 1400-2600 psi; elongation, 200-800%, tearing strength (Elmendorf), 100-1000g; water absorption, 24 hours, less than 0.001%; low rate of transmission of water vapor. Resistance, good toward acids, alkalis, grease and oils, organic solvents (at 60°F), water, dampness, sunlight, heat (212°F), extreme cold (-150°F), fungus growth. Flammability - slow burning. The film is permeable to gases and vapors.

Derivation: Three density grades of high molecular weight material are produced:

(a) low density. (b) medium density, (c) high density. This latter is a linear isotactic polymer.

(a) Low density material uses polymerization of ethylene at 1,000 to 2,500 atm and temperatures of 100-300°C in the presence of a peroxide catalyst. An alternative process employs the presence of an aromatic hydrocarbon, which acts as a diluent in preventing cross-linking.

(b) Intermediate pressures (500-1,500 psig) and temperatures (350-500°F), with a metallic oxide catalyst (molybdenum trioxide or chromic oxide, deposited on alumina) produce medium density material.

(c) A low temperature (140-175°F), low pressure (100 psig) process which employs a highly active catalyst gives high density polyethylene. The usual catalyst is an alkyl metal derivative (such as triethyl aluminum) activated with titanium tetrachloride or another heavy-metal derivative.

Forms: Available in milled or unmilled flake or cubed form with or without antioxidant and modifiers, extruded, cast, and calendared sheeting; extrusion and injection molding compounds. Also available as filaments, foam, and powder.

Uses: Films and sheets for packaging and covers of all kinds (thick sheets are used as radiation shields); molded materials such as all types of containers ranging from chemical and other equipment to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

kitchenware, pipe and tubing; electric wire insulation and various electrical parts and fixtures; coatings on metal, paper, and other surfaces; bottles; tank and pipe linings; textiles (filler cloth) and bristles; upholstery; cordage; window glazing.

polyethylene glycol. Name for polymers of ethylene glycol with the general formula $\text{HOCH}_2(\text{CH}_2\text{OCH}_2)_n\text{CH}_2\text{OH}$ or $\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$. Average molecular weights range from about 200 to at least 6000. Properties vary with molecular weight.

Properties: Clear, colorless, odorless, viscous liquids to waxy solids; soluble or miscible with water and for the most part with alcohol and other organic solvents, heat-stable; inert to many chemical agents; do not hydrolyze or deteriorate; have low vapor pressure.

Derivation: By condensation of ethylene glycol, or of ethylene oxide and water.

Uses: Chemical intermediates (lower molecular weight varieties); plasticizers; softeners and humectants; lubricants; bases for cosmetics and pharmaceuticals.

Descriptions of some typical polymers follow. The numbers indicate average molecular weight.

polyethylene glycol 300

$\text{HOCH}_2(\text{CH}_2\text{OCH}_2)_n\text{CH}_2\text{OH}$ (n varies from 5 to 5.75; average molecular weight from 285 to 315).

Properties: Clear, colorless, viscous liquid; m.p. -15 to $+8^\circ\text{C}$, sp.gr. 1.124-1.130 (20°C); slightly hygroscopic; soluble in water; pH (1 in 20 solution) 4.0-7.0. Also soluble in alcohol, acetone and other glycols, insoluble in ether and aliphatic hydrocarbons.

Grade: N.F. XI; technical.

Uses: See general article.

polyethylene glycol 400. Similar to polyethylene glycol 300; n varies from 8 to 10; average molecular weight 400.

Properties: Liquid; sp.gr. 1.110-1.140 (20°C); m.p. 4 - 10°C , flash point 224°C .

Grades: Technical; U.S.P. XVI.

polyethylene glycol 1000.

Properties: White, waxy solid; m.p. 35 - 40°C ; average molecular weight 1000, flash point above 232°C ; solubility in water, about 70% by weight.

Uses: Cosmetics; pharmaceuticals; plasticizer, lubricants in textile processing; metal extrusion and molding of rubber articles; softeners and humectants for textiles, paper, cork, etc.

polyethylene glycol 1540. Average molecular weight 1300-1600.

Properties: White, waxy, plastic material; having a consistency similar to beeswax, and having a slight, characteristic odor. Melting range 42 - 46°C ; pH of 5% solution between 4.0 and 7.0. Very soluble in water and chloroform; moderately soluble in alcohol; insoluble in ether.

Grade: N.F. XI.

Use: Cosmetics; pharmaceuticals; plasticizer.

polyethylene glycol 4000 $\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$. (n varies from 70 to 85.)

Properties: Pale creamy-white, waxy solid or flakes; m.p. 53 - 56°C ; practically odorless and tasteless; soluble in water, alcohol, and chloroform; insoluble in ether. pH (1 in 20 solution) 4.5-7.5.

Grade: U.S.P. XVI.

polyethylene glycol 6000 $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$.

Properties: White waxy solid; m.p. 58 - 62°C ; flash point above 246°C ; soluble in water.

Grade: Technical.

polyethylene glycol chlorides $\text{H}(\text{OCH}_2\text{CH}_2)_n\text{Cl}$.

A group of polymers, usually colorless liquids with very low vapor pressures at room temperature. Molecular weights from about 100 to about 600 have been reported. Miscible with water; sp.gr. (20°C) for a low molecular weight polymer is 1.18, for a high molecular weight polymer 1.14. The former sets to a glass at -90°C , the latter sets to a wax-like solid at 20°C . Used as solvents for cleaning, extracting, and dewaxing.

polyethylene glycol tert-dodecylthioether.

Properties: Straw-colored liquid; sp.gr. 1.04 ($20/20^\circ\text{C}$).

Containers: 5-gal cans, 55-gal drums, tank trucks, tank cars.

Uses: Non-ionic surface-active agent; textile detergent.

polyethylene glycol esters. See polyoxyethylene esters.

polyethylene glycol stearate. See polyglycol distearate; polyoxyl 40 stearate.

polyethylene oxide sorbitan fatty acid esters. See polyoxyethylene sorbitan fatty acid esters.

polyethylene terephthalate. A polyester resin (q.v.) formed from ethylene glycol and terephthalic acid. The product has a melting point of 265°C and a second order transition temperature of 70 to 80°C . It is produced as oriented films or fibers characterized by high strength, good electrical properties, and resistance to moisture.

A typical film ("Mylar") is made in thicknesses from 0.00025 to 0.01 inch and is useful from -60 to 150°C . It is used as electrical insulation for capacitors, motors, generators, transformers, and as a barrier tape for wire and cable. Its unusual balance of properties also permits its use in many non-electrical fields, such as decorative laminations, vapor barrier materials, as a printed covering for acoustical tile and various types of industrial tapes and magnetic recording tapes.

See also "Dacron", "Mylar", "Terylene" and "Cronar."

polyethylene thiuram sulfide.

Derivation: From oxidation of diammonium ethylene bisdithiocarbamate with calcium hypochlorite.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: 50% vegetable powder; 95% technical powder.

Containers: 50-lb multiwall paper bags.

Use: Fungicide.

"Poly-FBA." ¹⁵⁸ Trade name for poly-1, 1-dihydroperfluorobutyl acrylate (q.v.).

"Polyfil" Clay. ²⁸⁵ Proprietary brand name for chemically treated hydrous aluminum silicate (sedimentary kaolin) from South Carolina.

Properties: Sp.gr. 2.60; brightness 78-79 G.E.; airfloated; contains color stabilizer. Containers: 50-lb multiwall bags or bulk.

Uses: A specially prepared and treated clay to impart color stability in PVC resin compounding for floor tile and electrical compositions. Imparts abrasion, scratch and scuff resistance.

"Polyfilm." ²³³ Trademark for virgin polyethylene film specially formulated for converting and packaging.

"Polyflo." ⁴¹⁶ Trademark for a series of all-organic inhibitor-dispersants designed for treatment of all fuel and diesel oils. Depending on precise inhibitor needs, this series contains products (1) to improve jet fuel thermal stability, (2) to stabilize No. 2 heating oils and diesel fuels against color deterioration and sludge deposition, (3) to eliminate fouling in feed exchangers and reboilers, (4) to eliminate tank bottoms in crude and residual oil storage tanks. Each member of the series exhibits a different degree of effectiveness in different types of stocks.

"Polyfon H, O, T, R & F." ²²⁹ Trademarks for sodium lignosulfonates derived from "Indulin."

Properties: Brown, free-flowing powders, soluble in water, acids, and alkalis, sintering above 360°C; bulk density 25-30 lbs/cu ft, moisture 2-8%.

"Polyfon H": Sodium sulfonate groups 5.8%; sp.gr. 1.42; pH 8.0-8.2, surface tension (5% solution) 47 dynes/cm.

"Polyfon O": Sodium sulfonate groups 10.9%; sp.gr. 1.46; pH 9.0-9.5, surface tension (5% solution) 44 dynes/cm.

"Polyfon T": Sodium sulfonate groups 19.7%; sp.gr. 1.58; pH 9.7-10.2; surface tension (5% solution) 40-41 dynes/cm.

"Polyfon R": Sodium sulfonate groups 26.9%; sp.gr. 1.68; pH 10.0-10.5; surface tension (5% solution) 43-47 dynes/cm.

"Polyfon F": Sodium sulfonate groups 32.8%, sp.gr. 1.76; pH 10.2-10.7; surface tension (5% solution) 44-45 dynes/cm.

Containers: Packed in 50-lb MWP bags.

Uses: In dyestuff dispersion and levelling; boiler water conditioning; foam stabilization, insecticide compounding; emulsion thinning; concrete plasticizing; ceramics plasticizing and binding; drilling muds, and other dispersing applications.

polyform. A process for producing gasoline by the thermal non-catalytic conversion of naphthas and gas oils at high tempera-

tures and pressures in the presence of recirculated C₃ and C₄ hydrocarbon gases. The gasoline produced is designated polyform distillate.

polyformaldehyde. See paraformaldehyde.

polyformaldehyde resins. Better known as acetal resins (q.v.).

"Poly G." ⁸⁴ Trademark for a series of polyethylene glycols, polypropylene glycols and polyoxypropylene adducts of glycerol.

G200, 300, 400, and 600 are liquid polyethylene glycols; G1000, 1500, GB-1530 and GB-2000 are waxy polyethylene glycols. The number indicates the approximate molecular weight. See polyethylene glycols.

G420P, 1020P, 2020P are propylene oxide condensation polymers of propylene glycol. See polypropylene glycols.

G1030PG, 3030PG, 4030PG are propylene oxide condensation polymers of glycerol. See polyoxypropylene-glycerol adducts.

"Polygard." ²⁴⁸ Trade name for a mixture of alkylated aryl phosphites.

Properties: Liquid; clear amber; sp.gr. 0.99; soluble in acetone, alcohol, benzene, carbon tetrachloride, solvent naphtha and ligroin; insoluble in water but can hydrolyze.

Use: Nondiscoloring and nonstaining stabilizer for synthetic rubber and plastics.

polyglycol amine H-163 HO[C₂H₄O]₂C₃H₆NH₂. Properties: Colorless liquid, sp.gr. 1.0556; b.p. 278°C; f.p. 14.5°C; soluble in water; wt/gal 8.8 lbs; flash point 295°F. Containers: Drums.

polyglycol distearate (polyethylene glycol distearate) C₁₇H₃₅COO(CH₂CH₂O)_xOCC₁₇H₃₅. Distearate ester of polyglycol.

Properties: A soft, off-white solid, density 1.04 (50°C), m.p. 43°C; pH of 10% dispersion 7.26; saponification number variable; soluble in chlorinated solvents, light esters and acetone. Slightly soluble in alcohols, insoluble in glycols, hydrocarbons and vegetable oils.

Use: Used as plasticizer for various resins; as a component of grinding and polishing pastes to promote easy removal in water.

polyglycols. See polyoxyethylene esters.

polyhalite 2CaSO₄ · MgSO₄ · K₂SO₄ · 2H₂O. A naturally occurring potash salt found in Germany, Texas, and New Mexico. Use: Source of potash for fertilizer.

polyhexamethylenedipamide

[-NH(CH₂)₆NHCO(CH₂)₄CO-]_n. A nylon obtained by the condensation of hexamethylenediamine with adipic acid. Used in food-processing equipment; for fibers. See also nylon 66.

polyhexamethylene sebacamide. See nylon 610.

polyhydric alcohols. See alcohol.

"Poly-Ionic." ³⁰⁰ Trademark for a series of polyethylene emulsions. Used as softeners and lubricating agents for textiles. Grades are A(anionic), C(cationic), N(nonionic).

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

polyisobutylenes. See polybutenes.

polyisoprene. Polymer found as the major component of natural rubber, and also made synthetically. Can exist in several forms including stereospecific *cis*-1,4-, and *trans*-1,4-polyisoprene. Both of these can be produced synthetically by the effect of heat and pressure on isoprene in the presence of stereospecific catalysts. Natural rubber is *cis*-1,4-; the synthetic *cis*-1,4- is therefore referred to by terms such as synthetic natural rubber. The latter is proposed for use in large size rubber tires as a complete or partial replacement for natural rubber. See "Natsyn" and "Coral." *Trans*-1,4-polyisoprene resembles gutta-percha and is tough because its molecules are able to partially crystallize. It is therefore proposed for use as a replacement and extender for natural balata or gutta-percha in golf ball covers, shoe soles, floor tile, and cable covering. The corresponding polybutadiene derivatives may turn out to be more economic than the polyisoprenes.

polyisoprene, deuterio. Polyisoprene in which heavy hydrogen atoms have replaced the ordinary hydrogen of atomic weight one. *Cis*-1,4-deuteriopolyisoprene is stated to be more elastic than natural rubber.

"Polylite." ³⁶ A group of 100% reactive alkylid resins, dissolved in styrene and other monomers. Highly diversified applications both alone and in combination with such materials as fibrous glass. This group also includes resins for use with diisocyanate to form rigid or flexible polyurethane foams.

"Polymax." ³³² Trademark for woven fabrics of polyolefin fibers for liquid and pneumatic filtration.

polymer. A substance, often synthetic, composed of giant molecules that have been formed by the union of a considerable number of simple molecules with one another. The number of simple molecules that unite to form a polymer molecule varies from two to hundreds or thousands. The simple molecules that will undergo such a change are known as monomers and their union is called polymerization. The monomer molecules may be all alike, or there may be two or more varieties of monomer involved in the formation of a single polymer. Thus ethylene molecules can be united with themselves to form polyethylene resin which is a homopolymer. On the other hand, SBR synthetic rubber (the most common type) is a copolymer, since two different kinds of monomers (styrene and butadiene) are required. See also dimer and trimer.

Condensation polymers are those such as the phenol-formaldehyde resins, in which the union of the simple molecules involves incidental formation of water or some simple substance. Many natural polymers are known, for example, natural

rubber.

See also polymer, stereospecific.

polymerization. See polymer.

polymerized oils. See blown oils.

polymer, stereospecific (See also polymer structure.) A polymer whose molecular chains have a definite and specific spatial arrangement in the sense that there is a fixed position in three dimensional space for the various atoms and the various parts of the molecular chain with respect to one another. By way of contrast, the atoms and parts of molecules of a nonstereospecific polymer would have a random and varying spatial arrangement with respect to one another.

Synthetic stereospecific polymers and methods of making them have been known only recently. Natural rubber and its synthetic counterpart, *cis*-polyisoprene (see "Natsyn," "Coral") are examples of commercially useful polymers. Most older synthetic polymers were not stereospecific.

Five types of stereospecific structures are recognized. These are *trans*, *cis*, isotactic, syndiotactic (also spelled syndiotactic) and tritactic. Nonstereospecific polymers are designated atactic.

The isotactic and syndiotactic structures most commonly arise when double bonds are absent in the carbon chain but there are atoms other than hydrogen, or substituting groups, attached to the carbon atoms of the backbone chain. This type of polymer molecular structure is very common and is found in.

polystyrene

polyvinyl chloride

polypropylene

and 1,2-polybutadiene

Whenever molecules of this type are formed from their simple monomer building blocks, the substituting atoms or groups may be arranged so that (1) all are above, (2) all below, or (3) all on the same side of the backbone chain when it is arranged so that all the backbone atoms are in a single plane. The three arrangements are actually completely identical from a three-dimensional point of view. This is an isotactic arrangement. In somewhat oversimplified form, this may be represented in two dimensions by the two equivalent structures following, in which R might be

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

C_6H_5 , Cl, CH_3 , or $-HC=CH_2$.

or

The syndiotactic arrangement arises when some of the substituting groups are above the plane of the backbone chain, and the remainder are below, but there is a definite and regular pattern of arrangement of these substituting groups such as alternate groups lying on each side of the backbone, represented as:

An atactic arrangement, in which there is no definite pattern or relationship with respect to the groups above and below the carbon chain, may be represented as:

The cis and trans stereospecific forms differ from one another in the manner in which the atoms in the backbone chain are positioned with respect to adjacent atoms in the chain. These types depend on the presence of unsaturated (double) bonds in the molecule (see geometric isomerism). Thus cis-polybutadiene has the type of structure indicated (for the simplified case of two dimensions) by the following formula:

The carbon atoms in such a structure can be thought of as having a backbone structure thus:

In trans-butadiene the backbone structure is:

Tritactic polymers arise when an isotactic or syndiotactic type is also either cis or trans because the molecules are unsaturated and have double bonds. This can happen in:

which has double bonds in the backbone chain which give rise to cis and trans forms, either of which can be iso- or syndiotactic according to the positions of the methyl groups relative to one another and the atoms in the backbone chain.

As with many phenomena, the above concepts are idealized and real polymers are usually mixtures of the several types, with one type being predominant in some cases. It is common to refer to the degree of tacticity, i.e., the degree to which the idealized state is achieved. It is also common for actual polymer molecules to be composed of blocks or sections of one type interspersed with blocks or sections of another type. These are referred to as stereoblock polymers.

polymer structure. This refers to the relative positions, arrangement in space, and the freedom of motion of the atoms in a polymer molecule, which in turn determine many polymer properties. Stereospecific polymers (q.v.) have regularity of some kind in the arrangement of the atoms and groups that make up the large molecule. This regularity permits or causes parts of molecules that happen to be near one another to line up somewhat like the atoms and molecules in crystals of ordinary low molecular weight substances, and consequently these stereospecific polymers behave somewhat like actual crystals. The lining up of polymer chains is never complete, so that resemblance to real crystals is limited. Stereospecific polymers have relatively higher softening temperatures than nonstereospecific, so that such polymers can be used at higher temperatures.

An important property of polymers that is determined to a large extent by polymer structure is the second order transition temperature, or glass temperature. Each kind of polymer has a characteristic second order temperature point, analogous and similar in some ways to a melting point. This in turn determines the flexibility and elasticity of a polymer at a particular temperature, and the temperature at which softening occurs. Below the second order transition temperature the polymer is relatively rigid; above this temperature the polymer becomes flexible and rubbery. The rate of increase of volume with temperature becomes greater above the second order transition temperature, and there are also changes in other characteristics such as tensile strength and elongation to break point. All these properties and characteristics are inherently dependent upon freedom of movement of the polymer chains. As temperature rises rotation of parts of the polymer chains about carbon-to-carbon bonds becomes possible and the polymer molecules can slip and otherwise

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

move with respect to one another. Various types of side chains and substituent groups interfere with, or in some cases promote, such motion, and thus modify properties. Nonstereospecific polymers will behave entirely differently from those with definite stereospecific structure.

polymethoxy acetal (PMAC)

$\text{CH}_3(\text{CHOCH}_2\text{CH}_2)_n\text{CH}(\text{OCH}_3)_2$. (3, 5, 7, x-polymethoxy dimethyl acetal).

Properties: High boiling yellow liquids with an ethereal odor, slightly hygroscopic. Slightly soluble in water, widely soluble in organic solvents. Excellent compatibility with water and insoluble plasticizers and resins.

PMAC-5: Sp.gr. 0.978; refractive index 1.440, pour point -55°F , initial b.p. 140°C ; flash point 255°F .

PMAC-10: Sp.gr. 1.015; refractive index 1.453; pour point 5°F ; initial b.p. 220°C ; flash point 290°F .

PMAC-15: Sp.gr. 1.021; refractive index 1.456; pour point 15°F , initial b.p. 230°C , flash point 310°F .

Grades: Available in several molecular weight ranges.

Containers: Steel drums or tank cars.

Uses: Shell molding lubricants; phenolic resin modifiers; high boiling solvents; core binders; demulsifying agent; plasticizers and softeners.

Shipping regulations: None.*

polymyxin. Generic term for a series of antibiotic substances produced by strains of *Bacillus polymyxa*. Various polymyxins are differentiated by the letters A, B, C, D and E. All are active against certain gram-negative bacteria. Polymyxin B (q.v.) is the least toxic and most used.

Properties: All the polymyxins are basic polypeptides, soluble in water, the hydrochlorides are soluble in water and methanol, insoluble in ether, acetone, chlorinated solvents and hydrocarbons.

Use: Medicine (antibiotic).

polymyxin B. The least toxic and most used of the polymyxin series of antibiotics. It is a basic polypeptide containing leucine; threonine; phenylalanine; alpha, gamma-diaminobutyric acid and 6-methyloctanoic acid, $\text{C}_9\text{H}_{19}\text{O}_2$. It is stable in the dry state as the acid salt, polymyxin B sulfate (q.v.).

Uses: Medicine; also in beer production to kill bacteria which contaminate brewer's yeast.

polymyxin B sulfate. The commonly-used form of polymyxin B (q.v.).

Properties: White to buff-colored powder, odorless or faint odor; decomposes about 230° ; soluble in water and isotonic saline solution; slightly soluble in alcohol. Solutions are slightly acid or neutral to litmus, having pH 5-7.5.

Grade: U.S.P. XVI.

Use: Medicine (antibiotic).

"Polynycel." ⁷⁸ Trademark for compositions used as dyeing assistants.

polyolefins. A class name for the polymers derived by polymerization from relatively simple olefins, including particularly polyethylene and polypropylene from ethylene and propylene, but also including higher polymers such as polybutenes and polypentenes. In many cases the use of the term implies a stereospecific polymer.

polyols. See alcohol.

"Polyotlc." ⁵⁷ Trademark for tetracycline.

"Polyox." ²¹⁴ Trademark for a series of water-soluble resins consisting of ethylene oxide polymers with molecular weights in the 100,000 to several million range.

Properties: White powder; water soluble to form viscous solutions. WSR-35 (5% solution 700 cps). WSR-205 (5% solution 6000 cps). WSR-301 (1% solution 2500 cps). Forms tough, flexible films resistant to oil and biological attack.

Containers: 5-, 20-, 50- and 150-lb fiber drums.

Uses: Textile warp size, paper coatings, detergents, hair spray, toothpastes, water-soluble packaging film, adhesives.

polyoxamides. Nylon type material made from oxalic acid and diamines.

polyoxetanes. See oxetanes; see also "Penton."

polyoxyethylene esters. The naming of these polymers is varied, so that entries may also be found under polyethylene glycol or polyglycol. Similarly polyoxypropylene and polypropylene glycol are used interchangeably for the propylene esters. Some coined generic names are also used to avoid the awkward chemical names.

polyoxyethylene ethers. Synonym for polyethylene glycol ethers.

polyoxyethylene 40 monostearate. See polyoxyl 40 stearate.

polyoxyethylene sorbitan fatty acid esters. (polyethylene oxide sorbitan fatty acid esters; sorbitan polyoxyethylene fatty acid esters). Nonionic surfactants of rather indefinite composition, obtained by esterification of sorbitol with one or three molecules of stearic acid or a similar fatty acid under conditions which result in the splitting out of water from the sorbitol.

Varying amounts of ethylene oxide are added to the ester to control the water solubility of the product, additional ethylene oxide increasing the solubility. The products are used as emulsifying agents, cosmetic ingredients, and textile treating materials. See also "Tween."

polyoxyethylene (20) sorbitan mono-oleate. See polysorbate 80.

polyoxyl 40 stearate(polyoxyethylene 40 monostearate). The monostearate ester of a condensation polymer,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

$\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OCOC}_{17}\text{H}_{35}$ (n is approximately 40).

Properties: Waxy, light tan, nearly odorless solid; soluble in water, alcohol, ether, and acetone; insoluble in mineral oil and vegetable oils.

Grade: U.S.P. XVI.

Use: Ointments.

polyoxymethylene. Used as a name for para-formaldehyde (q.v.), and also for poly-formaldehyde resins. For the latter, see acetal resins.

polyoxypropylene esters. See polyoxyethylene esters.

polyoxypropylene-glycerol adducts. Condensation polymers of propylene oxide and glycerol, with molecular weights in the range 1000 to 4000. Clear, stable, almost colorless non-corrosive liquids. Uses similar to those of polypropylene glycols (q.v.).

polyoxypropylene glycols $\text{HO}(\text{C}_3\text{H}_6\text{O})_x\text{H}$.

Polyethers derived from propylene oxide, with molecular weights in the range 3000 to 4000, and used as intermediates for polyurethane foams, elastomers and coatings.

"Poly-pale." ²⁶⁶ Trademark for a thermoplastic resin and several glycol and glycerol esters made from it.

Properties: These resins are characterized by pale color, oxidation resistance, and high softening points when compared to rosin and comparable esters.

Typical specifications: Acid number 148 for "Poly-pale" resin and 6 to 8 for its esters; sp. gr. (20°C) 1.072 for the resin and 1.062 to 1.085 for its esters; lbs/gal 8.95 for the resin and 8.86-8.97 for its esters; color (U.S.D.A. rosin scale) N to WG for the resin, and M to WG for the esters.

Uses: "Poly-pale" Resin is used in the production of ester gums, gloss oils, spirit varnishes, adhesives, and modified maleic and phenolic resins. The esters are used in the production of adhesives, lacquers, emulsion paints, varnishes, wax compositions, linoleum, floor tiles, and printing inks.

polyphosphoric acid $\text{H}_6\text{P}_4\text{O}_{13}$ (approx).

Properties: Water-white, hygroscopic, viscous liquid. Does not crystallize on standing. Soluble in water (with hydration to ortho-phosphoric acid).

Grade: Technical.

Containers: Carboys.

Use: Wherever a concentrated phosphoric acid is desired.

polypropylene $(\text{C}_3\text{H}_6)_n$ Polymerized propylene, a synthetic thermoplastic resin of relatively recent development but major importance. The lightest plastic. Highly crystalline in nature. The commercial material has a molecular weight of 40,000 or more ($n = 1000$ for such a molecular weight) and is isotactic to the extent of 60%. Syndiotactic polypropylene has also been made and has a higher melting point. Low

molecular weight propylene polymers are also known. The tri- and tetrapropylenes are used in large quantities as gasoline additives and detergent intermediates. Somewhat higher molecular weight branched chain atactic propylene polymers have been used as greases or lube oil additives.

Properties: Sp. gr. 0.90; m.p. 168-171°C (isotactic); heat distortion temperature 220°F at 66 psi; color white or yellow; greater tensile strength (3000-5000 psi) and rigidity than high density polyethylene; remains tough and flexible at low temperatures, good clarity and freedom from haze; high gloss; low vapor transmission; dielectric strength 660 volts/mil; low creep; good abrasion resistance; lustrous surface; resistant to attack by chemical agents; withstands steam sterilization; resists moisture, oils, and greases; water absorption less than 0.01%. Somewhat sensitive to light and oxidation, so that antioxidants and inhibitors must be used. Relatively difficult to process. Polypropylene is also available in the form of a hard high-melting wax.

Typical properties of film: Sp. gr. 0.884-0.901; tensile strength 3500-6000 psi; elongation over 300, tensile modulus 9000-118,000; moisture vapor transmission 0.48-0.72 g/100 sq in/24 hrs/mil; resistance excellent to acids and alkalis; very good to oils and greases. Films can be coated, printed, or metallized, can be biaxially oriented to increase clarity, stiffness, and gloss.

Flammability: Slow burning.

Derivation: Aluminum alkyl and titanium tetrachloride or equivalent catalysts are mixed with solvents and propylene is introduced at 15 to 600 psi pressure, with temperatures up to about 212°F. The product varies widely with conditions and with the catalysts used.

Forms: Available as molding powder pellets with and without modifiers and pigments; in extruded sheet (10 to 250 mils thickness); in cast film (1 to 10 mils in thickness); in extruded monofilament, in textile staple and continuous filament yarn.

Uses: Film for packaging; molded parts for use in automobiles, utensils and appliances, housewares, closures; pipe fittings, wire and cable coating, coated and laminated products; bottles, pipe and tubing; filaments and fibers for upholstery webbing, cordage, ropes, bristles, and olefin yarns.

polypropylenebenzene. See dodecylbenzene.

polypropylene glycol esters. See polyoxyethylene esters.

polypropylene glycols $\text{CH}_3\text{CHOH}(\text{CH}_2\text{OCHCH}_3)_n\text{CH}_2\text{OH}$ (general formula). Comparable to the polyethylene glycols, but more oil-soluble and substantially less water-soluble. Classified by approximate molecular weight, as 425, 1025, and 2025. Non-volatile, noncorrosive liquids; lower molecular weight members are soluble in water. All are solvents for vegetable oils,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

waxes, resins.

Uses: Hydraulic fluids; rubber lubricants; antifoam agents; intermediates in urethane foams, adhesives, coatings, elastomers; plasticizers; paint formulations.

See polyethylene glycols.

"Polyrad." ²⁶⁶ Trademark for a series of reaction products of "Amine D" and ethylene oxide; used as corrosion inhibitors in the production and processing of petroleum products; also for inhibiting hydrochloric acid.

polysiloxanes. See siloxanes.

"Poly-Solv." ⁸⁴ Trademark for a series of glycol ether solvents. See under individual names.

"Poly-Solv" EM. Ethylene glycol monomethyl ether, $\text{CH}_3\text{OCH}_2\text{CH}_2\text{OH}$.

"Poly-Solv" EE. Ethylene glycol monoethyl ether, $\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OH}$.

"Poly-Solv" EB. Ethylene glycol monobutyl ether, $\text{C}_4\text{H}_9\text{OCH}_2\text{CH}_2\text{OH}$.

"Poly-Solv" DM. Diethylene glycol monomethyl ether, $\text{CH}_3(\text{OCH}_2\text{CH}_2)_2\text{OH}$.

"Poly-Solv" DE. Diethylene glycol monoethyl ether, $\text{C}_2\text{H}_5(\text{OCH}_2\text{CH}_2)_2\text{OH}$.

"Poly-Solv" DB. Diethylene glycol monobutyl ether, $\text{C}_4\text{H}_9(\text{OCH}_2\text{CH}_2)_2\text{OH}$. Used as solvents in the production of paints, varnishes, cleaners, soluble oils, dry-cleaning soaps, insecticides and cutting oils.

"Poly-Solv" EE Acetate. Ethylene glycol monoethyl ether acetate, $\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OOCCH}_3$. Used as solvent for paints and lacquers to give bluish resistance and flow out. Has numerous other solvent uses requiring slow rate of evaporation.

"Poly-Solv" D2M. Diethylene glycol dimethyl ether, $(\text{CH}_3\text{OCH}_2\text{CH}_2)_2\text{O}$. Used as anhydrous reaction medium for organo-metallic syntheses.

polysorbate 80 (polyoxyethylene (20) sorbitan mono-oleate; sorbitan mono-oleate polyoxyethylene). An oleate ester of sorbitol and its anhydrides condensed with polymers of ethylene oxide consisting of approximately 20 oxyethylene units. See also polyoxyethylene sorbitan fatty acid esters.

Properties: Lemon-to-amber colored, oily liquid; sp gr. 1.06-1.10, faint characteristic odor, warm, somewhat bitter taste; very soluble in water; soluble in alcohol, cottonseed oil, corn oil, ethyl acetate, methanol, and toluene, insoluble in mineral oil.

Grade: U.S.P. XVI.

Use: Emulsifier and dispersing agent.

"Polysperm 300." ²²¹ Trademark for an industrial sperm oil product containing a mixture of oxidized, polymerized, hydroxylated, and possibly epoxidized, higher fatty alcohol esters of fatty acids, and some triglycerides. Used in leather and textile chemicals, rust preventives, drawing compounds, lubricants and cordage manufacture.

polystyrene ($\text{C}_6\text{H}_5\text{CHCH}_2$)_n. Polymerized styrene, an important synthetic resin or plastic. When molded is a transparent glass-like material. Also available as rigid foam.

Properties: Water-white in color; very tough; has highest insulating power of the more common synthetic resins; soluble in aromatic hydrocarbons, chlorinated hydrocarbons and esters, very low water absorption; high mechanical strength.

Forms: Unmodified polystyrene contains only lubricants, stabilizers, plasticizers, and fillers to aid processing and properties. Heat resistant polystyrene includes also some alpha-methylstyrene copolymer. Impact resistant types contain butadiene copolymer; solvent and chemically resistant types are made with acrylonitrile as copolymer. See also ABS resins.

Uses: Major use is for refrigerators and air conditioners. Other uses are for packaging and foams, for containers or lids, dishes, tumblers, handles, fan blades, wall tile, signs, cabinets, and housings, sound records, impregnation of electric coils, lamination of fabrics, bonding of abrasives.

"Polysulfide." ²⁸ A sodium sulfuret similar to liver of sulfur, having a sodium base instead of a potassium base. Yellow to yellow-green powder, sodium polysulfide content, 56% min; total sulfur, 50.7% min. Containers: 10-lb tins (6/case); 100-lb drums. Uses: For coloring copper and brass; for stripping copperplated deposits; for purifying cyanide plating solutions.

polysulfide rubbers. Synthetic polymers obtained by the reaction of sodium polysulfide with organic dichlorides such as dichlorodimethyl formal, alone or mixed with ethylene dichloride. The polysulfide rubbers are outstanding for their resistance to light, oxygen, oils, and solvents and for their impermeability to gases. In general, they have poor tensile strength and abrasion resistance but are resilient and have excellent low temperature flexibility. A recent use is as binder and fuel in solid propellants.

See also "Thiokol."

"Poly Tergent" B, G. ⁸⁴ Trademark for a series of nonionic surface active agents consisting of ethoxylated nonyl or octyl phenols.

Properties: Pale yellow liquids; sp.gr. 1.02-1.06 (25/25°C), cloud point of 1% aqueous solution ranging from below 0° to 90°C; soluble or dispersible in water.

Uses: Emulsifiers, dispersing, wetting and foaming agents for petroleum oils, paraffins, chlorinated derivatives, aromatics, vegetable and pine oils.

"Poly Tergent" J. ⁸⁴ Trademark for a series of polyethoxylated higher alcohols.

Properties: Yellow or amber liquids; mild pleasant odor; sp.gr. 1.01-1.06 (25/25°C); cloud point from 0° to over 100°C (1% aqueous solution). Soluble or dispersible

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in water.

Uses: Emulsifiers; co-emulsifiers; wetting agents; detergents and stabilizers for corn oil, kerosene, xylene, fatty acids and systems containing other synthetic detergents, soaps, detergent builders, acids, alkalies and polyvalent metallic salts.

"Poly Tergent" LF. ⁸⁴ Trademark for polyethoxy ether with low foaming properties.

polyterpene resins. A class of thermoplastic resins or viscous liquids of amber color, obtained by polymerization of turpentine in the presence of catalysts such as aluminum chloride or mineral acids. Unpolymerized material is removed by distillation at reduced pressure. The resins consist essentially of polymers of alpha- or beta-pinene and are soluble in most organic solvents.

Uses: Paints; wax polishes, rubber plasticizers; curing concrete, impregnating paper.

polytetrafluoroethylene (PTFE) (C₂F₄)_n. A polymer, plastic or resin, abbreviated PTFE, derived from tetrafluoroethylene, C₂F₄. Sometimes called TFE fluorocarbon resin. Available as resin powder, as sheets, rods, tape, and as aqueous dispersions and films. The material has a waxy texture, is opaque with a milk-white color. It can be molded by special techniques involving mixing with a diluent that is subsequently removed. Sintering is then used to consolidate the molded object. The PTFE is nonflammable, highly resistant to oxidation and action of chemicals, including strong acids, alkalies, oxidizing agents. It retains useful properties from -450° to +550°F and is strong and tough. It has an almost uniquely low coefficient of friction, and anti-stick properties.

Uses include gaskets, seals, electrical component insulation, coatings, linings for drums and containers, valve seats, bearings and packings, spacers for coaxial cable, laminates, diaphragms, molded parts of pumps and fittings, tubing and hose, coverings where stickiness must be avoided as on heat sealing guides and plates, bakery rolls, candy molds.

polythene. Generic name for polyethylene (q. v.) used as plastics. The word is no longer current in the United States, but is still used in England.

polyurethane foams. The foam form of polyurethane resins. May be either rigid or flexible, hard and abrasive, or soft and resilient, depending upon components, fillers, and method of foaming.

A polyether such as polypropylene glycol, or a propylene oxide derivative of glycerol or sorbitol, a polyester, or similar material is treated with a diisocyanate in the presence of some water and a catalyst (amines, tin soaps, organic tin compounds) as well as fillers, dispersing and emulsifying agents, and other substances. Simultaneously with the polymer-forming

reactions, the water reacts with the isocyanate groups to cause cross linking and curing, and also produces carbon dioxide which causes foaming. In other cases trifluoromethane or similar volatile material is incorporated to serve as blowing agent, and to reduce the thermal conductivity of the finished foam.

The rigid foams when formed inside thin shells of metal, fabric, etc., add great strength and rigidity at little increase in weight. The flexible foams are unusual in having high strength, good heat insulating properties, resistance to water, oil, solvents, and abrasion.

Uses: Airplane construction; padding for mattresses and upholstery; interlinings for overcoats and sleeping bags; sound-proof walls, insulation against heat loss; life preservers; fish net floats; foam rubber applications; cigarette and air filters; packaging; bone surgery; have been suggested for tires.

polyurethane resins (isocyanate resins).

Synthetic polymers that may be either thermoplastic or thermosetting, and that range from soft and rubberlike to hard and brittle, usually made by action of tolylene diisocyanate or another diamine with polyols, polyethers, polyesters or other materials containing hydroxyl (OH) groups. The polyethers such as propylene or ethylene oxide derivatives are of increasing importance.

Properties: The polymers are made as flexible or rigid foams, flexible and stiff fibers (see spandex), coatings and linings, and as elastomers. These serve as foams of all kinds, insulation, reinforcing fillers, as adhesives, binders and sealers. The foams can be formed in place without heat or pressure, but in other applications heat is used. Density ranges from 2 to 30 lbs/cu ft.

Derivation: The basic polymer unit is formed as follows:

If R₁ has a second CNO group and R₂ has a second OH group, further chain growth occurs. Cross linking takes place if R₂ has three or more OH groups. Many variations are possible and in use.

See also polyurethane rubber; polyurethane foams.

polyurethane rubber (polyester rubber). A non-foamed or solid but flexible type of polyurethane resins.

Properties: High abrasion resistance, strength, hardness, solvent resistance, resistance to oxygen aging, good flexibility, elasticity and shock absorption. Somewhat affected by high and low temperatures and by hot water or steam. Easily cast into complex shapes.

Uses: Development items.

polyvinyl acetal resins. General name for resins formed by the condensation of acetaldehyde or any other aldehyde with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

polyvinyl alcohol, obtained in turn by partial hydrolysis of the polyvinyl acetate. The physical and chemical properties of the polyvinyl acetals can be varied greatly by: (1) the molecular weight of the starting polyvinyl acetate, (2) the degree of hydrolysis, (3) the degree of acetal formation. The polymers contain varying percentages of acetate, hydroxyl and acetal groups. The aldehydes commonly used are formaldehyde, acetaldehyde and butyraldehyde, producing polyvinyl formals, acetals, and butyrals, respectively. See descriptions following:

Polyvinyl formals: Usually almost completely hydrolyzed and completely reacted with formaldehyde. Soluble in water, dioxane, chlorinated hydrocarbons, acetic acid, mixtures of polar and non-polar substances, insoluble in alcohol, benzene, toluene, etc.

Uses: Mainly in lacquers; coatings, impregnations; but may be used for molding and casting. They have high softening temperatures and poor water resistance. Available in several grades.

Polyvinyl acetals: Slightly yellow; soluble in lacquer solvents and aromatic hydrocarbons; insoluble in water and aliphatic hydrocarbons.

Uses: In lacquers, coatings, films, and adhesives. May be compression and injection molded. May be used as a photographic film base and for decorative articles. Available in several grades, and in rod, sheet and tube forms.

Polyvinyl butyral: White granules generally high in acetal content; soluble in esters, alcohols, ketones, and chlorinated hydrocarbons; insoluble in water and hydrocarbons; stable in dilute alkali, but not in acid. The butyral resin with high hydroxyl content is the best safety-glass interlayer available. Its extreme toughness, adhesiveness, clarity and water resistance make it ideal for the manufacture of safety glass and bulletproof glass, and also making shatterproof laminates of methyl methacrylate resins. It retains its toughness and flexibility at very low temperatures. It is also used in strippable coatings; anti-fouling paints; waterproofing fabrics; adhesives.

All the resins are also used in molding compounds and for textile coatings and waterproofing, adhesives, laminations. They have good compatibility with plasticizers and can be modified by the addition of thermosetting materials, such as phenolics, to raise water resistance and softening temperature. Unusual characteristics of toughness, resiliency, and thermal and abrasion resistance have been produced in this way.

Available in various grades and forms.

polyvinyl acetate (PVAc) $(H_2C:CHOOCCH_3)_x$.

A synthetic resin.

Properties: Colorless, odorless, tasteless, nontoxic, transparent, thermoplastic solid; sp. gr. 1.19 at 15°C; insoluble in water, gasoline, oils and fats; soluble in

low molecular weight alcohols, esters, benzene, chlorinated hydrocarbons, ketones.

Derivation: Polymerization of vinyl acetate with peroxide catalysts. Produced by emulsion polymerization, solution polymerization, suspension and bulk polymerization.

Grades: Available as beads or pearls, powder, solutions, emulsions and latex.

Uses: Major use is in latex water paints because of low cost, stability to weathering, self-priming character, quick drying and easy recoatability. Also used in large quantities for hot melt and solution adhesives, as an intermediate for conversion to polyvinyl alcohol and acetals, for sealing, for coating and finishing fabrics, as a binder for nonwoven fabrics, as a component of lacquers, inks, and plastic wood, and as a strengthening agent for cements.

polyvinyl alcohol (PVA, PVOH) $(-CH_2CHOH-)_x$.

A water-soluble synthetic resin made by hydrolysis of polyvinyl acetate. As recovered from the polymerization process the resin is a white to cream-colored powder; density 1.21-1.31 g/cc at 20°C. It is produced in a number of grades whose properties depend on degree of hydrolysis and on molecular weight or viscosity.

Forms and Properties: The resin powder is used to a large extent in the form of a water solution; or may also be converted into molded objects and into cast and extruded sheets, rods, films and thread. The water solutions are stable over considerable periods of time. Films and coatings made from these solutions are colorless and clear, tough and abrasion-resistant, unaffected by oils, greases, fats, hydrocarbons, and most organic solvents. They possess a high degree of impermeability to gases and air, and have good adhesive properties.

Composition: Even in "completely hydrolyzed" polyvinyl alcohol only about 95% of the acetate groups have been replaced by OH groups.

Typical properties of plastic film: Sp. gr. 1.21-1.31; refractive index approx. 1.50 (n 25/D); tensile strength 7800-8000 psi; elongation 180-250%; good resistance to sunlight; poor resistance to acids, alkalies, water and dampness; darkens slowly if heated above 100°C.

Flammability: Moderate.

Containers (resin powder): 10-, 25-lb cartons; 50-lb multiwall bags; 100-lb drums.

Uses: Textile warp size; size for nylon and rayon knitting yarns; binder for pigmented paper coatings; greaseproofing paper; paper size; size on paperboard for high gloss printing; base materials for water-resistant laminating adhesives; non-blocking, re-moistenable adhesives; adhesives and binders for leather, cloth, nonwoven fabrics, and paper; pigment binder; temporary protective coatings; molded products; emulsifying agents; emulsion stabilizer and thickener; photosensitive films;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

intermediate for polyvinyl butyral and other polyvinyl acetals.

polyvinyl butyral (polyvinyl butyral acetal). See polyvinyl acetal resins.

polyvinyl butyral resin sheeting. Soft, pliable sheeting composed essentially of polyvinyl butyral resin and plasticizer. Several types are manufactured, differing in identity and proportion of plasticizer. The sheeting is made in thicknesses from 0.015 to 0.030 inch and is supplied in continuous lengths of various widths. The surface has embossed pattern, and is dusted with powdered sodium bicarbonate to prevent sticking to itself in the roll. As interlayer in safety glass, the sheeting is transparent and colorless, and highly resistant to moisture and to the light and heat of the sun. Since it remains extremely flexible, tough and stretchable over a wide range of temperatures, it yields without breaking when the glass is broken by impact, and, since it forms a strong bond with the glass, it holds the broken pieces together.

Uses: The commercial products are designed primarily for use as interlayer in safety glass, in bullet-resistant glass, and in shatter-resistant acrylic sheeting for aircraft, and in implosion shields for television. Some sheeting is used as a die-covering in metal-shaping.

polyvinyl carbazole. A brown, thermoplastic resin obtained by the reaction of acetylene with carbazole. It softens about 150°C, has excellent electrical properties, good heat and chemical stability, but poor mechanical strength. It is used principally as a substitute for mica in electrical equipment and as an impregnant for paper capacitors.

polyvinyl chloride (PVC) $(-H_2CCHCl-)_n$. A common and widely used synthetic thermoplastic resin.

Properties: White powder or colorless granules or pearls which can be converted by heat and pressure into colorless sheets or films. These are tasteless, odorless, resistant to action of chemicals including moisture and air, flame retarding, dimensionally stable. They do not absorb or dissolve either oil or water, are insoluble in water and most organic solvents, but somewhat soluble in methyl ethyl ketone and phorone. The properties vary widely with the method of polymerization. Small amounts of stabilizers (lead, zinc, barium, calcium, tin compounds, epoxy compounds) are added during manufacture to prevent slow decomposition involving liberation of hydrogen chloride. The finished product is relatively hard, brittle and horn-like at 0°C unless plasticizers are added. These are usually nonvolatile esters, low molecular weight resins, or certain rubbers.

Derivation: By polymerization of vinyl chloride monomer with peroxide catalysts.

Uses: The resin is converted into final form by calendering, extrusion, molding, and by coating from solutions, dispersion or latexes, and by fluid bed coating.

In rubber-like final form it appears as electric wire insulation and sleeving, garden hose and other tubing, gaskets, wetting, and flexible piping; in film form it appears in rainwear, aprons, and other garments, curtains and draperies, garment bags, hospital sheeting, upholstery, handbags and belts; it is coated on fabrics to be used as auto upholstery, clothing and wall coverings; one of the largest uses of rigid shapes is as floor tile and for related floor coverings; rigid shapes and sheets are also used as decorative panels, luminous ceilings, and for phonograph records, electrotpe molds, display items, and packaging; as pipe in chemical plants, breweries and similar processing plants, and for pipe lines for gas, oil, water, and electrical conduits because of corrosion resistance, smooth inside surface and weight savings. Extruded rigid shapes are used as window frames and tracks, baffles, decorative moldings, relief maps, luggage, book bindings, etc. In foam or expanded form it is used for padding and cushions and for fishing floats; the latex is also used to coat or impregnate paper, fabric and leather to improve abrasion resistance, strength, chemical and flame resistance. Films and sheets are sometimes laminated to metal.

polyvinyl chloride-acetate. A synthetic resin made by copolymerizing vinyl chloride and vinyl acetate, to obtain a polymer that is inherently more flexible than polyvinyl chloride. The copolymer resin usually contains 85 to 97% of the chloride. It is produced as sheets, rods, tubes, granules, powder, and dispersions, and is generally similar in properties and uses to polyvinyl chloride.

polyvinyl dichloride. A modified vinyl resin, possibly chlorinated polyvinyl chloride, with improved high temperature and chemical stability properties.

See "Geon, Hi-temp."

polyvinyl fluoride $(-H_2CCHF-)_n$. Polymer of vinyl fluoride. In film form it is characterized by superior resistance to outdoor weather, toughness, and chemical resistance, as well as flexibility. Such film is of potential use as a replacement for paint and as an outdoors protective coating for siding and roofs, and for glazing, packaging, and electrical uses. The film has a high dielectric constant and is resistant to thermal and hydrolytic decomposition. The film has low permeability to air and water.

Properties: (1.5 mil film) Tensile strength 13,000 psi at 25°C, 6000 psi at 100°C; elongation, 150% at 25°C, 165% at 100°C; impact strength, 5 kg-cm/ml at 25°C; flex life 70,000 cycles at 25°C, 40,000 at

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

-17°C; dielectric constant 7.5 at 60 cps.

See, for example, "Tedlar."

polyvinyl formals. See polyvinyl acetal resins.

polyvinylidene fluoride $(-\text{CH}_2\text{CF}_2-)_n$. A thermoplastic resin suitable for compression and injection molding and extrusion. Also can be applied from a dispersion. Crystalline melting point is 340°F; thermally stable at 650°F. Useful for packaging films, extruded jackets, insulation for high temperature wire, chemical tanks and autoclave linings. Tensile strength at 77°F, 7000 psi; yield stress 5500 psi; elongation 300%; compressive strength 10,000 psi; thermal conductivity 1.05 Btu/hr/sq ft/°F/in.; water absorption 0.04% in 24 hours; sp. gr. 1.76; refractive index 1.42.

polyvinyl isobutyl ether (PVI)
 $[-\text{CH}_2\text{CHOCH}_2\text{CH}(\text{CH}_3)_2-]_n$.

Properties: White, opaque elastomer or viscous liquid depending on molecular weight range; almost odorless. Soluble in hydrocarbons, esters, ethers, higher alcohols, and ketones. Insoluble in water and lower alcohols. Contains trialkylphenol stabilizer.

Typical specifications:

(1) High molecular weight PVI: white, rubbery sheets dusted with talc, density 0.93, brittle point -19° to +17°C, elongation at break approx. 500%.

(2) Medium molecular weight PVI: very viscous liquid; density 0.91, refractive index 1.46, softening point 44-46°C.

(3) Low molecular weight PVI: viscous liquid; density 0.85, refractive index 1.45.

Derivation: Polymerization of vinyl isobutyl ether.

Grades: As 100% material in three molecular weight ranges.

Containers: Fiber drums or open head steel drums.

Uses: Because of its adhesiveness, electrical properties and plasticity, for adhesives, waxes, tackifiers, plasticizers, surface coatings, laminating agents, cable filling compositions, lubricating oils.

Shipping regulations: None.*

polyvinyl methyl ether (PVM)
 $[-\text{CH}_2\text{CHOCH}_3-]_n$.

Properties: Light yellow to amber colored balsam-like tacky liquid; soluble in cold water, insoluble in hot water, soluble in most organic solvents except noncyclic hydrocarbons. Compatible with a wide range of synthetic and natural latices. Sp. gr. 1.05; refractive index 1.47; brittle, non-tacky solid at about 0°C. Very low toxicity.

Derivation: Polymerization of vinyl methyl ether.

Grades: Available as 100%, 50% aqueous solution, 50% toluene solution, 50% isopropanol solution.

Containers: Open head steel drums.

Uses: Component in pressure-sensitive and hot-melt adhesives for paper, polyethylene, polymer emulsions and rubbers, surface

coating tackifier and plasticizer, heat sensitizer for natural and synthetic rubbers. Shipping regulations: PVM 100% and aqueous solutions: None; toluene and isopropanol solutions: Flammable liquid. Red label.*

polyvinyl methyl ether-maleic anhydride.
 See PVM/MA.

polyvinylpyrrolidone (PVP) $(\text{C}_6\text{H}_5\text{NO})_n$.

Properties: A freely-flowing white amorphous powder; soluble in water, chlorinated hydrocarbons, alcohols, amines, nitro-paraffins, and lower molecular weight fatty acids. Sp. gr. 1.23-1.29; viscosity range K20-90 (Fikentscher).

Derivation: Prepared by a Reppe synthesis; butynediol is formed by the action of acetylene on formaldehyde at high pressure. Butynediol is hydrogenated to form butanediol which is then dehydrogenated over copper at 200°C to form gamma-butyrolactone. This is then ammoniated to form alpha-pyrrolidone. Vinylation and polymerization complete the process.

Uses: Pharmaceuticals; medicine (synthetic blood plasma); cosmetics (hair spray, etc.); dye stripping agent; textile finish; protective colloid, detergent; food stabilizer or thickener; substitute for natural gums; beer and wine clarification.

polyvinyl resins. See vinyl plastics.

"Polywood." ⁴⁴⁸ Trade name for polyester coatings for wood furniture and other wood products.

"Polyzime" P. ²¹² Trademark for a product containing diastatic and proteolytic enzymes. Properties: Dry, fine white powder, fully water soluble, non-hazardous; nonflammable; optimum pH for diastatic reaction, 7.0-7.2; for proteolytic reaction 7.5-8.0; optimum temperature 45°C.

Grades: Technical.

Packages: 1-, 5-, 10-, and 25-lb containers.

Uses: Desizing of textile fabrics preparatory to dyeing, bleaching, mercerizing, printing and finishing.

pomade. A perfumed oil or fat.

pomegranate bark. See granatum.

Pompeian red. Red pigment consisting, essentially, of ferric oxide. See iron oxide reds.

Pompey red. See iron oxide reds.

Ponceau 3R $(\text{CH}_3)_3\text{C}_6\text{H}_2\text{NNC}_6\text{H}_4(\text{OH})(\text{SO}_3\text{Na})_2$. Sodium cumeneazo-beta-naphthol disulfonate. A water-soluble red dye, C.I. No. 80.

Properties: Dark-red powder. Soluble in water and acids to form a cherry-red solution; slightly soluble in alcohol; insoluble in alkalis.

Use: Dyeing wool.

"Ponsol." ²⁸ Trademark for a line of vat dyes derived from anthraquinone. Used for dyeing and printing of cotton, rayon, and silk and characterized by excellent

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fastness properties. Under controlled conditions, they can be applied to wool. Also used to a limited extent on certain classes of paper.

"Pontachrome." ²⁸ Trademark for a line of colors used on wool and nylon. Dyed by forming lakes on the fiber. Used largely on materials such as mens' suitings and overcoatings.

"Pontacyl." ²⁸ Trademark for a line of colors for wool, nylon, silk and "Orlon" acrylic fiber. Dyed in an acid bath. Produce bright shades and are used largely on materials for women's wear, bathing suits, sweater yarns, upholstery fabrics, etc.

"Pontamine." ²⁸ Trademark for a line of direct dyeing colors for all fibers, except acetate. Also applied to paper and leather. Certain types, after dyeing, are diazotized and developed with various "Pontamine" developers with resultant improvement in fastness, particularly to washing.

"Pontamine" Whites. ²⁸ Trademark for fluorescent whitening agents that produce brilliant optical bleaches having outstanding wetfastness properties when applied to cotton and rayon. Also used in soaps, detergents, etc.

pontianak gum (jelutong). A copal.

Derivation: From species of *Dyera* indigenous to Malacca and Borneo and from the guayule from Parthenium, a shrub indigenous to the Chihuahua Desert of Mexico.

Properties: Grayish-white mass similar to burned lime, contains about 60% water; up to 25% rubberlike material.

Grades: Chips, nubs.

Containers: Bags.

Uses: Rubber manufacture; chewing gum, adhesives; lacquers; linoleum; varnishes and paints.

Shipping regulations: None.*

"Pontocaine" Hydrochloride. ¹⁶² Trademark for tetracaine hydrochloride.

poplar bud. The air-dried, closed winter leaf bud of *Populus candicans*, known in commerce as balm of Gilead buds, or of *Populus tacamahacca*, known in commerce as balsam poplar buds.

Properties: Pleasant and balsamic odor and aromatic, bitter taste.

Grade: N.F. XI.

Use: Medicine.

POPOP. Abbreviation for phenyl-oxazolyl-phenyl-oxazolyl-phenyl. See 1,4-bis[2-(5-phenyloxazolyl)]-benzene.

poppy capsules. See papaver.

poppy heads. See papaver.

poppy oil (poppy-seed oil).

Properties: Very pale golden yellow liquid; pleasant taste and odor. Soluble in ether, chloroform, petroleum ether, and carbon disulfide. Sp.gr. 0.924-0.928; saponifi-

cation value 189-196; iodine value 133-157; refractive index 1.4751-1.4773.

Derivation: By expressing the seed of the poppy, *Papaver somniferum*, *P. album* and *P. nigrum*.

Method of purification: Filtration.

Grades: Crude; red; white.

Containers: Barrels.

Uses: Food oil; artist's colors; adulterant for olive oil; soap stock; varnishes; lubricant.

Shipping regulations: None.*

poppy-seed oil. See poppy oil.

porcelain. Ceramic ware made largely of baked clay (kaolin) coated or glazed with a fusible substance.

porcelain clay. See kaolin.

Porcelain Enamels for Aluminum. ²⁸ Vitreous frits which fire at 521-538°C (970-1000°F) for use on aluminum alloys. Enamels have excellent resistance to impact, chemical attack, thermal shock, and salt-water corrosion.

Containers: 25-, 50-, 100-, and 200-lb fiber drums.

Use: To impart chemical resistance, dielectric strength, and color to aluminum alloys.

"Porocel." ⁹⁹ Trademark for a hard, highly adsorbent, high surface area, activated bauxite utilizing either foreign or domestic ores. Supplied in various standard meshes, moisture contents, and in regular, low iron and low silica grades.

Uses: Recommended generally as an adsorbent, catalyst, and catalyst carrier. Used as a lubrication oil and wax percolation medium; vapor phase desulfurization catalyst; naphtha reforming catalyst; purification medium for H₂SO₄ alkylate, aluminum chloride, ferric chloride, copper chloride, nickel, molybdena, or chromia; refining medium for sugar liquors and syrups. Used to recover elemental sulfur from refinery, smelter, or natural gas, and as an agent for the removal of fluoride contaminants from hydrocarbon streams.

porphine. The basic molecule for porphyrins. Consists of four pyrrole rings with four carbons in a single large ring.

porphyrins. Organic compounds of extreme importance in the maintenance of both animal and plant life. Porphyrins are colored pyrrole derivatives which occur universally in protoplasm, where they form the basis of the respiratory pigments. They have the ability to combine with metals, especially iron and magnesium, to form metalloporphyrins. For example, protoporphyrin bound to reduced iron forms the heme of hemoglobin. Hemoglobin and the cytochromes contain the iron-porphyrins while the chlorophylls contain the magnesium-porphyrins.

porpoise oil (dolphin oil).

Properties: Pale yellow liquid; sp.gr. 0.926-0.929; saponification value about 290; the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

iodine value varies with the part of the porpoise body used; jaw blubber 27, face blubber 22, body blubber 103. Soluble in ether, chloroform, benzene and carbon disulfide.

Derivation: By boiling the blubber of the brown porpoise.

Grades: Technical; also sold as body oil, jaw oil and junk oil (from the face blubber).

Containers: Wooden barrels; steel drums; tins.

Uses: Lubricant; soap stock; leather dressing; illuminating oil. The oil from the jaw blubber is used as a lubricant for watches and chronometers and is known as watch oil.

"Portite." ³²⁶ Trade name for corrosion-resistant masonry sulfur-base cement.

Portland cement. See cement, Portland.

Portugal orange. See orange peel, sweet.

positron. A fundamental particle identical in all aspects with the ordinary electron except that it carries a positive rather than a negative electrical charge. It is not stable in matter since it is annihilated by a negative electron to produce two quanta of radiant energy. See fundamental particle.

positronium. A positron associated with an electron during a very short period before the two interact to annihilate one another with the production of equivalent energy.

posterior pituitary. See pituitary.

potash. The word potash originally was applied to potassium carbonate recovered from wood ashes. The word is often used in trade in connection with any material containing the element potassium. The potash value is expressed as the equivalent amount of the oxide K_2O .

Sources of potassium: Stassfurt and Alsatian deposits of carnallite, kainite, and sylvinit; the Carlsbad, New Mexico, deposits of sylvinit and polyhalite; the Searles Lake, California, brines (4.7% KCl), Utah alunite. Other sources are: dust from cement kilns, dust from blast furnaces; ashes from molasses, sugar beet pulp residues, kelp and wood, flotation processes.

Since potassium is essential for the growth of plants, a large potash source is needed to supply the fertilizer industry.

potash alum. See aluminum-potassium sulfate.

potash blue. A pigment related to Prussian blue. Prepared by mixing potassium ferrocyanide and ferrous sulfate and oxidizing the resulting ferrous ferrocyanide.

Grade: C.P.

Containers: Barrels.

Use: In making carbon paper.

potash, caustic. See potassium hydroxide.

potash chrome alum. See chromium-potassium sulfate.

potash feldspar. See feldspar.

potash magnesia double salt. A material containing potassium carbonate, magnesium sulfate and a low proportion of chloride, containing 20-30% K_2O and used as a fertilizer.

potash muriate. Old term for potassium chloride.

potash, sulfurated (liver of sulfur; potassium, sulfurated; sulfurated potash). A mixture composed chiefly of potassium polysulfides and potassium thiosulfate, containing not less than 12.8% sulfur in combination as sulfide.

Properties: Liver brown when freshly made, changing to a greenish yellow; odor of hydrogen sulfide; bitter, acrid, and alkaline taste; decomposes upon exposure to air; soluble in water leaving a residue.

Grade: U.S.P. XVI.

Use: Medicine; production of decorative color effects on brass, bronze and nickel.

potassa. See potassium hydroxide.

potassio-cupric chloride. See copper-potassium chloride.

potassium (kalium) K. Element of atomic number 19, group Ia of the periodic system; one of the alkali metals. Potassium 40 is a naturally occurring radioactive isotope. The synthetic isotope, potassium 42, is used in tracer studies, primarily in medicine.

Properties: Soft, silvery metal; rapidly oxidized in moist air; igniting spontaneously if warm enough; reacts vigorously with water, acids, halogens. Must be kept submerged in liquids containing no oxygen, e.g., kerosene. Sp.gr. 0.862; m.p. 63°C; b.p. 770°C. Soluble in liquid ammonia, aniline, mercury, and sodium.

Source: See potash.

Derivation: Thermochemically by distillation of potassium chloride with sodium.

Grades: Technical.

Containers: 1-lb boxes and bottles; 50-, 250-lb drums.

Uses: Preparation of potassium peroxide; heat exchange alloys (see NaK).

Fire hazard: Dangerous.

Shipping regulations: Flammable solid. Yellow label.*

potassium abietate $KO_2CC_{19}H_{29}$. Water soluble soap resulting from action of rosin and potassium hydroxide. Used as a pesticide.

potassium acetate $KC_2H_3O_2$.

Properties: White, crystalline deliquescent powder; saline slightly alkaline taste. Keep well stoppered. Soluble in water and in alcohol; insoluble in ether. Solutions alkaline to litmus but not to phenolphthalein. M.p. 292°C.

Derivation: By the action of acetic acid on potassium carbonate.

Impurities: Chlorides; sulfates; heavy metals.

Grades: Pure; pure fused; C.P.; N.F. XI; reagent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Bottles; drums.

Uses: Dehydrating agent; textile conditioner; reagent in analytical chemistry; medicine; acetone; cacodylic derivatives; crystal glass.

Shipping regulations: None.*

potassium acid carbonate. See potassium bicarbonate.

potassium acid fluoride. See potassium bifluoride.

potassium acid oxalate. See potassium binoxalate.

potassium acid phosphate. See potassium phosphate, monobasic.

potassium acid saccharate

$\text{HOOC}(\text{CHOH})_4\text{COOK}$.

Properties: Light, off-white powder, pH of solution, 3.5; soluble in hot water, acid, or alkaline solutions.

Uses: Chelating agent; in rubber formulations; in metal plating, in soaps and detergents.

potassium acid sulfate. See potassium bisulfate.

potassium acid sulfate, anhydrous. See potassium pyrosulfate.

potassium acid sulfite. See potassium bisulfite.

potassium acid tartrate. See potassium bitartrate.

potassium allylmercaptomethyl penicillin. See penicillin.

potassium alum. See aluminum-potassium sulfate.

potassium aluminate $\text{K}_2\text{Al}_2\text{O}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Hard crystals, lustrous. Soluble in water with hydrolysis to form strongly alkaline solution; insoluble in alcohol.

Derivation: By fusing potassium hydroxide with aluminum oxide.

Grades: Technical.

Uses: Dyeing, printing (mordant); lakes, paper sizing.

potassium aluminosilicate. See feldspar.

potassium aluminum fluoride K_3AlF_6 .

Properties: White powder, slightly soluble in water; poisonous!

Derivation: Aluminum fluoride, ammonium fluoride, and potassium chloride.

Containers: Fiber cans.

Use: Insecticide.

Shipping regulations: None.*

potassium-aluminum sulfate. See aluminum-potassium sulfate.

potassium anhydrosulfate. See potassium pyrosulfate.

potassium antimonyl tartrate. See antimony-potassium tartrate.

potassium arsenate (Macquer's salt) KH_2AsO_4 .

Properties: Poisonous! Colorless crystals; sp. gr. 2.867; soluble in water; insoluble in alcohol.

Uses: Manufacture of fly paper; insecticidal preparations; as laboratory reagent; preserving hides; printing textiles.

Shipping regulations: Class B poison. Poison label.*

potassium arsenite (potassium metarsenite).

Approx. $\text{KH}(\text{AsO}_2)_2$.

Properties: White powder; hygroscopic; decomposes slowly in air. Variable composition. Caution! Very poisonous! Keep well stoppered! Soluble in alcohol, water.

Grades: Technical; reagent.

Uses: Analysis; medicine; mirrors.

Shipping regulations: Class B poison. Poison label.*

potassium aurate KAuO_2 .

Properties: Yellow crystals; soluble in water.

Derivation: Gold oxide dissolved in potassium hydroxide solution.

Uses: To prepare other gold compounds.

potassium auribromide. See gold-potassium bromide.

potassium aurichloride. See gold-potassium chloride.

potassium auric iodide. See gold-potassium iodide.

potassium-beryllium fluoride. * See beryllium-potassium fluoride.

potassium bicarbonate (potassium acid carbonate; known as baking soda in some countries) KHCO_3 .

Properties: Colorless, odorless, transparent crystals or white powder; slightly alkaline, salty taste. Soluble in water and potassium carbonate solution; insoluble in alcohol. Sp. gr. 2.17; m. p., dec. between 100° and 120°C .

Derivation: By passing carbon dioxide into a solution of potassium carbonate in water.

Grades: Commercial; highest purity; U.S.P. XVI, reagent; technical.

Containers: 25 to 250-lb drums; 220-lb barrels; 700-, 784-lb casks.

Uses: In baking instead of yeast or baking powder; medicine; manufacture of pure potassium carbonate, fire-extinguishing agent for jet, petroleum and chemical fires.

Shipping regulations: None.*

potassium bichromate. See potassium dichromate.

potassium bifluoride (potassium acid fluoride; Frey's salt) KHF_2 .

Properties: Colorless crystals; decomposed by heat; corrosive and poisonous! Soluble in alcohol (dilute), water; insoluble in alcohol (absolute).

Grades: Technical.

Uses: Etching glass; production of fluorine; flux in metallurgy.

potassium binoxalate (potassium acid oxalate; acid potassium oxalate; salt of sorrel; salt of lemon; sorrel salt) $\text{KHC}_2\text{O}_4 \cdot \frac{1}{2} \text{H}_2\text{O}$.

Properties: White crystals; bitter, sharp taste; somewhat hygroscopic; poisonous! Soluble in water; sp. gr. of the anhydrous

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

salt 2.088; m.p., decomposes when heated.

Derivation: Neutral potassium oxalate and oxalic acid are dissolved in water and crystallized.

Method of purification: Recrystallization.

Grade: Technical; C.P.

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 300-, 700-lb barrels.

Uses: Removing ink stains; scouring metals; cleaning wood; photography; bleaching straw.

Shipping regulations: None.*

potassium biphosphate. See potassium phosphate, monobasic.

potassium-bismuth tartrate (bismuth-potassium tartrate).

Properties: White, granular powder. Odorless; sweet taste; variable composition. Contains 60 to 64% bismuth. Decomposed by dilute mineral acid; darkens when exposed to light. Soluble in water; insoluble in alcohol, chloroform, ether.

Use: Medicine.

potassium bisulfate (acid potassium sulfate; potassium acid sulfate) KHSO_4 .

Properties: Colorless crystals; the fused salt is deliquescent. Soluble in water, yielding a solution with acid reaction; decomposes in alcohol. Sp.gr. 2.245; m.p. 200°C; b.p., decomposes.

Derivation: (a) By heating potassium sulfate with sulfuric acid; (b) by heating potassium chloride with sulfuric acid to a moderate heat.

Method of purification: Crystallization.

Impurities: Heavy metals, chlorine; arsenic.

Grades: Commercial, technical; reagent; fused; highest purity; medicinal.

Containers: Glass bottles, barrels; multiwall paper sacks.

Uses: Conversion of tartrate of lime, wine lees and tartrates into potassium bitartrate; food preservative, flux; manufacture of mixed fertilizers by double decomposition with tricalcium phosphate, anisole, methyl acetate; ethyl acetate.

Shipping regulations: None.*

potassium bisulfide. See potassium hydrosulfide.

potassium bisulfite (potassium acid sulfite) KHSO_3 .

Properties: White, crystalline powder; sulfur dioxide odor. Soluble in water; insoluble in alcohol. M.p., decomposes when heated.

Derivation: Sulfur dioxide is passed through a solution of potassium carbonate until no more carbon dioxide is given off; the solution is concentrated and allowed to crystallize.

Method of purification: Recrystallization.

Impurities: Heavy metals; arsenic.

Grades: Commercial; reagent; highest purity; medicinal.

Containers: Wooden barrels; glass bottles; multiwall paper bags.

Uses: Chemical (reduction of various organic compounds; purification of aldehydes and ketones, iodine, sodium hydro-sulfite); antiseptic; source of sulfurous acid, particularly in brewing; analytical chemistry; tanning; bleaching straw and textile fibers; chemical preservative in foods.

Shipping regulations: None.*

potassium bitartrate (cream of tartar; potassium acid tartrate) $\text{KHC}_4\text{H}_4\text{O}_6$.

Properties: White crystals or powder; soluble in water; pleasant slightly acid taste; slightly soluble in alcohol. Sp.gr. 1.956.

Derivation: From argols by extraction with water and crystallization.

Method of purification: Recrystallization.

Grades: Technical; C.P.; N.F. XI; reagent. Containers: 25- to 250-lb barrels; multiwall paper bags.

Uses: Baking powder; preparation of other tartrates; medicine; galvanic tinning of metals.

Shipping regulations: None.*

potassium borate. See potassium metaborate and potassium tetraborate.

potassium borohydride KBH_4 .

Properties: White crystalline powder; soluble in water, ammonia; insoluble in ethers and hydrocarbons; sp.gr. 1.18; stable in moist and dry air; stable in vacuum to 500°C. Decomposed by acids with evolution of hydrogen.

Derivation: By metathetical reaction of sodium borohydride and potassium hydroxide.

Grades: Technical, powder, pellets.

Containers: Glass bottles and polyethylene bags in 1- to 55-gal metal containers.

Use: Source of hydrogen and other borohydrides; reducing agent for aldehydes, ketones and acid chlorides.

Shipping regulations: Flammable solid. Yellow label.*

potassium borotartrate (cream of tartar, borated; cream of tartar, soluble; potassium-sodium borotartrate).

Properties: White, crystalline powder.

Odorless; soluble in water; sp.gr. 1.832.

Derivation: By evaporating a solution containing potassium bitartrate and borax in a proportion of 7:2.

Grades: Technical.

Containers: Glass bottles; fiber cans.

Uses: Medicine; photography.

Shipping regulations: None.*

potassium bromate KBrO_3 .

Properties: White crystals or crystalline powder. Soluble in water; insoluble in alcohol; sp.gr. 3.27; m.p. 434°C, with decomposition above 370°C.

Derivation: By passing bromine into a solution of potassium hydroxide, potassium bromide and bromate being formed, which are separated by crystallization.

Method of purification: Recrystallization.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Impurities: Potassium bromide.

Grades: Pure; C.P.

Containers: 1-, 5-lb bottles; 200-lb drums.

Use: Reagent in analytical chemistry; strong oxidizing agent; additive for permanent wave compounds and for flour.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

potassium bromide KBr.

Properties: White, crystalline granules or powder; pungent, strong, bitter saline taste; somewhat hygroscopic. Soluble in water and glycerin; slightly soluble in alcohol and ether; sp.gr. 2.749; m.p. 730°C; b.p. 1435°C.

Derivation: Solutions of iron bromide and potassium carbonate are mixed and heated, the solution filtered and concentrated and the bromide crystallized out.

Method of purification: Recrystallization.

Grades: Technical; C.P.; N.F. XI, reagent; single pure crystals.

Containers: 25-, 50-, 100-, 200-lb drums, 400-, 500-lb barrels; kegs.

Uses: Medicine; photography (gelatin bromide papers and plates); process engraving and lithography; special soaps, single crystals for spectroscopy; infrared transmission.

Shipping regulations: None.*

potassium carbonate (potash; pearl ash, American ashes, salt of tartar) (a) K_2CO_3 ; (b) $2K_2CO_3 \cdot H_2O$, (c) $K_2CO_3 \cdot H_2O$.

Properties: White, deliquescent, granular translucent powder; alkaline reaction. Soluble in water; insoluble in alcohol.

(a) Sp.gr. 2.3312; m.p. 909°C, b.p. volatile at white heat.

Derivation: (1) From Stassfurt potassium beds by saturating a solution of magnesium and potassium chlorides with carbon dioxide, heating under pressure and evaporating the solution. (2) Leaching of wood and plant ashes with water, concentration of the solution and calcination of residue, which is extracted with water.

(3) Aqueous residue of beet-sugar molasses after fermentation and distillation to remove alcohol is concentrated and treated as above. (4) Electrolysis of potassium chloride. (5) Recovered from wool washing. (6) Recovered in an impure form, by electrical precipitation from the fumes of cement factories, metallurgical furnaces.

Grades: Crystals, technical, reagent; N.F. XI; calcined 80-85%, 85-90%, 90-95%; 96-98%; hydrated 80-85%.

Containers: Drums; bags; kegs; barrels.

Uses: Chemical (dehydrating agent, potassium salts, potassium cyanide from potassium ferrocyanide, oxalic acid from sawdust, chromates, chlorates); brewing; ceramics; explosives; fertilizers; mineral waters; Bohemian glass; difficultly fusible glasses; tanning; electroplating; shampoo preparations; process engraving and lithography; soft soaps; textiles (dyeing, bleaching, wool washing); finishing oils and sizes;

chocolate preparations.

Shipping regulations: None.*

potassium chlorate $KClO_3$.

Properties: Transparent, colorless crystals or white powder; cooling, saline taste; poisonous! Must not be ground with sugar, sulfur or other combustible substances as may cause explosions. Soluble in water and alkalies; very slightly soluble in alcohol. Sp.gr. 2.337; m.p. 368°C; b.p., decomposes at about 400°C, giving off oxygen.

Derivation: (a) By electrolyzing a hot concentrated alkaline solution of potassium chloride. Preferably (b) by interaction of solutions of potassium chloride and sodium chlorate or calcium chlorate.

Method of purification: Recrystallization.

Grades: Highest purity; pure granulated;

C.P.; commercial.

Containers: 25-, 110-, 200-, 225-, 550-lb drums.

Uses: Oxidizing agent; explosives; matches; source of oxygen; printing textile fabrics; pyrotechnics; percussion caps; medicine; dyes; paper manufacture; disinfectant; bleaching.

Warning! Contact with combustible material may cause fire. MCA warning label.

Shipping regulations: Oxidizing material.

Yellow label.*

potassium chloride (potassium muriate) KCl .

Properties: Colorless or white crystals or powder; strong saline taste. Occurs naturally as sylvite. Soluble in water; slightly soluble in alcohol; insoluble in absolute alcohol. Sp.gr. 1.987; m.p. 776°C, b.p. 1500°C.

Derivation: (a) Extracted from certain lake brines; purified from accompanying borax by recrystallization; (b) by fusion or extraction of carnallite, $MgCl_2 \cdot KCl \cdot 6H_2O$, with a solution of magnesium chloride; (c) from sylvite by fractional crystallization, or by flotation. Most important U.S. process.

Grades: Refined (99.5 and 99.9%); technical (95%); agricultural grades sold as 60-62%; 48-52% and 22% K_2O ; single pure crystals.

Containers: Bags; drums; bulk.

Uses: Fertilizer; source of potassium salts; pharmaceutical preparations; photography; single pure crystals for spectroscopy.

Shipping regulations: None.*

potassium chlorochromate (Péligot's salt)

$KClCrO_3$.

Properties: Red crystals; on heating liberates chlorine. Soluble in water (dec). Sp.gr. 2.497.

Grades: Technical.

Use: Oxidizing agent.

potassium chloroiridate. See iridium potassium, chloride.

potassium chloroplatinate (platinum-potassium chloride; potassium platinichloride)

K_2PtCl_6 .

Properties: Small, orange-yellow crystals

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or powder. Insoluble in alcohol; very slightly soluble in water; m.p. decomposes when heated.

Derivation: By adding platinum chloride to a solution of a potassium salt and crystallizing.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Photography.

Shipping regulations: None.*

potassium chloroplatinite (platinous-potassium chloride) K_2PtCl_4 .

Properties: Ruby-red crystals. Soluble in water; insoluble in alcohol. Sp.gr. 3.291.

Derivation: By adding potassium carbonate to a solution of chloroplatinous acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Photography.

Shipping regulations: None.*

potassium chromate (potassium chromate, yellow; neutral potassium chromate) K_2CrO_4 .

Properties: Yellow crystals; soluble in water; insoluble in alcohol; sp.gr. 2.7319; m.p. 971°C.

Derivation: Roasting powdered chromite with potash and limestone, treating the cinder with hot potassium sulfate solution and leaching.

Method of purification: Recrystallization.

Impurities: Free alkali; sulfates; aluminum; alkaline earths.

Grades: Highest purity; technical, reagent; commercial; crude.

Containers: 1-, 5-lb bottles; drums.

Uses: Reagent in analytical chemistry; aniline black; textile mordant; enamels; chromate pigments; inks; medicine; fungicide; leather finishing, making chromium compounds.

Shipping regulations: None.*

potassium chromate, neutral. See potassium chromate.

potassium chromate, red. See potassium dichromate.

potassium chromate, yellow. See potassium chromate.

potassium citrate $K_3C_6H_5O_7 \cdot H_2O$.

Properties: Colorless or white crystals or powder; deliquescent; cooling saline taste; odorless. Soluble in water and glycerol, almost insoluble in alcohol. Sp.gr. 1.98; m.p., decomposes when heated to about 230°C.

Derivation: By the action of citric acid on potassium carbonate.

Method of purification: Crystallization.

Grades: Technical; C.P.; N.F. XI.

Containers: 25- to 250-lb drums.

Use: Medicine.

Shipping regulations: None.*

potassium cobaltinitrite. See cobalt-potassium nitrite.

potassium columbate. Obsolete name for potassium niobate.

potassium-copper chloride. See copper-potassium chloride.

potassium-copper cyanide (copper-potassium cyanide).

Properties: White, crystalline, double salt of copper cyanide and potassium cyanide. Copper content (Cu) min. 25.8%; free KCN 1.25-3.0%.

Containers: 100-lb drums.

Uses: For preparing and maintaining cyanide copper plating baths based on potassium cyanide.

potassium-copper ferrocyanide. See copper-potassium ferrocyanide.

potassium-cupric ferrocyanide. See copper-potassium ferrocyanide.

potassium cyanate KOCN.

Properties: Colorless crystals; sp.gr. 2.05; decomposes 700-900°C. Soluble in water; insoluble in alcohol.

Derivation: Heating potassium cyanide with lead oxide.

Caution! Avoid breathing dust or spray mist. Avoid prolonged or repeated contact with skin. MCA warning label.

Use: Herbicide; manufacture of organic chemicals and drugs.

potassium cyanaurite. See gold-potassium cyanide.

potassium cyanide KCN.

Properties: White, amorphous, deliquescent lumps or crystalline mass, faint odor of bitter almonds; extremely poisonous! Do not handle with bare hands! Soluble in water, alcohol and glycerol. Sp.gr. 1.52; m.p. 634°C.

Derivation: (a) Potassium carbonate and carbon are heated in a current of ammonia. The fused mass is extracted with alcohol, the latter distilled off and the cyanide fused. (b) Calcium cyanamide is prepared from calcium carbide and nitrogen and is fused with caustic potash. (c) From by-products of beet-sugar manufacture.

Grades: Commercial; pure; C.P.; solution; reagent.

Containers: 25-, 100-lb drums.

Uses: Extraction of gold and silver from ores; electroplating; heat treatment of steel; reagent in analytical chemistry; insecticide; fumigant; reagent in manufacture of various intermediate organic cyanogen derivatives; paper manufacture; pharmaceutical preparations; fixative in photography; process engraving and lithography; fumigant for raw cotton; fumigant for grain elevators; fumigant for citrus fruits.

Caution! Not flammable, but evolves hydrocyanic acid on contact with acids or moisture. Toxic by ingestion, absorption in skin lesions, and inhalation.

Shipping regulations: Class B poison. Poison label (both solid and in solution).*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

potassium cyclamate. Used as a non-nutritive sweetener. See sodium cyclamate.

potassium dichloroisocyanurate $\text{Cl}_2\text{K}(\text{NCO})_3$.
See also dichloroisocyanuric acid.

Properties: White; slightly hygroscopic; crystalline powder or granules; loose bulk density (approx) powder 37 lbs/cu ft, granular 64 lbs/cu ft. Active ingredient approx 59% available chlorine.

Containers: 200-lb fiber drums.
Uses: Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers, replacement for calcium hypochlorite.

potassium dichromate (potassium bichromate; red potassium chromate) $\text{K}_2\text{Cr}_2\text{O}_7$.

Properties: Bright, yellowish-red transparent crystals; bitter, metallic taste; poisonous! Soluble in water; insoluble in alcohol. Sp.gr. 2.692; m.p. 396°C ; b.p., decomposes at 500°C .

Derivation: (a) By adding sulfuric acid to crude potassium chromate solution. (b) By heating an aqueous solution of sodium dichromate with potassium chloride, concentrating the solution, whereupon sodium chloride is deposited in the vessel. Lead rods are suspended in the solution and the dichromate crystallizes on these.

Methods of purification: Recrystallization.

Grades: Commercial; highest purity; highest purity fused; reagent.

Containers: 100-lb bags; 400-lb drums.

Uses: Oxidizing agent (chemicals, dyes, intermediates); analytical reagent; brass pickling compositions; electroplating; pyrotechnics; explosives; safety matches; textiles; dyeing and printing; glass, chrome glues and adhesives; milk and milk products preservative, chrome tanning leather; wood stains; histology; poison fly paper; process engraving and lithography, bleaching tallow, palm oil, etc., photography; pharmaceutical preparations; synthetic perfumes, chrome alum manufacture, pigments; alloys; ceramic products.

Warning! Harmful dust may cause rash or external ulcers. MCA warning label.

Shipping regulations: None.*

potassium dihydrogen phosphate. See potassium phosphate, monobasic.

potassium diphosphate. See potassium phosphate, monobasic.

potassium dithionate (potassium hyposulfate) $\text{K}_2\text{S}_2\text{O}_6$.

Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp.gr. 2.278

Grades: Technical.

Use: Reagent.

potassium ethyldithiocarbonate. See potassium xanthate.

potassium ethylxanthogenate. See potassium xanthate.

potassium ferric oxalate $\text{K}_3\text{Fe}(\text{C}_2\text{O}_4)_3 \cdot 3\text{H}_2\text{O}$.

Properties: Monoclinic green crystals; loses 3 molecules water 100°C ; decomposes

230°C ; soluble in water, acetic acid; incompatible with alkali and ammonia, since these react to precipitate ferric hydroxide.

Grades: Technical.

Use: Photography and blue-printing.

potassium ferricyanide (red prussiate of potash; red potassium prussiate) $\text{K}_3\text{Fe}(\text{CN})_6$.

Properties: Bright red, lustrous crystals or powder; poisonous! Soluble in water; slightly soluble in alcohol. Sp.gr. 1.8109; m.p., decomposes when heated.

Derivation: Chlorine is passed into a solution of potassium ferrocyanide, the ferricyanide separating out.

Method of purification: Recrystallization.

Impurities: Ferrous salts; potassium chloride.

Grades: Pure crystals; pure powder; commercial; crude; highest purity reagent; technical.

Containers: 25-, 100-, 350-lb drums.

Uses: Calico printing; wood dyeing; tempering steel; etching liquid; production of pigments; electro-plating; leather; paper manufacture; ingredient of composition used to produce sensitive coatings on blue print paper; fertilizer compositions.

Shipping regulations: None.*

potassium ferrocyanide (yellow prussiate of potash) $\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$.

Properties: Lemon-yellow crystals or powder; mild saline taste; effloresces on exposure to air. Soluble in water; insoluble in alcohol. Sp.gr. 1.853 (17°C), m.p., loses its water of crystallization when heated to 60°C ; b.p., decomposes when heated to red heat.

Derivation: Produced from gas plant by-products and alkali metal or alkaline earth metal cyanides; or nitrogenous waste products, iron filings and potassium carbonate.

Method of purification: Recrystallization.

Impurities: Potassium carbonate, sulfate and chloride; calcium salts.

Grades: Technical; C.P.

Containers: 100-, 370-lb drums, multiwall paper sacks.

Uses: Medicine; potassium cyanide and ferricyanide; reagent in analytical chemistry; dry colors; tempering steel; dyeing; explosives; process engraving and lithography.

Shipping regulations: None.*

potassium fluoborate KBF_4 .

Properties: A gritty white powder (when dried) or gelatinous crystals, a weak but bitter taste; not acid to litmus, forms 6-sided prisms when crystallized from an aqueous solution; sp.gr. 2.5 (20°C); wet crystals give a green and finally a violet flame test; m.p. 530°C ; decomposes at a high temperature. Slightly soluble in water and alcohol (hot).

Derivation: By mixing fluoboric acid with a solution of a potassium salt forming a gelatinous precipitate that is washed and dried; by heating boric acid with potassium

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

silicofluoride and adding potassium carbonate.

Containers: Fiber drums.

Uses: Sand agents in casting of aluminum and magnesium; grinding aid in resinoid grinding wheels; flux for soldering and brazing; in electro-chemical processes and chemical research.

Shipping regulations: None.*

potassium fluophosphate. See fluophosphoric acids.

potassium fluoride (a) KF; (b) $\text{KF} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline, deliquescent powder; sharp saline taste; poisonous!

Soluble in water and hydrofluoric acid; insoluble in alcohol. Sp. gr. (a) 2.454.

M.p. (a) about 800°C ; (b) 41°C .

Derivation: By saturation of hydrofluoric acid with potassium carbonate.

Method of purification: Crystallization.

Impurities: Arsenic.

Grades: Technical; pure; purified; free of arsenic; C.P.

Containers: 1-, 5-lb waxed bottles; wooden kegs; tins; drums.

Uses: Etching glass; preservative, insecticide.

potassium fluosilicate (potassium silicofluoride) K_2SiF_6 .

Properties: White, odorless, fine crystalline powder; sp. gr. 3.0; slightly soluble in water.

Containers: 100-, 200-, 400-lb and in bulk.

Uses: Vitreous enamel frits; synthetic mica, metallurgy of aluminum and magnesium, ceramics; insecticide.

Shipping regulations: None.*

potassium fluotantalate. See tantalum-potassium fluoride.

potassium fluozirconate. See zirconium potassium fluoride.

potassium germanium fluoride. See germanium potassium fluoride.

potassium gibberellate. Salt of gibberellic acid (q.v.). Used to promote and control development of malt in grain.

potassium gluconate $\text{KC}_6\text{H}_{11}\text{O}_7$.

Properties: Odorless, salty tasting, fine, white crystalline powder. Soluble in water, insoluble in alcohol and benzene.

Derivation: Reaction of potassium hydroxide or carbonate with gluconic acid.

Method of purification: Crystallization.

Grades: Pharmaceutical.

Containers: Cans; fiber drums.

Use: Medicine.

Shipping regulations: None.*

potassium glutamate Similar to sodium glutamate (q.v.).

potassium glycerinophosphate. See potassium glycerophosphate.

potassium glycerophosphate (potassium glycerinophosphate) $\text{K}_2\text{C}_3\text{H}_5\text{O}_2 \cdot \text{H}_2\text{PO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Pale yellow syrupy liquid; acid

taste. Soluble in alcohol; miscible with water in all proportions.

Derivation: Glycerol and phosphorus pentoxide or metaphosphoric acid are mixed, warmed and exactly neutralized with potassium carbonate, warmed and concentrated.

Grades: Technical, 50 or 75% solution.

Containers: 5-, 10-lb bottles; 5-, 25-lb cans; 70-lb carboys.

Use: Medicine; dietary supplement.

Shipping regulations: None.*

potassium guaiacal sulfonate (orthocoll)

$\text{C}_6\text{H}_5\text{OCH}_2\text{OHSO}_3\text{K}$.

Properties: Fine, white powder or crystals; gradually turns pink on exposure to air and light; bitter taste, afterward becoming sweetish; odorless. Contains approx. 60% guaiacol. Nonirritant; soluble in water; sparingly soluble in alcohol.

Grades: N.F. XI.

Containers: 25- to 300-lb drums.

Use: Medicine.

potassium 2,4-hexadienoate. See potassium sorbate.

potassium hexafluorophosphate. See fluophosphoric acids.

potassium hexanitrocobaltate III. See cobalt potassium nitrite.

potassium hydrate. See potassium hydroxide.

potassium hydrogen phosphate. See potassium phosphate, dibasic.

potassium hydrogen phthalate.

$\text{HOOC}\cdot\text{C}_6\text{H}_4\cdot\text{COOK}$.

Properties: Colorless crystals. Soluble in water, sp. gr. 1.636.

Derivation: Potassium hydroxide and phthalic anhydride.

Method of purification: Recrystallization.

Grades: C.P., analytical.

Containers: Glass bottles.

Use: Alkalimetric standard.

Shipping regulations: None.*

potassium hydrosulfide (potassium sulfhydrate; potassium bisulfide) $(\text{KSH})_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; hydrogen sulfide odor. Turns yellow when exposed to air and forms the polysulfide. Hygroscopic. Soluble in alcohol and water.

Grades: Technical.

Use: Separation of heavy metals.

potassium hydroxide (caustic potash; potassium hydrate; potassa, lye) KOH.

Properties: White, deliquescent pieces, lumps, sticks, pellets, or flakes having a crystalline fracture. Keep well stoppered; absorbs water and carbon dioxide from the air. Soluble in water, alcohol, glycerin; slightly soluble in ether.

Constants: Sp. gr. 2.044; m.p. 360°C , but varies with water content.

Derivation: (a) Electrolysis of concentrated potassium chloride solution. (b) Boiling potassium carbonate with milk of lime.

Method of purification: Sulfur compounds are removed by the addition of potassium

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nitrate to the fused caustic. The purest form is obtained by solution in alcohol, filtration and evaporation.

Impurities: Alumina; silica; sulfuric acid.

Grades: Commercial; ground; flake; fused (88 to 92%); purified by alcohol (sticks, lumps and drops); reagent; highest purity; U.S.P. XVI; liquid (45%).

Containers: Bottles; boxes; kegs; 100-, 225-, 275-, 700- to 730-lb drums; tank cars.

Uses: Soap manufacture; bleaching; manufacture of oxalic acid; manufacture of potassium compounds; reagent in analytical chemistry; medicine (caustic); matches; process engraving and lithography.

Caution! Generates heat on contact with water.

Warning! Causes severe burns to skin and eyes. MCA warning label.

Shipping regulations: Solution: corrosive liquid. White label.*

potassium hyperchlorate. See potassium perchlorate.

potassium hypophosphite (potassium hypophosphite, monobasic) KH_2PO_2 .

Properties: White opaque crystals or powder with pungent saline taste, very deliquescent. Explosive if ground with nitrates, chlorates or other oxidizing agents. Soluble in water and alcohol; decomposed by heat.

Derivation: Interaction of calcium hypophosphite and potassium carbonate.

Containers: Drums.

Use: Medicine.

Fire hazard: Dangerous!

potassium hypophosphite, monobasic. See potassium hypophosphite.

potassium hyposulfate. See potassium dithionate.

potassium hyposulfite. See potassium thiosulfate.

potassium iodate KIO_3 .

Properties: White, crystalline powder.

Odorless; soluble in water, sulfuric acid (dilute); insoluble in alcohol. Sp.gr. 3.9, m.p. 560°C (partial decomposition).

Grades: Technical; C.P.

Uses: Analysis (testing for zinc and arsenic), iodometry; medicine; reagent; feed additive.

potassium iodide KI .

Properties: White crystals, granules or powder; strong bitter saline taste. Soluble in water, alcohol, and glycerol.

Constants: Sp.gr. 3.123; m.p. 723°C, b.p. 1420°C.

Method of purification: Recrystallization.

Impurities: Potassium carbonate; metals, sulfuric acid; potassium bromide, potassium chloride.

Grades: Crystals; granulated; powder; highest purity; reagent; U.S.P. XVI, single pure crystals.

Containers: 1-, 5-lb bottles; 25- to 300-lb

drums.

Uses: Medicine; reagent in analytical chemistry; photography (precipitating silver); feed additive; single crystals for spectroscopy, infrared transmission, scintillation.

Shipping regulations: None.*

potassium-iridium chloride. See iridium-potassium chloride.

potassium iridochloride. See iridium-potassium chloride.

potassium laurate $\text{KOOC}_{11}\text{H}_{23}$.

Properties: Light tan paste; soluble in water.

Uses: Emulsifying agent; base for liquid soaps and shampoos.

potassium linoleate $\text{KOOC}_{17}\text{H}_{31}$.

Properties: Light tan paste; soluble in water.

Use: Emulsifying agent.

potassium magnesium sulfate.

$\text{K}_2\text{SO}_4 \cdot 2\text{MgSO}_4$.

Properties: White tetragonal crystals; sp.gr. 2.829; m.p. 927.

Use: Fertilizer.

potassium manganate K_2MnO_4 .

Properties: Dark-green powder or crystals; soluble in potassium hydroxide solution and water; decomposes in acid solution. M.p. 190°C (decomposes).

Grades: Technical.

Uses: Bleaching chamois skins; bleaching fibers; disinfectants; mineral waters; mordant (wool); batteries; photography; printing, purifying and bleaching oils; source of oxygen (dyeing); water purification; oxidizing agent.

potassium manure salt. See manure salts.

potassium mercuric iodide. See mercuric potassium iodide.

potassium metabisulfite (potassium pyrosulfite) $\text{K}_2\text{S}_2\text{O}_5$.

Properties: White granules or powder; sulfur dioxide odor; sp.gr. 2.3; slightly soluble in water and alcohol.

Derivation: By heating potassium bisulfite until it loses water.

Grades: Technical, reagent.

Containers: 1-, 5-lb bottles; 100-, 300-, 350-lb drums.

Uses: Antiseptic, reagent in analytical chemistry, source of sulfurous acid; brewing (antiseptic and preservative, cleaning and sweetening casks and vats); food preservative; developing agent for photographic and motion picture films; process engraving and lithography; dyeing.

Shipping regulations: None.*

potassium metaborate (potassium borate) KBO_2 .

Properties: White, crystalline powder.

Alkaline reaction; caustic, alkaline taste.

Soluble in water.

potassium metaphosphate (monopotassium metaphosphate) KPO_3 .

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: White powder; soluble in acids (dilute); slightly soluble in water.

potassium metarsenite. See potassium arsenite.

potassium mica. See muscovite.

potassium molybdate $K_2MoO_4 \cdot 5H_2O$.

Properties: White, microcrystalline powder; deliquescent; soluble in water; insoluble in alcohol; sp. gr. 2.3; m. p. 919°C.

Grades: Technical; C.P.

Use: Reagent.

potassium monophosphate. See potassium phosphate, dibasic.

potassium muriate. See potassium chloride.

potassium naphthenate.

Properties: Gray paste; soluble in water.

Derivation: From naphthenic acids.

Uses: Driers; emulsifying agents.

potassium nickel sulfate. See nickel potassium sulfate.

potassium niobate (potassium columbate) $4K_2O \cdot 3Nb_2O_5 \cdot 16H_2O$. Potassium niobate is of importance technologically in the final purification of niobium material. Crystals of potassium niobate which are soluble in water form when niobic acid solutions are treated with concentrated potassium hydroxide.

potassium niobium oxyfluoride. See niobium-potassium oxyfluoride.

potassium nitrate (niter; nitre; saltpeter) KNO_3 .

Properties: Transparent, colorless or white crystalline powder or crystals, slightly hygroscopic; cooling, pungent, saline taste. Sp. gr. 2.1062; m. p. 337°C, b. p., decomposes at about 400°C. Soluble in water; slightly soluble in alcohol and glycerin.

Derivation: Interaction of a solution of sodium nitrate and potassium chloride, or of nitric acid and potassium chloride.

Grades: Commercial; C.P.; N.F. XI

Containers: Bottles; kegs; bags; barrels; drums.

Uses: Pyrotechnics; explosives; matches; pickling meat; fertilizer; reagent in analytic chemistry; tobacco, glass manufacture; metallurgy; medicine; oxidizer in solid rocket propellants.

Caution! Fire hazard; dangerous; in contact with organic materials causes violent combustion or ignition.

Shipping regulations: Oxidizing material. Yellow label.*

potassium nitrite KNO_2 .

Properties: White or slightly yellowish prisms or sticks; deliquescent. Caution! Keep well stoppered! Sp. gr. 1.915; b. p., decomposes; m. p., various values from 297 to 450°C are recorded, the variation presumably being due in part to the decomposition of the material, also to the difficulty of obtaining a pure sample. Soluble in water; insoluble in alcohol.

Grades: C.P.; technical; reagent.

Uses: Analysis (testing for amino acids, cobalt, iodine, urea); medicine; organic synthesis.

Shipping regulations: Oxidizing material. Yellow label.*

potassium oleate $C_{17}H_{33}COOK$.

Properties: Gray-tan paste; soluble in water.

Use: Textile soaps; emulsifying agent.

potassium orthophosphate. See potassium phosphate, monobasic, dibasic or tribasic.

potassium orthotungstate. See potassium tungstate.

potassium osmate (potassium perosmate) $K_2OsO_4 \cdot 2H_2O$.

Properties: Violet crystals. Hygroscopic; Caution! Poisonous! Keep well stoppered! Soluble in water; insoluble in alcohol and ether.

Grades: Technical.

Containers: Ground glass stoppered bottles. Use: Analysis (testing for nitrogenous matter in water).

Shipping regulations: None.*

potassium osmic chloride. See osmium potassium chloride.

potassium oxalate $K_2C_2O_4 \cdot H_2O$.

Properties: Colorless transparent crystals. Odorless; soluble in water; efflorescent in warm dry air; sp. gr. 2.08; m. p., decomposes when heated.

Derivation: Potassium formate or carbonate mixed with a small quantity of oxalate and a slight excess of alkali is heated, the oxalate extracted with water and crystallized.

Method of purification: Recrystallization.

Impurities: Heavy metals; chlorine.

Grades: Technical; C.P.

Containers: Bottles, 250-, 300-lb barrels; 25-, 50-, 100-lb drums.

Uses: Medicine; reagent in analytical chemistry, source of oxalic acid; bleaching and cleaning straw hats; removing stains from textiles; photography.

Shipping regulations: None.*

potassium oxide K_2O .

Properties: Gray, crystalline mass. Soluble in water; forms potassium hydroxide.

Sp. gr. 2.32; m. p. red heat.

Derivation: By heating potassium nitrate and metallic potassium.

Grades: Technical.

Containers: Tins; iron barrels.

potassium oxyfluoniobate. See niobium-potassium oxyfluoride.

potassium palladium chloride. See palladium potassium chloride.

potassium penicillin 152. See penicillin.

potassium penicillin G. See penicillin.

potassium penicillin O. See penicillin.

potassium penicillin V. See penicillin.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

potassium pentaborate $K_2B_{10}O_{16} \cdot 8H_2O$.

Properties: Colorless crystals; m.p. (anhydrous) 180°C. Very slightly soluble in cold water.
Containers: Drums.

potassium percarbonate $K_2C_2O_6 \cdot H_2O$.

Properties: Granular, white mass. Caution! Keep away from light and moisture! Soluble in water (liberates oxygen).
Grades: Technical.
Uses: Analysis (testing for cerium, chromium, vanadium, titanium); microscopy, oxidizing agent; photography; textile printing.

potassium perchlorate (potassium hyperchlorate) $KClO_4$.

Properties: Colorless crystals or white, crystalline powder. Decomposed by concussion, organic matter, and agents subject to oxidation. More stable than potassium chlorate. Soluble in water; insoluble in alcohol. Sp.gr. 2.524; decomposes at 400°C.

Grades: Technical; reagent.

Containers: Drums.

Uses: Explosives, medicine, oxidizing agent; photography, pyrotechnics; reagent; analysis; oxidizer in solid rocket propellants.
Caution! Oxidizing material, combustible in contact with organic materials.

Shipping regulations: Oxidizing material.
Yellow label.*

potassium periodate KIO_4 .

Properties: Small, colorless crystals or white, granular powder; slightly soluble in water. Sp.gr. 3.168; m.p. 582°C (decomposes at higher temperatures).

Grades: Technical; C.P., reagent.

Use: Analysis (oxidizing agent).

Shipping regulations: Oxidizing material.
Yellow label.*

potassium permanganate (purple salt) $KMnO_4$.

A powerful oxidizing agent.

Properties: Dark purple crystals having a blue metallic sheen; sweetish, astringent taste; odorless. Soluble in water; decomposed by alcohol. Sp.gr. 2.7032, m.p., decomposes at 240°C.

Derivation: (a) By the oxidation of the manganate (prepared by the fusion of pyrolusite with caustic potash) in an alkaline electrolytic cell. (b) A hot solution of the manganate obtained as in (a), is treated with carbon dioxide gas. On cooling, the solution deposits crystals of the permanganate.

Method of purification: Recrystallization.

Grades: Technical; C.P.; U.S.P. XVI.

Containers: Bottles; cans; boxes; kegs; 50-, 75-, 135-, 500-lb drums.

Uses: Oxidizer; disinfectant; deodorizer; bleach; dye; reagent in analytical chemistry; medicine; manufacture of organic chemicals; absorbent for poison gases in military gas-masks; purification of carbon dioxide used in the manufacture of effervescent drinks; water purification.

Fire hazard: Dangerous. Explosions are

hable to occur when brought in contact with organic or readily oxidizable materials either in solution or in the dry state.

Shipping regulations: Oxidizing material.
Yellow label.*

potassium perosmate. See potassium osmate.**potassium peroxide** K_2O_2 .

Properties: Yellow, amorphous mass; decomposes in water, evolving oxygen.

Derivation: By the oxidation of potassium in oxygen.

Grades: Technical.

Containers: Tins.

Uses: Oxidizing agent; bleaching agent; oxygen-generating gas masks.

Caution! Fire hazard, dangerous! Does not burn or explode itself but mixtures of potassium peroxide and combustible substances are explosive and ignite easily.

Shipping regulations: Oxidizing material.
Yellow label.*

potassium peroxydisulfate. See potassium persulfate.**potassium peroxymonosulfate.** See "Oxone."**potassium persulfate** (anthion; potassium peroxydisulfate) $K_2S_2O_8$.

Properties: White crystals; soluble in water; insoluble in alcohol; m.p., decomposes below 100°C.

Derivation: By electrolysis of a saturated solution of potassium sulfate.

Grades: Technical; C.P.

Containers: Glass bottles; 300-lb drums; 100-lb polyethylene-lined paper bags.

Uses: Bleaching; oxidizing agent; reducing agent in photography; antiseptic; soap manufacture, analytical reagent; polymerization promoter; pharmaceuticals; modification of starch; flour-maturing agent; defiberizing wet-strength paper, desizing of textiles.

Fire hazard: Dangerous; may cause explosion in a fire.

potassium phenethicillin. See potassium alpha-phenoxyethylpenicillin, under penicillin.**potassium phenoxymethylpenicillin.** See penicillin.**potassium alpha-phenoxyethylpenicillin.** See penicillin.**potassium phosphate.** See potassium phosphate, dibasic; potassium phosphate, monobasic; or potassium phosphate, tribasic.**potassium phosphate, dibasic** (DKP; potassium hydrogen phosphate; potassium monophosphate; dipotassium orthophosphate) K_2HPO_4 .

Properties: Deliquescent white crystals or powder. Very soluble in water; slightly soluble in alcohol.

Derivation: By action of phosphoric acid on potassium carbonate.

Method of purification: Crystallization.

Impurities: Chlorine; potassium sulfate.

Grades: Commercial; pure; highest purity; N. F. XI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Glass bottles; 100-lb bags; 100-lb fiber drums.

Uses: Buffer in antifreezes; ingredient of "instant" fertilizers; nutrient for penicillin culturing; humectant; pharmaceuticals.

potassium phosphate, monobasic (MKP; potassium acid phosphate; potassium diphosphate; potassium biphosphate; potassium dihydrogen phosphate) KH_2PO_4 .

Properties: Colorless crystals. Acid in reaction. Soluble in water; insoluble in alcohol; sp. gr. 2.338; m.p. 96°C .

Derivation: By the action of phosphoric acid on potassium carbonate.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Wooden kegs; glass bottles; barrels; multiwall paper bags.

Uses: Medicine, baking powders; nutrient solution; yeast foods.

Shipping regulations: None.*

potassium phosphate, neutral. See potassium phosphate, tribasic.

potassium phosphate, normal. See potassium phosphate, tribasic.

potassium phosphate, tertiary. See potassium phosphate, tribasic.

potassium phosphate, tribasic (potassium phosphate, neutral; potassium phosphate normal; tripotassium orthophosphate; potassium phosphate, tertiary; tripotassium phosphate) $\text{K}_3\text{PO}_4 \cdot 3\text{H}_2\text{O}$, or K_3PO_4 .

Properties: Granular white powder. Hygroscopic. Caution! Keep well stoppered! Soluble in water giving strongly basic solution; insoluble in alcohol. M.p. 1340°C .

Grades: Reagent; technical.

Containers: 275-, 300-, 400-lb drums.

Uses: Purification of gasoline; water-softening, liquid soaps; fertilizer.

potassium phosphite K_2HPO_3 .

Properties: White powder, hygroscopic. Caution! Keep well stoppered. Soluble in water; insoluble in alcohol. Slowly oxidized by air to phosphate.

potassium platinichloride. See potassium chloroplatinate.

"Potassium Polymetaphosphate HV." 172

Trade name for a grade of potassium metaphosphate having a high molecular weight and capable of yielding high viscosity solutions. $(\text{KPO}_3)_n$.

Properties: Insoluble in water. Soluble in sodium salt solutions; shows molecular weight of about 500,000.

Derivation: Dehydration of KH_2PO_4 .

Containers: Bags.

Uses: As a fat emulsifier and moisture retaining agent in sausage.

potassium polysulfide K_2S_x .

Properties: Crystals; soluble in water and alcohol.

Use: Fungicide.

potassium prussiate, red. See potassium ferricyanide.

potassium prussiate, yellow. See potassium ferrocyanide.

potassium pyroantimonate $\text{K}_2\text{H}_2\text{SbO}_7 \cdot 4\text{H}_2\text{O}$ (approx).

Properties: White crystalline powder or granules; slightly soluble in cold water; readily soluble in hot water. Insoluble in alcohol.

Grades: Reagent; technical.

Uses: Used in starch sizes and flame retarding compounds.

potassium pyroborate. See potassium tetraborate.

potassium pyrophosphate (TKPP; tetrapotassium pyrophosphate; potassium pyrophosphate, normal) $\text{K}_4\text{P}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals or white powder; somewhat hygroscopic in air (deliquesces above a relative humidity of 40-45%). Similar to tetrasodium pyrophosphate except for greater solubility; sp. gr. 2.33; dehydrated below 300°C ; m.p. 1090°C . Soluble in water; insoluble in alcohol.

Grades: Technical, 99.4%, 60% solution.

Containers: Fiber drums; multiwall paper bags.

Uses: In tin plating; stabilizing hydrogen peroxide baths; purification of china clay, oil drilling muds, dyeing; in soaps and detergents it sequesters magnesium, peptizes curds of calcium soaps and has solvent or dispersing action on gums, waxes or dirt; builder and clarifier of liquid soaps; in synthetic rubber production.

potassium pyrophosphate, normal. See potassium pyrophosphate.

potassium pyrosulfate (potassium anhydrosulfate; potassium acid sulfate, anhydrous) $\text{K}_2\text{S}_2\text{O}_7$.

Properties: Colorless needles or white, crystalline powder, or fused pieces. Soluble in water, converted to potassium bisulfate. Sp. gr. 2.27; m.p. (approx) 325°C .

Use: Acid flux in analysis.

potassium pyrosulfite. See potassium metabisulfite.

potassium rhodanide. See potassium thiocyanate.

potassium ricinoleate $\text{C}_{17}\text{H}_{32}\text{OHCOOK}$.

Properties: White paste, soluble in water.

Use: Emulsifying agent.

potassium selenate K_2SeO_4 .

Properties: White powder or colorless crystals. Soluble in water; sp. gr. about 3.

Grades: Technical; C.P.

Use: Reagent.

potassium silicate (glass)

Properties: Weight ratio $\text{SiO}_2:\text{K}_2\text{O}=2.5$, molar ratio $\text{SiO}_2:\text{K}_2\text{O}=3.87$ (approx);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- colorless, anhydrous lump, shattered or granular material; soluble in water only at elevated temperatures and pressure.
Derivation: Supercooled melt of potassium carbonate and pure silica sand.
Containers: Drums.
Uses: In the manufacture of glass and refractory material; in the manufacture of potassium silicate solutions; for dyeing and bleaching.
Shipping regulations: None.*
- potassium silicate (solution).**
 Water solutions with various ratios of $\text{SiO}_2:\text{K}_2\text{O}$ from 2.5 to 3.3.
Properties: Colorless to turbid liquid; gravity 29-41° Bé; sp.gr. 1.25-1.39; 10.4-11.6 lbs/gal.
Containers: 1- and 5-gal cans; 55-gal drums, tank cars and tank trucks.
Uses: As non-efflorescing base for inorganic paints and protective coatings; as a coating for roofing granules and welding rods; as a binder in the manufacture of carbon arc-light electrodes and for phosphors on television tubes; in detergents, as a catalyst, adhesives.
Shipping regulations: None.*
- potassium silicofluoride.** See potassium fluosilicate.
- potassium-sodium borotartrate.** See potassium borotartrate.
- potassium-sodium carbonate.** See sodium-potassium carbonate.
- potassium-sodium ferricyanide** $\text{K}_2\text{NaFe}(\text{CN})_6$.
Constants: Red crystals, over 99% pure, m.p., decomposes, non-hygroscopic and stable; easily soluble in water.
Derivation: From ferrocyanides.
Containers: Fiber drums.
Uses: In making blueprint paper, in photographic work.
Shipping regulations: None.*
- potassium-sodium phosphate.** See sodium-potassium phosphate.
- potassium-sodium tartrate** (Rochelle salt; seignette salt; sodium-potassium tartrate) $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.
Properties: Colorless transparent efflorescent crystals or white powder, having cool, saline taste. Soluble in water, insoluble in alcohol. Loses water of crystallization at 140°C; unstable above about 225°C. Sp.gr. 1.77, m.p. 70-80°C.
Derivation: Potassium acid tartrate is dissolved in water, the solution saturated with sodium carbonate, concentrated after purification and crystallized.
Method of purification: Hydrogen sulfide is passed in to remove copper and iron, the solution heated with animal charcoal and filtered.
Impurities: Copper; iron.
Grades: Highest purity; reagent; commercial crystals or powder; N.F. XI.
Containers: 25-, 225-, 250-lb drums.
Uses: Medicine; manufacture of Seidlitz
- powders; baking powders.
Shipping regulations: None.*
- potassium sorbate** (potassium 2,4 hexadienoate) $\text{CH}_3\text{CH}:\text{CHCH}:\text{CHCOOK}$.
Properties: White powder; m.p. 270°C; 58.5% sol in water (25°C); sp.gr. 1.36 (25/20°C).
Containers: 10-, 50-lb cartons; 150-lb fiber drums.
Uses: Water soluble form of sorbic acid for control of molds and yeasts in food.
- potassium stannate** $\text{K}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$.
Properties: White to light tan crystals. Soluble in water; insoluble in alcohol. Sp. gr. 3.197.
Grades: Technical.
Containers: 100-, 350-lb drums.
Uses: Textiles (dyeing and printing); alkaline tinplating bath.
- potassium stearate** $\text{C}_{17}\text{H}_{35}\text{COOK}$.
Properties: White crystal powder; soluble in hot water; slight odor of fat.
Grades: Commercial, contains considerable palmitate.
Use: Base for textile softener.
- potassium-strontium chlorate.** See strontium-potassium chlorate.
- potassium sulfantimonate** (potassium thioantimonate) $(\text{K}_3\text{SbS}_4)_2 \cdot 9\text{H}_2\text{O}$.
Properties: Colorless to yellowish crystals; soluble in water; insoluble in alcohol.
- potassium sulfate** (salt of Lemery) K_2SO_4 .
Properties: Colorless or white, hard crystals or powder; bitter, saline taste. Soluble in water; insoluble in alcohol. Sp.gr. 2.66; m.p. 1072°C
Derivation: (a) By treatment of potassium chloride with sulfuric acid. (b) By fractional crystallization of kainite.
Method of purification: Recrystallization.
Grades: Highest purity medicinal, commercial, crude, C.P., agricultural.
Containers: 100-lb bags, 25-, 100-, 350-, 375-lb drums.
Uses: Reagent in analytical chemistry; medicine, fertilizer, alum manufacture; glass manufacture.
Shipping regulations: None.*
- potassium sulphydrate.** See potassium hydrosulfide.
- potassium sulfide, fused or concentrated.** (potassium sulfuret; hepar sulfuric) K_2S .
Properties: Red or yellow-red crystalline mass or fused solid; deliquescent in air. Keep well stoppered. Soluble in water, alcohol, and glycerin; insoluble in ether. Sp.gr. 1.805 (20/4°); m.p. 471°C.
Derivation: Potassium sulfate and carbon are heated in a tightly closed crucible to a moderate temperature.
Grades: Technical.
Containers: Cans, glass bottles; metal drums.
Uses: Reagent in analytical chemistry; depilatory; medicine.
Fire hazard: Moderately flammable, yields flammable hydrogen sulfide on contact

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

with mineral acids and sulfur dioxide when burning.

Shipping regulations: Flammable solid. Yellow label.*

potassium sulfite $K_2SO_3 \cdot 2H_2O$.

Properties: White crystals or powder.

Soluble in water; sparingly soluble in alcohol.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles.

Use: Medicine; photography.

Shipping regulations: None.*

potassium sulfocarbonate (potassium trithiocarbonate K_2CS_3).

Properties: Yellowish-red crystals. Very hygroscopic. Soluble in alcohol and water.

Grades: Technical.

Uses: Analysis (testing for cobalt, nickel), medicine.

potassium sulfocyanate. See potassium thiocyanate.

potassium sulfocyanide. See potassium thiocyanate.

potassium, sulfurated. See potash, sulfurated.

potassium sulfuret. See potassium sulfide.

potassium-tantalum fluoride. See tantalum-potassium fluoride.

potassium tartrate $K_2C_4H_4O_6 \cdot \frac{1}{2}H_2O$.

Properties: Colorless, crystalline; soluble in water; decomposed by heat. Sp.gr. 1.98; insoluble in alcohol.

Grades: C.P., technical.

Uses: Manufacture of potassium salts, medicine; laboratory reagent.

potassium tellurate $K_2TeO_4 \cdot 3H_2O$.

Properties: Colorless crystals; soluble in water.

Use: Medicine.

potassium tellurite K_2TeO_3 .

Properties: Granular, white powder. Hygroscopic. Soluble in water.

Grades: Technical.

Use: Analysis (testing for bacteria).

potassium tetraborate (potassium pyroborate, potassium borate, potassium biborate) $K_2B_4O_7 \cdot 5H_2O$.

Properties: White powder; alkaline taste. Soluble in water.

potassium tetrathiocyanodiammonio-chromate. See Reinecke salt.

potassium thioantimonate. See potassium sulfantimonate.

potassium thiocyanate (potassium rhodanide; potassium sulfocyanate; potassium sulfo-cyanide) KCNS.

Properties: Colorless, transparent, hygroscopic, odorless crystals; soluble in water, alcohol and acetone. Saline, cooling taste. Sp.gr. 1.88; m.p. $173^\circ C$; turns brown, green, blue when fused, white again on cooling. B.p., decomposes at $500^\circ C$.

Derivation: By heating potassium cyanide with sulfur.

Method of purification: Crystallization.

Impurities: Heavy metals, sulfates.

Grades: Commercial; pure; purified; reagent.

Containers: Glass bottles; drums.

Use: In freezing mixtures; reagent in analytical chemistry; manufacture of sulfocyanides; thioureas; in admixture with allyl bromide for making allyl mustard oil; printing and dyeing textiles; photographic restrainer and intensifier; manufacture of synthetic dye-stuffs.

Shipping regulations: None.*

potassium thiosulfate (potassium hyposulfite) $K_2S_2O_3$ with varying proportions of water of crystallization.

Properties: Colorless crystals. Hygroscopic. Caution! Keep well stoppered! Soluble in water.

Grades: Technical; C.P.

Use: Analysis.

potassium titanate K_2TiO_3 (approx.).

Properties: White salt; hydrolyzes in water to give a strongly alkaline solution.

Derivation: From titanate acid and potassium hydroxide.

Containers: Cartons.

Use: See potassium titanate fibers.

potassium titanate fibers. Approximate composition $K_2O \cdot (TiO_2)_n$ where n is 4 to 7.

Properties: Crystalline fibers of small diameter; m.p. $2500^\circ F$, high refractive index, can diffuse and reflect infrared radiation.

Uses: Can be felted for use in rockets, missiles, nuclear-powered applications as an insulator, especially for the range 1300 - $2100^\circ F$.

potassium-titanium fluoride. See titanium-potassium fluoride.

potassium-titanium oxalate. See titanium-potassium oxalate.

potassium tripolyphosphate (KTPP) $K_5P_3O_{10}$.

Properties: White crystalline solid, m.p. 620 - $640^\circ C$, density 2.54; loose bulk density (approx) 67 lbs/cu ft; solubility in water ($26^\circ C$), over 140 g/100 ml water.

Containers: 100-lb bags, 400-lb fiber drums.

Uses: Water emulsion plants; water-treating compounds, cleaners; specialty fertilizers; sequestrant (including use in food preparation).

potassium trithiocarbonate. See potassium sulfocarbonate.

potassium tungstate (potassium orthotungstate; potassium wolframate; potassium wolframate, normal) K_2WO_4 .

Properties: Heavy, crystalline powder; sp. gr. 3.1; m.p. $921^\circ C$. Deliquescent.

Caution! Keep dry! Soluble in water, insoluble in alcohol.

Grades: Technical.

Use: Magenta bronze.

potassium undecylenate $CH_2CH(CH_2)_9COOK$.

Properties: Finely divided white powder; decomposes above $250^\circ C$, limited solubility in most organic solvents; soluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Uses: Bacteriostat and fungistat in cosmetics and pharmaceuticals.
- potassium wolframate.** See potassium tungstate.
- potassium wolframate, normal.** See potassium tungstate.
- potassium xanthate** (potassium ethyldithiocarbonate; potassium xanthogenate; potassium ethylxanthogenate) $\text{KS}_2\text{COC}_2\text{H}_5$.
Properties: Colorless or light yellow crystals; soluble in water and alcohol; sp. gr. 1.558 (21.5°C).
Derivation: Prepared by reaction of potassium ethylate and carbon disulfide.
Containers: Glass bottles; fiber cans.
Uses: Fungicide for soil treatment; reagent in analytical chemistry.
Shipping regulations: None.*
- potassium xanthogenate.** See potassium xanthate.
- potassium zinc iodide** (zinc potassium iodide) $\text{ZnI}_2 \cdot \text{KI}$.
Properties: Colorless crystals; very hygroscopic.
Grades: Technical.
Use: Analysis (testing for alkaloids).
- potassium-zinc sulfate.** See zinc-potassium sulfate.
- potassium zirconifluoride.** See zirconium-potassium fluoride.
- potassium zirconium chloride** $\text{KCl}, \text{ZrCl}_4$.
A source of zirconium for magnesium alloys, to remove iron in an insoluble form.
- potassium-zirconium sulfate.** See zirconium-potassium sulfate.
- potato oil.** See fusel oil.
- potato spirit.** See fusel oil.
- pot clays.** Refractory clays used for making the pots in which glass is produced.
-
- "Pot N Pan."** ¹⁰⁸ A light blue, free-flowing granular composition containing special soaps, mild alkaline cleaners, corrosion inhibitors and "Calgon" water conditioner.
Containers: 325-, 100-lb drums.
- potter's clay.** See ball clay.
- pottery body stains.** Calcined-oxide finely ground pigments for coloring ceramic bodies.
Use: As colors or designs for tile, terracotta, chinaware, etc., where the pigment becomes part of the ceramic body.
- potting.** A process in which an uncured liquid resin or its solution is caused to penetrate an assemblage of electrical wire and insulation, such as a solenoid or resistor coil, and the penetrated resin is then cured to produce a unit with improved electrical, handling, and deterioration characteristics. Epoxy resins are frequently used.
- pound centigrade unit (pcu).** See chu.
- pour point.**
1. The lowest temperature at which a liquid will flow when a test container is inverted.
2. The temperature at which an alloy is cast.
- povidone-iodine.** A water-soluble complex produced by reacting iodine with the polymer polyvinylpyrrolidone. Used in external medicine, for the slow release of its iodine.
- powder, black.** See gunpowder.
- "Powdered Acid Cleaner."** ²⁴⁴ Trade name for an acid cleaner compound of an acid salt and wetting agent.
* Properties: Light gray granular material readily soluble in water.
Containers: 100-lb net drum.
- powder metallurgy.** The arts of producing metal powder and of the utilization of metal powders for the production of massive materials and shaped objects (MPA definition, MPA Standard 9-50T).
The production of finished metal shapes and products by pressing metal powder in suitably shaped molds and then sintering the briquettes at an elevated temperature to consolidate the structure, reduce porosity and impart useful strength is a major metal-fabricating operation. Since it need involve no liquid phase, it is the only commercial method for the manufacture of ductile tungsten, tantalum and similar high-melting metals, and also of tungsten-copper contacts, copper-lead bearings and such parts whose component metals do not readily mix when molten. Cemented tungsten carbides used for tools and dies, and porous self-lubricating bearings are also manufactured only from powdered metals. A fast-growing application is the use of powder metallurgy for making small metal parts such as gears, magnets, bushings, etc. that were formerly made by casting and machining, bar-machining, stamping, forging and machining, etc. In such cases, molding to shape by powder metallurgy may save machining and material cost without sacrificing quality or time. See also metals, powdered.
- powellite** CaMoO_4 or $\text{Ca}(\text{Mo}, \text{W})\text{O}_4$. Natural calcium molybdate in which a portion of the molybdenum is replaced by tungsten.
Properties: Bluish-green crystals contain 1.65 to 10.28% WO_3 ; sp. gr. 4.35-4.52. Pearly-gray scales are more common and contain only traces of tungsten; sp. gr. 4.25.
Occurrence: United States (Idaho, Michigan) Texas, Nevada, California; Siberia.
Uses: Minor ore of molybdenum.
- "Power-Pak."** ²⁰⁴ Trademark for a liquid dry cleaning detergent, recommended for use in charged systems at 1-4% concentrations.
- power reactor.** See nuclear reactor.
- "Poxeal."** ¹¹⁶ Trademark for an insulation system for dynamoelectric machines whereby the electrical circuits are sealed in a tough flexible material (such as epoxy

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

resin) capable of withstanding severe environmental and thermal shock conditions.

pozzolana cement (puzzolana cement; Santorin cement; gaize cement; silikat-cement, tarras cement; trass cement). A cement produced by grinding together Portland cement clinker and a pozzolana, or by mixing together a hydrated lime and a pozzolana. A pozzolana is defined as a material which is capable of reacting with lime in the presence of water at ordinary temperature to produce a cementitious compound. Natural pozzolanas are silicious material of volcanic origin. They include trass and Santorin earth. Blast furnace slag is used to produce artificial pozzolanas.

PPO. See 2,5-diphenyloxazole.

Pr. Symbol for praseodymium.

Prague red. A red pigment consisting, essentially, of red iron oxide.
See also iron oxide reds and hematite.

pramoxine hydrochloride

$C_4H_9OC_6H_4OC_3H_6C_4H_8NO \cdot HCl$.

Properties: White, practically odorless, crystalline powder, numbing effect when tasted, melts between 169° and 172°C. Freely soluble in water and alcohol, practically insoluble in chloroform and ether.

Grade: N.F. XI.

Use: Medicine.

"Pranone." ³²¹ Brand name for ethisterone.

"Prantal." ³²¹ Brand name of diphemanil methylsulfate.

praseodymia. See praseodymium oxide; see also rare earths.

praseodymium Pr. Element of atomic number 59, Group III of the periodic table; one of the rare earth elements of the cerium subgroup.

Properties: Yellowish metal, tarnishes easily (color of salts green); sp.gr., 6.78-6.81, m.p. 940°C, b.p. 3000°C (approx), ignites to oxide (200-400°C), liberates hydrogen from water; soluble in dilute acids.

Source: See rare earth minerals.

Derivation: Reduction of the chloride or fluoride with calcium powder.

Use: Praseodymium salts.

Shipping regulations: None.*

See also didymium.

praseodymium salts.

praseodymium ammonium nitrate

$Pr(NO_3)_3 \cdot 2NH_4NO_3 \cdot 4H_2O$. Colored crystals; soluble in water. Purity 50% praseodymium salt.

praseodymium carbonate $Pr_2(CO_3)_3 \cdot xH_2O$.

Green powder; insoluble in water; soluble in acids. Grades 99% Pr salts, available as 70% Pr_6O_{11} . Containers: Glass bottles, fiber drums.

praseodymium chloride $PrCl_3 \cdot xH_2O$. Green crystals, soluble in water. Purities to 99%

praseodymium salt; color varies with the purity. Available as 45% Pr_6O_{11} . Containers: Glass bottles, fiber drums.

praseodymium fluoride $PrF_3 \cdot 2H_2O$. Green crystals. Grades up to 99% Pr salts. Available as 77% Pr_6O_{11} . Containers: Glass bottles, fiber drums.

praseodymium nitrate $Pr(NO_3)_3 \cdot xH_2O$. Green crystals; soluble in water. Color varies with the purity. Available as 40% Pr_6O_{11} . Containers: Glass bottles, fiber drums. Shipping regulations: Oxidizing material. Yellow label.*

praseodymium oxalate $Pr_2(C_2O_4)_3 \cdot xH_2O$. Green powder; insoluble in water; slightly soluble in acids. Grades 80%, 90%, 99%, 99.9% Pr salts. Available as 50% Pr_6O_{11} . Containers: Glass bottles, fiber drums.

praseodymium oxide (praseodymia) Pr_6O_{11} . Brown-black powder, insoluble in water; soluble in acids. Hygroscopic, absorbs carbon dioxide from the air. Purities to 99.8% oxide. Containers: Glass bottles, fiber drums.

praseodymium sulfate $Pr_2(SO_4)_3 \cdot xH_2O$. Green crystals; slightly soluble in hot water; more soluble in cold. Color varies with purity. Available as 45% Pr_6O_{11} . Containers: Glass bottles, fiber drums. Uses: Coloring glass; decolorizing glass. The oxide is used to impart green color to synthetic emeralds.

precipitation. The formation of solid particles in a solution. Also, the settling out of small particles in either a liquid or gaseous medium.

precision. The extent to which a set of measurements or observations conform to their own mean, as frequently measured by the standard deviation.

See also accuracy.

prednisolone $C_{21}H_{28}O_5$, delta^{1,4}-Pregnadiene-11 beta, 17 alpha, 21-triol-3,20-dione. Generic name for an analog of hydrocortisone.

Properties: White to practically white, odorless, crystalline powder. Very slightly soluble in water, soluble in alcohol, chloroform, acetone, methanol, dioxane. M.p. about 235°C with some decomposition.

Grade: U.S.P. XVI.

Use: Medicine.

prednisolone acetate $C_{23}H_{30}O_6$.

Properties: White to practically white, odorless, crystalline powder. Practically insoluble in water, slightly soluble in alcohol, chloroform, acetone. M.p. about 235°C, with some decomposition.

Grade: U.S.P. XVI.

Use: Medicine.

prednisolone phosphate sodium $C_{21}H_{27}Na_2O_8P$.

Properties: White powder; slightly hygroscopic. Stable at room temperatures. Soluble in water, methanol, ethanol.

Grade: N.N.D.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

prednisone $C_{21}H_{26}O_5$. $\delta^1,4$ -Pregnadiene-17 α , 21-diol-3, 11, 20-trione. Generic name for an analog of cortisone.

Properties: White to practically white, odorless, crystalline powder. Very slightly soluble in water; slightly soluble in alcohol, chloroform, methanol, and dioxane. M.p. about 225°C with some decomposition.

Grade: U.S.P. XVI.

Use: Medicine.

pregnanediol $C_{21}H_{36}O_2$. 5 β -Pregnane-3- α , 20 α -diol. A steroid; the metabolic product of progesterone.

Properties: Crystallizes in plates from acetone; m.p. 238°C; dextrorotatory in solutions; sparingly soluble in organic solvents; not precipitated by digitonin.

Derivation: Isolation from pregnancy urine of women, cows, mares, and chimpanzees; by reduction of pregnanedione.

Use: In the synthesis of progesterone; medically as a pregnancy test.

pregnenedione. See progesterone.

pregneninolone. See ethisterone.

4-pregnen-21-ol-3, 20-dione. See deoxycorticosterone.

pregnenolone $C_{21}H_{32}O_2$. δ^5 -Pregnene-3- β -ol-20-one. A steroid which is believed to be a precursor of progesterone and the adrenal steroid hormones.

Properties: Crystallizes in needles from dilute alcohol, m.p. 193°C; freely soluble in acetone, petroleum ether, benzene, and carbon tetrachloride.

Derivation: From stigmasterol or other steroids.

Containers: Bottles.

Use: Medicine; biochemical research.

Also available as acetate salt.

prehnite $Ca_2Al_2Si_3O_{10}(OH)_2$. A natural hydrous silicate of calcium and aluminum, related to the zeolites (q.v.).

Properties: Color, light green to white; luster vitreous; sp.gr. 2.8-2.95, hardness 6-6.5.

Occurrence: Europe; United States.

prehnitene (1, 2, 3, 4-tetramethylbenzene; premitol) $(CH_3)_4C_6H_2$.

Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp.gr. 0.901, b.p. 204°C, m.p. -7.7°C

Grades: Technical.

Use: Organic synthesis.

"Premose." ¹¹⁴ Trademark for a high-maltose content syrup made from malted and unmalted cereal grains.

"Prenderol." ⁴¹² Trademark for 2, 2-diethyl-1, 3-propanediol (q.v.).

prenitrol. See prehnitene.

preparing salt. See sodium stannate.

"Prestab Oil V." ³⁰⁷ Brand name for an anionic textile chemical consisting of purified sulfated castor-oil fatty acids.

Properties: Clear, yellow, oily liquid; soluble in water; stable to acid and alkali.

Uses: Dyeing assistant for both cotton and wool to give wetting, penetration, leveling as well as softness to the dyed fiber; in viscose manufacture, clarifying agent to prevent milkiness of the yarn; antistatic agent for acetate and polyacrylonitrile fibers.

"Prestone." ²¹⁴ Trademark for a group of automotive service products which include an ethylene-glycol base antifreeze, containing special inhibitors for prevention of corrosion, foaming, creepage and rust-loosening.

"Preventol." ³⁰⁷ Trademark for a series of fungicides and bactericides.

"Preventol" GD. Dihydroxydichlorodiphenyl methane; 96% active.

Properties: Fine, sandy, off-white powder; density 0.60-0.65; insoluble in water; soluble in caustic solutions, butanol, isopropanol, petroleum naphtha, and acetone.

Uses: Fungicide and bactericide which is non-toxic and non-irritating in normal use concentrations; mildewproofing agent for cotton yarn, thread and fabrics; preservative for liquid and paste products such as glues and adhesives; bactericide in cutting oils; used for slime control in the paper industry.

"Preventol" GDC. A 38-40% active alkaline solution of "Preventol" GD.

"Preventol" I. Sodium trichlorophenate; 56% solids; 51% active.

Properties: Clear, thin liquid; soluble in water; sp.gr. 1.40

Uses: Fungicide and bactericide for use in the leather trade, disinfectant and mold preventative for skins; preservative for print pastes, finishes, sizes, and adhesives.

priceite $Ca_4B_{10}O_{19} \cdot 7H_2O$. A hydrated calcium borate of variable formula, mined in Turkey for borax. Color white; luster earthy; hardness 3-3.5, sp.gr. 2.2-2.5.

prills. Material in small bead form.

"Prim." ²⁰⁴ Trademark for a solvent-soluble fabric size and water-repellent for dry cleaning use.

"Primal." ²³ Trademark for aqueous dispersions of acrylic resins, supplied in various grades that differ in hardness and flexibility. Produce finishes which are water-insoluble, require no plasticizer for flexibility, unimpaired by aging, and adhere tenaciously to leather and lacquer coats.

Use: Base coat for leather finishes.

"Primal" Binders. Dispersions or solutions of waxes and auxiliary materials.

Use: Binders for water finishes on all types of leather.

"Primal" Colors. Aqueous dispersions of pigments.

primaquine $H_2N(CH_2)_3CHCH_3NHC_6H_4NOCH_3$, 6-Methoxy-8-(4-amino-1-methylbutylamino) quinoline.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Viscous liquid; b.p. 175-179°C (0.2 mm); moderately soluble in water.
Use: Medicine (base).

primaquine phosphate $C_{15}H_{21}N_3O \cdot 2H_3PO_4$.
 8-(4-Amino-1-methylbutylamino)-6-methoxyquinoline phosphate.

Properties: Orange-red, crystalline powder; odorless; bitter taste; m.p. 200-205°C, solutions acid to litmus; soluble in water; insoluble in chloroform and ether.

Grade: U.S.P. XVI.

Use: Medicine.

primary. Term used to characterize certain types of compounds and distinguish them from other similar or isomeric substances. Thus a primary alcohol is one whose molecular structure may be written RCH_2OH rather than R_1R_2CHOH (secondary alcohol) or $R_1R_2R_3COH$ (tertiary alcohol). A primary amine is characterized by the formula RNH_2 , a secondary amine by R_1R_2NH , and a tertiary amine by $R_1R_2R_3N$. In all these cases R_1 , R_2 , and R_3 may designate either identical or different hydrocarbon groups or substituted hydrocarbon groups. See, e.g., amyl alcohol. See *tert-* for another use of tertiary.

The terms primary, secondary, and tertiary are also used to name salts of orthophosphoric acid (H_3PO_4) in which one, two, or three of the hydrogen atoms have been replaced by metal or radicals. Thus NaH_2PO_4 is primary sodium phosphate, while Na_2HPO_4 is secondary sodium phosphate. The same system of names is used for salts of other acids containing three replaceable hydrogen atoms.

primary azo dyes. Azo dyes derived from primary amines.

primary calcium phosphate. See calcium phosphate, monobasic.

"Primene." ²³ Trademark for tertiary alkyl amines (RNH_2 , where R is C_{12} - C_{24} t-alkyl) Supplied as oil-soluble liquids.

Use: Fuel oil stabilizers, corrosion inhibitors; intermediates for oil additives, surfactants, and other chemical products.

primidone $C_{12}H_{14}N_2O_2$. 5-Ethylidihydro-5-phenyl-4,6(1H,5H)-pyrimidinedione.
Properties: White, crystalline powder. Odorless. Slightly bitter taste. Very slightly soluble in water and most organic solvents; slightly soluble in alcohol; pH of saturated aqueous solutions 5.6-6.0, m.p. 279°-284°C.

Grade: U.S.P. XVI.

Use: Medicine.

"Priminox." ²³ Trademark for ethylene oxide derivatives of "Primene". Most grades are oil-soluble liquids, some water-soluble.
Use: Formulation of corrosion inhibitors, surfactants, and fuel oil additives.

"Primol." ⁵¹ Trademark for high viscosity white mineral oils conforming with U.S.P. specifications for internal use; in the class known as "Russian type."

primrose chrome. See chrome yellows.

primrose yellow. See chrome yellows.

primuline. A yellow synthetic dye.

primuline dyes. See thiazole dyes.

printer's acetate. See mordant rouge.

printer's iron liquor. See iron acetate liquor.

printing ink. Usually a mixture of finely divided pigment such as carbon black suspended in a drying oil such as heat-bodied linseed oil. Alkyds, phenol-formaldehyde or other synthetic resins are frequently also present, and cobalt, manganese, and lead soaps are added to achieve rapid drying by oxidation and polymerization. Mineral oils are sometimes present and some types of inks dry by evaporation of a volatile solvent rather than by oxidation and polymerization of a drying oil or resin. For colored inks, pigments such as chrome yellows, benzidine yellows or lithol reds are used.

Shipping regulations: May be classified as flammable liquids. Red label.*

"Priodax." ³²¹ Brand name for iodoalphonic acid.

"Priscoline." ³⁰⁵ Trademark for tolazoline.
Use: Medicine.

prisilidene hydrochloride. See alphaprodine hydrochloride.

"Prismac." ³³³ Trade name for cellulose-base crystallizing lacquers which are used to produce a clear or colored, opaque finish.

"Pristane." ⁴¹⁵ (norphytane; 2,6,10,14-tetramethylpentadecane) $C_{19}H_{40}$.
Properties: A colorless, odorless, liquid, b.p. 290°C, sp.gr. 0.780-0.790 (20°C); refractive index 1.4382-1.4392 (20°C); flash point ca 183°C. Soluble in ether, petroleum ether, benzene, chloroform, carbon tetrachloride.

Grade: 90% min.

Containers: 1-lb bottles; 1-gal metal tins; 5-gal metal pails; 100-lb metal drum.

Uses: Suggested as a precision lubricant, and as heat transfer fluid.

"Privine." ³⁰⁵ Trademark for naphazoline.

"Pro-Banthine." ⁷⁰ Trademark for propantheline bromide. (beta-Diisopropylaminoethyl xanthene-9-carboxylate methobromide).
Use: Medicine.

probarbital sodium $C_9H_{13}O_3N_2Na$. Sodium 5-ethyl-5-isopropylbarbiturate.

Properties: White, hygroscopic powder; insoluble in water; slightly soluble in alcohol; practically insoluble in ether and chloroform. Aqueous solutions are alkaline to litmus; bitter taste.

Use: Medicine.

probenecid $HOOC \cdot C_6H_4SO_2N(CH_2CH_2CH_3)_2$. (Dipropylsulfamyl) benzoic acid.

Properties: White, odorless crystalline powder; m.p. 198-200°C; soluble in acetone, alcohol, dilute alkalis, and dilute sodium

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

bicarbonate; insoluble in dilute acids and water.

Grade: U.S.P. XVI.

Use: Medicine.

procainamide hydrochloride

$\text{H}_2\text{NC}_6\text{H}_4\text{CONHCH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$. para-Amino-N-(2-diethylaminoethyl)benzamide hydrochloride.

Properties: White to tan, odorless, crystalline powder; m.p. 165-169°C, very soluble in water; soluble in alcohol; slightly soluble in chloroform; very slightly soluble in benzene and ether.

Grade: U.S.P. XVI.

Use: Medicine.

procaine. See procaine hydrochloride.

procaine base (para-aminobenzoyldiethylaminoethanol base; 2-diethylaminoethyl-para-aminobenzoate)

$\text{C}_6\text{H}_4\text{NH}_2\text{COOCH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2$. Crystallizes with $2\text{H}_2\text{O}$ from aqueous alcohol.

Properties: White, stable, granular powder, odorless; melts near 60°C when anhydrous. Sensitive to light and air. Soluble in alcohol, ether, chloroform, benzene, fixed and volatile oils, insoluble in water.

Use: Medicine.

Shipping regulations: None.*

procaine benzylpenicillin. See under penicillin, as procaine penicillin G.

procaine hydrochloride (para-aminobenzoyldiethylaminoethanol hydrochloride; ethocaine, kerocaine, procaine)

$\text{C}_6\text{H}_4\text{NH}_2\text{COOCH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$.

Properties: Small, colorless crystals or white, crystalline powder, odorless; stable in air. Soluble in water and in alcohol at 25°C; slightly soluble in chloroform; almost insoluble in ether; solutions acid to litmus. M.p. 153-156°C.

Derivation: (a) By heating chloroethyl-para-nitrobenzoic ester with diethylamine for 24 hours under pressure at 120°C. The product is then reduced with tin and hydrochloric acid. (b) By condensation of ethylene chlorohydrin with diethylamine. The chloroethyldiethylamine formed is heated with sodium para-aminobenzoate.

Containers: Drums.

Grade: U.S.P. XVI.

Use: Medicine.

Shipping regulations: None.*

procaine nitrate (para-aminobenzoyldiethylaminoethanol nitrate; beta-diethylaminoethyl-para-aminobenzoate nitrate)

$\text{C}_6\text{H}_4\text{NH}_2\text{COOC}_2\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HNO}_3$.

Properties: Small, colorless crystals; odorless. Soluble in water, alcohol. M.p. 100-102°C.

Use: Medicine.

Shipping regulations: None.*

procaine penicillin G. See penicillin.

"Processing Stiffener 710." ²⁴⁸ Trademark for a hydrazine salt (26.4% active material) compound.

Properties: A gray-white powder; sp.gr.

2.50; the active constituent is slightly soluble in water and insoluble in gasoline, benzol, ethylene dichloride, and acetone.

Uses: Used to prevent excessive softness and low plasticity in rubber stocks in process. It is used in all types of unvulcanized natural, SBR, neoprene and nitrile rubbers.

prochlorperazine ethanedisulfonate

$\text{C}_{20}\text{H}_{24}\text{ClN}_3\text{S}_2 \cdot \text{C}_2\text{H}_4\text{O}_6\text{S}_2$. 2-Chloro-10-[3-(4-methylpiperazinyl)propyl]phenothiazine ethanedisulfonate.

Properties: White to very light yellow, crystalline powder. Odorless. Solutions acid to litmus. Soluble in water; very slightly soluble in alcohol, insoluble in ether and chloroform.

Grade: U.S.P. XVI.

Use: Medicine.

prochlorperazine maleate $\text{C}_{20}\text{H}_{24}\text{ClN}_3\text{S} \cdot 2\text{C}_4\text{H}_4\text{O}_4$. Prochlorperazine dimaleate.

Properties: White to pale yellow, crystalline powder. Odorless. Saturated solution is acid to litmus. Practically insoluble in water and alcohol. Slightly soluble in warm chloroform.

Grade: U.S.P. XVI.

Use: Medicine.

"Procilyn" Dyes. ³²⁵ Brand name for reactive disperse dyes for nylon. Cover irregular-dyeing yarns, and produce dyeings having excellent wet fastness.

"Procion" Dyes. ³²⁵ Brand name for a range of dyes which form a chemical linkage with cellulosic fiber molecules. Applied to cotton and rayon by dyeing and printing.

"Procote." ⁴²⁸ Trademark for clear, fast drying, vinyl type lacquer and viscous, nonflammable, water soluble acrylic emulsion coatings for metals.

procyclidine hydrochloride (1-cyclohexyl-1-phenyl-3-pyrrolidino-1-propanol hydrochloride)

$\text{C}_{16}\text{H}_{21}(\text{C}_6\text{H}_5)\text{C}(\text{OH})\text{CH}_2\text{CH}_2\text{C}_4\text{H}_8\text{N} \cdot \text{HCl}$.

Grade: N.N.D.

Use: Medicine.

"Prodag." ⁴⁶ Trademark for a concentrated semi-colloidal dispersion of pure electric-furnace graphite in water.

Properties: Paste consistency; solids content 30%; sp.gr. 1.18; b.p. 100°C; freezing point 0°C, completely miscible with water.

Uses: General industrial mold-release and parting agent; "stopoff" coating; wire-drawing lubricant.

producer gas. A gas obtained by burning solid fuel with a restricted supply of air or by passing air and steam through a bed of incandescent fuel under such conditions that any carbon dioxide formed is, as far as possible, converted into carbon monoxide before it leaves the producer. The water vapor is split up chemically with the formation of carbon monoxide and hydrogen.

Uses: Producer gas is cheap but low Btu. It is used especially as an industrial fuel where it does not need to be transported,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

as in coke-ovens and other furnaces, and in gas engines run for power purposes. Producer gas is also a source material for synthetic ammonia manufacture.

A typical gas will analyze:

	From Coal	From Coke
	Per Cent	Per Cent
Illuminants	0.2	0.0
Carbon monoxide	17.6	25.3
Hydrogen	10.4	13.2
Methane	6.3	0.4
Ethane	0.0	0.0
Carbon dioxide	7.3	5.4
Oxygen	0.7	0.6
Nitrogen	58.1	65.2

The available Btu from a coal source is 161, and from a coke source is 137.

See also water gas; and synthesis gas.

"Product BCO." ²⁸ A surface-active agent based on cetyl betaine. It is unique in that it is cationic when in acid media and anionic when in basic. Used as a wetting agent, detergent, and dyeing assistant.

production reactor. See nuclear reactor.

"Pro-fax." ²⁶⁶ Trademark for several grades of polypropylene. Available as natural or colored molding powder pellets.

Properties: Lightest of all plastics; high heat resistance; resistance to greases, oils, and many chemicals.

Uses: Manufacture of monofilament for rope, outdoor furniture webbing, replacement auto seat covers and bristles. Multifilaments serve in fabrics and rug yarn. Yields tough, clear films for packaging and industrial use, and is FDA approved for direct contact with foods. Injection molded uses include housewares, pipe fittings, automotive parts and a variety of industrial moldings.

proflavine sulfate (proflavine, 3,6-diamino-acridinium hydrogen sulfate)
 $C_{13}H_{11}N_3 \cdot H_2SO_4$.

Properties: Reddish-brown, odorless, crystalline powder. Soluble in water and alcohol forming brownish solutions which fluoresce green on dilution, nearly insoluble in ether and chloroform.

Derivation: Synthetic.

Method of purification: Crystallization.

Containers: Amber glass bottles.

Uses: Medicine.

Shipping regulations: None.*

"Profume." ²³³ Trademark for an odorized methyl bromide product, used as a soil fumigant and insecticide.

progesterone (delta⁴-pregnene-3,20-dione)
 $C_{21}H_{30}O_2$. The female sex hormone secreted in the body by the corpus luteum, by the adrenal cortex, or by the placenta during pregnancy. It is important in the preparation of the uterus for pregnancy, and for the maintenance of pregnancy. It exists in two crystalline forms (alpha- and beta-) of equal physiological activity. Progesterone is believed to be the

precursor of the adrenal steroid hormones. **Properties:** White crystalline powder; odorless and stable in air but sensitive to light.

M.p., alpha form 128-133°C, beta form, about 121°C. Practically insoluble in water, soluble in alcohol, acetone, and dioxane; sparingly soluble in vegetable oils.

Units: The international unit (IU) of progestational activity is expressed as 1 mg of progesterone.

Derivation: Isolation from corpus luteum of pregnant sows; synthesis from other steroids such as stigmasterol (q.v.).

Grade: U.S.P. XVI.

Containers: Bottles.

Use: Medicine.

"Progynon." ³²¹ Brand name for estradiol.

"Progynon Benzoate." ³²¹ Brand name for estradiol benzoate.

prolactin. See luteotropin.

prolamin. See gliadin.

"Prolase." ¹⁷³ Trademark for a fungal protease system in powder form. It is useful for processing wheat gluten and other proteins in a pH range of 3.5-7.0.

proline (2-pyrrolidinedicarboxylic acid)

C_4H_7NCOOH . A nonessential amino acid found naturally in the L(-) form.

Properties: Colorless crystals; soluble in water and alcohol; insoluble in ether; optically active;

DL-proline: m.p. 205°C with decomposition.

D(+)-proline: m.p. 215-220°C with decomposition.

L(-)-proline: m.p. 220-222°C with decomposition.

Derivation: Hydrolysis of protein; organic synthesis.

Uses: Biochemical and nutritional studies; microbiological tests; culture media.

Available commercially as the L(-)-proline.

prolipin. A compound sterile solution of protein obtained from nonpathogenic bacteria, various animal fats and lipoids derived from bile.

"Prolixin." ⁴¹² Trademark for fluphenazine dihydrochloride (q.v.).

"Proluton." ³²¹ Brand name for progesterone.

"Promacetin." ³³⁰ Trademark for acetosulfone (sodium 4,4'-diaminodiphenylsulfone-2-N-acetylsulfonamide).

Use: Medicine.

"Promat." ⁴²⁸ Trademark for a line of cadmium, zinc and copper plating brighteners.

promazine hydrochloride (10-(3-dimethylaminopropyl)phenothiazine hydrochloride)
 $C_{17}H_{20}N_2S \cdot HCl$. Isomeric with promethazine hydrochloride.

Properties: Crystals; hygroscopic. Soluble in water, methanol, ethanol, chloroform; practically insoluble in ether, benzene. Incompatible with alkalis, oxidizing agents, heavy metals.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: N. N. D.

Use: Medicine.

promethazine hydrochloride $C_{17}H_{20}N_2S \cdot HCl$.
N-(2'-Dimethylamino-2'-methyl)-ethyl-phenothiazine hydrochloride; 10-(2-dimethylaminopropyl)phenothiazine hydrochloride.

Properties: White to faint yellow, practically odorless powder. Slowly oxidized, particularly when moistened, on prolonged exposure to air, becoming blue in color. Melts within a 3° range between 215 and 225° . Very soluble in water, in hot absolute alcohol, and in chloroform; practically insoluble in ether, acetone, and ethyl acetate. 1 in 10 solutions in water or chloroform are colorless and clear. pH (5% solution) 4.5-5.5.

Grade: U. S. P. XVI.

Use: Medicine.

promethium Pm. A rare earth element with atomic number 61, first discovered in the fission products of uranium. It is prepared in the cyclotron by bombarding neodymium with protons and from nuclear reactor fuels by ion exchange separations. Five isotopes have been made, the longest lived having a half-life of 3.7 years, thus making the existence of natural stable isotopes unlikely.

"**Promin.**" ³³⁰ Trademark for glucosulfone sodium (disodium para, para'-sulfonyldianiline-N,N'-diglucoside disulfonate).

Use: Medicine.

"**Promizole.**" ³³⁰ Trademark for thiazolsulfone (2-amino-5-sulfamylthiazole).

Use: Medicine.

promoters, in catalysts. Substances which, when added in relatively small quantities to a catalyst, increase its activity. Small amounts of aluminum and potassium oxide are commonly added as promoters to the iron catalyst used in facilitating combination of hydrogen and nitrogen to form ammonia.

promoters, in ore flotation. Those reagents which provide the minerals which are to be floated with a water-repellent surface that will adhere to air bubbles. Such reagents are generally more or less selective towards minerals of certain classes.

"**Pronestyl.**" ⁴¹² Trademark for procainamide hydrochloride (q.v.).

"**Pro-Noxfish.**" ³⁴² Trademark for fish-toxicant composition containing rotenone and sulfoxide in emulsifiable vehicles.

proof, degree of. A method of designating the strength of ethyl alcohol-water mixtures, most frequently for purposes of taxation, according to the number of gallons of "proof spirit" or "100 proof" alcohol that can be made from 100 gallons of the alcohol-water mixture under discussion. "Proof spirit" is defined by the regulation (in the U. S.) that it "contains one half its volume of alcohol of sp. gr. 0.7939 ($60^\circ F$)."

This latter is absolute alcohol, and pure absolute alcohol is, therefore, 200 proof. The degree of proof is twice the per cent by volume of alcohol. For example, one gallon of 95% alcohol is equivalent to 1.9 gallons proof alcohol. Due to volume contraction upon mixing alcohol and water, it is necessary to add 53.73 volumes of water to 50 volumes of alcohol in order to produce 100 volumes of 100 proof alcohol.

proof gallon. See proof, degree of.

propadiene. See allene.

propanal. See propionaldehyde.

propane (dimethylmethane) C_3H_8 .

Properties: Colorless gas. Characteristic natural gas odor. Heavier than air. Has no corrosive action on metals.

Constants: B. p. $-42.5^\circ C$; m. p. $-189.9^\circ C$; density of liquid at $0^\circ C$ 0.531; density of vapor at $0^\circ C$ (760 mm) (air = 1) 1.56; explosive limits in air per cent by volume, lower 2.4, upper 9.5; flash point $-104^\circ C$.

Grades: Technical; research (99.9%).

Containers: Cylinders; tank cars.

Uses: Organic synthesis; fuel for household and for many industrial purposes, either alone or in admixture with butane or air; extractant; solvent, refrigerant; gas enricher; standby gas; aerosol propellant; mixture for bubble chambers.

Shipping regulations: Flammable gas. Red gas label.*

propanedinitrile. See malonic dinitrile.

1, 2-propanediol. See propylene glycol.

1, 3-propanediol. See trimethylene glycol.

propane hydrate. See gas hydrates.

propanenitrile. See ethyl cyanide.

1-propanethiol. See n-propyl mercaptan.

propanoic acid. See propionic acid.

1-propanol. See propyl alcohol.

2-propanol. See isopropyl alcohol.

propanolamine. See 2-aminopropanol; 3-aminopropanol.

2-propanolpyridine $C_5NH_4C_3H_6OH$.

Properties: B. p. (760 mm) $260.2^\circ C$; sp. gr. ($25^\circ C$) 1.060; refractive index 1.5298 (n 20/D); miscible with water in all proportions at $20^\circ C$.

4-propanolpyridine $C_5NH_4C_3H_6OH$.

Properties: B. p. (760 mm) $289.0^\circ C$; f. p. $36.7^\circ C$; sp. gr. ($40^\circ C$) 1.053; soluble in water.

2-propanone. See acetone.

2-propanone oxime. See acetoxime.

propanoyl chloride. See propionyl chloride.

propantheline bromide $C_{23}H_{30}BrNO_3$. (2-Hydroxyethyl)diisopropylmethylammonium bromide 9-xanthenecarboxylate.

Properties: White or nearly white crystals, or powder. Odorless. Bitter taste. Very

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

soluble in water, alcohol, and chloroform; practically insoluble in ether and benzene. M.p. 155°-160°C with decomposition.

Grade: U.S.P. XVI.

Use: Medicine.

proparacaine hydrochloride

$C_9H_{17}OC_6H_4NH_2COOC_2H_4N(C_2H_5)_2 \cdot HCl$.

2-Diethylaminoethyl-3-amino-4-propoxybenzoate hydrochloride.

Properties: White crystalline substance; soluble in water; m.p. 178-179°C. (uncorrected).

Grade: N.N.D.

Use: Medicine.

propargyl alcohol (2-propyn-1-ol) $HC \equiv CCH_2OH$.

Properties: Colorless liquid; sp. gr. 0.9215; m.p. -17°C; b.p. 114°C; soluble in water, alcohol, and ether.

Derivation: From acetylene by high pressure synthesis.

Grades: Technical; 75% solution.

Containers: Up to tank cars.

Uses: Chemical intermediate; corrosion inhibitor; stabilizer.

propargyl bromide (3-bromo-1-propyne)

$HC \equiv CCH_2Br$.

Properties: Liquid; sp. gr. 1.520; b.p. 88-90°C.

Derivation: From acetylene by high pressure synthesis.

Containers: Up to tank cars.

Uses: Chemical intermediate; soil fumigants.

propargyl chloride (3-chloro-1-propyne)

$HC \equiv CCH_2Cl$.

Properties: Liquid; freezing point -76.9°C; b.p. range 56.0-57.1°C; refractive index (n_{25/D}) 1.4310; flash point 90-95°F. Has three centers of chemical reactivity, acetylenic hydrogen, triple bond and chlorine atom.

Derivation: From acetylene by high pressure synthesis.

Containers: Up to tank cars.

Uses: Chemical intermediate, soil fumigant.

propellants. Substances which contain the necessary ingredients (both a fuel and an oxidizer) for combustion in order to impart motion to an object. The term covers a wide range of materials, including gunpowder (q.v.) but now is usually associated with rockets and missiles. See rocket propellants.

"Pro-Pen." ¹²³ Trademark for antibiotic and vitamin supplements for animal and poultry feed.

propenal. See acrolein.

propene. See propylene.

propenenitrile. See acrylonitrile.

2-propene-1-thiol. See allyl mercaptan.

propene-1,2,3-tricarboxylic acid. See aconitic acid.

propenoic acid. See acrylic acid.

2-propen-1-ol. See allyl alcohol.

propenyl alcohol. See allyl alcohol.

2-propenylamine. See allyl amine.

para-propenylanisole. See anethole.

alpha-propenyldichlorohydrin. See alpha-dichlorohydrin.

propenyl gualacol. See methyl isoeugenol.

2-propenyl hexanoate. See allyl caproate.

2-propenyl isothiocyanate. See allyl isothiocyanate.

properdin. A protein which is a normal constituent of human blood serum and is important in natural immunity to infectious diseases.

propenpyridamine. See pheniramine.

propenpyridamine maleate. See pheniramine maleate.

proplodal (1,3-bis(trimethylamino)-2-propanol diiodide; iodisan; hexamethyldiaminoisopropanol diiodide) $[CH_2N(CH_3)_3]_2CHOH$.

Properties: White, crystalline; m.p. about 275°C (dec). Turns brown at 240°C. Freely soluble in water, slightly in alcohol; insoluble in ether, acetone.

Use: Medicine, iodine therapy.

beta-propiolactone (BPL) QCH_2CH_2CO .

Properties: A colorless liquid; pungent odor; b.p. 155°C (760 mm) with rapid decomposition; m.p. -33.4°C; refractive index (n_{20/D}) 1.4131; sp. gr. (20/4°C) 1.1460; soluble in water; miscible with ethyl alcohol, acetone, ether, and chloroform at 25°C. Reacts with alcohol. Flash point (open cup) 74°C, fire point (open cup) 74°C, quite stable when stored in glass at refrigeration temperature (+5° to +10°C).

Derivation: By the direct combination of ketene and formaldehyde.

Containers: Up to tank cars; tank trucks.

Use: Organic synthesis; vapor sterilant. Handle with caution!

propiomazine hydrochloride 1-[10(2-dimethylaminopropyl)phenothiazine-2-yl]-1-propanone hydrochloride.

Derivation: Synthetic compound.

Use: Medicine.

propionaldehyde (propanal; propyl aldehyde; propionic aldehyde) C_2H_5CHO .

Properties: Water-white liquid with suffocating odor, soluble in water.

Typical specifications: Flash point (open cup) 15°C; b.p. 48.8°C; sp. gr. 0.807 (20/4°C); refractive index (n_{20/D}) 1.364.

Derivation: (a) Oxidation of propyl alcohol with dichromate; (b) by passing propyl alcohol over copper at elevated temperatures.

Containers: 370-lb drums.

Uses: Manufacture of polyvinyl acetals and other types of plastics; synthesis of rubber chemicals; disinfectant; preservative.

Shipping regulations: Flammable liquid. Red label.*

propionamide nitrile. See cyanoacetamide.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

propione. See diethyl ketone.

propionic acid (methylacetic acid; propanoic acid) $\text{CH}_3\text{CH}_2\text{CO}_2\text{H}$.

Properties: Clear, colorless liquid; pungent odor; sp. gr. 0.9942 (20/4°C); m. p. -20.8°C; refractive index 1.3862 (20°C); b. p. 140.7°C; soluble in water, alcohol, chloroform and ether.

Derivation: By reaction of ethyl alcohol with carbon monoxide, using a boron trifluoride catalyst; also from the mixtures of oxygenated products produced by the catalytic (Fischer-Tropsch and Hydrocol processes) reaction of carbon monoxide with hydrogen, olefins, or alcohols.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; carboys; tank cars.

Uses: Propionates, some of which are used as mold inhibitors in bread; emulsifying agents; solutions for electroplating nickel; perfume esters; artificial fruit flavors; pharmaceuticals; solvent mixtures for cellulose derivatives.

Shipping regulations: None.*

propionic aldehyde. See propionaldehyde.

propionic anhydride $(\text{CH}_3\text{CH}_2\text{CO})_2\text{O}$.

Properties: Colorless liquid; pungent odor; m. p. -45°C; b. p. 167-169°C; sp. gr.

1.0119 at 20°C; vapor pressure 1 mm at 20°C; flash point 165°F; wt 8.4 lbs/gal at 20°C; coefficient of expansion 0.00107 at 20°C; viscosity 0.011 poise at 20°C; soluble in alcohol, ether, chloroform, and alkalis; insoluble in water.

Uses: Esterifying agent for fats, oils, cellulose; dehydrating medium for nitrations and sulfonations; production of alkyd resins, dyestuffs and pharmaceuticals.

propionic ester. See ethyl propionate.

propionitrile. See ethyl cyanide.

propionylbenzene. See propiophenone.

propionyl chloride (propanoyl chloride)

$\text{CH}_3\text{CH}_2\text{COCl}$.

Properties: Colorless liquid with pungent odor; m. p. -94°C, b. p. 80°C; sp. gr. 1.065 (20/4°C). Decomposes in water and alcohol.

Uses: Chemical intermediates.

propionyl erythromycin ester lauryl sulfate

See erythromycin propionate lauryl sulfate.

propiophenone (ethyl phenyl ketone; propionylbenzene; 1-phenyl propanone-1)

$\text{C}_6\text{H}_5\text{COC}_2\text{H}_5$.

Properties: Water-white to light amber liquid with strong persistent odor; sp. gr. 1.012 (20/20°C); refractive index (n_D 20/D) 1.527; congealing temperature 17.5-21°C; b. p. 218°C; flash point (TOC) 210°F. Insoluble in water, ethylene glycol, glycerine; miscible with ethyl alcohol, ethyl ether, benzene, and toluene.

Containers: 55-gal drums containing 450 lbs net each; 30-gal drums containing 250 lbs net each.

Uses: As a fixative in perfumes; as the

starting material for the synthesis of ephedrine and several other important pharmaceuticals; and as a raw material for the preparation of numerous synthetic organic chemicals.

Shipping regulations: None.*

propoxycaine hydrochloride.

$\text{H}_2\text{NC}_6\text{H}_3(\text{OC}_2\text{H}_5)_2\text{COO}(\text{CH}_2)_2\text{N}(\text{C}_2\text{H}_5)_2\cdot\text{HCl}$.

2-Diethylaminoethyl 4-amino-2-propoxybenzoate hydrochloride.

Properties: White, to pale yellow, odorless, crystalline solid; bitter taste. Discolors on prolonged exposure to light and to air.

Very soluble in water. Slightly soluble in alcohol and in chloroform. Practically insoluble in acetone and in ether. Melting range 146°-151°C; pH of solution (about 1%) is about 5.4.

Grade: N. F. XI.

Use: Medicine.

propoxyphene hydrochloride (dextro propoxyphene hydrochloride; alpha-d-4-dimethylamino-1, 2-diphenyl-3-methyl-2-butanol propionate hydrochloride)

$\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{C}_6\text{H}_5)(\text{OOC}_2\text{H}_5)\text{CH}(\text{CH}_3)\text{CH}_2\text{N}(\text{CH}_3)_2\cdot\text{HCl}$.

Properties: Crystalline solid; m. p. 170°C.

Grade: N. N. D.

Use: Medicine.

n-propyl acetate $\text{C}_3\text{H}_7\text{OOCCH}_3$.

Properties: Clear, colorless liquid having pleasant odor. Miscible with alcohols, ketones, esters, oils, hydrocarbons.

Constants: Sp. gr. 0.887; flash point 68°F; boiling range 96.0-102.0°C; wt 7.36 lbs/gal.

Derivation: Interaction of acetic acid and n-propyl alcohol in the presence of sulfuric acid.

Grades: Technical.

Containers: 55-gal drums; tank cars.

Uses: Flavoring agents; perfumery; solvent for nitrocellulose and wide range of cellulose derivatives, natural and synthetic resins; lacquers; plastics; organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

propyl acetone. See methyl butyl ketone.

propyl alcohol (1-propanol; n-propyl alcohol) $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Clear, colorless liquid; odor similar to ethyl alcohol; b. p. 97.2°C; m. p. -127.0°C; sp. gr. (20/4°C) 0.804; flash point (open cup) 96°F; lower explosive limit 2.6% by vol in air; autoignition temperature 540°C; refractive index (20°C) 1.385; viscosity 2.256 cps (20°C); soluble in water, alcohol, and ether.

Derivation: From oxidation of natural gas hydrocarbons, from Fischer-Tropsch process; also from fusel oil.

Containers: Up to 10,000 gal tank cars.

Uses: Organic synthesis; propionaldehyde; lacquers; cosmetics; solvent for dopes, waxes, vegetable oils, natural and synthetic resins, cellulose esters and ethers; solvent mixtures; polishing compositions.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

n-propyl alcohol. See propyl alcohol.

sec-propyl alcohol. See isopropyl alcohol.

propyl aldehyde. See propionaldehyde.

n-propylamine $C_3H_7NH_2$.

Properties: Colorless liquid; sp.gr. at 20°C 0.7182; b.p. 47.8°C; vapor pressure 248 mm (20°C); f.p. -83°C; odor, amine; soluble in water, alcohol and ether.

Containers: Drums; tank cars.

Use: Intermediate.

Fire hazard: Flash point -35°F.

Shipping regulations: Flammable liquid.

Red label.*

propyl butyrate $C_3H_7OCC_4H_9$.

Properties: Colorless liquid.

Constants: Sp.gr. 0.8789 (15°C); b.p. 142.7°C; m.p. -95.2°C.

Grades: Technical.

Containers: Tin cans.

Use: Solvent mixtures for cellulose ethers.

Shipping regulations: None.*

propyl chlorosulfonate $CH_3CH_2CH_2OSO_2Cl$.

Properties: Caution! Very irritant!

Constants: B.p. 70-72°C (20 mm).

Derivation: Interaction of n-propyl alcohol and sulfuryl chloride.

Grades: Technical.

Uses: Organic synthesis, military poison gas (lachrymator).

n-propyl cyanide See n-butyronitrile.

n-propyl diethyl malonate $C_3H_7CH(COOC_2H_5)_2$.

Properties: Colorless liquid with an aromatic odor; insoluble in water, soluble in alcohols, ethers, esters and ketones.

Uses: Intermediate; tobacco flavoring agent.

propyl 3,5-diiodo-4-oxo-1(4H)pyridineacetate.

See propyliodone.

propylene (propene) $CH_3CH=CH_2$. Now available in large quantities. Source of polypropylene.

Properties: Colorless gas, b.p. -47.7°C, m.p. -185.2°C; sp.gr. (liquid) 0.5139 (20/4°C); density of vapor at 0°C (760 mm, air 1) 1.46; critical temperature 92.1°C, critical pressure (absolute) 666 psi; explosive limits in air, % by volume, lower 2.2, upper 9.7; specific volume (70°F) 8.6 cu ft/lb. Flash point -108°C.

Derivation: From refinery off-gases or from cracking hydrocarbons during the production of ethylene.

Grades: 95%, 99% and research.

Containers: Cylinders, tank cars; or by direct pipeline.

Uses: (in approximate order of volume):

Production of isopropyl alcohol, propylene trimer and dimer, propylene oxide, cumene, synthetic glycerol, polypropylene and synthesis of isoprene (this use is growing fast), Oxo alcohols.

Danger! Extremely flammable. MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

propylene aldehyde. See crotonaldehyde.

propylene carbonate $C_3H_6CO_3$, possibly $CH_3CHOCOCH_2$.

Properties: Odorless, colorless mobile liquid. Freezing point -49.2°C (easily supercooled); b.p. 241.7°C; sp.gr. (20/4°C) 1.2057; wt/gal (20°C) 10 lbs; refractive index (n 20/D) 1.4209; flash point (Tag open cup) 270°F. Miscible with acetone, benzene, chloroform, ether, ethyl acetate. Moderately soluble in water and carbon tetrachloride.

Uses: Solvent extraction; plasticizer; organic synthesis; natural gas purification aid; synthetic fiber spinning solvent.

propylene chloride. See propylene dichloride.

propylene chlorohydrin (chloro-isopropyl alcohol; 1-chloro-2-propanol) $CH_3CH(OH)CH_2Cl$.

Properties: Colorless liquid. Mild odor, nonresidual.

Constants: B.p. 127.5°C; vapor pressure 4.9 mm (20°C); flash point 125°F; wt 9.3 lbs/gal (20°C), sp.gr. 1.1128 at 20/20°C; coefficient of expansion 0.00094 (20°C); viscosity 0.00467 poise (20°C). Soluble in water (in all proportions).

Typical specifications: Acidity not more than 0.02% (as hydrochloric), purity 46-54% propylene chlorohydrin by weight; sp.gr. 1.1270 at 20/20°C; color water-white (if shipped in glass).

Grades: Technical.

Containers: 1-gal glass jugs; 5-, 12-gal returnable glass carboys; 55-gal returnable steel drums.

Use: Organic synthesis (introducing hydroxypropyl group).

Danger! Extremely hazardous liquid and vapor. May be fatal if inhaled, swallowed, or absorbed through skin. MCA warning label.

propylenediamine (1,2-diaminopropane)

$NH_2CHCH_3CH_2NH_2$.

Properties: Colorless, very hygroscopic strongly alkaline liquid. Very soluble in water. Ammoniacal odor. Closely resembles ethylene diamine in its behavior, but yields products with greater oil solubility.

Constants: Sp.gr. 0.8732 at 20/20°C; vapor pressure 9.4 mm (20°C); flash point 160°F; wt 7.3 lbs/gal (20°C); b.p. 119.7°C, coefficient of expansion 0.00107 (20°C), viscosity 0.0170 poise (20°C).

Grades: Technical: 75% solution; 90% solution; 98% solution.

Containers: Tin-lined, nonreturnable containers, 5-, 10-, 55-gals.

Use: Synthesis of certain medicinals, dyes, rubber accelerators; electroplating; analytical test reagent.

Shipping regulations: None.*

See also 1,3-diaminopropane.

propylene dichloride (1,2-dichloropropane;

propylene chloride) $CH_3CHClCH_2Cl$.

Properties: Colorless, stable liquid. Low (moderate) flammability. Chloroform-like

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

odor.

Constants: B.p. 96.3°C; sp.gr. 1.1583 at 20/20°C; wt/gal 9.6 lbs (20°C); refractive index 1.4068 (20°C); surface tension 31.4 dynes/cm (25°C); viscosity 0.0088 poise (20°C); vapor pressure 40.0 mm (20°C); flash point (ASTM open cup) 21°C (70°F); solubility in water 0.26% by wt. (20°C); solubility of water in propylene dichloride 0.07% by wt (20°C); explosive limits in air, lower 3.4% by vol (25°C), upper 14.5% by vol (100°C); dielectric constant (85.8 kilocycles) 8.925 recip ohms (26°C); ignition temperature in air 557°C; coefficient of expansion (per °C) 0.00113 to 20°C, 0.001153 to 55°C; freezing point -80°C (-112°F); fire point 38°C; heat of vaporization 68.1 cal/g (b.p.); specific resistivity 2.5×10^8 ohms/cm. Miscible with most common solvents; insoluble in water.

Derivation: Action of chlorine on propylene.
Method of purification: Distillation.

Grades: Refined.

Containers: 50-gal drums; tank cars.

Uses: Solvent for fats, oils, waxes, gums, and resins; solvent mixtures for cellulose esters and ethers; organic synthesis; dry-cleaning fluids; scouring compounds; spotting agents; metal degreasing agents; fumigant.

Caution: Do not store in aluminum.

Shipping regulations: Flammable liquid.
Red label.*

1, 2-propylene glycol (1, 2-dihydroxypropane; methylethylene glycol; methyl glycol; 1, 2-propanediol) $\text{CH}_3\text{CHOHCH}_2\text{OH}$.

Properties: Colorless, viscous, stable, hygroscopic liquid; slight odor. Very slight acid taste. Miscible with water, alcohols, and many organic solvents.

Constants: B.p. 188.2°C; sp.gr. 1.0381 at 20/20°C; wt/gal 8.6 lbs (20°C); refractive index 1.4293 (27°C); surface tension 40.1 dynes/cm (25°C); viscosity 0.581 poise (20°C); vapor pressure 0.07 mm (20°C); specific heat 0.590 cal/g (20°C); latent heat of evaporation 168.6 cal/g at b.p.; flash point (ASTM open cup) 99°C (210°F); heat of combustion 431.0 kg cal/mole; coefficient of expansion (per °C) 0.000695 to 20°C, 0.000743 to 55°C.

Derivation: By hydration of propylene oxide.

Method of purification: By distillation.

Grades: Refined; U.S.P. XVI; technical.

Containers: Glass bottles; 5-, 55-gal drums, tank cars.

Uses: Organic synthesis; antifreeze solution, solvent for fats, oils, waxes, resins, dyes, flavoring extracts, perfumes; hygroscopic agent; lubricant in refrigeration machines; plasticizers, hydraulic fluids, bactericide, polyester resins; cosmetics; textile conditioners.

Shipping regulations: None.*

See also polypropylene glycols.

1, 3-propylene glycol. See trimethylene glycol.

propylene glycol diricinoleate

$[\text{C}_{17}\text{H}_{32}(\text{OH})\text{COO}]_2(\text{CH}_2\text{CHCH}_3)$.

Properties: Solid; sp.gr. 0.938; m.p. 49-51°C; insoluble in water.

propylene glycol methyl ether

$\text{CH}_3\text{OCH}_2\text{CHOHCH}_3$.

Properties: Colorless liquid; pour point -142°F; b.p. 120.1°C (760 mm); sp.gr. 0.919 (25/25°C); lbs/gal 7.65 (25°C); refractive index 1.402 (n 25/D); flash point 100°F. Soluble in water, methanol, ether.

Containers: Drums; tank cars.

Uses: Solvent; intermediate.

propylene glycol monoricinoleate

$\text{C}_{17}\text{H}_{32}(\text{OH})\text{COOCH}_2\text{CHOHCH}_3$.

Properties: A clear, pale yellow, moderately viscous oily liquid; mild odor; sp.gr. 0.960 (25/25°C); saponification value 160; hydroxyl value 285; solidifies at -26°C. Soluble in most organic solvents; insoluble in water.

Derivation: Castor oil and propylene glycol.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer; dye solvent; lubricant; in cosmetics; urethane polymers and hydraulic fluids.

"Propylene Glycol Monostearate 70." ²⁶⁰

Proprietary brand of the stearic acid ester of propylene glycol. Monoester content 70%. Balance essentially diester with small amounts of free fatty acid and free glycol. Waxy solid, white; mild fatty odor, soluble in water; flash point (open cup) 390°F; acid value 3.0 max; iodine value 0.5 max; m.p. 34.5-39.5°C.

Uses: Emulsifier in cosmetic, food, pharmaceutical, textile and other emulsion systems.

propylene glycol phenyl ether

$\text{C}_6\text{H}_5\text{OCH}_2\text{CHOHCH}_3$.

Properties: Almost colorless liquid, sp.gr. 1.060-1.070 (25/25°C); boiling range (760 mm) 5-95%, 237-242°C.

Use: High-boiling solvent; bactericidal agent; fixative for soaps and perfumes; intermediate for plasticizers.

"Propylene Glycol Stearate 8615." ²⁶⁰

Proprietary brand of modified ester of propylene glycol and stearic acid. Waxy solid; white; mild fatty odor, acid value 20.0 max; iodine value 3.0 max; m.p. 57-62°C; dispersible in water; anionic; flash point (open cup) 379°C.

Uses: Emulsifier and dispersing agent in cosmetic, pharmaceutical, textile and other emulsion systems.

propylene imine (2-methylethylene imine; 2-methylaziridine) $\text{CH}_3\text{CHNHCH}_2$.

Properties: A water-white liquid; soluble in water and most organic solvents.

Containers: Available in 5- and 30-gal drums.

Uses: Yields addition products when reacted with active hydrogen compounds, and polymers when reacted with other imine molecules.

Warning! Highly toxic and flammable.

Observe handling instructions.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

propylene laurate, edible. This product is of particular interest as an emulsifying agent to manufacturers of cosmetics, pharmaceuticals and foodstuffs, because of its nontoxicity and great degree of purity. It is physiologically harmless and definitely edible.

Properties: Amber oil, self-emulsifiable in water to form milky-white emulsions; non-hygroscopic and high-boiling, miscible with alcohol, glycerin, glycol, hydrocarbons, etc.; pH of 5% aqueous dispersion 8.0; practically odorless; non-toxic and edible, physiologically harmless, low surface tension and viscosity.

Containers: 2-, 10-lb cans; 50-, 225-, 417-lb drums.

Uses: Food and pharmaceutical stabilizers; food packaging.

Shipping regulations: None.*

propylene oxide $\text{CH}_3\text{CHCH}_2\text{O}$.

Properties: Colorless liquid, ethereal odor. Sp.gr. 0.8304 at 20°C/20°C; b.p. (760 mm) 33.9°C, vapor pressure 445 mm (20°C); flash point -35°F; wt 6.9 lbs/gal (20°C); coefficient of expansion 0.00151 (20°C); freezing point -104.4°C; viscosity 0.0038 poise (20°C). Soluble in water, alcohol, ether.

Typical specifications: Acidity not more than 0.05% (as acetic), sp.gr. 0.829-0.831 at 20°C/20°C, boiling range (760 mm) 33-37°C; water, substantially anhydrous; non-volatile not more than 0.005 g/100 cc, color water-white; average wt 6.92 lbs/gal (20°C).

Derivation: (a) Action of alkalis on propylene glycol. (b) Action of alkalis on propylene chlorohydrin.

Methods of purification: By distillation.

Grades: Refined.

Containers: 1-, 5-gal cans; 55-gal drums, tank cars.

Uses: (in approximate order of volume): Propylene glycol; adducts for urethane foams, glycols for brake fluids; surfactants and detergents; isopropanol amines, dipropylene glycol; propylene compounds.

Shipping regulations: Flammable liquid. Red label.*

propylene tetramer. See tetrapropylene.

propylene trimer. See tripropylene.

propylethylene. See alpha-n-amylenes.

propylformic acid. See butyric acid.

n-propyl furate $\text{C}_4\text{H}_3\text{OCO}_2\text{C}_3\text{H}_7$.

Properties: Colorless, aromatic smelling liquid, becomes yellow in light. Practically insoluble in water; soluble in alcohol and ether. Sp.gr. 1.0745 (25.9°C/4°C); b.p. 210.9°C (corr.); refractive index 1.4737 (25.9°C/D).

propyl gallate $\text{C}_3\text{H}_7\text{OOC}_6\text{H}_2(\text{OH})_3$. Colorless crystals; m.p. 150°C. Almost insoluble in water; somewhat soluble in oils. Used in minute proportions (up to 0.01%) as an antioxidant or synergist to retard or prevent rancidity in lard and other edible fats

and oils.

Containers: Canisters; fiber drums.

propylhexedrine (1-cyclohexyl-2-methylamino-propane; N-dimethylcyclohexaneethylamine) $\text{C}_6\text{H}_{11}\text{CH}_2\text{CH}(\text{CH}_3)\text{NHCH}_3$.

Properties: Clear, colorless liquid with amine odor; b.p. 202-206°C; very slightly soluble in water; soluble in dilute acids; miscible with alcohol, chloroform, and ether. Sp.gr. 0.848-0.852. Volatilizes slowly at room temperature; absorbs carbon dioxide from the air. Solutions are alkaline to litmus.

Grade: U.S.P. XVI.

Use: Medicine.

propyl hydride. See propane.

propyl para-hydroxybenzoate. See propylparaben.

propyliodone. (propyl 3,5-diiodo-4-oxo-1(4H)-pyridineacetate) $\text{I}_2(\text{O})\text{C}_5\text{H}_2\text{NCH}_2\text{COOC}_3\text{H}_7$.

Properties: White, or almost white, crystalline powder. Odorless or nearly so. Practically insoluble in water. Soluble in acetone, alcohol, and ether. M.p. 187-190°C.

Grades: U.S.P. XVI.

Use: Medicine (radiopaque medium).

propylmagnesium bromide $\text{C}_3\text{H}_7\text{MgBr}$. A solution in ether. A Grignard reagent.

Use: Alkylating agent in organic synthesis.

Shipping regulations: Flammable liquid.

Red label.*

n-propyl mercaptan (1-propanethiol).

Properties: Boiling range 65-80°C, sp.gr. (20/4°C) 0.8408; refractive index (20/D) 1.4380; flash point -20°C.

Grades: 95%.

Containers: Drums, tank cars.

Uses: Chemical intermediate.

Shipping regulations: Flammable liquid.

Red label.*

n-propyl nitrate (NPN) $\text{C}_3\text{H}_7\text{NO}_3$.

Properties: Liquid, white to straw-colored; ethereal odor; density 1.057 g/ml (20°C); boiling range 104-127°C (760 mm); flash point (open cup) 75°F; freezing point <-100°C; refractive index 1.3975 (n 20/D). Insoluble in water.

Grade: 96-98% pure.

Chief impurities: sec-Butyl and other nitrates.

Containers: 55-gal steel drums.

Use: Monopropellant.

Shipping regulations: Flammable liquid.

Red label.*

propylparaben (propyl para-hydroxybenzoate) $\text{C}_{10}\text{H}_{12}\text{O}_3$.

Properties: Small, colorless crystals or white powder; very slightly soluble in water; soluble in alcohol, ether and acetone; m.p. 95-98°C.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine; food additive as preservative; fungicide.

propylpiperidine. See coniine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

6-propylpiperonyl butyl diethylene glycol ether.
See piperonyl butoxide.

n-propyl propionate $\text{CH}_3\text{CH}_2\text{COOCH}_2\text{CH}_2\text{CH}_3$.
Properties: Colorless liquid. Soluble in most organic solvents; very slightly soluble in water. Boiling range $122^\circ\text{--}124^\circ\text{C}$; m.p. -76°C ; flash point 79°C ; wt 7.31 lbs/gal.

Grades: Technical.

Containers: 55-gal drums; tank cars.

Uses: Solvent for nitrocellulose; paints, varnishes, lacquers; coating agents.

Shipping regulations: None.*

4-n-propylpyridine $\text{C}_8\text{H}_{11}\text{N}$ or $\text{C}_3\text{H}_7\text{C}_5\text{H}_4\text{N}$.
B.p. 188°C . Used as an intermediate.
Not to be confused with conine (propylpiperidine).

propylthiouracil (6-propyl-2-thiouracil)
 $\text{C}_7\text{H}_{10}\text{N}_2\text{OS}$.

Properties: White powdery crystalline substance; starchlike in appearance and to touch; has bitter taste; m.p. $218\text{--}221^\circ\text{C}$. Sensitive to light. Very slightly soluble in water; sparingly soluble in alcohol; slightly soluble in chloroform and ether; insoluble in benzene; soluble in ammonia and alkali hydroxides.

Derivation: By the condensation of beta-oxocaproate with thiourea.

Grade: U.S.P. XVI.

Containers: Bottles.

Use: Medicine.

n-propyltrichlorosilane $\text{C}_3\text{H}_7\text{SiCl}_3$.

Properties: Colorless liquid. B.p. 123.5°C , sp.gr. 1.195 (25/25°C), refractive index (n 25/D) 1.4292, flash point (Cleveland open cup) 100°F . Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and propylmagnesium chloride.

Grades: Technical.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid.
White label.*

propyl xanthate. See xanthic acids.

propyne. See methylacetylene.

2-propyn-1-ol. See propargyl alcohol.

"Proquel." ⁴²⁸ Trademark for viscous liquid containing foam depressants for developing a controlled foam blanket on chromic acid plating solutions to limit loss of spray, fumes, mist and "drag-out."

"Prorex Oils." ³³¹ Trademark for a brand of highly-refined, light-colored, light-bodied mineral oils.

"Proseal." ⁴²⁸ Trademark for powdered acid conversion coating for electrodeposited zinc and cadmium.

prosthetic group. Low molecular weight proteins or metallo-proteins which can attach themselves to, and thus supplement, specific proteins to form active enzyme systems. The term coenzyme is

considered to be synonymous with the term prosthetic group when used in connection with conjugated proteins which have enzyme activity.

"Prostigmin." ¹⁹⁰ Trademark for neostigmine U.S.P.

"Pro-Strep." ¹²³ Trade name for an antibiotic feed supplement.

protactinium Pa. A radioactive element of atomic number 91, a member of the actinide series of elements. Protactinium is found in nature as a constituent of all uranium ores, about 70 mg being extracted from one ton of pitchblende. Protactinium may also be produced by the pile irradiation of thorium-230. Purification is carried out by ion exchange and solvent extraction techniques. The longest lived isotope, Pa-231, decays by alpha emission and has a half-life of about 34,300 years. Protactinium may be precipitated as the double potassium fluoride K_2PaF_7 or the oxide Pa_2O_5 . The metal may be prepared by reducing PaF_4 with barium or by heating PaI_4 in a vacuum.

protamine zinc insulin suspension. See insulin.

"Protan." ¹⁷² Trademark for sodium formate, HCOONa .

Properties: White, odorless material; soluble in water. Not less than 90% sodium formate.

Containers: 100-lb paper bags.

Uses: Masking agent in chrome tanning, neutralizer in wool dyeing; preparation of washable wallpapers; acidizing of oil wells; solubilizer and buffering agent for manufacture of chemicals.

protargin, mild. See silver protein, mild.

protargin, strong. See silver protein, strong.

"Protargol." ¹⁶² Trademark for strong silver protein for use as antibacterial. A different grade also available for use in staining nerve tissue.

protease. A class of enzymes which hydrolyze peptide linkages into peptides and proteins. These are subgrouped into two further classes: those which hydrolyze peptides into alpha-amino acids (peptidases), and those which hydrolyze proteins to polypeptides (proteinases). The latter group consists of many of the more widely known enzymes such as pepsin, trypsin, ficin, bromelin, papain and rennin. Proteases are water-soluble products used to solubilize proteins and commercially used for meat tenderizers, beer chill proofing, bread baking and as digestive aids.

"Protectol 3." ³⁰⁷ Trademark for a protective colloid, sulfite cellulose liquor; 46% active. Properties: Brown liquid; soluble in water. Uses: Protective colloid, primarily used as a retarding agent in vat color dyeing; fiber protective agent in wool dyeing and stripping.

proteinase. See protease.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

protein fibers. Synthetic fibers produced by converting natural proteins to a fluid form and extruding or spinning through an opening in a die, followed by coagulation or hardening to a filament or bristle. Fibers have also been made from the corn protein (zein), milk casein, soybean protein, and peanut protein.

protein hydrolysate. Solution of protein hydrolyzed into its constituent amino acids. Used extensively in medicine and surgery. Usually administered by a stomach tube or intravenous injection.

Grades: N.N.D., U.S.P. XVI.

proteins. A large group of compounds of great importance in the structure and functioning of living matter. Proteins may serve as structural elements, enzymes, hormones, oxygen carriers, antibodies, and many other important types of compounds. They are compounds of large molecular weight and contain carbon, hydrogen, oxygen, nitrogen, and with few exceptions, sulfur also.

Amino acids (q.v.) are the fundamental structural units of proteins and are the end result of the complete hydrolysis of proteins. Proteins form colloidal solutions, and can behave chemically as both acids and bases because they contain both acidic (carboxyl) and basic (amino) groups. Proteins are easily modified (denatured) by changes in pH, by heating in aqueous solution, by ultraviolet radiation and by many organic solvents, denaturation causes alteration in such properties as solubility and specific activity. Proteins may be classified as simple, which contain only amino acids, or conjugated, which contain amino acids and non-amino acid substances such as nucleic acids, carbohydrates, lipids, metals, or phosphoric acid. Proteins are also classified by their solubilities and other characteristics. They are difficult to purify but some have been crystallized.

There has recently been increasing success in deciphering the structure of proteins (their amino acid makeup), and even in synthesizing them.

"Protek-Sorb." ²⁴¹ Trademark for silica gel. Properties: A hard, chemically inert material resembling rock salt in appearance. Will not swell, cake, or become sticky, and may be reactivated by heating at 205°F. Density, about 45 lb/cu ft. Will adsorb approximately 24% of its weight in moisture at 40% relative humidity and 12% at 20% relative humidity. Meets military specification MIL-D-3464 (latest revision). Derivation: Silica gel is a synthetic desiccant made from sodium silicate and sulfuric acid.

Grades: "Protek-Sorb" 121 and 122.

Containers: Moisture-permeable bags ranging in size from 1/8 unit to 80 units (a unit is about 1 oz) available in cans and drums ranging from 1 gal to 20 gal.

Uses: For protecting packages which contain

materials that may rust, corrode, or mildew due to moisture during storage; for dehydrated packaging of military supplies, tools, electronic equipment, etc.

"Protexol" Fireproofed Wood. ¹⁷¹ Proprietary process consisting of the injection of ammonium salts into wood by the vacuum-pressure process in accordance with standard methods of the American Wood Preservers Association. Treatments vary in depth of penetration. Class A (doors, trim, finish) is total impregnation 6 lbs. per cu ft (dry salt); B (structural timbers) is partially impregnated 3 to 4 lbs. per cu ft; C (temporary scaffolding) is impregnated 2 to 3 lbs per cu ft.

Recommended for indoor use on wood or plywood. The impregnated salts form permanent, insoluble compounds, effective for the life of the structure.

"Protobore." ³⁴² Trademark for protoveratrine for medicine.

protocatechuic aldehyde, methyl ether. See vanillin.

protogen. See thioctic acid.

"Protol." ⁴⁵ Trademark for white mineral oil, U.S.P.

Properties: Sp.gr. 0.870-0.880; Saybolt viscosity 180-190 (100°F), odorless and tasteless.

Uses: Pharmaceutical and cosmetic formulations, plastics; tobacco; paper; animal husbandry.

"Protolin." ²³ Trademark for reducing agents based on zinc sulfoxylate and zinc formaldehyde sulfoxylate. Supplied as water-soluble white powder.

Use: Stripping of colors from textile fabrics; chemical synthesis.

proton. A positively charged particle that comprises the nucleus of the ordinary hydrogen atom and having almost the same mass but very much smaller dimensions than the atom. Its charge is equal but opposite to that of the electron. The proton is similar in mass and dimensions to the neutron except that the latter lacks an electric charge.

See fundamental particle.

"Protopet." ⁴⁵ Trademark for petrolatum of medium consistency and ranging in color from pure white to amber, but meeting U.S.P. and N.F. purity requirements for petrolatum.

Uses: Pharmaceutical and cosmetic bases; various industrial applications.

"Protovac." ⁶⁵ Trademark for a series of solubilized caseins, which include modified caseins, zinc casein or sodium caseinates. Uses: Binders, emulsifiers, stabilizers and coatings in the paint, paper, leather, printing and textile industries.

protoveratrine. A substance isolated from the *Veratrum album* plant. This substance is a mixture of two alkaloids, designated

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

protoveratrine A and protoveratrine B. The chemical formula has been determined as $C_{32}H_{51}NO_{11}$, but the structural formulas of the two alkaloids are unknown.

Properties: White, odorless, slightly bitter, crystalline powder; causes sneezing; m.p. 256-260°C (dec). Freely soluble in chloroform; very slightly soluble in ether; practically insoluble in petroleum ether and water. Stable to light and air. pH (saturated solution) 6.5-7.3.

Grade: N.N.D.

Use: Medicine.

protoveratrine A and B maleates. The maleate salts of protoveratrine A and B.

Properties: White to buff colored powder with faint characteristic odor and strong sternutatory action; m.p. 210-222°C (dec); freely soluble in alcohol, chloroform, and water; very slightly soluble in ether and petroleum ether. pH of 0.2% solution is 4.1-4.7.

Grade: N.N.D.

Use: Medicine.

"Protox" Zinc Oxide. ²⁶⁸ Brand name for a propionic-acid-treated zinc oxide having incorporation and dispersion characteristics particularly desired by compounders of rubber.

Grade: "Protox" 166.

Containers: 50-lb paper bags.

Use: In both natural and synthetic rubber where easier mixing and better dispersion is desired.

"Protozyme." ⁷⁸ Trademark for a series of diastatic, proteolytic, and pectolytic enzymes of fungal origin on a cereal base carrier for application where subsequent filtration permits the removal of the inactive portion.

proustite (light ruby silver ore; light red silver ore) Ag_3AsS_3 or $3Ag_2S \cdot As_2S_3$, sometimes some Sb.

Properties: Scarlet or vermilion mineral with scarlet to aurora red streak. Adamantine luster. Contains 65.4% silver, 15.2% arsenic, 19.4% sulfur. Usually occurs disseminated through the gangue or as a stain or crust. Blackens when exposed to sunlight. Decomposed by nitric acid with separation of sulfur. Differs from pyrrhite in scarlet streak and from cuprite and cinnabar by garlic odor when heated. Constants: Sp.gr. 5.57-5.64 (5.57 if pure), hardness 2-2.5.

Occurrence: United States (Idaho, Nevada, Colorado, Arizona), Germany; France, Czechoslovakia; Spain, Sardinia, Mexico, Peru, Chile.

Use: Ore of silver.

"Provinite." ³⁰⁴ Trademark for a two part barium-cadmium organic vinyl stabilizer.

Properties: (Provinite A) soft white powder, sp.gr. 1.31; refractive index 1.56; (Provinite B) clear straw-colored liquid, sp.gr. 0.91; refractive index 1.45.

Containers: (Provinite A) fiber board drums containing 75 lbs; (Provinite B) metal

drums containing 35 lbs.

Uses: Heat and light stabilizers for vinyl film, sheeting and dispersion resin systems.

provitamin. A precursor of a vitamin. It assumes vitamin activity upon activation within the animal body. No differentiation customarily is made between the free vitamin and the provitamin when speaking of the vitamin content of a food.

provitamin A. The chief dietary source of vitamin A. See carotene and cryptoxanthin.

provitamin D₂. See ergosterol and vitamin D.

provitamin D₃. See 7-dehydrocholesterol.

prunolide. See gamma-nonyl lactone.

prunus virginiana (wild cherry; wild black cherry bark).

Derivation: Bark of *Prunus serotina*.

Occurrence: North America.

Grades: Technical; U.S.P. XVI.

Containers: Bags; bales.

Use: Medicine.

Shipping regulations: None.*

Prussian blue. The most common and best known name for blue iron ferrocyanide (iron blue) pigments made by a variety of procedures. See iron blue; also peacock blue.

Prussian red. A name sometimes given to red varieties of ferric oxide (see iron oxides red), and at other times to potassium ferricyanide (red prussiate of potash).

prussiate of potash, red. See potassium ferricyanide.

prussiate of potash, yellow. See potassium ferrocyanide.

prussiate of soda, red. See sodium ferricyanide.

prussiate of soda, yellow. See sodium ferrocyanide.

prussic acid. See hydrocyanic acid.

"Prym." ⁴² Proprietary products. A group of thermosetting carbamide fiber reactants. Properties: Colorless syrups; dissolve readily in water at 25°C.

Containers: 55-gal steel drums.

Use: Textile fabric finishes on cotton, rayon, acetate and blends. Impart crush resistance and shrinkage stabilization.

"Prym" CR. ⁴² Proprietary compound. Modified carbamide cellulose reactant.

Properties: Colorless clear liquid. Dispersible in water at 25°C.

Containers: 55-gal steel drums.

Use: Chlorine resistant resin finish for use on cotton or viscose fabrics in textile finishing where crush resistance and fabric stabilization are desirable.

pseudobutylene glycol. See 2,3-butylene glycol.

pseudocumene (1,2,4-trimethylbenzene; untrimethylbenzene) $C_6H_3(CH_3)_3$.

Properties: Liquid, f.p. -43.91°C; b.p. 168.89°C, sp.gr. (20/4°C) 0.8758;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

refractive index (20/D) 1.5045; flash point 54°C. Insoluble in water; soluble in alcohol, benzene, and ether.

Source: Coal tar and petroleum.

Grades: 95%, 99%, and research.

Containers: Bottles; drums.

Uses: Manufacture of dyes and perfumes; sterilizing catgut.

Shipping regulations: None.*

pseudocumidine (2,4,5-trimethylaniline; 1,2,4-trimethyl-5-aminobenzene)
 $C_6H_2(CH_3)_3NH_2$.

Properties: White crystals; sp. gr. 0.957; m. p. 62°C; b. p. 236°C. Soluble in alcohol and ether; insoluble in water.

Derivation: By heating crude xylidine with methyl alcohol and hydrochloric acid in an autoclave. The pseudocumidine is separated from the product by means of its sparingly soluble, crystalline nitrate.

Grades: Technical.

Containers: Wooden barrels.

Uses: Manufacture of dyes; organic synthesis.

Shipping regulations: None.*

d-pseudoephedrine hydrochloride.

$C_6H_5CHOHCH(NHCH_3)CH_3 \cdot HCl$.

Properties: Needles; m. p. 181-182°C.

Soluble in water, alcohol, chloroform.

Uses: Pharmaceuticals.

pseudoplasticity. See thixotropy.

psi. Abbreviation for pounds per square inch.

psia. Abbreviation for pounds per square inch absolute.

psilomelane $BaMn_2O_6(OH)_4$. A natural oxide of variable composition. Calcium, nickel, cobalt and copper frequently are present. The name sometimes refers to mixtures of manganese minerals.

Properties: Color black; streak brownish black; luster submetallic; hardness 5-6; sp. gr. 3.7-4.7.

Occurrence: U. S. S. R., India; South Africa;

Cuba; Arkansas, Virginia, Georgia.

Use: Important ore of manganese.

psyllium (fleawort; fleaseed).

Properties: Dark brown, boat-shaped, shiny seeds, containing a mucilaginous compound.

Derivation: Seeds of *Plantago psyllium*.

Occurrence: Southern Europe.

Grades: Technical blonde, black.

Containers: Boxes; bags.

Uses: Sizing silk; printing fabrics; paper manufacture; medicine.

Shipping regulations: None.*

Pt. Symbol for platinum.

PTA. Abbreviation for phosphotungstic acid.

PTA pigments. See phosphotungstic pigments.

pterylmonoglutamic acid. See folic acid.

PTFE. Abbreviation for polytetrafluoroethylene (q. v.).

PTMA. Abbreviation for a mixture of phosphotungstic and phosphomolybdic acids,

used in making pigments. See phosphotungstic pigments.

ptomaines. Basic bodies resulting from the putrefaction or metabolic decomposition of animal proteins. Many of them are highly poisonous. Examples of ptomaines which have been isolated and prepared synthetically are cadaverine (1,5-diaminopentane) (q. v.), muscarine (hydroxyethyltrimethylammonium hydroxide), putrescine (tetramethylenediamine), and neurine (trimethylvinylammonium hydroxide) (q. v.).

PTSA. Abbreviation for para-toluenesulfonamide.

ptyalin. A salivary amylase which acts upon alpha-1,4-glycosidic linkages converting starch to various dextrans and maltose. It can act over a pH range of 4.0-9.0; optimum pH 5.6-6.5. It requires the presence of certain negative ions for activation; chlorides and bromides are the most effective.

Use: Biochemical research.

ptychotis oil. See ajowan oil.

p-type crystal. See transistor.

Pu. Symbol for plutonium.

pudding pipe. See cassia fistula.

pudding stick. See cassia fistula.

pulegium oil. See hedeoma oil.

pulegone $C_{10}H_{16}O$. A ketone found in pennyroyal oil.

Properties: Only liquid with pleasant odor; sp. gr. 0.9323 (20°C); b. p. 221°C; dextrorotatory, refractive index (n 20/D) 1.4894.

pulsatilla camphor. See anemonin.

pumice. A highly porous igneous rock, usually containing 65-75% SiO_2 and 10-20% Al_2O_3 ; with a glassy texture. Potassium, sodium, and calcium are generally present in small amounts. Insoluble in water; not attacked by acids.

Occurrence: New Mexico, California, Idaho, Oregon, Nebraska; Italy; New Zealand.

Grades: Lump; powdered; ground, N. F. XI; technical.

Containers: Bags of various sizes.

Uses: Abrasive, light weight concrete aggregate; heat and sound insulation; insecticides, bricks; filtration; plastics, paint fillers; absorbents, solvents; support for catalysts; dental abrasive.

Shipping regulations: None.*

pumpkin seed. See pepo.

"Puratized" B-2. ³⁰⁷ Brand name for a mildewproofing agent consisting of phenylmercuricarbonate; 17% active. Used in lakes, rubber, paints, fabric and paper coatings.

"Puratized" N5DS. ³⁰⁷ Brand name for a mildewproofing agent consisting of phenylmercuritriethanolammonium lactate, 22% active. Used with emulsion-type water repellents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Puratized" Sprays. ⁵⁵ Brand name for agricultural sprays containing phenylmercuri mono- or tri-ethanol ammonium acetate. Used on apples, pears and other fruits.

"Purayonier." ³⁷ Trademark for a wood cellulose developed for applications requiring a highly refined and absorbent form of cellulose.
 Properties: Cellulose—alpha 96%, beta 2.2%, gamma 1.8%, 10% KOH solubility, 5.3%.
 Use: Manufacture of cellulose derivatives, saturating papers and plastics. It has also been used for diversified special applications where high whiteness or cleanliness are of importance.

"Purecal." ²⁰³ Trademark for precipitated calcium carbonate.
 Properties: Fine, white, microcrystalline powder, insoluble in water; soluble in dilute mineral acids.
 Grades: M, T, and U, which meet U.S.P. requirements, having particle sizes 0.12-0.32, 0.045-0.055, and 0.033-0.040 microns respectively, "Purecal SC" (0.050-0.060 microns and surface treated with 2% modified fatty acid coating).
 Containers: Bags and hopper cars.
 Uses: Primary - paper, paint, rubber, ink, and plastic. Secondary - adhesives, ceramics, chemicals, cosmetics, crayons, dentifrices, filtering media, foods, animal and poultry feeds; baking powder, candy, ice cream concentrates; glass, lacquer, leather tanning, linoleum; neutralizing agent, pharmaceuticals, polishes, putty and caulking compounds; soaps; textiles, varnishes; water treatment, window shades, wood fillers.

purging cassia. See cassia fistula.

purging croton. See tiglium.

purified ozocerite. See ceresin wax.

purine [imidazo (4,5-d) pyrimidine]

Properties: Colorless crystals; m.p. 217°C, soluble in water, alcohol, toluene, slightly soluble in ether.

Derivation: Prepared from uric acid and regarded as the parent substance for compounds of the uric acid group, many of which occur naturally in animal waste products.

Uses: Organic synthesis; metabolism studies.

purines. Basic compounds found in living matter and having a purine-type molecular structure. For specific purines, see adenine, guanine, hypoxanthine, xanthine, uric acid, caffeine, and theobromine.

"Purinethol." ³⁰¹ Trademark for 6-mercaptopurine (6MP), used in the medical treatment of leukemia.

"Purite." ⁸⁴ Trademark for a specially prepared fused soda ash furnished in the form of two-pound cast pigs and stated to contain over 98% sodium carbonate.

Containers: 200-lb bags; 350-lb barrels; bulk.
 Uses: Cupola flux; refining and desulfuring iron, steel and other metals.

"Purodigin." ²⁴ Trademark for digitoxin (q.v.).

puromycin $\text{C}_{22}\text{H}_{29}\text{N}_7\text{O}_5$. Crystals; m.p. 176°C.

An antibiotic which inhibits protein synthesis, prevents transfer of amino acid from its carrier to the growing protein.

Puromycin is produced by *Streptomyces alboniger*, it is effective against bacteria, protozoa, parasitic worms, an alga, and cancerous tumors. Toxic to living cells of all kinds.

purple cone flower. See echinacea.

purple copper ore. See bornite.

purple fox-glove. See digitalis.

purple lakes. A class of lakes derived from combination of such compounds as 2-diazonaphthalene-1-sulfonic acid and beta-hydroxynaphthoic acid. Used in printing inks.

purple of Cassius. See gold-tin purple.

purple oxide. Name given to certain varieties of ferric oxide.

See iron oxide reds.

purple salt. See potassium permanganate.

purpurin (1,2,4-trihydroxyanthraquinone)
 $\text{C}_{14}\text{H}_5\text{O}_2(\text{OH})_3$.

Properties: Reddish needles; m.p. 256°C; slightly soluble in hot water; soluble in alcohol and ether.

Derivation: Occurs as a glucoside in madder root. Made synthetically by oxidation of alizarin.

Uses: Dye for cotton; stain for microscopy; reagent for calcium.

purpurin red. See anthrapurpurin.

"Purzaust." ⁴¹⁶ Trademark name of catalytic converter developed for the removal of air pollutants normally present in raw exhaust gases from internal combustion engines. The device is self-contained and replaces the conventional acoustic muffler for both automotive and stationary engines. A fixed bed of solid catalyst promotes removal by oxidation of combustible pollutants to carbon dioxide and water. The device has no moving parts and does not require supplemental fuel or ignition systems; no additional operating or maintenance costs are involved. The device is designed to meet the 1960 California Motor Vehicle Emissions Standards without adversely affecting engine operation or materially increasing temperatures of any part of the vehicle.

"PuTrol." ¹⁸⁸ Trademark for a powerful aromatic compound used for masking the odors of putrefaction associated with the decomposition of protein materials, as in fat rendering operations, sewage disposal, and certain problems involving industrial wastes.

putty. A mixture of whiting (chalk) with 18% of linseed oil, with or without white lead

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

or other pigment. Containers must be air-tight.

putty oil. A petroleum fraction added to putty as a lubricant and softener so the putty will not become too hard after the linseed oil dries.

puzzolana cement. See pozzolana cement.

PVA. Abbreviation for polyvinyl alcohol or polyvinyl acetate.

PVAc. Abbreviation for polyvinyl acetate.

PVC. Abbreviation for polyvinyl chloride.

PVI. Abbreviation for polyvinylisobutyl ether.

PVM. Abbreviation for polyvinyl methyl ether.

PVM/MA. Common name for copolymers of vinyl methyl ether and maleic anhydride. $[-CH_2CHOCH_3CHCOOCOCH-]_n$.

Properties: White, amorphous powder available in a wide range of viscosities. Soluble with chemical reaction in water (over entire pH range) and in alcohols. Also soluble in ketones and esters, etc. Insoluble in aliphatic and aromatic hydrocarbons. Compatible with a wide variety of water-soluble resins and plasticizers. Gives typical anhydride reactions. Sp.gr. 1.3-1.4; bulk density 16 lbs/cu ft. Very low toxicity.

Derivation: Reaction of vinyl methyl ether and maleic anhydride.

Grades: Several viscosity grades available.

Containers: Fiber drums.

Uses: Protective colloid, dispersing agent, thickener, binder, adhesive and size in coatings, detergents, emulsions, paper, textiles, leather, latex, etc.

Shipping regulations: None.*

PVM/MA half amide. Common name for the copolymer of vinyl methyl ether and ammonium maleamate.

$[-CHOCH_3CH_2CHCONH_2CHCOONH_4-]$.

Properties: White, amorphous, hygroscopic powder soluble in water and polar organic solvents. Sp.gr. (dry film) 1.2-1.3 g/ml, bulk density 13 lbs/cu ft, pH of aqueous sol. 6.8-7.2.

Derivation: Treatment of PVM/MA (vinyl methyl ether - maleic anhydride copolymer) with ammonia. Approximately 75% of the anhydride group is converted to the ammonium maleamate.

Grades: Several viscosity grades available.

Containers: Fiber drums.

Uses: Thickener, binder, adhesive and size for coatings, dispersions, latex, paper, textiles.

Shipping regulations: None.*

PVOH. Abbreviation for polyvinyl alcohol.

PVP. Abbreviation for polyvinylpyrrolidone.

"PX." ²⁸ Trademark for vinyl or pyroxylin, book cloth.

py. An abbreviation for pyridine, used as in formulas for coordination compounds. See also dien; en; pn.

"Pycal." ⁸⁹ Trademark for a series of plasticizers used for cellulose acetate, cellulose acetate butyrate, nitrocellulose, vinyls, and synthetic rubber.

pycnometer. A standard vessel for measuring and comparing densities of liquids and solids. Most often a device for determining the volume of a known weight of material for density calculations. Volume determination is made by liquid displacement in standard vessels, or by gas displacement in air comparison pycnometers.

"Pydraul." ⁵⁸ Trademark for a series of hydraulic fluids.

Properties: Only fire resistant liquids with lubricating and non-corrosive characteristics.

Containers: 54-gal and 55-gal steel drums; 5-gal cans.

Uses: Used in high precision and low temperature equipment; diecasting machines; forging and extrusion presses; automatic welding machines; hydraulic presses and air compressors.

pyolipic acid. An antibiotic produced by certain strains of *Pseudomonas pyocanea* when grown on broth containing glucose. An oily liquid soluble in alcohol or ether. Composed of several fatty acids and the sugar, levo-rhamnose. Of possible use in treating tuberculosis infections. Differs from streptomycin in that the latter suppresses growth of the tuberculosis germs whereas pyolipic acid is fatal to these organisms.

"Pyramidon." ¹⁶² Trademark for aminopyrine.

"Py-Ran." ⁵⁸ Trademark for anhydrous monocalcium phosphate $CaH_4P_2O_8$ or $CaH_4(PO_4)_2$. Conforms with federal and state pure food laws.

Use: As an acid component for leavening agents in self-rising flours and corn meal, also baking powders and prepared mixes.

Containers: 100-lb bags.

"Pyranol." ²⁴⁵ Trademark for dielectric material, principally of the askarel type (q v.), also for capacitors.

pyrargyrite (dark ruby-silver ore) Ag_3SbS_3 or $3Ag_2S \cdot Sb_2S_3$, sometimes with some As.

Properties. Black to grayish-black mineral, light deep red by transmitted light. Purplish-red streak, metallic to adamantine luster. A natural silver sulfantimonite.

Contains 59.9% silver, 22.3% antimony, 17.8% sulfur. Distinguished from proustite by color of streak and from cuprite, cinnabar and realgar by color of streak and silver reaction. Soluble in nitric acid.

Constants: Sp.gr. 5.77-5.86; hardness 2.5.

Occurrence: United States (Idaho, Nevada, Arizona, Colorado, Utah); Mexico; Chile; Germany, Czechoslovakia, Hungary, Norway, Spain, England, Canada.

Use: Ore of silver.

"Pyratex." ²⁴⁸ Trademark for a vinyl pyridine latex.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Total solids 40-42%, pH 10.5-11.5; sp. gr. 0.96.

Uses: Used in adhesive compounds to enhance the adhesion between rayon or nylon fibers and rubber. Main uses are in tire cord, belting, hose and other mechanical goods.

pyrathiazine hydrochloride (10-[2-[1-pyrrolidyl) ethyl] phenothiazine hydrochloride) $C_{18}H_{20}N_2S \cdot HCl$.

Properties: White or grayish white powder becoming darker upon exposure to light; odorless; solutions neutral to litmus. Soluble in water, chloroform, and alcohol, insoluble in ether and benzene.

Use: Medicine.

"Pyrax." ⁶⁹ Brand name for a proprietary ground pyrophyllite-aluminum silicate used as a filler in paints, plastics, and for dusting unvulcanized rubber.

pyrazinamide (pyrazinoic acid amide, pyrazine carboxamide) $C_5H_5N_3O$.

Properties: Crystals, m.p. 189-191°C, begins to sublime at 159°C. Soluble in water.

Grade: N.N.D.

Use: Medicine.

pyrazine hexahydride. See piperazine.

pyrazoline $HNNCHCH_2CH_2$. B.p. 144°C.

Use: Organic synthesis.

pyrazolone $HNNCHCH_2CO$ (3-ketopyrazoline).

Properties: Solid, m.p. 165°C.

Use: Organic synthesis.

pyrazolone dyes. Dyes whose molecules contain both the $-N=N-$ and the $=C=C=$ chromophore groups in their structure and whose color index ranges from 636 to 654. These are acid dyes most used for silk and wool, and to some extent for lakes. Tartrazene, C.I. 640, is a very important member of this group. See dyes.

"Pyrefume." ³⁴² Trademark for pyrethrin-extract insecticidal concentrates.

pyrene $C_{16}H_{10}$. A condensed ring hydrocarbon.

Properties: Colorless solid (tetracene impurities give a yellow color); solutions have a slight blue fluorescence. M.p. 156°C, density 1.271 (23°C); b.p. 404°C. Insoluble in water, fairly soluble in organic solvents.

Derivation: From coal tar. Also obtained by destructive hydrogenation of hard coal.

"Pyrene." ³⁴¹ A proprietary name for liquid fire-extinguisher stated to consist of carbon tetrachloride.

"Pyrenone." ⁵⁵ Proprietary insecticide products based on mixtures of blends of either piperonyl butoxide or piperonyl cyclonene and pyrethrins. Available in form of oil solutions, impregnated dusts, wettable powder, etc.

"Pyrenone" 20 New: A deodorized base oil concentrate standardized to contain 4.0 g technical piperonyl butoxide plus 0.5 g pyrethrins per 100 cc. Used in

manufacture of household sprays and livestock sprays.

"Pyrenone" Dust Base 100: An impregnated dust base standardized to contain 2.5% technical piperonyl cyclonene plus 0.2% pyrethrins. Used in the manufacture of horticultural dusts and household dusts.

"Pyresote." ¹⁷¹ See "Protexol." Combines high fire resistance with a standard wood preservative.

pyrethrin I $C_{21}H_{28}O_3$. Pyrethrolone ester of chrysanthemum monocarboxylic acid. Most potent insecticidal ingredient of pyrethrum flowers. See also cinerin I and II and pyrethrin II.

Properties: Viscous liquid, oxidizes readily in air. Insoluble in water; soluble in other common solvents. Incompatible with alkalis.

Source: Pyrethrum extract (q.v.).

pyrethrin II ($C_{22}H_{28}O_5$). Pyrethrolone ester of chrysanthemum dicarboxylic acid. One of the four primary active insecticidal ingredients of pyrethrum flowers. See also pyrethrin I, cinerin I and II. Properties similar to those of pyrethrin I, less toxic than pyrethrin I.

Source: Pyrethrum extract (q.v.).

pyrethrosin $C_{17}H_{22}O_5$. A sesquiterpenoid.

Properties: White crystals, melts 188-189°C; insoluble in water; soluble in hot alcohol, chloroform; slightly soluble in ether or petrol.

Derivation. Obta. from pyrethrum flowers.

pyrethrum extenders (synergists). Substances not powerful insecticides when used alone, but which increase the potency of pyrethrum when used in combination with it. Among them are piperonyl butoxide, and piperonyl cyclonene (q.v.).

pyrethrum extract. An extract obtained from powdered pyrethrum flowers by using a hydrocarbon of the kerosene type. Not compatible with alkaline material. The chief constituents of the extract are called pyrethrins I and II and cinerins I and II (see also allethrin). These compounds are non-volatile and very slightly soluble in water. Used for medicine and insecticides.

pyrethrum flowers (Persian insect flowers; Dalmatian insect powder, Persian pellitory). **Derivation.** Dried flowers of *Chrysanthemum cinerariaefolium*, *C. coccineum* and *C. marshallii* found in Africa, India, and southern Europe.

Grades: Technical. Sold by pyrethrin content.

Containers: Bags.

Use: Insecticide.

Shipping regulations: None.*

pyrethrum root (pellitory; Spanish pellitory; Spanish chamomile; bertram; longwort).

Derivation: Root of *Anacyclus pyrethrum*, D.C.

Occurrence: North Africa.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

"Pyretox." ⁵⁵ Brand name for insecticidal product containing 1.0% by wt. of pyrethrin.

"Pyrex." ²⁰ Trademark for heat and chemical resistant glassware of various compositions and physical properties, and accessories used therewith.

"Pyrex Glass Brand No. 7740." ²⁰ Trademark. Borosilicate glass of American manufacture, widely used in the fabrication of laboratory and pharmaceutical glassware, domestic cooking utensils and industrial items; noted for its low expansion coefficient and high mechanical strength.

Physical characteristics: Linear coefficient of expansion 0.000032 between 19° and 350°C; elasticity coefficient 6.230 kg/sq mm; hardness-scleroscope 120, sp.gr. 2.25; specific heat 0.20; refractive index 1.4754; dispersion 0.00738; light and heat transmission higher than the best plate glass.

Softening temperature: Softening does not commence at below 600°C, and for a limited time, these glasses can be used safely at temperatures somewhat higher.

Uses:

Chemical manufacture: Laboratory and pharmaceutical glassware and apparatus, tubes for horizontal and vertical coolers, heaters and condensers, and for Hart nitric acid condensers, tubes and return bends for atmospheric condensers; socket pipes for conveying gases and liquids; socket tower sections; "S" bends and "U" bends, plates and bonnets for fractionating and reaction columns; pulsometer tubes and "monkey" pumps; sight cylinders for pipe lines; sight glasses; sheets for lookboxes; ballon flasks and retorts, cascade dishes and pans; drying trays, pots and jars; bottles, carboys.

Electrochemical manufacture: Cell thimbles; brine wells; liquid and gas connectors, cooler pipes for sodium hypochlorite, inter-cell coolers; cyanide plating jars.

Silk and rayon manufacture: Corrugated reels and rollers; Godet wheels, guides; bleach coolers; piping.

Miscellaneous: Dielectric tubes for ozone generators, fruit-juice sterilizer tubes, motion-picture developing tanks (tubular type), rollers for plating machines, gage tubes for hot solutions, instrument tubing; vacuum-bottle blanks; battery jars.

Domestic: Cooking utensils; teapots; coffee makers.

"Pyrexcel." ³⁴² Trademark for synergized pyrethrin extracts for insecticides.

"Pyribenzamine." ³⁰⁵ Trademark for tri-pelennamine, an antihistamine.

pyridine $N(CH_3)_4CH$. An important organic base.

Properties: Slightly yellow or colorless liquid; sharp penetrating empyreumatic odor; burning taste; slightly alkaline in reaction. Soluble in water, alcohol, ether, benzene, ligroin and fatty oils. Sp.gr. 0.978; m.p. -42.0°C; b.p. 115.5°C; flash point (closed cup) 68°F.

Derivation: (a) Distillation of organic compounds containing nitrogen, or of gas liquor or light coal-tar oil. (b) Also synthetically from acetaldehyde and ammonia.

Method of purification: Fractional distillation.

Grades: Technical; medicinal; C.P.

Containers: Bottles, drums; barrels; tank cars.

Uses (in approximate order of volume): Synthesis of vitamins and drugs; waterproofing; solvent; rubber chemicals; denaturant for alcohol; dyeing assistant in textiles.

Warning: Flammable. Vapor harmful.

MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

2-pyridine aldoxime methiodide (PAM)

$C_5NH_4CHNOH \cdot ICH_3$. Stated to be an antidote for nerve gas, because of its property of reactivating the enzyme cholinesterase by removal of phosphoryl groups introduced by the nerve gas.

beta- or meta-pyridinecarboxylic acid. See nicotinic acid.

pyridine-3-carboxylic acid, diethylamide.

See nikethamide.

2,5-pyridinedicarboxylic acid. See isochin-chomeronic acid.

pyridine-N-oxide C_5H_5NO . F.p. 67.0°C.

Soluble in water. Used as an intermediate.

pyridinium bromide perbromide (PBPB)

$C_5H_4NBr \cdot Br_2$.

Properties: Red prismatic crystals, m.p. 135-137°C (dec) with preliminary softening. The salt is stable in the dry state and can be used in glacial acetic acid, ethanol and related solvents. This compound has 45% to 50% available bromine.

Uses: Brominating agent for phenols, and for the addition to double bond; agent for mono and polybromination of ketones, including aliphatic, alicyclic, steroid and amino carbonyls. Used in micro or semi-micro quantitative analysis.

pyridinium hexafluorophosphate. See fluophosphoric acids.

"Pyridose." ³²⁹ Trademark for a brand of pyridylmercuric acetate, an organo-mercurial fungicide for positive control of paper-mill slime. Available in 1-oz packets for use in paper mills.

pyridostigmine bromide

$C_5H_4N(CH_3)OOCN(CH_3)_2Br$. 3-Hydroxy-1-methylpyridinium bromide dimethylcarbamate.

Properties: White or practically white, crystalline powder. Agreeable odor;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

hygroscopic. Freely soluble in water, alcohol, and chloroform. Slightly soluble in solvent naphtha; insoluble in ether.

M. p. 154-157°C.

Grade: U.S.P. XVI.

Use: Medicine.

pyridoxal hydrochloride $C_6H_5NO_3 \cdot HCl$. An aldehyde derivative of pyridoxine, with vitamin B₆ activity.

Properties: Rhombic crystals, m. p. 165°C (dec); soluble in water and 95% ethyl alcohol.

Use: Nutrition.

pyridoxal phosphate (2-methyl-3-hydroxy-4-formyl-5-pyridylmethylphosphoric acid) $CH_3C_5H_4N(OH)(CHO)(CH_2PO_4H_2)$. The active coenzyme form of pyridoxine; functions as a coenzyme for transaminases, decarboxylases, desulfurases and racemases. It is involved in the conversion of tryptophan to the nicotinamide portion of the pyridine coenzymes, it also participates in energy transformations in brain and nervous tissue.

Properties: Colorless in acid solution, bright yellow in alkaline solution.

Commercial derivation: (a) action of adenosine triphosphate on pyridoxal; (b) action of phosphorus oxychloride on pyridoxal in aqueous solution, (c) phosphorylation of pyridoxamine with 100% phosphoric acid followed by oxidation.

Uses: Medicine; nutrition.

Also described under codecarboxylase (a synonym) q. v.

pyridoxamine dihydrochloride $C_8H_{12}N_2O_2 \cdot 2HCl$. The dihydrochloride of the amino derivative of pyridoxine, exhibiting vitamin B₆ activity.

Properties: Platelets, m. p. 226-227°C (dec), soluble in water and 95% ethyl alcohol.

Uses: Medicine; nutrition.

pyridoxine (vitamin B₆) $C_8H_{11}O_3N$. 3-Hydroxy-4,5-dihydroxymethyl-2-methylpyridine. Pyridoxine is a group name to designate the naturally occurring pyridine derivatives with vitamin B₆ activity. It is essential for the dehydration and desulfhydration of amino acids and for the normal metabolism of tryptophan. It also appears to be related to fat metabolism. Pyridoxine is required in the nutrition of all species of animals.

Sources: Food source: vegetable fats, whole grain cereals, legumes, yeast, muscle meats, liver, and fish. Commercial source: synthetic pyridoxine, pyridoxal, and pyridoxamine are produced by a complex series of reactions from isoquinoline.

Units: Amounts are expressed in micrograms.

Uses: Medicine, nutrition.

Commercially available as pyridoxine hydrochloride (q. v.).

pyridoxine hydrochloride $C_8H_{11}O_3N \cdot HCl$. Usual commercial form of pyridoxine.

Same biological function.

Properties: Colorless, white platelets;

m. p. 204-206°C (dec); salty taste; stable in air and slowly affected by sunlight; stable to heat, concentrated acid and alkali; soluble in water, alcohol and acetone; slightly soluble in other organic solvents.

Grades: U.S.P. XVI.

Containers: Fiber drums, bottles.

Uses: Medicine; nutrition.

alpha-pyridylamine. See 2-aminopyridine.

beta-pyridylamine. See 3-aminopyridine.

3-pyridylcarbinol $C_5H_4NCH_2OH$.

Properties: B. p. (760 mm) 266°C; f. p.

-6.5°C, density (20°C) 1.131 g/ml; refractive index (n_D 20/D) 1.5455. Soluble in water at 20°C in all proportions.

Use: Intermediate.

beta-pyridylcarbinol tartrate (3-pyridine-methanol tartrate) $C_5H_7NO \cdot C_4H_6O_6$.

Properties: M. p. 146.5-148.5°C. Soluble in water; sparingly soluble in alcohol; insoluble in chloroform and ether.

Use: Vasodilator.

2-(3-pyridyl)piperidine. See anabasine.

pyrilamine maleate $C_{17}H_{23}N_3O \cdot C_4H_4O_4$.

2-[(2-Dimethylaminoethyl)(para-methoxybenzyl)amino]-pyridine maleate; $CH_3OC_6H_4CH_2N(C_5H_4N)CH_2CH_2N(CH_3)_2 \cdot C_4H_4O_4$.

Properties: White crystalline powder with faint odor and bitter, saline taste. M. p. 99-101°C. Very soluble in chloroform and water; freely soluble in alcohol; slightly soluble in benzene and ether. 5% solution is clear and colorless (or nearly so) and has pH 4.5-5.5.

Grades: U.S.P. XVI.

Use: Medicine.

pyrimethamine $(NH_2)_2C_4N_2(C_2H_5)C_6H_4Cl$.

2,4-Diamino-5-(para-chlorophenyl)-6-ethylpyrimidine.

Properties: White, odorless, crystalline powder. Practically insoluble in water. Slightly soluble in alcohol, chloroform, and acetone. M. p. 238-241°C.

Grade: U.S.P. XVI.

Use: Medicine.

pyrimidine (1,3-diazine; miazine) $\overline{CHN(CH)_3N}$.

Properties: Liquid and crystalline mass with a penetrating odor, melting point 20-22°C; b. p. 123-124°C, soluble in water, alcohol, and ether.

pyrimidines. Basic compounds found in living matter and having a pyrimidine-type molecular structure. They may be isolated following complete hydrolysis of nucleic acids. Such pyrimidines include uracil, thymine, cytosine, and methylcytosine. Thiamine is also a pyrimidine derivative. Other pyrimidines such as alloxan and thiouracil are important for use in medicine and biochemical research.

pyrimidinetrione. See barbituric acid.

pyrite (iron pyrites, fool's gold) FeS_2 , often with small amounts of Cu, As, Ni, Co, Au, Se.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Brass-yellow or brown tarnished mineral, greenish or brownish-black streak, metallic luster. Contains 46.7% iron, 53.3% sulfur. Differs from chalcopyrite and pyrrhotite in hardness, from marcasite in that its powder is completely soluble in strong nitric acid, and from gold in color, streak and brittleness. Is very widely distributed, being the most common sulfide mineral.

Constants: Sp.gr. 4.9-5.2, hardness 6-6.5.

Occurrence: United States (Virginia, New York, Massachusetts, Connecticut, New Jersey, Colorado, Utah); Norway, Germany; France, Italy; Spain; Portugal; England; Hungary; Sweden; Canada; North Africa.

Uses: Ore of iron; sulfuric acid manufacture; paper manufacture (sulfur dioxide), sulfur manufacture (by distillation), copperas; radio (detectors); cheap jewelry, recovery of gold, silver, copper.

See also ferrous sulfide.

pyrite, white. See marcasite.

pyrites, arsenical. See arsenopyrites.

pyrites, cinder.

Properties: Dark red lumps; composed mainly of iron oxide but contains, usually, from 1-4% sulfur as sulfate of the metals present.

Derivation: The residue from the burning of pyrite.

Use: Sometimes sold for the recovery of the iron or copper and silver.

Shipping regulations: None.*

pyrites, cobalt. See linnaeite.

pyrites, copper. See copper sulfide, also chalcopyrite.

pyrites, iron. See pyrite.

pyrites, magnetic. See pyrrhotite.

pyrites, tin. See stannite.

pyrithiamine (neopyrithiamine) $C_{14}H_{20}Br_2N_4O$. A thiamine antagonist.

Properties: Crystallizes from acetone; m.p. 219°C (dec), soluble in water.

Derivation: Synthetically from the condensation of 2-methyl-3-(beta-hydroxyethyl) pyridine with the pyrimidine moiety of thiamine.

Uses: Biochemical research.

pyro-. A prefix indicating formation by heat, specifically, an inorganic acid derived by loss of one molecule of water from two molecules of an ortho acid, as pyrophosphoric acid.

pyroacetic ether. See acetone.

pyrobitumen. A native, dark-colored, solid material composed of hydrocarbons, which may be partly oxygenated. Inorganic material may be present. The hydrocarbon portion is fusible and relatively insoluble in carbon disulfide. Pyrobitumen includes the asphaltic pyrobitumens (q.v.) and peat, coal, and bituminous shales.

"Pyrobor."® Trademark for dehydrated borax, $Na_2B_4O_7$.

pyrocatechol (ortho-dihydroxybenzene; 1,2-benzenediol; catechol) $C_6H_4(OH)_2$.

Properties: Colorless crystals; discolors to brown on exposure to air and light, especially when moist; sp.gr. 1.371; m.p. 104°C; b.p. 245°C, sublimes; soluble in water, alcohol, ether, benzene and chloroform, also in pyridine and aqueous alkaline solutions.

Derivation: (a) By fusion of ortho-phenol-sulfonic acid with caustic potash at 350°C.

(b) By heating guaiacol with hydriodic acid.

Method of purification: Crystallization.

Grades: Technical; C.P.; resublimed.

Containers: 25- to 200-lb drums.

Uses: Antiseptic; photography; dyestuffs; for dyeing, electroplating; specialty inks; antioxidants and light stabilizers.

Shipping regulations: None.*

pyrocatechol dimethyl ether. See veratrole.

pyrocatechol methyl ester. See guaiacol.

pyrocatechol monomethyl ether. See guaiacol.

"Pyroceram."® Trademark for crystalline ceramic materials made from glass of various compositions and physical properties and accessories used therewith.

"Pyroceram Brand Cement."® Trademark for powdered glasses which are thermo-setting and utilized for sealing inorganic materials. The resultant seals are crystalline and have service temperatures in excess of the sealing temperatures.

"Pyroceram Brand Ceramic Code No. 9608."® Trademark for crystalline ceramic material made from glass having favorable electrical properties.

Properties: Flexural strength of abraded articles is 20,000 psi. Dielectric constant varies only slightly with temperature at frequencies on the order of 8.5 kmc and above.

Uses: High temperature, high frequency applications in the electronics field.

"Pyroceram Brand Ceramic Code No. 9608."® Trademark for crystalline ceramic material made from glass having high thermal shock resistance.

Properties: Thermal expansion coefficient of $3.9-11 \times 10^{-7}/^\circ F$. Flexural strength of 14,000-23,000 psi.

Uses: Cooking ware, telescope mirrors.

pyrochlore $NaCaNb_2O_6F$. A complex oxide of sodium, calcium and niobium. Tantalum, rare earth metals, and other elements may be present. Color brown to black, streak light brown; hardness 5-5.5; sp.gr. 4.2-6.4. Forms a series with microlite. Koppite is a variety of pyrochlore.

Occurrence: Maine, California, Colorado; Africa; Europe.

Use: Ore of niobium.

pyrochroite. See manganous hydroxide.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Pyrofax."²¹⁴ Brand name of a proprietary fuel gas.

Constants: Heat of combustion 2509 Btu/cu ft, 21,500 Btu/lb; vapor density (air = 1.0) 1.56; vapor pressure at 70°F approx. 117 lbs/sq in; vol/lb at 15.6°C and 760 mm 8.56 cu ft.

Containers: 50-, 100-lb cylinders (net wt) 120- to 1000-gal tanks; approx. 8000-gal tank cars.

Uses: As fuel for domestic and heavy-duty cooking; water heating; refrigeration, space heating; and for schools and laboratories not served with city gas. Fuel and atmosphere for heat-treating and carburizing metals; for annealing; tool dressing; brazing, soldering and other industrial applications. Also used for singeing and drying and for heating calender rolls.

pyroforic (also spelled pyrophoric). Spontaneously combustible upon exposure to air.

pyroforic fuel, or solutions.

Shipping regulations: Flammable liquid. Red label.*

pyrogallol acid (pyrogallol, 1,2,3-trihydroxybenzene) $C_6H_3(OH)_3$.

Properties: White, lustrous crystals; turn gray on exposure to light; sp.gr. 1.463; m.p. 132.5°C, b.p. 309°C; soluble in water, alcohol, and ether. A solution of pyrogallol acid acquires a brown color on exposure to air. This absorption of oxygen and change of color take place rapidly when the solution is made alkaline.

Derivation: By heating gallic acid with three times its weight of water, in an autoclave.

Grades: Technical, C.P.

Containers: 1-lb bottles; 1-, 5-lb cans, wooden barrels; drums.

Uses: Protective colloid in preparation of metallic colloidal solutions; photography, dyes, intermediates, synthetic drugs, medicine, process engraving, analysis of free oxygen in air and other gas mixtures, antioxidant in lubricating oils.

pyrogallol. See pyrogallol acid.

pyrogallol monoacetate (eugallol)

$C_6H_3(OH)_2OOCCH_3$.

Derivation: By heating pyrogallol with glacial acetic acid or acetic anhydride.

Grades: Medicinal, 17% solution in acetone.

Use: Medicine.

pyrogallol triacetate (lenigallol)

$C_6H_3(OOCCH_3)_3$.

Properties: White crystalline powder.

Soluble in alcohol; almost insoluble in water; decomposed by alkali hydroxide solutions. M.p. 165°C.

Derivation: By heating pyrogallol with acetic anhydride.

Method of purification: Crystallization in alcohol.

Use: Medicine.

pyrographite. See graphite, pyrolytic.

pyroligneous acid (wood vinegar). Crude yellow to red liquid, a mixture of materials

from wood distillation. Crude product contains methanol, acetic acid, acetone, furfural and various tars and related products; sp.gr. 1.018-1.030; miscible with water and alcohol.

Use: Formerly an important source of acetic acid and acetone, as well as certain medicinal products.

pyroligneous liquor. See pyroligneous acid.

pyroligneous vinegar. See pyroligneous acid.

pyrolignite of iron. See iron acetate liquor.

pyrolignite of lime. See calcium acetate.

pyrolusite (manganese dioxide, black) MnO_2 .

Properties: Iron-black to dark steel-gray or bluish mineral; streak, black or bluish-black; luster, metallic or dull. Sufficiently soft to soil the fingers. Found with psilomelane and other black manganese oxides. Is thought to be an alteration product of manganite or polianite, etc. Contains 63.2% manganese. Soluble in hydrochloric acid.

Constants: Sp.gr. 4.73-4.86; hardness 2-2.5.

Occurrence: United States (Virginia, Georgia, Arkansas, Lake Superior region, Massachusetts, Vermont, New Mexico); Germany; Czechoslovakia; Australia; India; Canada.

Use: An important manganese ore. See also manganese dioxide. For many uses the ore and synthetic material are interchangeable.

"Pyrolux Maroon."¹⁴¹ Trade name for organic maroon pigments used in plastics because of exceptional resistance to discoloration due to heat and excellent permanence.

pyrolysis. Breaking down of complex materials into simpler units by use of heat.

pyromellitic acid (PMA; 1,2,4,5-benzenetetracarboxylic acid) $C_6H_2(COOH)_4$.

Properties: White powder, sp.gr. 1.79; m.p. 257-265°C, b.p. converts to dianhydride; bulk density 32 lb/cu ft. Picks up moisture slowly if exposed to atmosphere. Keep sealed.

Grade: 99% purity.

Containers: 5-, 25-, 100-lb fiber drums.

Uses: Intermediate for polyesters and polyamides used in electrical and nonfogging plasticizers, lubricants and waxes.

Hazard: A primary irritant.

Shipping regulations: None.*

pyromellitic dianhydride $C_6H_2(C_2O_3)_2$.

Properties: White powder; sp.gr. 1.68; m.p. 286°C, b.p. 397-400°C (760 mm), 305-310°C (30 mm), bulk density 21 lb/cu ft. Soluble in some organic solvents. Hydrolyzes to the acid when exposed to moisture.

Grade: 98% purity.

Containers: 5-, 25-, 100-lb fiber drums.

Uses: Curing agent for epoxy resins used in high temperature laminates, molds, and coatings; crosslinking agent for epoxy plasticizers in vinyls, in alkyd resins; as intermediates for esters of pyromellitic

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acid for use as electrical grade and non-fogging plasticizers and high temperature lubricants.

Hazard: Strong primary irritant.

Shipping regulations: None.*

pyrometric cones (Seeger cones). Small pyramids composed of mixtures of oxides which melt at known temperatures and are used to measure temperatures in the 1100-3700°F range.

pyromucamide. See furoamide.

pyromucic acid. See furoic acid.

pyromucic aldehyde. See furfural.

"Pyronate."⁴⁵ Trade name for water-soluble petroleum sulfonates.

"Pyronil."¹⁰⁰ Trademark for pyrrobutamine phosphate (q.v.).

pyrope. See garnet.

pyrophoric. See pyroforic.

pyrophoric alloy (sparking metal; ferrocerium; Auer metal). An alloy of misch metal with about 30% of other metals, chiefly iron. Containers: Wooden or plastic boxes.

Uses: Pyrophoric alloy produces sparks on gentle friction and is used as the tip in various kinds of lighters, e.g., gas lighters, pocket lighters, etc.

Shipping regulations: None.*

pyrophosphoric acid $H_4P_2O_7$.

Properties: A viscous, syrupy liquid which tends to solidify on long standing at ordinary temperature. When diluted with water it is rapidly converted into orthophosphoric acid. Soluble in water. M.p. 61°C.

Derivation: By heating disodium phosphate, dissolving in water, and precipitating with a soluble lead compound. The lead in turn is precipitated with H_2S , the solution filtered off and concentrated in vacuo.

Grades: Technical.

Containers: Carboys; casks.

Use: Chemical catalyst; manufacture of organic phosphate esters.

pyrophyllite (agalmatolite) $Al_2Si_4O_{10}(OH)$. A natural hydrous aluminum silicate, found in metamorphic rocks.

Properties: Color white, green, gray, brown; luster pearly to greasy; good micaceous cleavage; sp.gr. 2.8-2.9; hardness 1-2. Similar to talc.

Occurrence: North Carolina, California; Newfoundland; Japan.

Use: Ceramics, insecticides, slate pencils, substitute for talc.

pyroracemic acid. See pyruvic acid.

"Pyroset" DO Fire Retardant.⁵⁷ This product is a water-soluble organic compound that is applied with phosphoric acid to provide a high degree of fire retardancy to cellulosic fabrics. The finish is durable to repeated commercial dry cleanings.

"Pyroset" Fire Retardant N-2.⁵⁷

Resin used principally to produce a

durably stiff, fire retardant finish on nylon.

pyrosulfuric acid. See sulfuric acid, fuming.

pyrosulfuryl chloride (disulfuryl chloride)

$S_2O_5Cl_2$.

Properties: Colorless, mobile; very refractive, fuming liquid; sp.gr. 1.819; b.p. 146°C; m.p. -38°C; refractive index (n_D¹⁹) 1.449.

Containers: Carboys.

Use: Synthetic processes.

Caution: Decomposes violently with water to sulfuric and hydrochloric acids.

Shipping regulations: Corrosive liquid.

White label.*

pyrotartaric acid (methylsuccinic acid)

$HOOCCH(CH_3)CH_2COOH$.

Properties: White or yellowish crystals.

Soluble in water, alcohol, and ether.

Constants: Sp.gr. 1.4105; m.p. 111-112°C.

Derivation: By distilling tartaric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; wooden kegs.

Use: Organic synthesis.

Shipping regulations: None.*

pyrotartaric acid, normal. See glutaric acid.

pyrovanadic acid. See vanadic acid.

pyroxenes. A group of silicate minerals with similar physical properties, chemical composition, and atomic structure. The group is characterized by prismatic cleavage and a silica:oxygen ratio of 1:3. Pyroxenes are common in igneous and metamorphic rocks.

pyroxylin (soluble guncotton). A nitrocellulose (q.v.) consisting chiefly of cellulose tetranitrate $[C_{12}H_{16}O_6(NO_3)_4]_n$.

Properties: Light yellow matted filaments; decomposed by light when kept in closed containers. Exceedingly flammable! Soluble in a mixture of ether-alcohol (3:1) (U.S.P. grade), in acetone and glacial acetic acid, and is precipitated from solution by water.

Grades: U.S.P. XVI; technical.

Containers: Cartons, protected from light.

Must be loosely packed. Also bottles.

Uses: In making collodion.

Shipping regulations: (solid) Flammable solid, yellow label; (solution) flammable liquid, red label.*

pyrrhotine. See pyrrhotite.

pyrrhotite (magnetic pyrites, pyrrhotine) FeS .

A natural iron sulfide. Frequently has a deficiency in iron. May contain small amounts of nickel, cobalt, manganese and copper.

Properties: Color brownish bronze; streak black; luster metallic; slightly magnetic; hardness 4; sp.gr. 4.6.

Occurrence: Tennessee, Pennsylvania; Europe; Canada.

Uses: Ore of iron; manufacture of sulfuric acid; sometimes an ore of nickel; possible source of sulfur.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pyrrobutamine phosphate

$\text{ClC}_6\text{H}_4\text{CH}_2\text{C}(\text{C}_6\text{H}_5)_2\text{CHCH}_2\text{NC}_4\text{H}_8 \cdot 2\text{H}_3\text{PO}_4$.
(1-[4-(para-Chlorophenyl)-3-phenyl-2-butenyl]pyrrolidine diphosphate).

Properties: A light cream to off-white powder with a slight odor and a bitter taste. It is soluble in water, slightly soluble in alcohol and almost insoluble in chloroform and ether. The melting range (U.S.P.) is 127° to 131°C.

Grade: N.N.D.

Use: Medicine.

"Pyrrolazote." ³²⁷ Trademark for pyrathiazine-10-[2-(1-pyrrolidyl) ethyl] phenothiazine hydrochloride ($\text{C}_{18}\text{H}_{21}\text{ClN}_2\text{S}$).

Properties: M.p. 200°C; soluble in water, alcohol; insoluble in ether and benzene.

Derivation: Synthetic.

Use: Medicine; antihistamine.

pyrrole $\text{CHNH}(\text{CH})_2\text{CH}$.

Properties: Yellowish or brown liquid oil with a burning, pungent taste; odor similar to chloroform; readily polymerizes by the action of light and turns brown. The pure material is colorless if every trace of oxygen is kept away. Soluble in alcohol, ether, and dilute acids; insoluble in water and dilute alkalis.

Constants: B.p. 130-131°C; m.p. -24°C; sp.gr. 0.968 (20/4°C); refractive index (n_D 20) 1.5091, flash point (Tag closed cup) 39°C, slightly soluble in water; soluble in most organic chemicals.

Derivation: By the fractional distillation of bone-tar or bone-oil with sulfuric acid.

Method of purification: Conversion into the potassium compound ($\text{C}_4\text{H}_4\text{NK}$), washing with ether and treatment with water, followed by drying and distillation.

Grades: Technical.

Containers: Iron drums.

Use: Manufacture of drugs.

Shipping regulations: None.*

pyrrole tetralodide. See iodole.

pyrrolidine $\text{C}_4\text{H}_9\text{N}$.

Properties: Colorless to pale yellow liquid, penetrating amine-like odor; poisonous.

Sp.gr. 0.8660 (20/20°C); m.p. -60°C,

b.p. 87°C (760 mm), refractive index

1.4425 (n_D 20/D).

Grades: 95% min purity.

Uses: Intermediate for pharmaceuticals, fungicides, insecticides, rubber accelerators, citrus decay control; cure for epoxy resins; inhibitor.

Containers: 1-, 5-gal cans; 55-gal drums.

Shipping regulations: Flammable liquid.

Red label.*

2-pyrrolidinecarboxylic acid. See proline.

3-pyrrolidinopropiophenone hydrochloride

$\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{NC}_4\text{H}_8 \cdot \text{HCl}$. A white to yellow crystalline powder; m.p. 160-166°C.

2-pyrrolidone $\text{CH}_2\text{CH}_2\text{CH}_2\text{C}(\text{O})\text{NH}$. Made from acetylene and formaldehyde by high pressure synthesis.

10-[2-(1-pyrrolidyl)ethyl] phenothiazine hydrochloride. See pyrathiazine hydrochloride.

pyruvic acid (alpha-ketopropionic acid; acetylformic acid; pyracemic acid)

CH_3COCOOH . An acid which is a fundamental intermediate in protein and carbohydrate metabolism in the cell. As the sodium salt, it is known to activate nitrogen fixation at least under artificial conditions.

Properties: Liquid with odor resembling acetic acid; m.p. 11.8°C, miscible with water, ether, and alcohol.

Derivation: Dehydration of tartaric acid by distilling with potassium acid sulfate.

Use: Biochemical research.

pyruvic alcohol. See acetol.

pyruvic aldehyde (methyl glyoxal) CH_3COCHO .

Properties: Supplied commercially as approximately 30% aqueous solution, sp.gr. 1.20 (20/20°C), 10 lbs/gal (20°C).

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Organic synthesis, as of complex chemical compounds such as pyrethrins; for the tanning of glove leathers.

pyrvinium chloride $\text{C}_{26}\text{H}_{28}\text{ClN}_3 \cdot 2\text{H}_2\text{O}$. 6-Dimethylamino-2-[2-(2,5-dimethyl-1-phenyl-3-pyrryl)vinyl]-1-methylquinolinium chloride dihydrate. A red powder, m.p. 250°C (dec). Slightly soluble.

Grade: N.N.D.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Q

"Q302.4." ²³³ Trademark for commercial divinylbenzene and related compounds.
Derivation: Diethylbenzene by-products of styrene manufacture.
Use: Polymerization monomer.

Q-lure. 4-(para-acetoxyphenyl)-2-butanone.
A lure for the male melon fly.

"QO." ²²⁴ Trademark for a line of furan chemicals and derivatives.

"Quadrafos." ¹⁶⁴ Trademark for a sodium phosphate glass commonly called sodium tetraphosphate (q.v.), a linear polymer containing a minimum of 63.5% P_2O_5 . Soluble in water; insoluble in organic solvents.

Grades: Beads; granular; powder.

Containers: Bags; fiber drums. Beads are also packed in 20-lb cloth "dissolver" bags.

Uses: In general, as a sequestering, dispersing and deflocculating agent; specifically, to sequester alkaline earth and heavy metal ions; to prevent scaling and corrosion of pipes; to soften water; to disperse pigments and clays in paper making and oil well drilling.

"Quadrex." ³⁰⁹ Trademark for high potency vitamin-containing solids for fortifying foods and feeds with vitamins.

"Quadrol." ²⁰³ Trademark for N,N,N',N'-tetrakis (2-hydroxypropyl)-ethylenediamine. It is a colorless viscous liquid with a boiling point of 190°C at 1 mm. It has a low order of toxicity and is used as a humectant, chelating agent, plasticizer, and intermediate in resin and adhesive manufacture.

"Quakeral." ²²⁴ Trademark for furfural (q.v.).

"Quaker Blue." ²⁰⁴ Trademark. Highly concentrated sour liquid blue for finished work.

quaker buttons. See nux vomica.

"Quaker Improved Chlorinated Lime." ²⁰⁴
Trademark. A chloride of lime with 30-33% available chlorine content.

"Quakersol." ³¹⁹ Trademark for a proprietary alcohol-type solvent used as a substitute for denatured alcohols in the manufacture of nitrocellulose and other lacquers, polishes, soldering fluxes, disinfectants, paint removers, cements, waterproofing materials, insecticides and cleaning compounds.

quartering, in sampling. Form of hand sampling used to obtain a representative sample

of a granular or powdered solid. It is carried out by thoroughly mixing the solid and separating into four piles, rejecting the two opposite piles, mixing the remaining two parts again and repeating the procedure until a sample of the desired size is obtained.

quartz SiO_2 . Crystallized silicon dioxide. It is the main constituent of sandstone, one of the two principal constituents of granite, pegmatite, and some other igneous and metamorphic rocks, and is the most frequent gangue mineral in mineral veins. It is very resistant to weathering and is left as quartz sand when rocks containing quartz are disintegrated.

Properties: Color variable; luster vitreous; hardness 7, sp.gr. 2.65; insoluble in acids except hydrofluoric; only slightly attacked by solutions of caustic alkali; piezoelectric and pyroelectric.

Varieties: The most important varieties are agate; chalcedony; chert; flint; opal; and rock crystal. See under individual entries for uses.

Derivation: Synthetic crystals of good size and purity are now grown by mass production methods under very carefully regulated conditions of temperature and concentration.

Uses of synthetic crystals: Electronic components, for piezoelectric control in filters, oscillators, frequency standards, wave filters, radio and TV components.

quartz, fused. Pure silica that has been fused so as to yield a glass-like material on cooling. Used for apparatus and equipment where its high melting point, ability to withstand large and rapid temperature changes, chemical inertness and transparency (including ultra violet light) are valuable and useful.

quartzite (quartz rock). A metamorphic or sedimentary rock composed almost wholly of quartz grains cemented by silica. Color white, gray, or brownish.

Occurrence: Pennsylvania, Maryland, Virginia, Wisconsin.

Use: Road material; tube mill linings, tower packings; glass sand; silica brick.

quartz rock. See quartzite.

quassia (bitter ash; bitterwood).

Derivation: The wood or bark of *Picrasma excelsa* or *Quassia amara*; very bitter taste. White to bright yellow chips or shavings.

Occurrence: Warmer regions of the world.
Chief constituents: Quassin, quassol,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

picrasmin.

Grades: Technical, as chips.

Containers: Bags.

Uses: Decoction or tincture as a fly poison; surrogate for hops, medicine (powerful bitter); hair lotion.

Shipping regulations: None.*

quassin $C_{22}H_{30}O_6$. Extract of quassia.

Properties: Colorless crystals; m.p. 205°C; odorless but very bitter in taste. Slightly soluble in water; soluble in organic solvents.

Use: To denature alcohol.

quat. Slang for quaternary ammonium salt.

quaternary ammonium salt. A type of organic nitrogen compound in which the molecular structure includes a central nitrogen atom joined to four organic groups as well as to an acid radical of some sort. Octadecyl-dimethylbenzyl ammonium chloride and hexamethonium chloride are examples of this type of compound. In addition to the ordinary substituted ammonium compounds, pentavalent nitrogen ring compounds, such as lauryl pyridinium chloride, are also considered quaternary ammonium compounds. These are all cationic surface-active compounds and tend to be adsorbed on surfaces.

Uses: Disinfectant, cleanser and sterilizer; cosmetics (deodorants, dandruff removers, emulsion stabilizers), fungicides, mildew control, to increase affinity of dyes for film in photography, coating of pigment particles to improve dispersibility, to increase adhesion of road dressings and paints.

See also detergents, synthetic.

"Quaternary O." ²¹⁹ Trade name for alkyl imidazolium chloride ($C_{17}H_{35}C_3H_4N_2R^1R^2Cl$).

Properties: 80% active viscous oil, soluble in water and most organic solvents, unstable at pHs over 7.

Uses: Cationic wetting agent, foamer, penetrant for strong acids, salt solutions, solvents; germicide. Corrosion inhibitor in acids; emulsion breaking.

para-quaterphenyl $C_6H_5C_6H_4C_6H_4C_6H_5$.

Properties: Crystals, m.p. 316-318°C; b.p. 428°C (18 mm).

Grade: Purified.

Use: As primary fluor or as wave length shifter in solution scintillators.

quebrachine. See yohimbine.

quebracho (aspidosperma).

Derivation: The bark of *Aspidosperma quebrachoblanco* and *quebracho-colorado* from Argentina.

Chief constituents: *Aspidospermine*, tannin, quebrachine.

Grades: Technical.

Containers: Bags; multiwall paper sacks.

Uses: *Quebracho-blanco* in medicine for its tannin and alkaloid content; *quebracho-colorado* in tanning and dyeing for its

tannin content; has also been used as an additive to well drilling muds.

quebracho extract.

Derivation: From the wood of *Aspidosperma quebracho* and *Quebracho lorentzi*, which is imported into the United States in logs.

Grades: Liquid: 35-37% tannin. Solid: 65% tannin.

Containers: Extract: 400-, 500-lb wooden barrels, tank-cars. Extract (powdered): 110-lb bales.

Uses: Tanning industry, dyeing; ore flotation; oil well drilling muds.

Shipping regulations: None.*

Queensland asthma weed. See *euphorbia*.

queen's metal. A jeweler's alloy composed approximately of 9 parts tin and 1 part of antimony, and small proportions of copper, zinc, lead, or bismuth.

queen's root. See *stillingia*.

"Quelcin Chloride." ³ Trademark for succinylcholine chloride (q.v.).

quercetin (meletin, quercetinic acid, tetrahydroxyflavanol, flavin) $C_{15}H_{10}O_7 \cdot 2H_2O$.

Properties: Brown or yellow crystalline powder. Soluble in alkalies, slightly soluble in water.

Constants: Dihydrate loses water at 95-97°C; anhydrous form melts with decomposition at 313-315°C.

Derivation: Action of dilute sulfuric acid on quercitrin.

Grades: Technical.

Containers: Glass bottles; tins.

Use: Dyeing.

Shipping regulations: None.*

quercetinic acid. See quercetin.

quercetin-3-rutinoside. See rutin.

quercimetin. See quercitrin.

quercite. See quercitol.

quercitol (acorn sugar; quercite, pentahydroxycyclohexane) $C_6H_7(OH)_5$.

Properties: Colorless crystals, sweet taste.

Soluble in water; very slightly soluble in alcohol; insoluble in ether.

Constants: Sp.gr. 1.5845, m.p. 234°C.

Derivation: By extraction of acorn meal with water.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

quercitrin (quercimetin, quercitrinic acid) $C_{21}H_{20}O_{11}$.

Properties: Yellow glucosidal, crystalline powder. Soluble in acids, alkalies and amyl alcohol; slightly soluble in alcohol, ether and water.

Constants: M.p. 182-185°C.

Derivation: By extraction of the bark of the black-oak, *Quercus tinctoria*.

Grades: Technical.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Wooden kegs.
 Use: Manufacture of quercetin.
 Shipping regulations: None.*

quercitrinic acid. See quercitrin.

"Questex." ³³⁴ Trademark for ethylenediamine tetra-acetic acid (EDTA) and derivatives, a group of polyamino-acid based organic sequestering agents which complex or chelate multivalent, metallic cations (such as calcium, magnesium, copper and iron) into stable, coordinated anionic complexes.

"Questex" 4H: Purified form of anhydrous EDTA.

"Questex" 25W: Disodium dihydrogen EDTA dihydrate, offered in purified fine crystal form.

"Questex" 45W Crystal: Tetrahydrate of tetra-sodium-EDTA. This granular, crystalline form is unusually free flowing, non-dusting and readily soluble.

"Questex" 4S: Anhydrous granular form of tetrasodium-EDTA.

quicklime. See calcium oxide.

quicksilver. See mercury.

quicksilver, horn. See calomel, native.

"Quik-Gel." ²³⁶ Trademark for a peptized high-swelling bentonite. Used as thickener and suspending agent in fluids for core hole drilling.

Containers: 50-lb multiwall paper bags.

quillaia. See quillaja.

quillaja (soap bark, quillaia, panama bark, china bark; murillo bark).

Derivation: The dried bark of *Quillaja saponaria* from Bolivia, Peru, Chile, etc.
 Chief constituents: Quillajic acid; quillaja saponin and tannin.

Grades: Technical.

Containers: Whole: Bags and bales of variable size. Cut, crushed: 175-, 200-lb barrels, bags of variable size.

Uses: Medicine; manufacture of saponin, saponin and quillajic acid, in the soft-drink and shampoo liquid industries as a foam producer, emulsifier for oils, balsams and resins.

Shipping regulations: None.*

"Quilon." ²⁸ Trademark for a Werner type chromium complex in isopropanol.

Properties: Dark green liquid with an alcoholic odor, completely soluble in water, and many short-chain aliphatic alcohols, approximately 30% solution of stearate chromic chloride in isopropanol, sp.gr. 0.94, b.p. 82.4°C.

Containers: 6 1/2-gal carboys; 55-gal drums.

Uses: As a water repellent and sizing treatment of paper and other cellulosic materials; for treatment of felt hats, leathers, wool fabrics, hydrophobic fibers, and siliceous and other negatively charged surfaces; as an anti-blocking or release agent; for insolubilizing various water-soluble or swellable coatings.

quinacrine $C_{23}H_{30}ClN_3O$. The antimalarial drug brought to prominence during World War II. An alkaloid used in the form of one of its acid combinations. See quinacrine hydrochloride.

quinacrine hydrochloride

$C_{23}H_{30}ClN_3O \cdot 2HCl \cdot 2H_2O$. 3-Chloro-7-methoxy-9-(1-methyl-4-diethylaminobutyl-amino) acridine dihydrochloride).

Properties: Bright yellow, crystalline powder; odorless and with a bitter taste.

Decomposes at 248-250°C. Soluble in water and alcohol; pH of 1% water solution 4.5.

Derivation: Organic synthesis.

Grade: U.S.P. XVI.

Use: Medicine.

quinaldine (chinaldine; alpha-methylquinoline) $C_9H_9NCH_3$.

Properties: Colorless oily liquid; odor of quinoline; darkens to reddish-brown in air. Soluble in alcohol, ether, and chloroform; soluble in water. B.p. 246-247°C.

Derivation: (a) By the treatment of aniline and paraldehyde with hydrochloric acid and heat. (b) From coal-tar.

Grades: Technical.

Containers: Iron drums.

Use: Manufacture of dyes, pharmaceuticals, fine organic chemicals.

Shipping regulations: None.*

quinaphthol (chinaphthol, quinine-beta-naphthol-alpha-sulfonate)

$C_{20}H_{24}N_2O_2 \cdot (OHC_{10}H_6 \cdot SO_3H)_2$.

Properties: Yellow, crystalline powder, containing 42% of quinine; bitter taste. Moderately soluble in hot water or alcohol, insoluble in cold water.

Constants: M.p. 185-186°C.

Derivation: By the interaction of quinine and beta-naphtholsulfonic acid.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

quince seed. See cydonia.

"Quindex." ⁷⁴ Trademark for solubilized form of copper 8-quinolinolate. Contains 1.8% copper. Used when non-mercurial fungicide is required.

"Quindo." ⁴³⁸ Trademark for quinacridone pigments. Used in paints, printing inks, and plastics.

quinhydrone $C_6H_4O_2 \cdot C_6H_4(OH)_2$.

Properties: Dark green crystals. Slightly soluble in water; soluble in alcohol, ether, hot water, ammonia.

Constants: M.p. 171°C, sp.gr. 1.40.

Derivation: Oxidation of hydroquinone with sodium dichromate.

Method of purification: Recrystallization.

Grades: Reagent; technical.

Containers: Glass bottles.

Use: Quinhydrone electrode for pH determination.

Shipping regulations: None.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

quinic acid (ch inic acid)

$C_6H_7(OH)_4COOH \cdot H_2O$. Hexahydro-1,3,4,5-tetrahydroxybenzoic acid.

Properties: White, transparent crystals; very acid taste. Soluble in water, alcohol, and glacial acetic acid, insoluble in ether. Constants: Sp.gr. 1.637; m.p. 162°C; b.p. decomposes.

Derivation: From cinchona bark.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

quinidine (chinidine; conchinine; beta-quinine; pitayine) $C_{20}H_{24}N_2O_2$.

Properties: Colorless, lustrous, crystalline alkaloid; efflorescing on exposure to air. Soluble in chloroform, alcohol, and ether; very slightly soluble in water. M.p. 171.5°C.

Derivation: By the extraction of certain species of cinchona bark; also by synthetic methods.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Vials; 1-, 5-, 25-, 50-, 100-oz tins.

Use: Medicine (as the alkaloid or as the various salts).

Shipping regulations: None.*

quinidine gluconate $C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$.

Properties: White, odorless powder with very bitter taste. Freely soluble in water; only slightly soluble in alcohol.

Derivation: It is the gluconate of an alkaloid obtained from various species of Cinchona and their hybrids or from Remijna pedunculata, or prepared from quinine.

Grade: N.F. XI.

Use: Medicine.

quinidine sulfate $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: Fine, needle-like, white crystals, frequently cohering in masses; odorless with a very bitter taste and darkens on exposure to light. Soluble in water, alcohol, and chloroform; almost insoluble in ether.

Grade: U.S.P. XVI.

Containers: Tins, drums.

Use: Medicine.

quinine $C_{20}H_{24}N_2O_2 \cdot 3H_2O$. One of the most important natural alkaloids.

Properties: Bulky, white, amorphous powder or crystalline alkaloid; very bitter taste, odorless and levo-rotatory. Soluble in alcohol, ether, chloroform, carbon disulfide, ligroin, oils, glycerol, alkalies and acids (with formation of salts), very slightly soluble in water.

alkaloid, anhydrous $C_{20}H_{24}N_2O_2$.

M.p. 174.9°C.

alkaloid, hydrated $C_{20}H_{24}N_2O_2 \cdot 3H_2O$.

M.p. 57.0°C.

bisulfate $C_{20}H_{24}N_2O_2 \cdot H_2SO_4 \cdot 7H_2O$.

M.p. about 160.0°C.

hydrobromide $C_{20}H_{24}N_2O_2 \cdot HBr \cdot H_2O$.

M.p. (anhydrous form) 152-200°C.

hydrochloride $C_{20}H_{24}N_2O_2 \cdot HCl \cdot 2H_2O$.

M.p. (anhydrous form) 156-160°C.

salicylate $C_{20}H_{24}N_2O_2 \cdot C_7H_6O_3 \cdot H_2O$.

M.p. 183-187°C.

Derivation: Finely ground cinchona bark mixed with lime is extracted with hot high-boiling paraffin oil. The solution is filtered, shaken with dilute sulfuric acid, the latter neutralized hot with sodium carbonate and on cooling quinine sulfate crystallizes out. The sulfate is treated with ammonia, the alkaloid being obtained.

Method of purification: Precipitation as tartrate from its solution by means of Rochelle salt.

Impurities: Other cinchona alkaloids.

Grades: Technical; N.F. XI (several of the salts).

Containers: Vials; up to 1000-oz drums.

Uses: Medicine (antimalarial), as the alkaloid or as the acetate, albuminate, arsenate, benzoate, camphorate, citrate, gallate, glycerophosphate, lactate, phenolate, salicylate, tannate, tartrate, etc. N.F. XI salts are the dihydrochloride, hydrochloride, phosphate, and sulfate. Most of these salts are soluble in water.

Shipping regulations: None.*

beta-quinine. See quinidine.

quinine acid sulfate. See quinine.

quinine bisulfate. See quinine.

quinine carbacrylic resin. The quinine salt of a polyacrylic carboxylic acid resin. Contains 1.85% of quinium ion.

Properties: Buff, odorless, tasteless, free-flowing amorphous, granular solid. Practically insoluble in dilute acids and alkalies, alcohol, ether and water.

Use: Medicine.

quinine carbonate. See aristoquin.

quinine dichloride. See quinine dihydrochloride.

quinine dihydrochloride (quinine dichloride)

$C_{20}H_{24}N_2O_2 \cdot 2HCl$.

Properties: White powder, intensely bitter taste, odorless, affected by light. Contains 81.63% quinine. Very soluble in water (1 g in 0.6 cc) and alcohol (1 g in 12 cc); slightly soluble in chloroform and ether.

Derivation: (a) By passing hydrochloric acid gas over dry quinine. (b) Decomposition of quinine bisulfate with barium chloride.

Grades: N.F. XI.

Shipping regulations: None.*

quinine ethylcarbonate $C_{23}H_{28}O_4N_2$.

Properties: White, odorless needles, darken on exposure to light; m.p. 89-91°C; slightly soluble in water, soluble in alcohol, ether or chloroform.

Use: Medicine.

quinine hydrobromide. See quinine.

quinine hydrochloride. $C_{20}H_{24}N_2O_2 \cdot HCl \cdot 2H_2O$.

Properties: White silky needles; odorless, bitter taste; effloresces in warm air.

Soluble in water; more soluble in alcohol

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and chloroform.

Grade: N. F. XI.

Use: Medicine.

quinine-beta-naphthol-alpha-sulfonate. See quinapthol.

quinine phosphate $(C_{20}H_{24}N_2O_2)_2 \cdot 2H_3PO_4 \cdot 5H_2O$.

Properties: Small, white crystals or as white crystalline powder. Odorless with bitter taste. Affected by light. Saturated solution is acid to litmus. Very slightly soluble in water; slightly soluble in boiling alcohol.

Grade: N. F. XI.

Use: Medicine.

quinine salicylate. See quinine.

quinine salts. See quinine.

quinine sulfate $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties: White needle-like crystals; odorless; very bitter taste; turns brown in the light; a saturated solution is neutral or slightly alkaline to litmus paper; m. p. 205°C, if exposed to damp air it may take up 5 mols of water. Loses water of crystallization at about 100°C. Soluble in hot water and in alcohol. Slightly soluble in chloroform and ether.

Derivation: The sulfate of an alkaloid usually obtained from the cinchona tree (see quinine).

Grade: N. F. XI.

Containers: See quinine.

Use: Medicine.

quinine-urea hydrochloride (urea-quinine)

$C_{20}H_{24}N_2O_2 \cdot HCl \cdot CO(NH_2)_2 \cdot HCl \cdot 5H_2O$.

Properties: White, granular powder, or colorless, translucent prisms. Bitter taste, odorless. Contains not less than 58% anhydrous quinine. Soluble in water and strong alcohol.

Derivation: By dissolving quinine hydrochloride in hydrochloric acid, filtering, adding urea, heating and crystallizing.

Purification: Recrystallization.

Containers: 1-oz bottles.

Grade: N. F. XI.

Use: Medicine.

Shipping regulations: None.*

quininic acid $CH_3OC_9H_5NCO_2H$.

Properties: Yellow prisms. Slightly soluble in alcohol, very slightly soluble in water and ether. M. p. decomposes at 280°C, b. p. sublimes in part.

Grades: Technical.

Containers: Glass bottles.

Use: Organic synthesis.

Shipping regulations: None.*

quinoidine (chinoidine).

Properties: Brownish-black lustrous mass, resinous appearance; conchoidal fracture; very bitter taste. It is a mixture of the amorphous alkaloids remaining in the solution from the extraction of cinchona bark, after the crystallizable alkaloids have been removed. Soluble in dilute acids, alcohol and chloroform. M. p. softens below 100°C.

Grades: Technical.

Containers: 70-, 140-lb drums.

Uses: Medicine, either as such, or as the borate, citrate, hydrochloride, sulfate or tannate.

Shipping regulations: None.*

quinol. See hydroquinone.

quinoline (chinoline; leucoline)

$CHCHCHCHCHCNCHCHCH$.

Properties: An aromatic nitrogen compound, occurring in coal-tar and obtained from it, but more frequently by synthesis; highly refractive, colorless liquid; darkens with age; absorbs water from the air; peculiar, characteristic odor. Keep well stoppered. Soluble in water, alcohol, ether and carbon disulfide. Sp. gr. 1.0899; m. p. -15°C; b. p. 238°C.

Derivation: By treatment of aniline and nitrobenzene with glycerol and sulfuric acid and heat.

Method of purification: Rectification.

Grades: Pure, from cinchomine, synthetic, C. P.

Containers: Glass bottles; 5- and 55-gal drums; tank cars.

Uses: Medicine; preserving anatomical specimens; manufacture of quinosol, niacin, and copper-8-quinolinolate.

Shipping regulations: None.*

8-quinolinol. See 8-hydroxyquinoline.

8-quinolinol sulfate. See 8-hydroxyquinoline sulfate.

quinone (1,4-benzoquinone, chinone) $C_6H_4O_2$.

Properties: Yellow crystals; characteristic, irritating odor. Soluble in alcohol, ether and alkalies; slightly soluble in hot water. Sp. gr. 1.307, m. p. 115.7°C, b. p. sublimes; volatile with steam, being in part decomposed.

Derivation: By the oxidation of aniline with chromic acid, extraction with ether and distillation of the latter.

Method of purification: Steam distillation.

Grades: Technical.

Containers: 1-lb bottles, 25-lb boxes, 100-lb barrels.

Use: Manufacture of dyes and hydroquinone.

Shipping regulations: None.*

quinone oxime dyes. See nitroso dyes.

quinophthalone $NC_{10}H_6CCOHC_6H_4CO$.

Properties: Yellow powder.

Grade: Technical.

Use: Intermediate.

quinosol (chinosol) $C_9H_8NOSO_3K \cdot H_2O$.

Properties: Yellow, crystalline powder, weak saffron odor, burning taste, incompatible with alkalies, iron and mercury compounds. Does not coagulate albumin. M. p. 175-177.5°C. Soluble in water; difficultly soluble in alcohol; insoluble in ether.

Use: Medicine.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

quinoxaline (1,4-benzodiazine; benzo-para-diazine) $C_8H_6N_2$ (bicyclic). An organic base. Properties: Colorless crystalline powder; m.p. $30^{\circ}C$; b.p. $229^{\circ}C$; soluble in water and organic solvents.

Use: Organic synthesis.

N-(2-quinoxaliny) sulfanilamide. See sulfaquinoxaline.

"Quixol." ³¹⁹ Trademark for a proprietary alcohol-type solvent used as a solvent, cleaner, drying agent, shellac thinner, and as a lamp and stove fuel.

"Quotane." ⁷¹ Trademark for dimethisoquin.

Q. V. Abbreviation for which see.

*See "I. C. C. Shipping Regulations," page xiii.
Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

R

r. Abbreviation for roentgen.

"R-2" Crystals. ⁵⁸ Trademark for a reaction product of carbon disulfide with 1,1'-methylene-dipiperidine.

Properties: Light brown, coarse crystalline solid; sp. gr. 1.11; m.p. 59°C min, soluble in acetone, benzene, and naphtha.

Containers: 50-lb fiber drums.

Uses: An ultra accelerator for latex and fast-curing cements.

Ra. Symbol for radium.

racemic acid (para-tartaric acid; tartaric acid, inactive; DL-tartaric acid)
 $\text{HOOC}(\text{CHOH})_2\text{COOH}$. Not a mixture of D- and L- acids, but a true crystalline variety.

Properties: Transparent, colorless crystals. Soluble in water; slightly soluble in alcohol. Sp. gr. 1.697, m.p. 205-206°C.

Derivation: A by-product of the manufacture of tartaric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; boxes, wooden kegs.

Use: Organic synthesis.

Shipping regulations: None.*

racemic ephedrine. See racephedrine.

racemic ephedrine hydrochloride. See racephedrine hydrochloride.

racemic ephedrine sulfate. See racephedrine sulfate.

racephedrine (racemic ephedrine, *dl*-ephedrine) $\text{C}_{10}\text{H}_{15}\text{NO}$. For optically active form, see ephedrine.

Properties: Crystals, m.p. 79°C, soluble in water, alcohol, chloroform, and oils.

Derivation: Synthetic.

Use: Medicine.

racephedrine hydrochloride (ephedron; racemic ephedrine hydrochloride)
 $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$. For optically active form, see ephedrine hydrochloride.

Properties: White crystals, m.p. 187-188°C; soluble in water; slightly soluble in 95% alcohol; insoluble in ether, neutral to litmus; pH about 6; affected by light.

Derivation: Synthetic.

Grade: N.F. XI.

Use: Medicine.

racephedrine sulfate (racemic ephedrine sulfate) $(\text{C}_{10}\text{H}_{15}\text{NO})_2 \cdot \text{H}_2\text{SO}_4$.

Properties: Crystals, m.p. 247°C, soluble in water and alcohol, neutral to litmus;

pH about 6.

Use: Medicine.

R acid. See 2-amino-3-naphthol-6-sulfonic acid; 2-naphthol-3,6-disulfonic acid.

2R acid. See 2-amino-8-naphthol-3,6-disulfonic acid.

rad. The unit of absorbed dose of energy from ionizing radiations. It is equal to 100 ergs/gram. See roentgen.

"Radapon." ²³³ Trademark for a grass killer, based on dalapon.

raddle. See reddle.

radiation.

1. The process by which energy in forms such as light, heat, x-rays or electricity is transmitted through space without the presence of movement of matter in or through this space. The term is also applied to these forms of energy themselves, i.e., one speaks of light radiation, heat radiation, or electrical radiations as in transmission of electrical energy in radio and television.
2. The rapidly moving atomic or subatomic particles (alpha particles, protons, electrons, neutrons) encountered in nuclear processes such as radioactivity. The words soft and hard are often used to describe in a general way the ability of radiation to pass through matter, hard radiation being penetrating and soft radiation being easily absorbed.

radiation biology. A general name for the broad fields of study of the effects of radiation, especially ionizing radiation, on living systems. In particular it includes the study of the production of mutations and their genetics, radiation damage and repair of living systems, inhibitions of growth, radiation therapy, and the treatment of radiation sickness.

radiation catalysis. The activation or speeding up of chemical or physical changes by exposure to the proper amount of radiation. For example, polymerization can be brought about by radiation without using heat, pressure or chemical catalysts. Thus the irradiation of ordinary polyethylene plastic results in a product which is more heat resistant, more elastic, less soluble, harder, more dense and stronger than the original material (see "Irrathene"). The advantages of radiation catalysis are that no foreign material need be added to the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

reaction mixture and that the catalyst can not be poisoned and made inactive.

radiation chemistry. The study of chemical changes which are brought about by ionizing radiations such as gamma rays, neutrons, protons, electrons, etc.

radiation damage. The general term applied to changes in physical and chemical properties of materials caused by irradiation (bombardment) with neutrons, gamma rays, etc. Radiation exposure can cause compounds to decompose, plastics to become soft or brittle, metals to change in mechanical properties such as strength and toughness and in their ability to conduct heat and electricity, etc. A study of radiation damage to structural materials is of especial importance since the development of nuclear power plants, where very intense radiations are encountered.

radical. A group of atoms which occurs in the molecules of a number of compounds, and which remains unchanged through many chemical reactions. Ethyl, C_2H_5 (valence 1), and sulfate, SO_4 (valence 2), are typical organic and inorganic radicals, respectively.

radio-. A prefix denoting radiation or radioactivity. It is used in designating radioactive substances, as radioisotopes, radioactive elements, as radiocarbon (q.v.), radiogold, radiobarium, etc. and substances containing them, as radiocompounds, radiocolloids, radiochemicals, etc.

radioactive decay. Same as radioactivity. For the radioactive decay series, see actinium decay series, neptunium decay series, thorium decay series, uranium decay series.

radioactivity. The phenomenon of spontaneous nuclear transformation. The energy of the process is carried away by particulate or electromagnetic radiations, alpha, beta, or gamma radiation. Two fundamental laws apply to the process. One states that the rate of emission of radiation from a radioactive element is proportional to the amount of the element, and the other states that when particles are emitted the nuclear charge and mass are changed by the charge and mass carried off by the particle. Thus radium-226 undergoes radioactive decay by the emission of an alpha particle, and the new product is radon-222. Radioactivity is not affected by the physical state or chemical combination of the element.

The radioactivity of a particular nuclide is characterized by the nature of the radiations, their energy, and the half-life of the process, i.e., the time required for the activity to decrease to one-half of the original. Half-lives in different cases vary from microseconds to billions of years. Substances which are radioactive as found in nature are said to exhibit natural

radioactivity. Induced, or artificial radioactivity may be brought about with almost every element by irradiation with neutrons in a nuclear reactor, or by charged particles from an accelerator.

Amounts of radioactive material are usually expressed in units of activity, the rate of the radioactive decay. The accepted unit is the curie and its metric fractions, the milli- and microcurie. A curie is 3.7×10^{10} disintegrations per second. Specific activities may be quoted either as a percentage abundance of the radioactive isotope, or in units of curies per unit weight or curies per mole. A common unit is millicuries per millimole.

radiobiology. A general name for the many areas in the biological sciences in which radioactive tracers are used. In particular, studies on intermediate metabolism in plant and animal forms of life, fertilizer uptake studies, trace nutrients, dispersion of insect hatches, blood flow patterns, transmission of materials through cell walls, and some diagnostic procedures are included.

radiocarbon. See carbon 14.

radiochemistry. That phase of chemistry which deals with the study of radioactive substances. Radiochemistry includes the investigation of the properties of radioactive materials, the study of the behavior of very small quantities of radioactive materials by means of their radioactivity and the use of radioactive materials in the study of chemical problems.

radiocyanocobalamin solution. A solution containing cobalt-60 labeled cyanocobalamin in which a portion of the molecules contain radioactive cobalt in the molecular structure.

Grade: U.S.P. XVI.

Use: Medicine (diagnosis).

radiogold. A radioactive colloidal concentrate of gold-198 (q.v.) in the particle range 0.003 to 0.007 μ diameter. Stable to heat but not to autoclaving under pressure; miscible with many solvents and solutions but flocculated by metallic ions.

Grade: N.N.D.

Use: Medicine.

radiography. Determination of the internal characteristics and behavior of ordinarily opaque objects, particularly metals, machinery, and the human body, by passing x-rays or gamma rays into the object, and obtaining shadowgraphs of the transmitted x-rays on a photographic film or fluorescent screen. By this method, irregularities and abnormalities from normal conditions are distinguished. Hidden flaws in metallic castings are detected in this fashion.

radio-iodinated serum albumin. See iodine 131.

radioisotopes. Isotope forms of an element that exhibit radioactivity.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

radionuclide. See nuclide.

radiopurity. The term is used in several different ways in connection with the proportion of radioactive material of a particular kind compared with the total radioactivity of a sample. Thus 90% of the carbon 14 in a particular sample of acetic acid may be in acetic acid molecules, while the remaining 10% of the carbon 14 is in an impurity such as propionic acid. In certain cases however the impurity or its radioactivity will not interfere with or enter into the reactions in which the material is used. When such is the case the radiopurity of the sample cited is given as 100%. Various other circumstances arise and must be known in order to be clear as to the meaning of any particular statement regarding radiopurity.

radium Ra. Naturally radioactive element of atomic number 88; group II of the periodic table. The best known radioactive element, until development of nuclear piles. Radium was discovered by Marie and Pierre Curie in France in 1898.

Properties: Brilliant white metal; m.p. about 700°C, b.p. 1140°C; sp.gr. nearly 6.0 (?); half-life 1600 years. Metal shows luminescence; turns black on exposure to air; soluble in water with evolution of hydrogen; causes serious flesh burns.

Derivation: Occurs in minute concentrations (one part in three million) in uranium ores such as pitchblende and carnotite, and has been found more recently in richer ores. Radium-bearing material is now produced as a byproduct in the treatment of uranium ores, when formerly it was the primary product. The general method used for isolating radium is similar to that used by Mme. Curie, and involves extensive fractional crystallization.

Containers: Dry salts are stored in sealed glass tubes opened regularly by experienced workers to relieve pressure. Glass tubes are kept in lead shields.

Caution: Radium and its salts are very poisonous to all life, due to the property of radioactivity (q.v.) which results in its spontaneous breakdown into decomposition products, one of which is radon (gaseous).

Uses: In medical treatments for malignant growths (either radium or radon); industrial radiography (inspecting metal castings); luminous paints; ionization agent in static elimination; as a source of neutrons in searching for oil deposits.

Shipping regulations: Poison, radioactive material. Blue or red label.*

radium bromide RaBr₂.

Properties: White crystals, becoming yellow or pink with age; radioactive; powerful corrosive effect on skin and flesh. Do not handle. M.p. 728°C; sublimes at 900°C; soluble in water.

Derivation: Freed from the ores as a bromide mixed with barium bromide.

Method of purification: Fractional crystallization.

Impurities: Barium salts.

Grades: Technical; pure. The purity is determined by the strength of the ionizing power of the salt, i.e., the extent to which it causes air to conduct electricity.

Containers: Glass bottles; sealed tubes enclosed in sheet lead.

Uses: Medicine (chiefly in the treatment of cancer); mixed with calcium sulfide to produce luminescent paint; physical research.

Shipping regulations: Poison, radioactive material. Blue or red label.*

radium carbonate RaCO₃.

Properties: Amorphous powder, white when pure, but sometimes yellow, orange, or pink due to impurities. Insoluble in water. Marketed as a mixture with barium carbonate.

Use: Medicine.

Caution: Usual precautions with radioactive material.

Shipping regulations: Poison, radioactive material. Blue or red label.*

radium chloride RaCl₂.

Properties: Yellowish-white crystals, becoming yellow or pink on standing; radioactive; powerful corrosive effect on skin and flesh. Do not handle. Soluble in water and alcohol. M.p. 1000°C; sp.gr. 4.91.

Derivation: Freed from the ores as a chloride mixed with barium chloride.

Method of purification: Fractional crystallization.

Impurities: Barium salts.

Grades: Technical; pure. The purity of radium salts is determined by the strength of their ionizing power, i.e., the extent to which they cause air to conduct electricity.

Containers: Glass bottles; sealed tubes enclosed in sheet lead.

Uses: Medicine (chiefly in the treatment of cancer); mixed with calcium sulfide to produce luminescent paint; physical research.

Shipping regulations: Poison, radioactive material. Blue or red label.*

radium emanation. See radon.

radium sulfate RaSO₄.

Properties: White crystals when pure, but sometimes yellow, orange, or pink due to impurities. Insoluble in acids and water.

Use: Medicine.

Caution: Care in handling as for all radioactive materials.

Shipping regulations: Poison, radioactive material. Blue or red label.*

radon (earlier names: radium emanation; niton; emanon) Rn. Radioactive element. Atomic number 86; helium group of periodic table.

Properties: Colorless gas; radioactive; density 9.72 g/liter (0°C, 760 mm); soluble in water; can be condensed to colorless transparent liquid (b.p. -61.8°C) and to an opaque, glowing solid. The heaviest gas known.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Formed by radioactive decomposition of radium. Radon is obtained by bubbling air through a radium salt solution and collecting the gas plus air. Thoron and actinon are isotopes.

Caution: See radium.

Use: Medical treatment.

Shipping regulations: Poison, radioactive material. Blue or red label.*

raffinate. The portion of an oil that is not dissolved in solvent refining of lubricating oil.

raffinose (melitose; melitriose; gossypose) $C_{18}H_{32}O_{16} \cdot 5H_2O$. A trisaccharide composed of one molecule each of D(+)-galactose, D(+)-glucose, and D(-)-fructose.

Properties: White, crystalline powder; sweet taste. Soluble in water; very slightly soluble in alcohol. Sp. gr. 1.465; m. p. (anhydrous) 118° to 119°C; b. p. decomposes at about 130°C; optical rotation +104.5°C.

Derivation: By hydrolysis from cotton seed meal; from sugar beet concentrates.

Method of purification: Recrystallization.

Grades: Technical; pure.

Containers: Wooden barrels, glass bottles.

Uses: Medicine; preparation of melibiose, bacteriology.

Shipping regulations: None.*

raisin-seed oil. See grape-seed oil.

"Raldeine." ²²⁷ Trademark for methyl ionones, available in several grades, used in perfume materials, especially in cosmetics, to give a violet character.

Raman spectra. See spectroscopy.

"Ramapo." ²⁸ Trademark for resinated forms of phthalocyanine blues and greens.

Uses: Paint, printing ink plastics, and other applications requiring excellent lightfastness and a high degree of chemical stability.

ramie. A natural fiber of vegetable origin, obtained from the stems of *Boehmeria nivea*, of the hemp family. Lustrous, strong fiber of high wet strength, highly absorbent but dries quickly; is light but can be spun or woven. Wears well and has great rot and mildew resistance; tensile strength four times that of flax, elasticity 50% greater than flax.

Sources: China; Formosa; Egypt; Brazil, Florida.

Uses: High grade paper (Europe); fabrics (wearing apparel and car seat covers), stern-tube packing in ships; patching water-mains (Great Britain.)

Raney nickel. A spongy form of nickel. It is pyrophoric and hence is shipped under water.

Derivation: By leaching the aluminum from an alloy of 50% Al-50% Ni with 25% caustic soda solution.

Use: Catalyst for hydrogenation.

Rankine. A scale of absolute temperature based on Fahrenheit degrees. See absolute temperature.

Raoult's law. The vapor pressure of a substance, in equilibrium with a solution containing the substance, is equal to the product of the mole fraction of the substance in the solution, and the vapor pressure of the pure substance at the temperature of the solution. The law is not applicable to most solutions, but is often approximately applicable for mixtures of closely similar substances, particularly for substances present in high concentration.

rape oil. See rape-seed oil.

rape-seed oil (colza oil; rape oil).

Properties: Dark brown when crude; pale yellow when refined. A very viscous, liquid oil; unpleasant taste and odor; may deposit stearin on standing. Soluble in ether, chloroform and carbon disulfide.

Constants: Sp. gr. 0.9132-0.9168; solidifying point -2° to -10°C; m. p. 17-22°C; refractive index 1.4720-1.4752, saponification value 167-179; iodine value 96 to 104; *Hehner* value 95.1, acid value 1.4-13.2.

Derivation: By the expression of rape-seed, *Brassica napus*, followed by treatment of the cake with solvents, and evaporation of the solvent. The oil is frequently oxidized or "blown" to increase its density and viscosity. It is refined by treatment with fuller's earth or sulfuric acid.

Grades: Crude; refined.

Containers. Tins, steel drums; tank cars.

Uses: Refined and "blown" rape-seed oil is used as a lubricant; illuminant; manufacture of rubber substitutes; heat treatment of steel. The refined cold-drawn oil is also used for edible purposes.

Shipping regulations: None.*

"Rapidase." ¹⁷³ Proprietary name for an enzyme preparation containing starch-liquefying and proteolytic enzymes.

Properties: Liquid of low specific gravity and viscosity; active in slightly acid, neutral, and weakly alkaline solutions; can withstand temperatures from 25-75°C.

Derivation: Produced by growing pure cultures of certain microorganisms in sterilized wort.

Use. Desizing agent.

Shipping regulations: None.*

"Rapidogen." ³⁰⁷ Trademark of stabilized azoic-naphthol compounds soluble in caustic soda which are developed by means of acid aftertreatment. Used for printing on cotton rayon. Characterized by bright shades of very good fastness to washing, chlorine and light.

rare earth elements. See rare earth metals.

"Rare Earth Fluoride." ³³⁷ Trade designation for arc carbon grade materials of formula "RE"F₃.

Contains typically: rare earth elements, 54.7%, fluorine, 26.1%, carbon, balance. Black powder, bulk density 100-lb/cu ft; mesh size 80; approximate melting point 1350°C (2462°F). The anhydrous product

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

typically consists of 30.6% cerium, 15.6% lanthanum, 5.8% neodymium, 2.2% praseodymium, and minor amounts of samarium and gadolinium to make up the rare earth total of 54.7%. Used as source of rare earth elements suitable for addition to cored arc carbons.

rare earth metals (rare earth elements; rare earth series; lanthanide series). A group of elements, with names and atomic numbers thus:

lanthanum	La	57
cerium	Ce	58
praseodymium	Pr	59
neodymium	Nd	60
promethium	Pm	61
samarium	Sm	62
europium	Eu	63
gadolinium	Gd	64
terbium	Tb	65
dysprosium	Dy	66
holmium	Ho	67
erbium	Er	68
thulium	Tm	69
ytterbium	Yb	70
lutetium	Lu	71

The elements 57-62 are known as the cerium subgroup, and 63-71 as the yttrium subgroup. Yttrium, atomic number 39, although not a rare earth element, is found associated with the rare earths and is only separated with difficulty. See also didymium.

Properties: Soft and malleable metals becoming harder as the atomic number increases, para-magnetic, good heat conductors, active reducing agents, the freshly cut metals have a silver white to gray color and tarnish immediately in air, react slowly with water; are readily soluble in dilute acids.

Source: The rare earth elements are found in many minerals but only monazite and bastnaesite are important ores (see rare earth minerals). These elements are also found in the fission products of uranium and plutonium, this being the only source of promethium.

Derivation: Separation of these elements is very difficult because they have nearly identical chemical properties. Separation was originally made by fractional crystallization of the salts but more recently and successfully by selective absorption on synthetic resins. In the elementary state these elements are strongly electro-positive metals, prepared with difficulty by (1) displacement with sodium, calcium, or magnesium, (2) electrolysis of the fused halide, (3) as an amalgam by electrolysis of alcoholic solutions.

Uses: Misch metal (q.v.); pyrophoric material for gas lighters, etc; alloys.

See also rare earths and individual elements.

rare-earth minerals. Sources of the rare-earth elements. Monazite and bastnaesite are the most important. Less important

are gadolinite, fergusonite, samarskite, xenotime, cerite, and allanite.

rare earths.

1. A term commonly used to designate the rare earth metals.
2. Since "earths" are usually considered to be metal oxides, the term may also be used in the latter sense, the rare earth oxides being known under the following names: lanthana La_2O_3 , ceria CeO_2 , neodymia Nd_2O_3 , praseodymia Pr_2O_3 , promethia Pm_2O_3 , samaria Sm_2O_3 , europia Eu_2O_3 , gadolinia Gd_2O_3 , terbia Tb_2O_3 , dysprosia Dy_2O_3 , holmia Ho_2O_3 , erbia Er_2O_3 , thulia Tm_2O_3 , ytterbia Yb_2O_3 , and lutetia Lu_2O_3 . These basic oxides, very similar to one another in physical and chemical properties, are usually found associated in certain rare minerals of complex composition. They all absorb moisture and carbon dioxide from the air.

rare earth salts. Salts prepared from monazite and containing the rare earths in essentially the same ratio as found in monazite. The salts have a rare earth oxide composition of approximately 24% lanthana (La_2O_3), 48% ceric oxide (CeO_2), 6% praseodymium oxide (Pr_2O_3), 19% neodymia (Nd_2O_3), 2% samaria (Sm_2O_3), 0.5% gadolinia (Gd_2O_3), 0.2% yttria and yttrium earth oxides, 0.3% others. (The symbol RE as used here represents this mixture of rare earth elements. Note that the so-called didymium salts (q.v.) are also prepared from monazite, but do not contain ceria).

rare earth acetate $\text{RE}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot x\text{H}_2\text{O}$.

Fine light pink powder, soluble in water and acids. Used in textile water-proofing.

rare earth carbonate $(\text{RE})_2(\text{CO}_3)_3 \cdot x\text{H}_2\text{O}$.

Fine, light pink powder; soluble in acids; insoluble in water. Used as a coloring agent.

rare earth chloride $\text{RECl}_3 \cdot x\text{H}_2\text{O}$.

Light pink crystals. Very soluble in water. Used in textile water-proofing and in embalming. The anhydrous chloride is used as a source for making rare earth metal (misch metal), used in lighter flints.

rare earth fluoride REF_3 .

Pink powder; insoluble in water and acids. Used in manufacture of cored carbon for arc lighting; for nodular steel; special alloy steels.

rare earth hydrate.

Yellow hydrous rare earth oxide containing cerium in the tetravalent form. Soluble in acids; insoluble in water. Used in glass as a decolorizer and as an ultraviolet absorber.

rare earth nitrate $\text{RE}(\text{NO}_3)_3 \cdot x\text{H}_2\text{O}$.

Pink crystals; very soluble in water. Shipping regulations: Oxidizing material. Yellow label.*

rare earth oxalate $(\text{RE})_2(\text{C}_2\text{O}_4)_3 \cdot x\text{H}_2\text{O}$.

Pink powder; insoluble in water; slightly soluble in acids. Used in pharmaceuticals.

rare earth oxide.

Brown powder. Contains cerium in the tetravalent state. Soluble in acids;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

insoluble in water. Readily absorbs moisture and carbon dioxide from the air. Used in glass coloring, glass polishing and in cores of arc carbons.

rare earth sodium sulfate
(RE)₂(SO₄)₃·Na₂SO₄·2H₂O.

Fine pink crystals, sparingly soluble in water and acids. Common name: pink salts. Used in the manufacture of ultra-violet absorbing glass and as an intermediate in the making of rare earth and cerium materials.

rare earth sulfate (RE)₂(SO₄)₃·xH₂O.

Fine pink crystals, soluble in cold water; sparingly soluble in hot water. Source material for conversion to other compounds.

Containers: Glass bottles; fiber and steel drums.

Other uses of rare earth salts: coloring, decolorizing glass, catalysts in esterification and hydrocarbon dehydrogenation, oxygen carrying catalyst, blood anticoagulant.

rare earth series. See rare earth metals.

rare earth sulfides. Cerium and samarium sulfides are being used as high temperature thermoelectric materials. Both have stability and thermoelectric efficiency at 2000°F. They are made by fusing samarium or cerium with sulfur at high temperatures in an induction furnace. The sulfide is crushed, made into pellets, and sintered in a vacuum furnace. Its composition is determined by x-ray diffraction analysis

rare gases. Helium, neon, argon, krypton, xenon, and radon. Also known as inert or noble gases. They are elements, monatomic, and completely inert chemically.

rare metals. A loose term for the less common and more expensive metallic elements. Commonly included are the alkaline earth metals barium and strontium, beryllium, bismuth, cadmium, cobalt, gallium, germanium, hafnium, indium, lithium, molybdenum, rhenium, selenium, tantalum, niobium, tellurium, thallium, thorium, titanium, tungsten, uranium, vanadium, and zirconium. Also sometimes included are boron and silicon, the platinum metals, the rare earths, manganese and calcium.

"Rareox." ²⁴¹ Brand name for a finely divided pink powder consisting of cerium oxide and other rare earth oxides.

Raschig process

1. A process for the production of phenol. Benzene in the vapor phase reacts with hydrogen chloride and air (only the oxygen reacts) in the presence of iron chloride and copper chloride catalysts at 200-300°C to produce chlorobenzenes. Monochlorobenzene is separated from the polychlorobenzenes and is then hydrolyzed with a silica or tricalcium phosphate catalyst at 350°C to produce phenol. The latter is washed with water, then with benzene, and finally distilled.

2. A commercial process for making hydrazine hydrate (q.v.) from ammonia, chlorine, and caustic soda.

"Rasorite." ⁴⁴¹ Trademark for mineral kernite. rattlesnake root. See senega.

"Raudixin." ⁴¹² Trademark for rauwolfia (q.v.).

"Raunormine." ³⁴² Trademark for brand of deserpidine hydrochloride.

"Rau-Sed." ⁴¹² Trademark for reserpine (q.v.).

"Rauserfia." ³⁴² Trademark for an extract of weakly basic alkaloids from Rauwolfia.

rauwolfia (so-called snake root). The powdered whole root of Rauwolfia serpentina. The plant is of value as a source of alkaloids, especially reserpine.

Properties: Light tan to light brown, bitter, fine, amorphous powder; slight aromatic odor. Sparingly soluble in alcohol and very slightly soluble in water.

Grade: N.F. XI.

Containers: Barrels; drums.

Use: Medicine.

"Raven." ¹³³ Trademark for a series of general utility impingement carbon blacks for paint, paper and printing ink. Available as:

"Raven 11." Low oil absorption, good color, high tinting strength.

"Raven 15." Lowest oil absorption of all impingement blacks, which permits high loadings.

"Raven Beads." A low-viscosity black in dustless free-flowing form. Particularly suited for ball mill grinding of news and rotogravure inks.

Containers: 25-lb bags.

"Rayaceta." ³⁷ Trademark for a highly refined wood cellulose.

Properties: Cellulose-alpha 96.0%, beta 2.2%, gamma 1.8%. 10% KOH solubility, 5.3%.

Uses: Production of cellulose acetate rayon; manufacture of acetate films, sheets, and molding powders for varied uses.

"Rayamo." ³⁷ Trademark for a wood cellulose of low viscosity which was developed to meet the increasing need for greater economies in the manufacture of cellophane. It permits savings both in equipment and operating costs in cases where full advantage is taken of its special properties. Properties: Cellulose-alpha 89.1%, beta 6.5%, gamma 4.4%. 10% KOH solubility, 15.2%.

"Raydex." ²⁰⁴ Trademark for a high wettability general cleaner for medium hard water, using either brush or spray method. Safe on all equipment and workers' hands. Packed in 125-lb and 350-lb drums.

"Rayocord." ³⁷ Trademark for a highly purified wood cellulose developed specifically for the production of continuous filament rayon yarns of high tenacity.

Properties: Cellulose-alpha 95%, beta 2.5%, gamma 2.5%. 10% KOH solubility 12.9%.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

rayon. Generic name for a manufactured fiber composed of regenerated cellulose, as well as manufactured fibers composed of regenerated cellulose in which substituents have replaced not more than 15% of the hydrogens of the hydroxyl groups (Federal Trade Commission).

Rayon was first made by denitration of cellulose nitrate fibers (Chardonnet process) but this process is now obsolete. Most rayon is now made by the viscose process. See also cuprammonium rayon and saponified acetate fiber.

rayon coning oils. Oils used to lubricate and reduce the static of yarns wound on cones by the coning machine. Usually composed of mineral oils of low viscosity or body, compounded to emulsify in water.

rayon, modified. Rayon composed principally of regenerated cellulose, and containing amounts of non-regenerated cellulose fiber-forming material; for example, a fiber spun from viscose containing casein or other protein. (ASTM definition, ASTM D123-54).

Rb. Symbol for rubidium.

RBE. Abbreviation for relative biological effectiveness (q.v.).

RDGE. See resorcinol diglycidyl ether.

RDX. See cyclonite.

Re. Symbol for rhenium.

RE. Abbreviation for rare earth elements in general or for various mixtures of these. See didymium salts and rare earth salts.

reagent. Any substance used in a reaction for the purpose of detecting, measuring, examining or producing other substances.

realgar As_2S_3 (arsenic disulfide).

Properties: Soft aurora-red mineral becoming orange-yellow on long exposure. Orange-red streak, resinous luster. Contains 70.1% arsenic, 29.9% sulfur. Usually occurs in veins associated with silver and lead ores. Has also been found in volcanic regions as a sublimation product and as a deposit from hot spring waters. Is often associated with orpiment and is frequently noted as a sublimation product from furnaces roasting ores of arsenic. Soluble in nitric acid and potassium hydroxide. Sp.gr. 3.4-3.6, hardness 1.5-2.

Occurrence: United States (Utah, Washington, Wyoming); Hungary, Germany; Iran, Switzerland; China.

Uses: Pyrotechnics (artificial now more used); calico printing; tanning (depilatory); shot manufacture (hardening); pigment.

Réaumur. Name of a temperature scale invented by Réaumur in which the freezing point of water is set at 0 and its boiling point at 80. Temperature is then measured in °R. Not widely used.

"Reax" 23 and "Reax" 31. ²²⁹ Trademark for

lignin phenolic resin coreactants produced from the sulfate pulping process.

Properties: Brown, free-flowing powder; insoluble in water and mineral acids, soluble in phenol and aqueous alkaline solutions. Solvents include glycols, "Cello-solves," amines, dioxanes, and alcohol-ketone mixtures. Sp.gr. 1.3; bulk density 25-30 lbs/cu ft; moisture "Reax" 23: 2.0-7.0%, "Reax" 31: 2.0-5.0%, pH "Reax" 23: 6.5-7.5, "Reax" 31: 2.3-3.5. Composition dry basis: ash, "Reax" 23: 0.8% maximum, "Reax" 31: 0.5% maximum.

Containers: 50-lb MWP bags.

Uses: Phenolic and cresylic resin coreactants.

rectification. The enrichment or purification of the vapor during the distillation process by contact and interaction with a countercurrent stream of liquid condensed from the vapor.

red acetate. See mordant rouge.

red arsenic. See arsenic disulfide.

red bark. See cinchona bark, succirubra.

red bole. See iron oxide reds.

red brass. Copper-zinc (brass) alloys characterized by their red color and high copper content. The term is used for several different types of brass. One ASTM classification permits 2-8% zinc, tin less than zinc, and lead less than 0.5%. Other alloys referred to as red brass include those with 75-85% copper, up to 20% zinc, and usually very small amounts of lead and tin. In one alloy possessing good machining qualities, the lead content may be as high as 10%, the tin as high as 5%.

Red brasses are widely used for decorative purposes and in plumbing and piping because of their resistance to atmospheric corrosion and dezincification.

red chalk. See iron oxide reds.

red cinchona. See cinchona bark, succirubra.

"Red Cross Extra." ²⁸ Trademark for high density general purpose ammonia dynamite of 20 to 60% strength. Used for quarrying, stripping, agricultural and general construction work.

"Red Cross" (F.R.). ²⁸ Trademark for five grades of ammonia dynamite (based upon strengths) with free-running characteristics (F.R.). Designed for use in dry holes.

reddle (raddle). A name for a naturally occurring mixture of red hematite and clay. See also iron oxide reds.

red earth. See iron oxide reds.

red glass. About 1% selenium may be added to the melt of soda-zinc glass containing a small amount of cadmium. Red may also be obtained by using cuprous oxide or gold chloride, the latter usually in the form of purple of Cassius.

red hematite. See hematite, red.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

red iron ore. See hematite, red.

red iron trioxide. See ferric oxide.

"Redisol # 4." ¹⁷⁰ Trademark for refined precooked pulverized tapioca starch derived from cassava, for room temperature method of thickening and stabilizing foods. Properties: Maximum moisture 8%, maximum ash 0.35%, pH: 5.0-7.0.

Containers: 80-lb multiwall poly-lined paper bags.

red lake C pigments. A family of organic acid azo pigments prepared by coupling the diazonium salt of orthochloro-meta-toluidine-para-sulfonic acid with beta-naphthol. Both sodium and barium salts of the parent dye are used as pigments.

sodium salt. Known as "bronze orange" because of its very yellowish tone and high print bronze. Since it has noticeable bleed tendencies in both aqueous and organic media and discolors under heat, uses are limited.

barium salt. Known as "red lake C" and represents toners having varying degrees of fulltone color, bronze, strength and transparency depending on the amount of resination and method of processing. Exhibits excellent bleed resistance on aqueous media, alkalies and acids, together with good ease of dispersion. They are superior to lithol reds in permanency and color stability on baking.

Uses: Printing ink, plastic, rubber, metal decorating.

red lead. See lead oxide, red.

red liquor. See mordant rouge.

red ocher. A red earthy impure hematite, due to admixture with clay which is often partly removed by treatment (see ocher) of the original materials (also known as redden, raddle, ruddle, red chalk, or red iron froth). The term red ocher is used both for these raw materials and the treated or finished product.

See also iron oxide reds.

red oil. Used to describe the commercial grade of oleic acid.

red orpiment. See arsenic disulfide.

redox. Handy version of the term oxidation-reduction, as in redox reactions, redox conditions, redox equations.

redox fuel cells. See fuel cells.

red oxide. See iron oxide reds.

"Redoxyvat." ³²⁸ Brand product consisting of an antioxidant dissolved in sulfonated oil. It is employed in the textile industry as an oxidation moderator to prevent premature oxidation of vat dyes.

red pepper. See capsicum.

red Peruvian bark. See cinchona bark, succirubra.

red precipitate. See mercuric oxide, red.

red prussiate of potash. See potassium ferricyanide.

red prussiate of soda. See sodium ferricyanide.

red puccoon. See sanguinaria.

red root. See sanguinaria.

red rudd. See iron oxide reds.

red sandalwood. See santalum rubrum.

red saunders. See santalum rubrum.

red stone. See iron oxide reds.

reduced states. See corresponding states.

red zinc ore. See zincite.

refiner's syrup. See molasses.

refinery gas. The mixture of hydrocarbon gases (and often some sulfur compounds) produced in cracking and distilling petroleum in the course of refinery operations. The usual components are hydrogen, methane, ethane, propane, butanes, pentanes, ethylene, propylene, butenes, pentenes, and small amounts of other components such as butadiene.

Use: As a source of raw material for components of high octane fuel; butadiene for synthetic rubber; and organic synthesis of alcohols.

reflux. Term used in distillation with a fractionating column for the liquid condensed from the rising vapor and allowed to flow down the column toward the still.

Reformatsky reaction. The interaction of an alpha-halo ester, an aldehyde or ketone and zinc in the presence of anhydrous ether or ether-benzene, followed by hydrolysis, to yield a beta-hydroxy ester.

reforming. The use of controlled heat and pressure, with or without catalysts, to cause cracking and isomerization of the hydrocarbon molecules in low octane petroleum fractions. The hydrocarbons formed are lower in molecular weight, somewhat more branched and somewhat unsaturated, and so have higher octane numbers. Several kinds of reforming are in use, such as hydroforming, catalytic reforming, "Platforming," etc.

"Refractaloy." ³⁰⁸ Trademark for a nickel-cobalt-chromium-molybdenum-iron alloy. Type 26 is a precipitation-hardenable material using titanium as the hardening agent, and having high strength, high ductility, and corrosion resistance at high temperatures - up to 1450°F. Gas turbine discs, bolting and blading are typical applications.

refraction. When a light ray passes from one medium to another of different density it is bent from its original path. The ratio of the sine of the angle of incidence to the sine of the angle of refraction is the index of refraction of the second medium. Index of refraction of a substance may also be expressed as the ratio of the velocity of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

light in a vacuum to its velocity in the substance. It varies with the wave length of the incident light, temperature and pressure. The usual light source is the D line of sodium at 20°C; the expression for refractive index is $n_{20/D}$.

refractive index. See refraction.

refractories. (See also brick). Nonmetallic structural materials for use at high temperatures. In addition to their primary function, they may also be called upon to resist abrasion, corrosion, pressure, and rapid changes in temperature. No single refractory will stand up equally well under all of these conditions so that a large variety of materials have been developed. These include fire clay, kaolin, bauxite, magnesite, dolomite, chromite, carbon, silicon carbide, zirconia, spinel, mullite, sillimanite, forsterite, olivine, electrocast and unburned and insulating refractories. In each case, the refractory consists of an infusible portion (the refractory proper) and a relatively small proportion of binder. Refractories are classified as acid, basic, or neutral according to the character of the oxide present in largest proportion. Refractories are graded according to fusion temperature, porosity, spalling, strength, resistance to rapid temperature change, thermal conductivity and heat capacity.

refractories, basic. Include both magnesia and chrome refractories, which are commonly used together.

refractories, electrocast. Consist of relatively pure aluminum silicate of mullite composition ($3Al_2O_3 \cdot 2SiO_2$) that has been fused in an electric furnace, and cast into blocks. The product is vitreous, nonporous, hard, and has a low coefficient of expansion.

refractories, insulating. Are of a porous nature, resulting from the use of porous diatomaceous earth as raw material, or expanded perlite or vermiculite, diaspore clay or similar light weight materials. In some cases sawdust or other combustible is used.

refractories, specialties. These are castables, ramming mixes and plastics that form monolithic structures and high temperature bonding mortars. Castables are ground refractory materials containing added bonding agents. Supplied in dry form but when mixed with water they form a strong hydraulic set at room temperatures and a ceramic bond at high temperatures.

Ramming mixes are made of ground refractory materials, carefully graded as to relative proportions of different particle sizes and other materials added for workability and self bonding. Ramming mixtures are supplied in plastic form, or in dry form, needing water addition. They are rammed into place and set upon drying.

refractories, unburned. Are shaped without burning, by use of high pressures after deaeration to reduce voids between grains. Chemical bonding and metal encasement are also used.

refractory. As an adjective, means resistant to heat. For noun, see refractories.

refractory clays. Clays that withstand high temperature, i.e., fire clays.

"Refrasil." ¹⁶¹ Trademark for fibrous silica of high purity SiO_2 ; available as bulk fibers, batts, cloth, tape, sleeving, cordage and yarn; useful as extreme high temperature thermal insulation, as in jet aircraft tail cones and pipes. Batted fibers resemble cotton in appearance and feel. Fiber diameters are 0.0002 to 0.0005 inches while lengths are $\frac{1}{2}$ to 2 inches. No binders are present. Blankets made from batts are resistant to high frequency vibrations encountered on jet aircraft. Fibrous silica cloth resembles cloth made of spun glass. The fibers used are continuous, and no lubricant is used. Textile products are widely used as electrical space separators at high temperatures.

"Refrax." ²⁸⁰ Trademark for silicon nitride-bonded silicon carbide refractories. Available in brick and precision-formed shapes and parts.

Properties: High thermal conductivity, high dimensional stability, high resistance to spalling, cracking, mechanical wear, heat shock and extreme temperatures. Thermal conductivity is 113.5 Btu/sq ft/inch thickness/°F/hr. Porosity ranges from 7 to 10%. Modulus of rupture at 2462°F is 5000-7000 psi.

Uses: Brazing and furnace fixtures; pumps and pump parts handling corrosive, abrasive slurries, rocket motor components; spray nozzles, burners, pyrometer protection tubes; sinker assemblies in wire aluminumizing; bolts and nuts, valve parts; aluminum melting furnace linings and parts; conveyor parts.

"Refrex." ²¹⁴ Trademark for a blend of alcohols, for refrigerator car-heating fuels.

"Regal." ²⁷⁵ Trade name for a series of oil furnace carbon blacks for use in rubber. Available as:

"Regal 600." Highly reinforcing oil furnace black.

"Regal 300." Fully reinforcing oil furnace black.

"Regal SRF." Oil semi-reinforcing furnace carbon black. (SRF).

"Regent 12XX." ¹⁷² Trademark for a hydrated monocalcium phosphate.

Properties: Brilliant white, free-flowing, crystalline material. Its purity complies with all Food and Drug laws.

Containers: 100-lb paper bags.

Uses: Manufacture of household baking powders, prepared mixes, and phosphated

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

flours; ingredient in commercial bread improvers; yeast manufacture; manufacture of frits for vitreous enamels.

"Regent Yellows." ¹⁴¹ Trade name for light-fast chrome yellow pigments.

Properties: Considerably better light resistance and alkali resistance than regular chrome yellow pigments.

Grades: Primrose, light or lemon and medium shades.

Uses: In paints for all exterior uses; in vinyl, particularly automotive or furniture upholstery.

"Regithane" Foaming Resins. ²⁷ Urethane resin systems which can be formulated to densities ranging from less than 2 to 40 pounds per cubic foot and are adaptable to many end uses.

Properties of cured foams: Low thermal conductivity, good energy absorption, good strength, light weight; excellent adhesion to most materials, room temperature cures; compatibility with colorants, non-friable, self-extinguishing; impervious to vermin, mildew, and rot, very good "K" factors.

Uses: Thermal insulation for trucks, railroad cars, refrigerators, etc.; molded toys, shipping containers; encapsulation; structural reinforcement; void filling; vibration dampening, sound absorption, packaging; life preservers, rafts, etc.; submarines.

"Regitine." ³⁰⁵ Trademark for phentolamine, regulus of antimony. See antimony.

Reichert-Meißl number. A measure of volatile soluble fatty acids derived under arbitrary conditions.

Reich process. A method for purifying carbon dioxide produced in fermentation. The small amounts of organic impurities are oxidized and absorbed and the gas is then dehydrated with chemicals.

Reimer-Tiemann reaction. Reaction for the formation of phenolic aldehydes by heating a phenol with chloroform in the presence of alkali.

Reinecke salt (ammonium tetrathiocyanodiammonochromate, ammonium reineckate) $\text{NH}_4[\text{Cr}(\text{NH}_3)_2(\text{SCN})_4] \cdot \text{H}_2\text{O}$.

Properties: Dark-red crystals or crystalline powder, moderately soluble in cold water, soluble in hot water and alcohol, decomposes in aqueous solutions.

Derivation: From fusion of ammonium thiocyanate with ammonium dichromate.

Grade: Reagent, technical.

Use: As a reagent for organic bases, such as choline, amines, and for certain amino acids, etc., as a reagent for mercury.

reinforced concrete. See concrete.

relative biological effectiveness (RBE). A factor used in health physics to adjust for the different biological effects of the various radiations, and is defined to be the ratio

of dose in rads of 200 kv x-rays that produces some particular effect to the dose in rads of the radiation in question that produces the same effect. Thus since fast neutrons are about ten times as effective as x-rays in their deleterious effects on tissue, the RBE for fast neutrons is ten.

relaxin. A polypeptide hormone.

Properties: Amorphous powder. Slightly soluble in water and alcohol; soluble in acid or alkaline solutions. Insoluble in absolute alcohol, ether, acetone, benzene. Decomposes above pH 9.0.

Derivation: Obtained commercially from pregnant sows' ovaries. Isolation procedure and purification by resin chromatography.

Grade: N.N.D.

Use: Medicine.

rem. A rem (roentgen equivalent man) is a radiation dose of any ionizing radiation estimated to produce a biological effect equivalent to that produced by one roentgen of x-rays.

"Renex." ⁸⁹ Trademark for a group of non-ionic synthetic organic detergents, chiefly ethylene oxide esters and ethers.

renierite $(\text{Ca}, \text{Fe})_3(\text{Fe}, \text{Ge}, \text{Zn}, \text{Sn})(\text{S}, \text{As})$. A mineral reported to contain up to 8% germanium, found in the Congo.

Use: Possible source of germanium.

rennase. See rennin.

rennin (rennase; chymosin). The enzyme secreted by the glands of the stomach which causes curdling of milk. It has the power of coagulating 25,000 times its own weight of milk.

Properties: Yellowish-white powder or as yellow grains or scales. Characteristic and slightly salty taste and peculiar, not unpleasant odor. Slightly hygroscopic. Partially soluble in water and diluted alcohol.

Derivation: From the glandular layer (inner lining) of the true stomach of the calf.

Grade: N.F. XI. Rennet is the dried commercial extraction containing the rennin. Containers: Glass bottles; fiber cans and drums.

Uses: Medicine; pharmacy, cheese-making, coagulation of casein for plastics.

Shipping regulations: None.*

"Renografin." ⁴¹² Trademark for methylglucamine diatrizoate (q.v.).

"Reogen." ⁶⁹ Trademark for a plasticizing agent.

Properties: Liquid, clear mahogany; sp.gr. 0.82-0.85.

Uses: Plasticizer and processing aid in all elastomers.

rep.* Abbreviation for roentgen equivalent physical. See roentgen.

"Repel-O-Flame." ³²⁸ Trademarked product consisting of ammonium salts and designed to serve as a fire retardant for textiles.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Repel-O-Tex D3 and D4." ³²⁵ Trademark for a combination that produces a wax emulsion containing heavy metal formates. It serves as a durable noncuring water repellent for rayon, acetate, and cotton-rayon mixtures.

"Repel-O-Tex ST." ³²⁵ A silicone-type milk-white dispersion, 30% active, and instantly dispersible in cold water; used in water repellent finishes.

replacement. See substitution.

Reppe processes (Reppe chemistry). Various reactions or processes by which acetylene is converted to other products. Included are reaction of acetylene (a) with formaldehyde to produce 2-butyne-1,4-diol, which can be converted to butadiene, (b) with formaldehyde under different conditions to produce propargyl alcohol and from this, allyl alcohol, (c) with hydrocyanic acid to yield acrylonitrile, (d) with alcohols to give vinyl ethers, (e) with amines or phenols to give vinyl derivatives, (f) with carbon monoxide, and (g) by polymerization to produce cyclooctatetraene. The use of catalysts, of pressures up to 30 atmospheres, and of special techniques to avoid or contain explosions, is an important factor in these processes.

"Republic '65'" High Strength Alloy Steel. ²⁵¹ Trademark for a high strength steel with corrosion resistance higher than ordinary copper-bearing steels.

Typical Analysis: 0.12% carbon; 0.45% manganese; 0.04% phosphorus; 0.04% sulfur, 0.20% silicon; 1.00% copper; 1.30% nickel; 0.20% molybdenum.

Properties: Yield point 67,000 psi; tensile strength 89,000 psi; elongation in 2 inches, 18%.

Forms: Wide ranges of sizes, sheets, plates and bars.

Uses: For lightweight construction.

"Republic '70'" High Strength Alloy Steel. ²⁵¹ Trademark for a high strength steel with corrosion resistance higher than ordinary copper-bearing steels.

Typical Analysis: 0.14% carbon; 0.75% manganese; 0.04% phosphorus; 0.04% sulfur, 0.25% silicon; 1.15% copper; 1.50% nickel; 0.22% molybdenum.

Properties: Yield point 73,000 psi; tensile strength 96,000 psi; elongation in 2 inches, 17%.

Forms: Wide ranges of sizes, sheets, plates and bars.

Uses: For lightweight construction.

"Republic '50'" High Strength Steel. ²⁵¹

Trademark for a low alloy steel with 50% higher yield point and four to six times the corrosion resistance of carbon steel.

Composition: 0.12% carbon (max); 0.50-1.00% manganese; 0.04% phosphorus (max); 0.05% sulfur (max); 0.50-1.00% copper, 0.50-1.10% nickel; 0.10% molybdenum (min).

Properties: Yield point, min. 50,000 psi;

tensile strength min 70,000 psi; elongation in 2 inches, ASTM Standard Flat Specimen, 22% min.

Forms: Available in sheet and plate.

Use: Used for lightweight construction.

rescinamine $C_{35}H_{42}N_2O_9$. Alkaloid from certain species of Rauwolfia.

Properties: White or pale buff to cream colored, odorless, crystalline powder. Darkens slowly on exposure to light, more rapidly when in solution. Soluble in chloroform and acetic acid. Slightly soluble in alcohol. Practically insoluble in water.

M.p. 236°C (in vacuum).

Grade: N.F. XI.

Use: Medicine.

research reactor. See nuclear reactor.

reserpine $C_{33}H_{40}N_2O_9$. An important alkaloid.

Properties: White or pale buff to slightly yellowish, odorless powder. Darkens slowly on exposure to light, and darkens more rapidly in solution. Insoluble in water; very slightly soluble in alcohol. Soluble in chloroform and acetic acid. M.p. 264-265°C (decomposes).

Derivation: From Rauwolfia serpentina (q. v.).

Grade: U.S.P. XVI.

Containers: Bottles.

Use: Medicine, often in the form of its salts.

"Resi-Chem." ²³¹ Trademark for urea-formaldehyde resins, polyester resins, polyamide resins; liquid resin syrups supplied in bulk and in drums. Used for wet strength in paper products, furniture and plywood adhesives, as textile and paper size, and in structural plastics.

residual oils. Liquid or semi-liquid products obtained as residues from the distillation of petroleum. They contain the asphaltic hydrocarbons. Residual oils are also known as asphaltum oil, liquid asphalt, black oil, petroleum tailings, and residuum. Shipping regulations: None.*

residuum. See residual oils.

"Resilon." ³²⁶ Trademark for a bituminous base lining for chemical process equipment. Use: To resist acids and alkalis up to temperatures of 150°F.

"Resimene." ⁵⁸ Trademark for a series of resins based on melamine. Used for baked enamel and industrial finishes for appliances, automobiles and other fabricated metal items; for mar-resistant laminates for furniture; for electrical, electronic and radar components.

"Resin 731." ²⁶⁶ Trademark for a disproportionated, pale-colored rosin, unusually stable to the effects of light and heat. Uses: In adhesives; coatings; rubber compounding.

resinated lithols. See lithol reds.

resinols. A coal tar distillation fraction containing phenols. It is the fraction soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in benzene but insoluble in light petroleum, obtained by solvent extraction of low temperature tars or similar materials. Resinols are very sensitive to heat and oxidation.

"Resinox." ⁵⁸ Trademark for a series of phenolic resins, supplied in various forms suitable for applications as bonding agents for shell molding and as core binders for metal casting; impregnants or bonding materials for grinding wheels, brake linings, insulation and similar industrial uses; as pipe linings, air conditioning equipment coatings, special primers; as laminating, bonding, impregnating resins for paper, fibers; for use in can, drum, and tank car linings requiring a high degree of chemical and solvent resistance; and for heavy-duty products, such as equipment housings.

Resin S. ¹⁷⁵ Brand name for a neutral synthetic coal tar resin of high styrene content.

Properties: Light color; m.p. 115-123°C, sp.gr., approx 1.05, mineral oil cloud point, 130-150°C.

Containers: 55-gal destructible steel drums.

Uses: Principally to impart alkali- and grease-resistance to floor tile.

resins, natural (resins, true). Solid or semi-solid viscous materials derived mostly from secretions of certain plants and trees. Common examples are rosin, amber, copal, Kauri, pine tar, pitch, and Canada balsam. The latter three are oleoresins (q.v.). Amber is a fossil resin, found as a deposit rather than taken from a living tree. Hard resins are those that occur naturally as hard solids. Most of these will soften on warming. All these materials are compounds of carbon, hydrogen and oxygen. They are usually clear or translucent yellow or brown materials that burn easily with a yellow and smoky flame. They are insoluble in water, soluble in ether, alcohol, benzene, and carbon disulfide. Spirit-soluble resins are those that are easily soluble in alcohol or other volatile solvents. Oil-soluble resins are those that are more easily soluble in fatty oils.

Natural resins are used in lacquers and varnishes, as modifiers of synthetic plastics, and in inks and adhesives.

Some gums (q.v.) are natural resins.

See also shellac.

resins, synthetic (See also plastic.) Amorphous, organic, semi-solid or solid materials produced by union (polymerization or condensation) of a large number of molecules of one, two, or less frequently three relatively simple compounds. Properties vary widely with the raw materials, their proportions, and the conditions of formation of the resin. The term synthetic resin is also sometimes applied to chemically modified natural resins. Resins are broadly classified as thermoplastic or thermosetting according as they soften

or harden with application of heat. In the following table the principal types of synthetic resins are classified according to their derivation by (1) modification of natural polymers, (2) polymerization, or (3) condensation. Many commercially important plastics represent combinations of these types, resulting from co-polymerization, crosslinking, etc.

Typical Resins Derived from Natural Polymers

Hydrocarbons
rubber, chlorinated
rubber hydrochloride
Cellulose
cellulose nitrate
cellulose acetate
methylcellulose
Protein
casein
zein
Miscellaneous
ester gums
lignin

Typical Resins Derived by Polymerization (union of small molecules without formation of water or some other simple molecule as a byproduct)

acetal resins
acrylate resins
allyl resins
coumarone-indene resins
fluorocarbon resins
furan resins
polyethylene
polypropylene
polystyrene
vinyl plastics
vinylidene resins

Typical Resins Derived by Condensation (union of small molecules with formation of water or some other simple molecule as a byproduct)

alkyd resins
epoxy resins
melamine resins
phenolic resins
polyamide resins
polycarbonate resins
polyester resins
polyurethane resins
polyether foams
silicone resins
urea-formaldehyde resins

resins, true. See resins, natural.

"Resipon." ³⁰⁰ Trademark covering a series of textile resin finishes. Includes thermosetting types for crush resistance and dimensional control, polyvinyl acetate emulsions and alkyd types.

"Resipon" BC: Methylated urea-formaldehyde type.

"Resipon" C: Standard urea-formaldehyde type.

"Resipon" NC: Ethylene urea type.

"Resipon" NDC: Cyclic urea type, for wash and wear finishes.

"Resipon" ST: Triazone type.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Resipon" V: Polyvinyl acetate emulsion.

"Resipon" RF: Solubilized alkyd type.

resist. A term used in textile printing to describe a material which will prevent the fixation of dye on the fiber, in order to obtain patterned prints. The resist may act mechanically, as a wax, resin or gel which may prevent the absorption of the dye, or it may act chemically to neutralize either the dye or its accompanying mordant. Citric acid, oxalic acid, and various alkalis are among the more common resists of the chemical type.

"Resistac." ¹¹¹ Trade name for an aluminum bronze alloy available in three special grades containing 89% copper, 10% aluminum, 1% iron (Resistac No. 1); 89.5% copper, 8% aluminum, 2.5% iron (Resistac No. 2); 78% copper, 10-11.5% aluminum, 3-5% iron, 3-5.5% nickel (Resistac No. 3).

Properties: Gold color; resistant to dilute sulfuric acid solutions, salt solutions, and vapors; heat resistant; good fatigue resisting qualities.

Forms available: Castings; rods and bars; forgings.

Uses: Applications requiring resistance to chemical corrosion; hot mill guides; valve guides in internal combustion engines, valve seats for superheated steam; oscillating equipment.

Resistor Compositions. ²⁸ A new type of fired-on resistor composition of specially treated semiconducting metal powders compounded with glass binders and temporary organic carriers. Can be applied to glass or ceramic surfaces by stenciling, spraying, brushing or dipping; firing range 1300° to 1400°F. Resistance of 500 to 10,000 ohms/square obtained with 1-mil film. Fired resistors have good reproducibility, low temperature and voltage coefficients, and stability to abrasion, moisture, and relatively high (125°C) ambient temperature.

Containers: 1- to 32-oz jars.

Uses: To produce fired-on resistor components for electronic circuits.

"Resistox" Copper Powders. ^{294, 296} Trademark for stabilized grades of metallic copper powder assaying a minimum of 99% copper with a specific gravity of 8.9 and apparent density range of 2.0-3.5 grams per cubic centimeter. Marketed in several grades of various particle sizes.

Containers: 500-lb pails. (Also available in smaller containers).

Uses: Fabrication of porous bearings; infiltration of sintered ferrous machine parts; chemical catalysts; additive to magnesium chloride cements; metal friction surfaces; electric brushes; electrical contacts; metallic paints.

resite. See C-stage resin.

resitol. See B-stage resin.

"Resloom." ⁵⁸ Trademark for a line of synthetic plastic resins based on melamine.

Used to impart shrinkage control, wrinkle-resistance and durability to woollens, rayon, synthetics and cottons.

"Resmetal." ⁶⁵ Trademark for a resin-metal composition which when catalysed converts to metal-like solid. Recommended for mold making, patching, forming and general repair of metal surfaces and objects.

"Resodors." ¹² Trademark for a group of heat stable, residual odor modifiers and reodorants for application to resins and latices. Compatible, soluble and non-deteriorating to plastic.

"Resoform." ³⁰⁷ Brand name of a line of dye-stuffs used for the coloring of plastics.

resol. See A-stage resins.

resonance. In chemistry, a property of certain types of molecular structure in which the atoms forming it remain substantially in a fixed spatial arrangement with their electrons arranged so as to simultaneously satisfy two or more classical structural formulas. (See formula, chemical). Resonance usually is responsible for high molecular stability. The structure of benzene is one of the best-known examples of this property.

resorcin. See resorcinol.

resorcinol (resorcin, meta-dihydroxybenzene; 3-hydroxyphenol) $C_6H_4(OH)_2$.

Properties: Very white crystals, becoming pink on exposure to light when not perfectly pure, unpleasant sweet taste, sp.gr. 1.2717; m.p. 110.7°C; b.p. 281°C, soluble in water, alcohol, ether, glycerol, benzene and amyl alcohol; slightly soluble in chloroform.

Typical specifications. 98.5-99.5% pure; freezing point 108.5-109.1°C; fine crystals or flakes, flash point (open cup) 339°F.

Derivation: By fusing benzene-meta-disulfonic acid with sodium hydroxide, dissolving the melt in water, acidifying the solution with hydrochloric acid and extracting the resorcinol with a volatile solvent, followed by evaporation of the latter.

Method of purification: Redistillation.

Impurities: Diresorcinol; phenol; salicylic acid.

Grades: U.S.P. XVI; powder; resublimed, pure, reagent; technical, crude.

Containers: 25- to 350-lb fiber drums; multi-wall paper sacks.

Uses: Manufacture of dyes, medicine; reagent in analytical chemistry; celluloid (camphor substitute); manufacture of styphnic acid, tanning agents, synthetic resin adhesives, pharmaceuticals, rubber tackifiers.

Caution: Avoid inhalation of dust or vapor and contact with skin (except under medical care).

Shipping regulations: None.*

resorcinol acetate (resorcinol monoacetate) $HOC_6H_4OCOCH_3$.

Properties: Viscous, pale yellow or amber liquid with a faint characteristic odor and a burning taste. B.p. about 283°C (dec);

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

boiling range (10 mm) 150-153°C. Saturated solution is acid to litmus. Soluble in alcohol and most organic solvents; sparingly soluble in water. Sp.gr. 1.203-1.207.

Derivation: Action of acetic anhydride on resorcinol.

Method of purification: Fractional distillation.

Grades: C.P.; N.F. XI.

Containers: Glass bottles; drums.

Uses: Medicine; cosmetics.

resorcinol blue. See lacmoid.

resorcinol diglycidyl ether (RDGE, 1,3-diglycidylxybenzene; meta-bis(2,3-epoxypropoxybenzene) $C_6H_4(OCH_2CHOCH_2)_2$.

Properties: Straw-yellow liquid; sp.gr. 1.21 (25°C), b.p. 172°C (0.8 mm), refractive index 1.541 (n_D 25/D), viscosity 500 cps (25°C); flash point 350°F (Cleveland open cup). Miscible with most organic resins.

Use: Epoxy resins.

resorcinol monoacetate. See resorcinol acetate.

resorcinol monobenzoate $C_6H_5COOC_6H_4OH$.

Properties: A white, crystalline solid, m.p. 132-135°C; b.p. 140°C (0.15 mm).

Uses: Non-coloring ultraviolet inhibitor for various plastics; color stabilizer in cosmetic compositions.

resorcinolphthalein. See fluorescein.

resorcinolphthalein sodium. See uramine.

alpha-resorcylic acid (3,5-dihydroxybenzoic acid) $(OH)_2C_6H_3COOH$.

Properties: White crystals, m.p. 237°C.

Soluble in water, ethanol and ether.

Grade: C.P.

Uses: Intermediate for dyes; pharmaceuticals; light stabilizers; resins.

beta-resorcylic acid (BRA, 2,4-dihydroxybenzene carboxylic acid; 2,4-dihydroxybenzoic acid, 4-hydroxysalicylic acid, 4-carboxyresorcinol) $(OH)_2C_6H_3COOH$.

Properties: White needles, m.p. (with decomposition) 219-220°C; b.p., decomposes, almost insoluble in water and benzene, soluble in alcohol, ethyl ether. The sodium, potassium, ammonium, calcium and barium salts are soluble in water, the silver, lead and copper salts are only slightly soluble.

Typical specifications: White or light buff crystalline powder, moisture 2.5% max, m.p. (decomposition point) 215°C min, assay not less than 97.0% pure.

Containers: 100-lb net nonreturnable fiber drums.

Use: As a dyestuff and pharmaceutical intermediate and as a chemical intermediate in the synthesis of fine organic chemicals.

"Reswax." ⁶⁵ Trademark for a series of wax-resin blends used as coatings and hot melt adhesives in paper conversion. The resins or polymers used include butyl rubber, polyisobutylene, chlorinated rubber, polyethylene, and styrene co-polymers.

"Resyn." ⁵³ Trademark for a line of synthetic resin-base adhesives and coatings.

"Resyn 3600." ⁵³ Trademark for aqueous dispersion of modified polyvinylidene chloride, of special value for paper coating, resulting in a film characterized by excellent barrier properties.

ret. To reduce or digest fibers, especially linen, by enzymatic action.

retarder. Designation of a group of cationic surface-active agents operative in acid and electrolyte solutions. Used as dye retarders, stripping agents, and as oil well acidizing assistants.

"Retarder E-S-E-N." ²⁴⁸ Trademark for phthalic anhydride.

Properties: White crystalline powder, sp.gr. 1.52, melting range 127-132°C; soluble in acetone, moderately soluble in ethylene dichloride, slightly soluble in benzol and water. Insoluble in gasoline.

Uses: Retarder or anticorchor for rubber compounding.

Hazards: Excessive dustiness is to be avoided as a source of possible irritation to mucous membranes.

"Retarder J." ²⁴⁸ Trademark for N-nitrosodiphenylamine. (q.v.).

"Retarder PD." ⁵⁷ A proprietary name for a modified phthalic anhydride. Effective as a retardant of premature cure or set-up during processing of rubber compounds. Normally used in combination with thiazole or mixtures of thiazole-guanidine accelerators.

"Retarder W." ²⁸ Trade name for salicylic acid with a dispersing agent.

Properties: Buff-colored, non-dusty powder; sp.gr. 1.43.

Containers: 300-lb drums.

Uses: To prevent premature curing of natural and synthetic rubbers, to activate blowing agents.

"Retardex." ⁹⁴ Trademark for a vulcanization retarder.

Properties: A light colored, finely divided solid, easily dispersed, no staining characteristics; may safely be used in white or pastel colored rubber, stable in storage, sp.gr. 1.14.

Uses: In low temperature curing to elevate "critical" temperature without affecting the time-tensile curing curve.

"Retardion." ²³³ Trademark for an ion-exchange resin used in ion retardation, a separation process in which the flow of ions through a column is retarded by the ion-absorbing properties of the resin.

retinene (vitamin A aldehyde) $C_{20}H_{28}O$. A necessary component of rhodopsin, the light-sensitive pigment of the eye. Retinene is the aldehyde form of vitamin A, which is an alcohol.

retinol. Vitamin A₁ or axerophthol. See vitamin A.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

retort carbon. See carbon, gas.

retort graphite. See carbon, gas.

"Retrol." ²¹⁷ Brand name of acid activated clay used as decolorizing adsorbent for refining used crankcase or other industrial oils. See also "Filtrol."

"Rexforming" Process. ⁴¹⁶ Patented process combining certain of the elements of the "Platforming" process (q.v.) and "Udex" extraction (q.v.) to convert a naphtha fraction into a highly aromatic motor fuel blending component of high octane rating. A comparatively much smaller volume of an essentially paraffinic product also is produced, which has desirable characteristics as a component of jet fuels but which may, if preferred, be recycled to extinction. By-product hydrogen also is produced.

Reynold's number. The function DUP/μ used in fluid flow calculations to estimate whether flow through a pipe or conduit is streamline or turbulent in nature. D is the inside pipe diameter, U is the average velocity of flow, P is density and μ is the viscosity of the fluid. Different systems of units give identical values of the Reynold's number, and values much below about 2100 correspond to streamline flow, while values above 3000 correspond to turbulent flow.

"Rezgard." ⁵⁸ Trademark for a fire retardant. Properties: A white, water-soluble crystalline powder. An alkaline mixture of flame-retarding chemicals to give proper balance to flame extinguishing, elimination of afterglow and retention of tensile strength. Containers: 100-lb bags; 300-lb fiber drums. Uses: Fire retardant for cellulosic fabrics.

"Rezyl" Resins. ⁵⁷ Proprietary products. Reaction products of polybasic acids and polyhydric alcohols modified with various oils and oil acids. Some grades further modified with resins of other types. Those based on drying oils are used in air drying surface coatings and alone, or in combination with amino resins, for baking finishes. The nondrying oil modifications are used as plasticizers for amino resins in baking finishes and for nitrocellulose and other high polymer film-forming materials. Available in numerous grades which vary in oil content and are designed for specific applications. Usually supplied in solution in organic solvents.

RF black. Abbreviation for reinforcing furnace black. See furnace black.

R film. Name used for "Tedlar" polyvinyl-fluoride film during development stages.

RFNA. Abbreviation for red fuming nitric acid. See nitric acid, fuming.

Rh. Symbol for rhodium.

rhabarberone. See aloe-emodin.

rhenum Re. Element, atomic number 75; group VII of the periodic table.

Properties: Silver white metal or gray to black powder; sp.gr. 20.53; m.p. about 3100°C; tensile strength 80,000 psi; soluble in concentrated nitric acid; slowly soluble in sulfuric acid; practically insoluble in hydrochloric acid; can be hot forged or rolled.

Sources: Principally molybdenite.

Derivation: Solutions from refinery residues (molybdenum ore flue dust, copper ore treatment) are (a) concentrated by salting-out processes and reduced by hydrogen gas under pressure to give the metal or (b) passed through an anionic resin from which pure rhenum can be extracted by a strong mineral acid.

Forms: Metal powder techniques are used to make rods, wires and strips.

Uses: As a catalyst for dehydrogenation; thermocouples; electric contact points, spark-plug points, electrodes, high temperature and corrosion resistant alloys.

rhenum compounds. Rhenum is multivalent, but its more stable compounds are heptavalent. Rhenum heptoxide, Re_2O_7 , is a yellow crystalline material, sp.gr. 8.2; m.p. 220°C; dissolves in water to form perrhenic acid, $HReO_4$. Rhenum trioxochloride, ReO_3Cl , is a colorless liquid, m.p. 4°C; b.p. 131°C (760 mm); reacts readily with organic substances.

rhenum heptoxide. See rhenum compounds.

rhenum trioxochloride. See rhenum compounds.

rheology. Study of the deformation and flow of matter in terms of stress, strain and time. See Newtonian flow, consistency, dilatancy, thixotropy, and viscosity.

rhesus factor. A substance present in the red blood cells of the rhesus monkey, and of approximately 85% of an average white American population. Those whose red cells contain this factor are termed Rh-positive; others, Rh-negative. A negative individual may develop anti-Rh antibodies, if Rh-positive red cells enter his blood; such antibodies can then agglutinate Rh-positive cells. Hemolytic reactions may thus occur following transfusion of Rh-positive bloods cells into a recipient previously sensitized and having Rh antibodies in the serum. Likewise, an Rh-positive fetus may give rise to antibodies in the blood of an Rh-negative mother; the antibodies, returning into the fetus, may then produce the disease erythroblastosis fetalis. There are many subtypes of the Rh factor; these can be distinguished by serologic tests, and the laws of their inheritance have been determined.

Rh factor. See rhesus factor.

rh.m. The abbreviation for one roentgen per hour at one meter.

rho acid. See anthraquinone-1,5-disulfonic acid.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

983

wettable powder or emulsion concentrate.

Use: Controls insects on plants and livestock. Also used for mosquito larvicide and adulticide.

"Rhozyme." ²³ Trademark for enzyme concentrates with diastatic or proteolytic activity. Buff-colored powders or liquids of fungal or bacterial origin which hydrolyze and solubilize proteins and starches, depending upon type.

Use: Desizing of textile fabrics; dry-cleaning spotting; liquefaction of starch paste; fermentation processes; manufacture of corn syrup, fish solubles, septic tank formulations; medicinal, animal feed, and meat tenderizer applications.

rhubarb. The dried rhizome and root of certain species of *Rheum*. The official rhubarb of N.F. XI is a Chinese rhubarb: *Rheum officinale*, *Rheum palmatum* or certain other species grown in China. Indian rhubarb, N.F. XI (Himalayan rhubarb) is *Rheum webbianum*, *Rheum emodi*, and certain other species native to India, Pakistan or Nepal.

Chief constituents: Chrysophanic acid and other derivatives of methylanthracene.

Grades: Technical; N.F. XI.

Containers: Bags.

Use: Medicine.

"Rhulitol." ⁵⁷ Trademark for tannic acid solution.

riboflavin. Alternate spelling of riboflavin. The latter is preferred by the IUPAC.

riboflavine (vitamin B₂) C₁₇H₂₀N₄O₆. 7,8-Dimethyl-10-(1'-D-ribityl) isoalloxazine. A crystalline pigment, the principal growth promoting factor of the vitamin B₂ complex. It functions as a flavoprotein in tissue respiration. A syndrome resembling pellagra is thought to be due to riboflavin deficiency.

Properties: Orange yellow crystals; bitter taste, m.p. 282°C (dec). Slightly soluble in water and alcohols, insoluble in lipid solvents, stable to heat in dry form and in acid solution; stable to ordinary oxidation, unstable in alkaline solution, and quite sensitive to light. In solution, riboflavin has an intense greenish-yellow fluorescence.

Units: Amounts are expressed in milligrams or micrograms of riboflavin.

Sources: Food sources: milk, green leafy vegetables, egg yolk, liver, enriched flour, yeast. Commercial sources: distiller's residues, fermentation solubles; synthetic production (indirectly from dextrose).

Grades: U.S.P. XVI.

Uses: Medicine; nutrition; animal feed supplement, enriched flours.

riboflavine 5'-phosphate (FMN, flavine mononucleotide). The phosphate ester of riboflavin (q.v.) in which the phosphate is esterified to the ribityl portion of riboflavin.

It functions as a coenzyme for many flavine enzymes (q.v.). The riboflavin group has the ability to take up hydrogen

atoms, thus oxidizing the substrate.

Properties (sodium salt): Yellow crystals.

Much more soluble than riboflavin in water. Quite sensitive to ultraviolet light.

Derivation: By treating riboflavin with chlorophosphoric acid.

Containers (sodium salt): Fiber drums.

Use: Biochemical research.

9-beta-D-ribofuranosyladenine. See adenosine.

ribonucleic acid (ribose nucleic acid; yeast nucleic acid; RNA) C₃₈H₄₉O₂₉N₁₅P₄ (for the tetranucleotide). Contains the sugar D-ribose, the bases adenine, guanine, cytosine and uracil, and phosphoric acid. Ribonucleic acid is universally present in the cytoplasm (cellular material exclusive of the cell nucleus) of cells, and some evidence indicates that it is also present in the cell nucleus. The acid is usually bound to proteins to form ribonucleoproteins. See deoxyribonucleic acid for recent ideas about the structure of the nucleic acids.

Properties: White to buff powder; insoluble in water and dilute acid; soluble in alkali.

Derivation: From yeast.

Uses: Biochemical research.

D-ribose CH₂OH(CHOH)₃CHO D(-)-ribose.

A five-carbon-atom sugar which is a constituent of components in living cells, or their decomposition products, such as deoxyribonucleic acid, ribonucleic acid, nucleotides, nucleosides, and many coenzymes.

Properties: White, crystalline, slightly sweet odor; m.p. 86-87°C; soluble in water, ethyl alcohol, and methyl alcohol. Insoluble in ether, acetone, benzene, and chloroform.

Use: Physiological and biochemical studies of cell function.

ribose nucleic acid. See ribonucleic acid.

D-ribose-5-phosphoric acid C₅H₉O₄·H₂PO₄.

A constituent of nucleotides and nucleic acids.

Properties: The barium salt (5½ H₂O) is sparingly soluble in cold water and crystallizes in hexagonal plates.

Derivation: From inosinic acid.

Use: Biochemical research.

D-ribosyl uracil. See uridine.

Rice's bromine solution. A reagent used for the quantitative determination of urea; depends upon the oxidizing action of bromine.

ricin. White powder. The tox-albumin of the castor oil bean, being the poisonous principle. Extracted from the pressed seeds with 10% solution of sodium chloride followed by precipitation with magnesium sulfate.

Uses: As a reagent for pepsin and trypsin.

Caution! Extremely poisonous; handle with care, small particle in cut or abrasion, eye or nose, may prove fatal. Poison label.

ricinine C₈H₉O₂N₂. 1,2-Dihydro-4-methoxy-1-methyl-2-oxonicotininonitrile.

Properties: White crystalline alkaloid; bitter;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

soluble in water, chloroform and ether.
M.p. 201.5°C; sublimes at 170-180° under 20 mm pressure.

Derivation: From castor oil seeds and leaves.

Shipping regulations: None.*

ricinola oil. See castor oil.

ricinoleic acid (cis-12-hydroxyoctadec-9-enoic acid; 12-hydroxyoleic acid; castor oil acid)
 $\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}_2\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOH}$.
A C_{18} unsaturated fatty acid which comprises approximately 80% of the fatty acid content of castor oil. The presence of the hydroxyl group imparts a number of properties (following sulfonation or dehydration) which widens its utility.

Properties: Colorless to yellow viscous liquid, soluble in most organic solvents, insoluble in water. Sp.gr. 0.940 (27.4/4°C); m.p. 5.5°C; b.p. 226°C (10 mm), refractive index 1.4697 (20°C).

Derivation: Saponification of castor oil.

Method of purification: Rectification.

Grades: Technical, purified (99+%).

Containers: 5-gal cans; 55-gal drums.

Uses: Soaps, Turkey red oils; textile finishing; source of sebacinic acid and heptanal, ricinoleate salts; 12-hydroxystearic acid.

Shipping regulations: None.*

ricinoleyl alcohol

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}_2\text{CH}=\text{CH}(\text{CH}_2)_7\text{CH}_2\text{OH}$.

The fatty alcohol derived from ricinoleic acid. It has a long straight chain with one double bond and one hydroxyl (OH) group in a secondary position on this chain besides the primary group on the end. Available as a 90% product. A colorless non-drying liquid at room temperature.

Typical specifications: Iodine value 91.8; cloud point below 10°F, boiling range 170-328°C, viscosity 51 (SSU/21°C), fire point 435°F.

Derivation: Reduction of acid made from castor oil.

Impurities: Oleyl and linoleyl alcohols.

Use: Protective coatings; polyesters; plasticizers; organic synthesis, pharmaceuticals, lubricants, surface active agents.

ricinus (castor oil plant, palma christi, Mexico seed; oil plant; castor bean).

Derivation: The seeds of *Ricinus communis*.

Occurrence: United States; East Indies; West Indies; southern Europe and Africa.

Grades: Technical.

Containers: Bags.

Use: Source of castor oil.

Shipping regulations: None.*

ricinus oil. See castor oil.

Riegler's test. A reagent composed of sodium naphthionate, beta-naphthol, and concentrated hydrochloric acid for the detection of nitrites and nitrous acid in very small amounts.

"Rila." ⁴ Trademark for a series of phosphorescent and fluorescent pigments

(ZnS-CdS, CaS-SrS), compatible with a variety of vehicles.

Uses: Lacquers, paints, printing inks, paper, tape and plastics.

"Rimex." ²⁵⁰ Trademark for a chemically compounded material used in the production of rimming steels. It is an effective ingot mold addition agent which reduces fuming characteristics and improves rimming action.

Containers: 4- and 8-oz polyethylene bags; bulk drums.

"Rimifon." ¹⁹⁰ Trademark for isoniazid (isonicotinylhydrazine).

"Ringots." ³²⁹ Trademark for uncoated, doughnut-shaped pieces of misch metal. They are available in 1, 2, and 5-lb sizes with the center hole large enough to permit a standard 1" pipe or rod to be passed through. This hole is convenient for mounting, plunging and effectively mixing misch metal with molten metal.

Use: Special steels.

"Ringwood Repellent." ⁴⁰¹ Trade name for a rodent repellent containing trinitrobenzene-aniline complex (5%).

Containers: 1 pint, 1 quart and 1 gallon containers.

Use: To protect dormant deciduous trees and shrubs against rabbit damage.

Caution: Harmful if swallowed, inhaled or absorbed through skin.

"Rio Resin." ⁶⁹ Trademark for proprietary blend of resinous and protective materials. Properties: Resinous; orange to dark red; sp.gr. 1.13 ± .03; softening point 54°C min.

Use: In compounding heat resistant copolymer and corona resistant neoprene.

"RISA." ³ Radioactive iodinated blood serum albumin (human) used as research and diagnostic tool.

ristocetin. An antibiotic produced by the fermentation of *Nocardia lurida*, a species of Actinomycetes. The antibiotic has two components, ristocetin A and ristocetin B, the chemistry of which is not completely known. The commercial product is a lyophilized preparation representing a mixture of A and B.

Grade: N.N.D.

Use: Medicine.

"Ritalin." ³⁰⁵ Trademark for methylphenidate. Use: Medicine.

Rittinger's law. The energy required for reduction in particle size of a solid is directly proportional to the increase in surface area. See also Kick's law.

"R Monel." ²⁸³ Trademark for a wrought alloy containing approximately 66% nickel and 31% copper which has had its machining qualities enhanced by a controlled addition of sulfur.

Rn. Symbol for radon.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

RNA. Abbreviation for ribonucleic acid.

road oil. 1. Asphaltic-, see asphalt. 2. Non-asphaltic-, a non-hardening petroleum residual oil used as a dust-laying oil. It has sufficiently low viscosity to be applied without preheating.

roasting. Heating in the presence of air or oxygen. Most commonly used in converting natural metal sulfide ores to oxides as a first step in recovery of metals such as zinc, lead, copper, etc.

"Robane." ⁴¹⁵ Trademark for squalane (q.v.) Purity 90% min.

Containers: 1-lb bottles; 1-gal metal tins, 5-gal metal pails; 100-lb metal drums.

Uses: Since it is a derivative or possible component of the sebum hydrocarbons, it is especially suited as a vehicle for skin medicines and cosmetics.

Robison ester. See glucose 6-phosphate.

"Roccal." ¹⁶² Trademark for a mixture of high molecular weight alkyl benzyl dimethyl ammonium chlorides in 10 and 50% aqueous solution. The alkyl groups are straight chain C₈ to C₁₈ from coconut fatty acids. Used as a germicide in the food and beverage industry, and for similar applications.

rochelle salt. See potassium-sodium tartrate.

rock candy. Semi-transparent crystals of hydrated sugar, the purest form of sucrose commercially obtainable.

Derivation: Gently heating concentrated sugar syrup, adding alcohol, and cooling slowly.

rock crystal. 1. Colorless and very pure quartz (q.v.) occurring in crystals found in Brazil and Madagascar; used for oscillator plates in electronic equipment, optical equipment; raw material for fused quartz; gemstone.

2. Rock crystal is also used to refer to highly polished blown glassware that has been handcut or engraved.

rocket fuels. See rocket propellants.

"Rocketon." ³⁴⁹ Trademark for a wet or dry phenolic-abestos molding compound used when good heat and ablative properties are needed.

rocket propellants (rocket fuels). Solid and liquid propellants of various classifications. The homogeneous solid propellant consists of a base—usually nitrocellulose—which acts both as oxidizer and fuel. Stabilizers, of which the most common are diphenylamine and diethyldiphenylurea, remove oxides of nitrogen which are formed in nitrocellulose decomposition during storage. Plasticizers, added to improve mechanical qualities, may be nonexplosive, such as various phthalates, or explosive, such as nitroglycerine. The latter is not only a plasticizer, but a propellant in itself. Darkening agents, such as carbon black, are added to stop radiation transfer which

results in premature ignition. The composite solid propellant, on the other hand, is a mixture of a finely ground oxidizer and a plastic-consistency fuel, which acts as the binder. The oxidizers are usually alkali nitrates or perchlorates. The fuels are of several types: synthetic resins, elastomers (such as polysulfide rubber), polyesters, and formerly cellulose derivatives and asphalt. Inert plastics are added to the molded propellant along certain surfaces to produce burning in a particular section.

Liquid propellants fall into two classifications: the mono- and bipropellants. The liquid monopropellant is analogous to the homogeneous solid propellant in that it is basically a single substance which is both oxidizer and fuel. Typical monopropellants are nitroglycerin, nitromethane, diethylene glycol dinitrate (the German DEGN of World War II). The bipropellant consists of fuel and oxidizer stored in separate chambers, then mixed for combustion. Oxidizers are most commonly liquid oxygen or nitric acid, but other oxygen compounds or halogens and their compounds (and in special cases, water) are also used. The fuels include hydrogen and wide range of hydrogen compounds—ammonia, hydrazine, metallic hydrides, such as those of boron, hydrocarbons, amines, alcohols. Bipropellants are far more commonly used than monopropellants. The following table gives common systems:

Fuel	Oxidizer
ammonia	liquid oxygen
ethyl alcohol	liquid oxygen
gasoline or kerosene	liquid oxygen
gasoline	red fuming nitric acid
aniline	red fuming nitric acid
hydrogen	fluorine
methanol	chlorine trifluoride
hydrazine	hydrogen peroxide
furfuryl alcohol	white fuming nitric acid
boron hydride	water
uns-dimethyl-hydrazine and hydrazine	nitrogen tetroxide
hydrazine	red fuming nitric acid
ammonia	red fuming nitric acid
hydrogen	ozone
hydrogen	oxygen
hydrogen	white fuming nitric acid
hydrogen	nitrogen tetroxide

The hybrid type of propellant combines solid and liquid propellant characteristics. It is also called a slurry. There are three varieties:

(a) Solid oxidizer and liquid fuel. Example: kerosene, a gelling agent, perchlorate oxidizer.

(b) Solid binder containing part of the oxidizer with the rest of the propellant in the liquid state.

(c) Solid fuel binder with a liquid oxidizer.

Rocket propellants are usually compared

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

on the basis of specific impulse which means the pounds of thrust produced per pound of propellant burned per second. High specific gravity is also desirable, to reduce the size of the containing rocket or missile.

Generally, the liquid propellants are more easily controlled during operation, and certain liquid systems have the highest performance potential. However, solid propellants have been gaining favor due to their simplicity of storage, handling, and the fact that they can be fired almost immediately, with no complex mixing, and with great reliability.

Future propellant possibilities, which are being studied due to the definite limits on performance of chemical fuels, include use of the recombination energy of free radicals, use of nuclear propulsion, ion flow, solar energy, and (most ultimately) propulsion by high energy photons.

rock oil. A synonym for petroleum (q.v.).

rock salt. See halite.

rock salt moss. See chondrus.

rock wool. See mineral wool.

"Rodar." ¹⁵⁵ Trademark for an iron-nickel-cobalt alloy.

Properties: Produces a permanent vacuum-tight seal with simple oxidation procedure, resists mercury corrosion; readily machined and fabricated, can be welded, soldered, or brazed.

Forms: Wire, strip; bar.

Use: For sealing metal to hard glass.

rodenticide. Chemicals used to kill rats and other undesirable rodents. Many older rodenticides (arsenic, strychnine, ANTU) were toxic to all animals. Newer materials, such as the indandione compounds and warfarin (a coumarin derivative), are more selective, and owe their activity to their anticoagulating effect on the blood and subsequent hemorrhages in the animal.

"Rodform." ⁶⁹ Trademark for rubber accelerators supplied in the form of extruded rods or pellets.

"Rodine." ³⁴² Trademark for red squill liquid-extract rodenticides.

"Rodo No. 0." ⁶⁹ Trademark for a blend of essential oils.

Properties: Sweet odor; clear, nontoxic, sp. gr. 0.96.

Use: To offset the usual rubber odor, leaving the finished product practically odorless.

"Rodo No. 4." ⁶⁹ Trademark for a product similar to "Rodo No. 0." Imparts a pleasing, distinctive odor to finished rubber.

"Rodo No. 10." ⁶⁹ Trademark. Same as "Rodo No. 0." Imparts to rubber stocks a pleasing and lasting odor.

roentgen (r). The international unit of quantity or dose for both x-rays and gamma rays.

It is defined as the quantity of x^2 or gamma rays which will produce as a result of ionization one electrostatic unit of electricity of either sign in 1 cc (0.001293 g) of dry air as measured at 0°C and standard atmospheric pressure.

The use of the roentgen unit has been extended to include particle radiation such as alpha and beta particles and protons and neutrons. The roentgen equivalent physical, abbreviated rep, is defined as the quantity of particle radiation which upon absorption in 1 gram of body tissue is accompanied by the gain of 93 ergs of energy. One rep of ionizing radiation produces essentially the same physical effect in soft tissue as does one roentgen of x-rays. One mrep is one thousandth of a rep.

Roentgen rays. See x-rays.

"Roetinic." ²⁹⁹ Trademark for a vitamin and mineral preparation, used in medicine.

Rohrbach solution.

Properties: Clear, yellow liquid. Very refractive, sp. gr. 3.5.

Derivation: An aqueous solution of mercuric-barium iodide.

Uses: Separating minerals by their specific gravity; microchemical detection of alkalis.

Caution. Poison; keep well closed.

"Rolandshuette." ⁴⁴⁷ An aluminous cement of the fused type which originated in Germany. See cement, aluminous.

"Romark." ⁴⁴⁸ Trade name for alkyd and chlorinated rubber type road marking paints.

"Romilar" Hydrobromide. ¹⁹⁰ Trademark for a brand of dextromethorphan hydrobromide (q.v.).

"Rongalite CX." ³⁰⁷ Trademark for a stripping and reducing agent, sodium sulfoxylate formaldehyde, 99% pure.

Properties: Hard, white lumps; decomposes slowly in moist, warm air.

Uses. Textile stripping agent, reducing agent for discharge and vat prints; reducing agent in GR-S latex low temperature redox polymerization systems.

"Roniacol" Tartrate. ¹⁹⁰ Trademark for a brand of beta-pyridylcarbinol tartrate (q.v.).

ronnel (O,O-dimethyl O-(2,4,5-trichlorophenyl) phosphorothioate). Accepted as generic name by the Ent. Soc.

Use: Systemic insecticide, used for the elimination of external parasites on animals by oral treatment.

"Ronopole" Oil. ¹⁶⁵ Trademark for a highly oxidized sulfonated castor oil.

"Roofmate." ²³³ Trademark for a "Styrofoam" product used in insulation.

"Roctone." Trade name for indolebutyric acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Roracyl." ²⁸ Trademark for a group of soluble dyes that have good affinity and fastness properties on "Orlon" acrylic fiber. They are used with selected acid dyes in many instances.

"Rosaldehyde." ¹⁸⁸ Brand name for a synthetic floral perfume base.

"Rosanlik." ¹⁸⁸ Trademark for a synthetic replacement for otto of rose.

roscoelite $K_2V_4Al_2Si_6O_{20}(OH)_4$. A vanadium-bearing species of mica (q.v.). Formula variable, with V_2O_3 up to 28%. Occurs as minute scales with micaceous cleavage; dark green to brown in color, pearly luster. Hardness 2.5, sp.gr. 3.0.

Occurrence: Colorado, California, Australia.

Use: Minor source of vanadium.

rose absolute. Pure oil of rose. The first filtrate obtained on separation of waxes from the cooled alcohol solution of rose concrete in perfume manufacture.

rose concrete. Semi-solid residue, a mixture of essential oils and waxes, resulting from extraction of rose flower petals, leaves, seeds, fruit, roots, gums or bark by means of a volatile solvent. Term used in perfume manufacture. See rose absolute.

rose flower oil. See rose oil.

rose geranium oil. See geranium oil, rose.

rosemary (garden rosemary).

Derivation: Flowers and leaves of *Rosmarinus officinalis*.

Occurrence: Mediterranean basin; cultivated in gardens.

Containers: Boxes.

Uses: Perfumery; medicine.

Shipping regulations: None.*

rosemary oil.

Properties: Colorless or pale yellow, limpid liquid, volatile oil, warm, somewhat camphoraceous taste; pungent; rosemary odor, sp.gr. 0.894-0.912, optical rotation -5° to $+10^\circ$, saponification value 12-20; refractive index (n 20/D) 1.4640-1.4760. Soluble in alcohol, ether, and glacial acetic acid.

Chief known constituents: Pinene, borneol, camphene, cineole, camphor and bornyl acetate.

Derivation: By steam distillation from the leaves of *Rosmarinus officinalis*.

Occurrence: Southern Europe.

Grades: Technical, N.F. XI.

Containers: Cans; drums.

Uses: Perfumery; medicine.

Shipping regulations: None.*

rose oil (otto of rose oil; attar of roses).

Properties: Pale yellow, pale green, or pale red, transparent, volatile, liquid oil, mild, sweet taste; strong, fragrant odor; semi-solid at ordinary temperature; keep containers well stoppered. Sp.gr. 0.845-0.865; solidifying point 18-37°C; saponification value 10-17; acid value 0.5-3,

refractive index (n 30/D) 1.457-1.463.

Chief constituents: Geraniol, citronellol and phenylethyl alcohol.

Derivation: By steam distillation of the fresh flowers of *Rosa damascena*, *Rosa centifolia*, *Rosa gallica* and *Rosa alba*.

Grades: Bulgarian; French; Turkish.

Containers: 1-, 8-, 16-oz bottles; 1-, 8-,

16-, 32-oz packages; 1-, 2-kilo packages.

Uses: Perfumes; flavoring.

Shipping regulations: None.*

Rose's alloy. See table under fusible alloys.

"Rosetone." ¹⁹ Trademark for trichloromethyl phenyl carbonyl acetate (q.v.).

rose water. A water solution of the odorous materials of *Rosa centifolia*, prepared by steam distillation of the fresh flowers.

Grade: U.S.P. XVI.

rosewood oil. See oil bois de rose Brazilian.

rosin (gum rosin; colophony; pine resin, wood rosin; common rosin)

Properties: Angular, translucent, amber-colored fragments, sp.gr. 1.08; m.p. 100-150°C, acid no. not less than 150. Insoluble in water; freely soluble in alcohol, benzene, ether, glacial acetic acid, oils, carbon disulfide, dilute solutions of fixed alkali hydroxides.

Chief constituents: Resin acids of the abietic and pimaric types, having the general formula $C_{19}H_{29}COOH$, and having a phenanthrene nucleus. They are unsaturated and hence reactive. An unsaponifiable portion of rosin (3-10%) contains hydrocarbons and high molecular weight alcohols. These constituents vary greatly according to the source of the rosin.

Derivation: From pine trees, chiefly *Pinus palustris* and *Pinus caribaea*. (a) Gum rosin is the residue obtained after the distillation of turpentine oil from the crude turpentine oleoresin. (b) Wood rosin is obtained by extracting pine stumps with naphtha and distilling off the volatile fraction. (c) Tall oil rosin is a byproduct in the fractionation of tall oil (q.v.).

Grades: Virgin, yellow dip, hard; N.F. XI. Rosin is graded B, C, D, E, F, G, H, I, K, L, M, N, W-G (window-glass), W-W (water-white). The grading is done by color, B being the darkest and W-W the lightest rosin. Ordinarily the first three grades, B, C, and D, are not separated. Occasionally factors other than color are considered in the grading such as the acidity and the melting point.

Containers: Multiwall paper bags; drums.

Uses: Linoleum; soldering compounds; core oils; insulating compounds; molding compounds; sealing waxes. Metallic salts (soaps) of rosin are used in soaps, emulsifiers for SBR manufacture, paper sizing, printing inks, varnishes. Rosin esters are used in protective coatings, as are polymers and copolymers.

Caution: Combustible; gives off flammable vapors when heated.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

rosin essence. That portion of rosin distilling below 360°C.

rosin ester gums. See ester gums.

rosin esters. See ester gums.

rosin oil (rosinol; codoil).

Properties: Water-white to brown liquid, viscous; odorless; strong, peculiar taste. Soluble in ether, chloroform, fatty oils and carbon disulfide; slightly soluble in alcohol; insoluble in water. Essentially decarboxylated rosin acids.

Constants: Sp.gr. 0.980-1.110, iodine number 112-115.

Derivation: By fractional distillation of rosin in a retort, that portion distilling above 360°C being rosin oil.

Method of purification: Second distillation.

Grades: Technical (first, second, third run).

Containers: 50-gal wooden barrels.

Uses: Lubricant, adulterant for boiled linseed oil; printing inks, impregnating paper for wrapping electric cables, rubber reclaimers; core compounds; linoleum.

Shipping regulations: None.*

rosinol. See rosin oil.

rosin size. A material compounded of rosin, soda ash and alum used for paper sizing to impart water and ink resistance to the paper.

rosin soap. See sodium abietate, and soap.

rosolic acid. The names rosolic acid, pararosolic acid and aurin are used confusingly either as direct synonyms for each other or to mean similar compounds or groups of compounds. The preponderance of opinion seems to lean toward the use of rosolic acid as a direct synonym for aurin (q.v.).

"Rosottone." ³⁴² Trademark for a composition from natural and synthetic sources reproducing Rose de Mai absolute.

"Rossville." ³¹⁹ Brand name for a line of ethyl alcohols available under the following proprietary names:

"Rossville Hexagon Cologne Spirits." Pure or specially denatured, highly refined grain spirit, 190 proof, pure, clear, and free from foreign odor, used in manufacture of finest perfumes, colognes, and toilet waters.

"Rossville Algrain Alcohol." Crystal clear, 190 proof, grain alcohol free from foreign odor or flavor for use in manufacture of medicinals, perfumes, toilet waters, flavoring extracts, and other high-grade products.

"Rossville Gold Shield Alcohol." Pure or specially denatured, 190 or 200 proof, high quality alcohol for industrial, scientific, pharmaceutical, and cosmetic purposes.

"Rotalin." ²⁸ Trademark for a line of spirit-soluble printing colors.

Uses: Principally in the printing of glassine and other types of paper and cellophane.

"Rotax." ⁶⁹ Trademark for a purified grade of 2-mercaptobenzothiazole.

Properties: Pale yellow powder; sp.gr.

1.52 ± .03, melting range 169-180°C; very soluble in dilute caustic, benzene, carbon disulfide, chloroform, alcohol; insoluble in water.

Uses: Primary accelerator for natural and nitrile rubber and SBR. Used in tires and tubes, wire and cable, molded and extruded goods, coated fabrics, footwear.

rotenone (tubatoxin) $C_{23}H_{22}O_6$. A pentacyclic compound.

Properties: White, odorless crystals. Soluble in ether, alcohol, acetone, carbon tetrachloride, chloroform and other organic solvents; insoluble in water. Not compatible with alkalis.

Constants: Sp.gr. 1.27 at 20°C; m.p. 163°C, strongly levorotatory in solution, specific rotation for D line, 230° in benzene, 62° in ethylene dichloride.

Derivation: By solvent extraction of derris and cube root.

Method of purification: Recrystallization from alcohol.

Grades: C.P. crystals; technical; also as extracts of derris and cube root.

Containers: Fiber drums; tins; multiwall paper sacks.

Uses: A very powerful insecticide (harmless to mammals and birds) claimed to be also very toxic to fish; flea powders, fly sprays; mothproofing agents.

"Rotessenol." ¹ Trademark for an insecticide concentrate.

Typical analysis: Rotenone, 6%; cube extracts (other than rotenone), 9%; mono- and di-isopropyl cresols, 26%, dipentene, 29%, petroleum oil, 30%.

Uses: In insecticide formulations, in water emulsion sprays for truck garden crops; and for emulsion concentrates for warbles and cattle grub.

Caution: Harmful if swallowed. Do not leave on skin, in eyes or on clothing. Avoid contamination of feed and foodstuffs.

Fire hazard: Combustible mixture.

"Rotoclor." ⁵⁶ Trademark for ferric chloride solution with other additives specially prepared for rotogravure work. Contains 43% $FeCl_3$. Sold only in 155-lb carboys.

rotten-stone. See tripoli.

rouge (synthetic iron oxide). A high-grade red pigment used as a polishing agent. It is similar to Venetian red (q.v.). The finer grades of rouge are known as jeweler's rouge. See also iron oxide reds. The term rouge is also applied to a cosmetic prepared from dried flowers of the safflower.

rouge black. See iron oxide, black.

rouge de mars (red iron oxide). A form of ferric oxide. See iron oxide reds.

"Rovana." ²³³ Trademark for a thermoplastic vinylidene chloride copolymer filament in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

the form of a folded flat tape, offered in 300, 400 and 550 deniers.

"Roxtone." ⁵¹ Trademark for low cold test oils for journal bearings. Typical uses are on construction equipment, crushers and mine equipment. Heavier grades are applied to rough bearings and gears.

"Royal Methyl Violet." ¹⁴¹ Trade name for violet pigment produced by precipitation of the basic methyl violet dyestuff with phosphomolybdic acid.

Properties: Brilliant shade, very high strength, fair lightfastness.

Uses: Printing inks.

"Royal Spectra." ¹³³ Trademark for an impingement carbon black. Used in specialty application requiring highest blackness.

"Royal Victoria Blue." ¹⁴¹ Trade name for blue pigment produced by precipitation of basic victoria blue dye with phosphomolybdic acid.

Properties: Excellent strength, good permanence.

Uses: Printing inks and some paints.

royal yellow. See orpiment.

RPA No. 2 Rubber Peptizing Agent. ²⁸

(33 $\frac{1}{3}$ % 2-naphthalene thiol $C_{10}H_7SH$, and inert hydrocarbon 66 $\frac{2}{3}$ %).

Properties: White, waxy material or slightly cream colored waxy flakes, sp.gr. 0.92.

Containers: 50-lb boxes.

Use: As a plasticizing and peptizing agent for crude and synthetic rubbers.

RPA No. 3 Rubber Peptizing Agent. ²⁸

(36.5% mixed xylene thiols and 63.5% petroleum oil).

Properties: Amber or light yellow liquid; sp.gr. 0.91.

Containers: 400-lb drums.

Uses: As a plasticizing and peptizing agent for crude and synthetic rubbers; as a rubber reclaiming agent.

RPA No. 6 Rubber Peptizing Agent. ²⁸

(90% pentachlorothiophenol C_6Cl_5SH , and 10% inert hydrocarbon wax.)

Properties: White or light gray powder; sp.gr. 1.79.

Containers: 125-lb drums.

Use: As a plasticizing and peptizing agent for natural and synthetic rubber.

RR-10. ²⁸ Trade name for a rubber reclaiming chemical. Mixed dixylyl disulfides $[(CH_3)_2C_6H_3]_2S_2$.

Properties: Dark amber liquid; sp.gr. 1.05.

Containers: 450-lb drums.

Use: As agent for accelerating devulcanization of natural rubber, SBR (styrene butadiene rubber) and mixed scrap during the reclaiming process.

RR acid. See 2-amino-8-naphthol-3,6-disulfonic acid.

R salt. The disodium salt of 2-naphthol-3,6-disulfonic acid (q.v.).

"RSR." ¹⁷³ A proteolytic enzyme preparation for removal of stains available in powder form specifically designed for removing albuminous spots and stains from garments.

"RTV" Silicone Rubber. ²⁴⁵ Trade name for a family of silicone rubber compounds. RTV (room temperature vulcanizing) rubbers have good physical properties and possess electrical properties similar to silicone rubber. These compounds are available in forms from easily pourable liquids to stiff pastes and cure at room temperature, after the addition of a catalyst, to the consistency of rubber. They are operative over the temperature range -65 to 600°F. RTV's possess good release characteristics and excellent bonding ability and exhibit shrinkage of less than 0.02%.

Uses: The material can be applied to objects of virtually any size or shape. Used in sealing, caulking, potting, encapsulating and flexible mold-making applications. Useful in electronic, aircraft, missile, and building industries and wherever a long term protective and thermal coating or sealant is required. Provides protection against heat, cold, moisture, ozone, arc, corona, and corrosive atmospheres of many types.

Ru. Symbol for ruthenium.

"Rubanox Red." ¹⁴¹ Trade name for lithol rubine pigments.

Composition: Calcium salts of the azo pigments formed when 4-aminotoluene-3-sulfonic acid is coupled with beta-hydroxynaphthoic acid.

Properties: Bright bluish shade reds, clean in masstone, clean and strong in tint. Good resistance to light, good heat resistance, non-bleeding in water and organic solvents. May be blended with light reds to give clean intermediate shades.

Grades: Resinated and non-resinated.

Uses: Printing inks, paints, enamels, lacquers, rubber, plastics, wallpaper, floor coverings.

rubber accelerators. See accelerator (1).

rubber, chlorinated. See chlorinated rubbers. See also rubber hydrochloride.

rubber, cold. See cold rubber.

rubber, crepe brown. An inferior grade of raw natural rubber.

rubber fiber. Generic name for a manufactured fiber in which the fiber-forming substance is comprised of natural or synthetic rubber (Federal Trade Commission). Often the rubber is a core around which yarns of cotton or other fibers are wrapped to make an elastic yarn. Such yarns are used for girdles, swimwear, elastic bands and tapes.

rubber, hard. Rubber compounded with 30-50% sulfur. Usually contains some lime

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or magnesia as a filler. Used for acid and alkali resistant tank linings, battery boxes, etc.

rubber hydrochloride. A hydrochloride derivative rather than a chlorine derivative.

Properties: A thermoplastic white powder or clear film. Odorless, tasteless, non-flammable. Chlorine content 29-30.5%. Soluble in aromatic hydrocarbons. Softens at 110-120°C. Films are highly resistant to moisture, oils, acids, and alkalis but tend to become brittle on exposure to sunlight. The life of such films is greatly extended by the incorporation of suitable stabilizers and plasticizers.

Derivation: A solution of rubber is treated with anhydrous hydrogen chloride under pressure and at low temperature. After neutralization of excess hydrogen chloride the product is precipitated by the addition of ethyl alcohol.

Uses: Protective coverings for machinery, rainclothing, shower curtains, food packaging.

See also "Pliofilm."

rubber, natural (India rubber; caoutchouc) (C_5H_8)_x. Essentially cis-1,4-polyisoprene, a stereospecific polymer produced by natural growth processes in rubber trees and plants. The elastic solid obtained from the sap (latex) of the rubber tree (*Hevea brasiliensis*) by coagulation and drying, or from other similar sources.

Properties: Light cream to dark amber, amorphous, elastic, dry leaves, sheets, or slabs, consisting of caoutchouc, resins, and proteins. Sp. gr. about 0.9. Soluble in carbon disulfide, petroleum and coal-tar hydrocarbons, particularly solvent naphtha, chlorinated hydrocarbons and essential oils. Vulcanization (q.v.) with sulfur, etc., improves the properties markedly for practical application.

Grades: Rubber is graded according to the localities from which it is obtained, the best being first latex pale crepe and smoked sheets.

Occurrence: Brazil, British Malaya, Sumatra.

Containers: Bales, wooden boxes.

Uses: Electric insulation, elastic bands and webbing; combs, pen-holders; footwear, brush and other handles; toys, gas, air, and water hose, containers; vehicle tires, belting; etc.

Shipping regulations: None.*

rubber, pale crepe. A yellowish-white raw rubber obtained by addition of sodium bisulfite to latex, and then drying the washed coagulum without smoking.

rubber-plated metal. Metal with a coating of rubber applied by "electrodeposition" or "ionic coagulation" from latex or artificial dispersions of rubber. In forming a rubber coating by electrodeposition the surface to be covered is made the positive electrode and the layer is built up by the migration of the rubber particles toward this

positive electrode and their coagulation thereon by positively charged ions formed at that electrode by the passage of the current.

In ionic coagulation no electric current is employed. In this case the positively charged coagulating ions necessary to build up the rubber layer from the latex or rubber dispersion are supplied entirely by diffusion from a surface layer of salts or acids, which has been applied mechanically to the surface to be rubber covered. In either case the freshly deposited layer of rubber contains a large percentage of water and some soluble materials and hence is washed and dried before vulcanization.

The properties of the vulcanized coating may be varied from those of a soft, highly resilient rubber to a hard ebonite.

In general, rubber plating is applied to metal for the following reasons: (1) Protection against corrosion; (2) electrical insulation, (3) protection against abrasion or to furnish a cushioned surface. Hard rubber coatings furnish the greatest resistance to corrosion, and soft the greatest resistance to abrasion. Either hard or soft rubber coatings are satisfactory for electrical insulation.

Specific applications in each of the above three fields are as follows: (1) Corrosion resistance (dipping baskets, fan and pump rotors, centrifuge baskets, conveyor pins, spinnerette tubes, and bobbins; (2) electrical insulation (plating racks; pliers, screw drivers, and guards); (3) abrasion resistance (screen, perforated metal, conveyor buckets, and dishwashing racks).

rubber, reclaimed. A term used to describe replastified vulcanized rubber. It is made from old tires, ground up and digested with caustic soda, and from pulverized inner tubes by long heating with various hydrocarbon oils.

Properties:

Unvulcanized material: Somewhat rubbery. Vulcanizes with sulfur to become non-thermoplastic.

Vulcanized material: Rubbery. Said to have fair tensile strength, fair elongation at break.

Uses: Reclaimed rubber is widely used in mechanical rubber goods, footwear, etc. It may be used alone or in combination with crude rubber, depending on the quality of product desired. Its chief uses are in baby carriage tires, heels, jar rings, friction tape, garden hose and lower grades of belting.

Shipping regulations: Flammable solid. Yellow label.*

rubber resin. See rubber, synthetic.

rubber, smoked sheets. Made by sheeting coagulated natural rubber on even-speed rolls and drying in an atmosphere of smoke which acts as a preservative and turns the rubber brown. Pressed into bales of 200-220 lbs for shipment.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

rubber softener. See softening agents.

rubber solvent. A petroleum distillate used in making rubber cements and in tire manufacture. The volatility is usually similar to that of gasoline (boiling range 150-300°F) but may vary according to application.

rubber sponge (foam rubber) A cellular rubber containing 4-5 times the volume of air ordinarily found in rubber. May be produced by beating air into soapy latex with subsequent curing, or by incorporating ammonium carbonate or stearic acid and sodium bicarbonate in a very soft rubber stock. The heat of vulcanization releases NH_3 and CO_2 which inflate the rubber to a spongy mass. Certain organic nitrogen compounds (diazoaminobenzene, etc.) are often substituted for the above chemicals, since they also decompose with heat to yield a gas, and thus function as blowing agents.

rubber substitute. See factice.

rubber, synthetic. Synthetic elastic products whose properties resemble those of natural rubber. Synthetic rubbers are inferior to natural rubber in some respects, but definitely superior in other properties. Each variety of rubber tends to become a specialty product for the uses requiring a particular set of properties. See styrene-butadiene rubber (SBR, formerly GR-S), acrylonitrile rubber, butyl rubber, cold rubber (a variety of SBR), neoprene, polysulfide rubbers, polyurethane foams and rubber, and the new stereoregular polymers, polybutadiene, cis- and trans-polybutadiene, and polyisoprene. In addition to these commercially important synthetic rubbers, a great variety of experimental and special synthetic rubbers are known.

rubber, synthetic natural. An awkward term for the stereospecific synthetic rubbers which closely resemble natural rubber. These include cis-polybutadiene and cis-polyisoprene, which are like ordinary natural rubber, and trans-polybutadiene, which is like balata and gutta percha.

rubenic acid. See dithiooxamide.

rubellite. See tourmaline.

rubene. See naphthacene.

rubidium Rb. Element of atomic number 37; group I of the periodic table; radioactive isotopes known.

Properties: Soft, silvery-white metal; very easily oxidized in air. Must be kept immersed in naphtha, kerosine or the like. Soluble in acids and alcohol, decomposes water.

Constants: Sp.gr. 1.532, m.p. 39°C, b.p. 680°C.

Derivation: (a) By thermochemical reduction of rubidium chloride with calcium; (b) electrolysis of fused cyanide or chloride.

Source: Lepidolite.

Method of purification: Redistillation.

Grades: Technical.

Containers: Glass bottles under naphtha or kerosine.

Uses: Photocells; radio vacuum tubes; catalyst or catalyst promotor. The metal has been suggested as working fluid for vapor turbines in space vehicles; plasmas in thermoelectric devices; heat transfer fluids in power generators; grain-refining agents in metals.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label.*

rubidium alum. See aluminum-rubidium sulfate.

rubidium bromide (rubidium monobromide)

RbBr.

Properties: Lustrous, colorless, crystalline powder. Soluble in water; insoluble in alcohol.

Constants: Sp.gr. 3.35, m.p. 682°C.

Grade: C.P.

Use: Medicine.

rubidium carbonate (rubidium carbonate, normal) Rb_2CO_3 .

Properties: White powder; m.p. 837°C. deliquescent. Soluble in water.

Grades: C.P.

Caution: Keep well stoppered!

rubidium carbonate, normal. See rubidium carbonate.

rubidium-caesium-ammonium bromide. See cesium-rubidium-ammonium bromide.

rubidium-caesium bromide. See cesium-rubidium bromide.

rubidium-caesium chloride. See cesium-rubidium chloride.

rubidium chloride RbCl.

Properties: White, crystalline powder.

Lustrous. When heated it decrepitates, melts and volatilizes. Soluble in water; very slightly in alcohol.

Constants: Sp.gr. 2.76, m.p. 715°C.

Grades: Technical, C.P.

Use: Analysis (testing for perchloric acid).

rubidium hydrate. See rubidium hydroxide.

rubidium hydroxide (rubidium hydrate) RbOH.

Properties: Grayish-white mass, deliquescent, strong base. Soluble in alcohol, water.

Constants: Sp.gr. 3.2, m.p. 300°C.

rubidium iodide RbI.

Properties: White crystals. Soluble in water.

Constants: Sp.gr. 3.65, m.p. 642°C; b.p. 1300°C. Discolors in air and light.

Use: Medicine

rubidium monobromide. See rubidium bromide.

rubidium sulfate Rb_2SO_4 .

Properties: White rhombic crystals. Stable. Soluble in water.

Constants: Sp.gr. 3.613; m.p. 1060°C.

Insoluble in alcohol.

Grades: C.P.

Use: Medicine.

rubigo. See iron oxide reds.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Rubinol.**" ³⁰⁷ Fast alizarine direct red dye-stuff.

"**Rubramin.**" ⁴¹² Trademark for vitamin B₁₂ (q. v.).

"**Rub-Sol.**" ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run overhead distillation of crude petroleum.

Properties: Water-white; boiling range 105-204°F; sp. gr. 0.687 (60°F); wt/gal 5.72 lbs at 60°F; flash point, Tag closed cup, -40°F.

Caution: Fire hazard — keep lights and fire away.

Use: In rubber industry for rubber cement and swabbing.

Shipping regulations: Flammable liquid. Red label.*

rubus (blackberry bark).

Derivation: The dried root-bark of the blackberry, *Eubatus rubus*.

Occurrence: Eastern United States.

Grades: Technical.

Containers: Barrels.

Use: Medicine.

Shipping regulations: None *

ruby. See corundum for the true ruby. Synthetic rubies are made from aluminum oxide (containing small amounts of other metals) by the single crystal-growing technique. These have found some use in masers.

ruby wood. See *santalum rubrum*.

"**Ruelene.**" ²³³ Trademark for organophosphorus products and formulations for use as parasiticides, insecticides, veterinary drugs and animal health products.

rue oil.

Properties: Essential oil, colorless to yellow; usually fluoresces, intense, persistent, characteristic odor.

Chief known constituents. Methyl n-nonyl ketone, methyl n-heptyl ketone, methyl anthranilate.

Constants: Variable, according to botanical origin and vegetative condition of plant at time of distillation.

Range of properties: Sp. gr. 0.8328-0.847 (15°C), optical rotation -5° to +2°, soluble in 1½-4 vols 70% alcohol.

Derivation: Distilled from various species of the genus *Ruta*.

Adulteration: Mineral oil, turpentine oil.

Containers: Bottles.

Uses: Veterinary medicine, organic synthesis; perfumery, and for isolation of methyl nonyl ketone.

Shipping regulations: None.*

"**Rufert.**" ¹³⁴ Trademark for nickel catalyst for hardening margarine.

"**Ruflux.**" ³³⁷ Trade name for a line of titanium and zirconium products.

"Ruflux" C: See "Weldopax."

"Ruflux" I: Ilmenite (granular and milled) 60% TiO₂ min, black to brown color, sp. gr. 4.7; bulk density 180 lb/cu ft; m. p. 2800°F, particle size (granular) +100 mesh 3%,

+200 mesh 67%; (milled) +200 mesh 2%.

Used in weld rod coatings, ceramic glaze speck material, ceramic body and glaze colorant.

"Ruflux" P: Potassium titanate (K₂TiO₃ + TiO₂). 72% min TiO₂. Tan powder; sp. gr. 4.1; bulk density 91 lbs/cu ft; m. p. 2940°F. Used in weld rod coatings.

"Ruflux" S: Sodium titanate, 78% min TiO₂. Used in weld rods to help stabilize the arc.

"Ruflux" T: See "Treopax." Used in weld rod coatings to increase slag viscosity.

"Ruflux" Z: See Zircon Milled "G". Used in weld rod coatings to increase slag viscosity.

"Ruflux" 61: Rutile milled; 92% min TiO₂, gray brown powder, sp. gr. 4.2; bulk density 120 lbs/cu ft, m. p. 3250°F. Used in weld rod coatings to aid fluxing, control fusion, stabilize the arc, and contribute to welding speed.

"Ruflux" 84: Rutile granular, 92% min TiO₂, gray-brown powder, sp. gr. 4.2; bulk density 171 lbs/cu ft; m. p. 3250°F; fineness +140 mesh 57.2%; +180 mesh 37.5%, -180 mesh 5.4%. Used in coatings for mild and alloy steel welding rods to provide arc stabilizing flux and slag forming material, minimizes cracking from excessive shrinkage of the weld rod coating; also used as source of TiO₂, as a speckling agent in ceramic glazes, and as a raw material for titanium metal.

"**Rulan.**" ²⁸ Trademark for flame-retardant plastic, composed essentially of "Alathon" polyethylene resin, a flame-retardant, and an antioxidant.

Form: "Cube-cut," in 50-lb multiwall paper bags.

Properties: "Rulan" has most of the good properties of polyethylene, particularly low electrical loss, high resistivity, and moisture-resistance. It does not support combustion, and does not drip when heated. It has passed the Underwriters' Laboratories vertical flame test.

Constants: Tensile strength 1400 psi, yield point 1400 psi, elongation 300%, water-absorption 0.02%, power factor 0.0015; dielectric constant 2.5.

Uses: As a high-frequency dielectric with flame-retardant characteristics, particularly as insulation on wire.

rumex (yellow dock, curl dock).

Derivation: Dried root of *Rumex crispus* or *obtusifolius*.

Occurrence: United States, Europe.

Chief constituent: Tannins.

Use: Medicine.

rosa oil. See *palmarosa* oil.

Russian blistering flies. See *cantharides*.

Russian flies. See *cantharides*.

"**Rust-Ban.**" ⁵¹ Trademark for a series of products designed to prevent corrosion of metals. Group comprises hard-drying and bituminous types with thinners and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

primers. Also grades suitable for aviation and automotive crank-case use.

"Rustmaster." ⁴⁴⁸ Trade name for alkyd type primers and top coatings for metal, wood, and masonry.

ruthenic chloride. See ruthenium chloride.

ruthenium Ru. Element of atomic number 44, group VIII of the periodic system.

Properties: Silvery-white, nonductile metal of the platinum group. Sp.gr. 12.2, m.p. 2450°C, b.p. 3700°C, Brinell hardness 220 (cast). Insoluble in acids and in aqua regia, is attacked by fused alkalis.

Derivation: Occurs with platinum, from which it is recovered.

Uses. Hardener for platinum and palladium in jewelry, electrical contact alloys.

ruthenium chloride (ruthenic chloride; ruthenium sesquichloride) RuCl_3 .

Properties: Brownish-red crystalline mass; deliquescent. Soluble in water.

Grades: Technical, C.P.

Use: Analysis (testing for sulfur trioxide).

ruthenium red (ammoniated ruthenium oxychloride) $\text{Ru}_2(\text{OH})_2\text{Cl}_4 \cdot 7\text{NH}_3 \cdot 3\text{H}_2\text{O}$.

Properties: A brownish-red powder.

Soluble in water.

Grade: C.P.

Uses: Microscopic stain and reagent for pectin, plant mucin and gum.

ruthenium sesquichloride. See ruthenium chloride.

ruthenocene $(\text{C}_5\text{H}_5)_2\text{Ru}$. Dicyclopentadienyl-ruthenium. A coordination compound.

See dicyclopentadienyl metal compounds.

rutile TiO_2 . Natural titanium dioxide. May contain up to 10% iron.

Properties: Color red, reddish brown, to black; luster adamantine to submetallic, streak pale brown; hardness 6-6.5, sp.gr. 4.18-4.25. May occur included in other minerals in hair or needle-like penetrations. Insoluble in acids.

Occurrence: Virginia, Florida, North Carolina, Arkansas, Maryland, Nevada; Europe, Brazil.

Use: Source of titanium and titanium compounds, ceramics, steel deoxidizer, pigment for paints, enamels and tiles. See also titanium dioxide.

"Rutile, Ceramic." ³³⁷ Trade designation for 92% TiO_2 . Light brown powder, sp.gr. 4.2, bulk density 98 lbs/cu ft, m.p. 3250°F, fineness (average) 44 microns max. In-

soluble in water and alkalis, slightly soluble in dilute mineral acids, soluble in hot concentrated sulfuric acid.

Uses: Glazes, floor tile, art ware and dinner ware bodies.

Containers: 100-lb paper bags; 600-lb barrels, 40,000-lbs min carload.

rutin (melin; quercetin-3-rutinoside)

$\text{C}_{27}\text{H}_{30}\text{O}_{16} \cdot 3\text{H}_2\text{O}$. The 3-rhamnoglucoside of 5,7,3',4'-tetrahydroxyflavonol. A bioflavonoid.

Properties: Tasteless, bright yellow or greenish yellow powder; nontoxic; m.p. about 190°C; dec. 215°C. Very slightly soluble in cold water, more soluble in hot water and hot alcohol; soluble in isopropyl alcohol, pyridine and solutions of alkali hydroxides.

Derivation: By extraction from buckwheat.

Grades: N.F. XI, technical.

Containers: Fiber drums.

Use: Medicine; vitamins.

rutinsol.

Properties. A water-soluble rutin obtained from the reaction of rutin with magnesia. Reddish-brown amorphous powder, odorless, bitter taste. Water solutions slightly alkaline, pH about 9. Insoluble in organic solvents.

Grades: 83-88% pure rutin.

Use. Liquid medical preparations.

ryania. Ground stem wood or *Ryania Speciosa*.

The active principles are alkaloids.

Toxicity: Low to animals.

Containers: Bags.

Use. Insecticide.

"Ryanicide." ³⁴² Trademark for powdered ryania insecticide concentrates.

rye ergot. See ergot.

"RZ-50-A." ⁵⁸ Trade name for 50% solution of N,N-dimethylcyclohexylamine salt of dibutylidithiocarbamic acid. Also available as "RZ-50-B" with emulsifying agents for use in latex.

Properties: Clear, dark liquid, sp.gr. 0.964.

Containers: 40-lb cans.

Uses: Rubber accelerators.

"RZ-50-B." ⁵⁸ Trademark for 50% solution in "Cellosolve" of the N,N-dimethylcyclohexylamine salt of dibutyl-dithiocarbamic acid, with emulsifying agents added. Specifications: A clear dark-brown liquid; sp gr. (25°C) 0.98, turbid point 10°C max. Use: Stabilizer for latex emulsions.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

S

S. Symbol for sulfur.

"SA-326." ⁵⁸ Trade name for ortho-biphenyl biguanide (q.v.).

sabadilla (cevadilla).

Derivation: Seeds of *Sabadilla officinalis*.
Occurrence: Mexico to Guatemala and Venezuela.

Grades: Technical.

Containers: Bags, barrels.

Uses: Medicine; source of veratrine, insecticides.

Shipping regulations: None.*

sabal. See serenoa.

sabina. See savin.

D-saccharic acid (2, 3, 4, 5-tetrahydroxyhexanedioic acid, tetrahydroxyadipic acid)

$\text{COOH}(\text{CHOH})_4\text{COOH}$. The 1, 6-dicarboxylic acid formed by the oxidation of D-glucose.

Properties: White needles or syrup, very soluble in water, alcohol, or ether, deliquescent; m.p. 125-126°C with decomposition.

Derivation: Oxidation of cane sugar, glucose, starch by nitric acid.

saccharin (ortho-benzosulfimide, glucide, benzoylsulfonic imide) The anhydride of orthosulfimide benzoic acid.

$\text{CHCHCHCHCHCCCO}(\text{NHSO}_2)$.

Properties: White, crystalline powder; exceedingly sweet taste (500 times that of cane sugar). M.p. 226°-230°C. Soluble in amyl acetate, ethyl acetate, benzene and alcohol; slightly soluble in water, chloroform and ether.

Derivation: A mixture of toluenesulfonic acids is converted into the sodium salt, then distilled with phosphorus trichloride and chlorine to obtain the ortho-toluene sulfonyl chloride, which by means of ammonia is converted into ortho-toluenesulfamide.

This is oxidized with permanganate, treated with acid and saccharin crystallized out.

Method of purification: Recrystallization.

Grades: Commercial; C.P.; U.S.P. XVI.

Containers: Bottles; drums.

Uses: Manufacture of syrups; medicine (substitute for sugar); sweetening champagne, oils, soft drinks, foods, etc.

Shipping regulations: None.*

saccharin calcium (calcium ortho-benzosulfimide) $\text{C}_{14}\text{H}_9\text{CaN}_2\text{O}_6\text{S}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$.

Properties: White crystalline powder or white crystals. Odorless, or with faint aromatic odor. Intensely sweet taste (500 times that of cane sugar). Soluble in water.

Grade: U.S.P. XVI.

Containers: Fiber drums.

Use: Medicine, sweetening agent.

saccharin, sodium (sodium benzosulfimide, soluble glucide; soluble saccharin) $\text{C}_7\text{H}_4\text{NNaO}_3\text{S} \cdot 2\text{H}_2\text{O}$. The sodium salt of saccharin (q.v.). A sweetening agent. (In dilute solutions, 500 times as sweet as sucrose).

Properties: White crystals or crystalline powder, odorless; intensely sweet taste; very soluble in water; slightly soluble in alcohol.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine, sweetening agent.

saccharin, soluble. See saccharin, sodium.

saccharolactic acid. See mucic acid.

saccharose. See sugar, cane.

saccharum lactis. See lactose.

saccharum, U.S.P. See sugar, cane.

Sachsse process. See BASF process.

S-acid. See 1-amino-8-naphthol-4-sulfonic acid, 1-naphthylamine-8-sulfonic acid.

"Saron." ¹⁷³ Trademark for a concentrated water-soluble material used to restore sizing in dry cleaned garments. It is a thermoplastic resin type product which restores sizing lost through wear and in the course of dry cleaning.

sacred bark. See cascara sagrada bark.

SAE. Abbreviation for Society of Automotive Engineers. The initials are applied to its specifications and tests for motor fuels, oils and steels.

SAF black. Abbreviation for super abrasion furnace black. See furnace black.

"Safemark." ⁹⁹ Trade name for a specially processed natural earth mineral of exceptional whiteness, which is completely free flowing even in humid weather. Will go into water suspensions quickly and easily with minimum stirring, making it an excellent wet marking material.

Containers: 50-lb multiwall paper bags.

safety glass. See polyvinyl butyral resin sheeting.

"Safety-Linen Sour." ²⁴⁴ A proprietary product consisting chiefly of acid fluorides.

Properties: White granular solid; soluble in water, neutralizing value 21.7 oz sodium bicarbonate per lb.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

salol (phenyl salicylate; salicylic acid phenyl ester) $C_6H_4OHCOOC_6H_5$.

Properties: White crystalline powder; faint aromatic odor and taste. Soluble in alcohol, ether, chloroform, benzene and fixed or volatile oils; sparingly soluble in water. Sp.gr. 1.2614; m.p. 41.9°C; b.p. 172°-173°C. Absorbs light, especially at 290-330μ.

Derivation: By heating salicylic acid and phenol with phosphorus pentachloride or other dehydrating agent.

Method of purification: Recrystallization. Grades: Technical; N.F. XI (as phenyl salicylate).

Containers: 100-lb kegs; barrels.

Use: Medicine; preservative; as light absorber in plastics, waxes, polishes, suntan oils.

Shipping regulations: None.*

sal soda (washing soda, sodium carbonate decahydrate) $Na_2CO_3 \cdot 10H_2O$.

Properties: White crystals; sp.gr. 1.44; m.p. 32.5-34.5°C, loses water at this temperature. Easily soluble in water, insoluble in alcohol. A pure but relatively expensive form of sodium carbonate (soda ash).

Containers: Steel drums, multiwall paper sacks, wooden barrels; fiber cans.

Uses: Washing textiles, bleaching linen and cotton; general cleanser.

Shipping regulations: None.*

salt.

1. The compound, other than water, which is formed by the reaction of an acid with a base, e.g., copper sulfate is the salt resulting from the reaction between sulfuric acid and copper hydroxide.

2. Specifically, sodium chloride.

sal tartar. See sodium tartrate.

salt, black. A monohydrated sodium carbonate containing some caustic soda, as was obtained in the Leblanc soda process.

salt cake Impure sodium sulfate (90-99%) obtained, usually as a byproduct, from (a) production of hydrochloric acid, (b) by crystallization from natural brines, such as the Searles Lake brine; (c) from the coagulating bath for viscose rayon; (d) by the Hargreaves process. Impurities vary with the source.

Grades: Technical; glassmakers' (iron-free).

Containers: 200-lb bags, 500-lb barrels, carloads.

Uses: Paper pulp, detergents and soaps, plate and window glass; sodium salts; ceramic glazes; dyes.

salt, common. See sodium chloride.

salt, Glauber's. See Glauber's salt.

salting out process. The addition of salts to a mixture to recover proteins, soaps, or simpler organic substances. The salting out or precipitation of the desired component results from the dehydrating action of the added salt.

salt of Lemery. See potassium sulfate.

salt of lemon. See potassium binoxalate.

salt of phosphorus. See sodium ammonium phosphate.

salt of sorrel. See potassium binoxalate.

salt peter. See niter, and potassium nitrate.

salt peter, Chile. See caliche.

salt peter, soda. See caliche.

salt, preparing. See sodium stannate.

salt, rock. See halite.

salt, sea. See sodium chloride.

salts, Epsom. See magnesium sulfate.

salt, table. See sodium chloride.

salt, tin. See stannous chloride.

salufer. See sodium fluosilicate.

"Salvarsan." See arsphenamine.

salvia (sage; garden sage). Dried leaves of perennial shrub, *Salvia officinalis*.

Occurrence: Southern Europe, cultivated in United States; England; France and Italy.

Grades: Dalmatian; Greek, Italian.

Containers: Bags, cans.

Use: Condiment.

Shipping regulations: None.*

salvia oil. See sage oil.

"Salyrgan." ¹⁶² Trademark for mersalyl.

samarium. Sm. One of the rare earth metals (Group III) of the cerium subgroup, atomic number 62, valence +2 and +3.

Properties: Hard brittle metal which quickly tarnishes in air. Found in small quantities in such minerals as cerite, gadolinite and others. Ignites to form oxide at 200-400°C; liberates hydrogen from water. Sp.gr. about 7.50; m.p. 1052°C; b.p. 1600°C (approx); about as hard as iron.

Derivation: Reduction of the oxide with barium or lanthanum.

Grades: Ingots, lumps, turnings (high purity).

Uses: Nuclear reactor control rods; neutron shields; metallurgy.

samarium salts.

samarium chloride $SmCl_3 \cdot xH_2O$. Faintly yellow crystals, soluble in water. Hygroscopic.

Obtained by treating the carbonate or oxide with hydrochloric acid. Grades: Up to 99.9% samarium salts. Available as 45% Sm_2O_3 .

samarium fluoride $SmF_3 \cdot 2H_2O$. Grades: Up to 99.9% samarium salts. Available as 77% Sm_2O_3 .

samarium nitrate $Sm(NO_3)_3 \cdot xH_2O$. Faintly yellow crystals; soluble in water. Grades: Up to 99.9% samarium salts. Available as 40% Sm_2O_3 . Shipping regulations: Oxidizing material. Yellow label.*

samarium oxalate $Sm_2(C_2O_4)_3 \cdot xH_2O$. White powder, insoluble in water, slightly soluble in acids. Grades: Up to 99.9% samarium salts. Available as 50% Sm_2O_3 .

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

samarium oxide Sm_2O_3 . Cream-colored powder; insoluble in water; soluble in acids. Absorbs moisture and carbon dioxide from the air. M.p. 2300°C ; sp.gr. 7.43.

Grades: Up to 99.9% samarium oxide. **samarium sulfate** $\text{Sm}_2(\text{SO}_4)_3 \cdot x\text{H}_2\text{O}$. Faintly yellow crystals, slightly soluble in hot water, more soluble in cold. Grades: Up to 99.9% samarium salts. Available as 45% Sm_2O_3 .

Containers: Glass bottles; fiber drums.

Uses: In red and infrared sensitive phosphors; (oxide) infrared-absorbing glass; catalysis.

samarskite (Y, Er, Fe, U)(Ta, Nb) $_2\text{O}_6$.

A natural oxide of rare earth metals, iron, uranium, niobium, and tantalum.

Properties: Color black to brown, streak reddish brown, black; luster vitreous to resinous; hardness 5-6; sp.gr. 5.7.

Occurrence: North Carolina, Colorado, Idaho, Europe; Brazil; Madagascar.

sand. A natural material, usually composed largely of quartz, with grain sizes ranging from 0.05-5 mm. It is found in rivers and lakes, on seashores, in soils, and elsewhere. Varieties include furnace sand (q.v.), glass sand (q.v.), and also filter sand and molding sand.

Uses: Building and construction work; glassmaking; filtration; foundry work, by railroads; as a filler; dusting agent; abrasive.

sand acid. See fluosilicic acid.

sandal oil. See sandalwood oil.

sandalwood. See *santalum album*.

sandalwood oil (*santalum* oil; *santal* oil, *sandal* oil; East Indies sandalwood oil).

Properties: Pale yellow, somewhat viscous essential oil; faint, aromatic, persistent odor; harsh, resinous taste, somewhat pleasant. Sp.gr. 0.974-0.985 (15°C); optical rotation -15° to -20° in 100 mm tube at 25°C , refractive index 1.504-1.508; acid value 0.5-8.0, ester value 3-17, after acetylation, not less than 196; soluble in 3-5 vols of 70% alcohol, in 5-6 vols of 69% alcohol; in 6-7 vols of 68% alcohol.

Derivation: By the steam distillation of the wood of *Santalum album* of India.

Adulteration: Cedarwood oil, copaiba and gurjun balsam oils, castor oil; sesame oil; liquid paraffin; linseed oil.

Containers: Cans.

Uses: Medicine, perfumery.

Shipping regulations: None.*

sandalwood oil, Australian.

Properties: Differs slightly from Indian sandalwood oil and is cheaper.

Derivation: By distillation of wood of *Eucalypta spicata* in West Australia.

Use: Perfumery.

sandalwood oil, East Indies. See sandalwood oil.

sandalwood oil, West Indies (*amyris* oil).

Properties: Viscous essential oil. Odor,

faint, somewhat unpleasant. Soluble in 1 vol or less of 90% alcohol; in 2-10 vols of 80% alcohol (occasionally).

Chief known constituents: Amyrol; amyrolin; cadinene; caryophyllene; etc.

Constants: Sp.gr. 0.950-0.970 at 15°C ; optical rotation $+19^\circ$ to $+29^\circ$; refractive index 1.508-1.513; acid value up to 3.0; ester value up to 6.0, after acetylation, 66-125.

Derivation: By steam distillation of the wood of *Amyris balsamifera*, L.

Containers: 24-oz bottles; 25-, 40-lb tins; 80-lb cases.

Uses: Medicine; perfumery.

Shipping regulations: None.*

sandalwood, red. See *santalum rubrum*.

sandarac gum (*juniper* gum).

Properties: Yellow, brittle, translucent, amorphous lumps or powder. Soluble in alcohol, ether, acetone, amyl alcohol and hot caustic alkali; partially soluble in volatile oils, carbon disulfide, chloroform and oil of turpentine; insoluble in light petroleum hydrocarbons, benzene and water.

Derivation: The resin from *Callitris quadrivalvis*, indigenous to Morocco.

Grades: Technical.

Containers: Bags.

Uses: Incense; varnishes, lacquers, dental cements.

Shipping regulations: None.*

sand, glass. A sand of medium grain consisting of 98 to 100% of silica (SiO_2) and containing less than 1% of : oxides. Found in many parts of the country.

sand, molding. A sand used for making the molds for casting metal.

sand, placing. A sand used in the pottery industry for the placing of bisque ware. It must be free of iron and fluxes so that it will not flux with the body with which it comes in contact.

"Sandril."¹⁰⁰ Trade name for reserpine (purified reserpine alkaloid of *Rauwolfia* species) (3,4,5-trimethoxybenzoic acid plus an amino acid called reserpic acid).

Properties: M.p. $264-265^\circ\text{C}$, optically active, $[\alpha]_D^{25} -115^\circ$ (in chloroform).

Use: Medicine.

sandstone. A variety of sedimentary rock consisting essentially of grains of quartz, sometimes with feldspar, mica, and other materials. The cohesion of the grains may be caused by pressure or by a binder of silica, iron oxide, calcite, or clay. The corresponding rocks are siliceous, ferruginous, calcareous or argillaceous sandstones.

Use: Building stone.

sandwich molecule. See molecular sandwich.

"Sanforized."⁷ Trademark used on fabrics treated by a special process to limit shrinkage to not over 1% by the government standard wash test. Used extensively on cotton goods and to lesser extent on others.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

The process mechanically rearranges the yarns of a fabric by the amount the yarns would be shortened if laundered. The shrinkage characteristics are first determined in separate tests. The desired shrinkage is obtained by water spray and steam heat while the cloth is in a special machine that regulates the width and length of the cloth. The machine regulating the length consists of a large steam heated cylinder, an endless thick woolen felt blanket in close contact with the cylinder for most of its perimeter, and an electrically heated shoe which presses the cloth against the blanket while the former is in a stretched condition as it curves around the feed-in roll.

sanguinaria (bloodroot; blood geranium; red puccoon; red-root, tetterwort).

Derivation: Dried rhizome and roots of *Sanguinaria canadensis*.

Occurrence: North America.

Grades: Technical, N.F. XI.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

sanitizers. A special class of disinfectants designed for use on food processing equipment; dairy utensils; dishes and glassware in restaurants. Among them are the hypochlorites; chloramines and other organic chlorine-liberating compounds, and quaternary ammonium compounds, many of which are proprietary. See antiseptics; disinfectants.

santal oil. See sandalwood oil.

santalol $C_{15}H_{24}O$. A sesquiterpene alcohol.

Properties: Colorless liquid, with a characteristic odor of oil of sandalwood. Soluble in 3 parts of 70% alcohol. Insoluble in water; sp.gr. 0.971-0.973; refractive index 1.504-1.508, b.p. about 300°C.

Derivation: From sandalwood oil.

Use: Perfumery.

santalum album (sandalwood, yellow saunders).

Heartwood of *Santalum album*.

Occurrence: India, Malaya.

Use: Source of sandalwood oil; incense, fumigant.

santalum rubrum (red saunders; ruby wood, sandalwood). Heartwood of tree *Petrocarpus santalinus*.

Properties: (Unground) purplish, reddish-orange or reddish-brown powder, dusky red to dark reddish-orange chips; nearly odorless; slightly astringent taste.

Occurrence: East Indies.

Containers: (Chips) bags; (powder) fiber drums.

Use: Coloring extract.

Shipping regulations: None.*

santaly acetate. Acetic acid ester of a mixture of alpha- and beta-santalols.

Properties: Colorless liquid, with a light odor of sandalwood. Sp.gr. 0.982-0.985, refractive index 1.487-1.492.

Derivation: By the treatment of sandalwood oil or santalol with acetic anhydride.

Use: Perfumery.

"Santicizer." ⁵⁸ Trademark for a line of resin plasticizers including:

"Santicizer 1-H": N-Cyclohexyl-para-toluene-sulfonamide, $C_{13}H_{19}O_2NS$.

Properties: Yellowish brown fused mass.

M.p. 83.5°C min; moisture 0.25% max;

color of melt APHA 250 max; soluble in alcohols, esters, ketones, aromatic hydrocarbons, and vegetable oils; slightly soluble in gasoline hydrocarbons; insoluble in water.

Use: In paper coatings, textile coatings and adhesives.

"Santicizer 3": N-Ethyl-para-toluenesulfonamide.

Properties: Practically white crystalline solid, m.p. 58.0°C min; acidity (as acetic acid) 0.10% max; sp.gr. (65/65°C) 1.166-1.176; compatible with cellulose acetate up to about 50 parts per 100 parts of resin.

Uses: Especially in combination with other plasticizers.

"Santicizer 8": Mixture of N-ethyl-ortho- and para-toluenesulfonamides.

Properties: Light yellow, viscous liquid; odor slight, characteristic, free amide 9-13%; acidity (as acetic acid) 0.1% max.

Solubility: Readily miscible with all common organic solvents except the petroleum hydrocarbons in which it is only very slightly soluble. In water, soluble to approx. 0.13% at 23°C, 0.21% at 48°C, soluble in castor oil, slightly soluble in china wood oil, insoluble in linseed oil. Its solubility in water decreased by presence of ammonia but increased by other alkalis.

Uses: Plasticizer for cellulose acetate, for coatings designed to withstand gasoline and related products. Some plasticizing action on casein, glue, soybean protein and corn protein. Increases the flexibility of shellac with considerable softening effect; also useful with polyvinyl acetate adhesives; and synthetic polyamides such as nylon.

"Santicizer 9": Mixture of ortho- and para-toluenesulfonamides.

Properties: Fine granular particles, m.p. 105°C min; melt clear and light yellow, acidity, pH 4.6 min in dilute acetone (2 g sample in 15 ml A.R. acetone and 35 ml of CO₂-free distilled water).

Solubility: Quite low in coal-tar hydrocarbons and negligible in petroleum hydrocarbons, readily soluble in most other solvents, and in hot linseed, china wood and castor oils, soluble in water only about 1.0% at 34°C, but this is increased by the presence of alkali, solubility in ethylene dichloride approx. 4%, in benzene approx. 1.5%, each at 30°C.

Uses: Relatively small amounts impart a gloss to polished articles, give smooth working and uniform curing of molded thermosetting products; blends readily with most synthetic resins, does not impart the softening action of liquid plasticizers. Valuable for molding compositions. In

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

some phenol-aldehyde resins it appears to act as a promoter, giving more uniform and thorough curing.

"Santicizer B-16": Butyl phthalyl butyl glycolate.

Properties: A liquid; sp. gr. (25/25°C) 1.098 ± 0.005 ; refractive index 1.490 ± 0.002 at 25°C; acidity (as acetic acid) 0.02% max; essentially odorless; sulfur (copper strip test) negative; b.p. (5 mm) 219°C; does not crystallize at temperatures as low as -35°C; water solubility 0.0012% at 30°C; extremely light-stable; darkens on heating above 290°C.

Uses: A polyvinyl-chloride plasticizer where a tasteless and non-toxic composition is required, may be used in vinyl food wrappings. Solvent for nitrocellulose; compatible with most resins, imparting flexibility. Miscible with castor, linseed and china wood oils, somewhat retards gel formation in the latter on heating. Swells crepe rubber but appears to have no effect on vulcanized rubber, plasticizer for chlorinated rubber and polystyrene.

"Santicizer E-15": Ethyl phthalyl ethyl glycolate.

Properties: A liquid; color (APHA), 20 max, sp. gr. (25/25°C) 1.182 ± 0.003 , refractive index 1.498 ± 0.002 (25°C); acidity (as acetic acid) 0.02% max, odor slight; sulfur (copper-strip test) negative.

Solubility: Miscible with the common organic solvents except the petroleum hydrocarbons; when heated, miscible with vegetable oils but partially separates on cooling, solubility in water 0.0175% at 30°C.

Use: Solvent for nitrocellulose and cellulose acetate and many other resins, giving clear, tough flexible films which have increased resistance to moisture penetration; light-fast, does not evaporate even from the thinnest films. May be used as plasticizer in composition for food wrapping and packaging.

"Santicizer M-17": Methyl phthalyl ethyl glycolate.

Properties: A liquid, color (APHA) 20 max, sp. gr. (25/25°C) 1.220 ± 0.005 , refractive index 1.504 ± 0.002 (25°C), acidity (as acetic acid) 0.02% max, slight characteristic odor, sulfur (copper strip test) negative.

Solubility: Not miscible with castor, linseed, or china wood oils or with petroleum hydrocarbons, readily miscible with other organic solvents; solubility in water 0.09% at 30°C.

Uses: A solvent for nitrocellulose and cellulose acetate; imparts plasticity which is undiminished even in thin films exposed to air currents for a long time. Light-stable. Dissolves "Santolite" resins to produce gasoline-resistant coatings.

"Santicizer 140": Mixed cresyl diphenyl phosphates.

Properties: Clear mobile liquid; color (APHA) 40 max; sp. gr. (25/25°C) 1.208 ± 0.005 ; refractive index 1.56 ± 0.01 (25°C); acidity (as H_3PO_4) 0.01% max; odorless; b.p. (10 mm) 258°C; pour point -37°C approx.

Uses: Imparts flame retardance, permanence, chemical stability; and heat and light stability in vinyl sheeting, lacquers, paper coating, cellulose acetate, cellulose nitrate, ethyl cellulose, cellulose acetate-propionate, polyvinyl formal and polyvinylbutyral.

"Santicizer 141": Alkyl aryl phosphate. Used as a non-flammable plasticizer for vinyl resins.

"Santicizer 160": Butyl benzyl phthalate.

Properties: Nearly water-white, oily liquid with faint characteristic odor; sp. gr. about 1.113-1.121 (25/25°C), acidity (as phthalic acid) 0.02% max.

Uses: A relatively nonvolatile plasticizer for polyvinyl chloride, polyvinyl chloride-acetate, polyvinyl butyral, ethyl cellulose and nitrocellulose. Compatible with cellulose triacetate, polyvinyl formal, cellulose acetate-butyrate, cellulose propionate, polyvinyl acetate and acrylics. Effective in cellulosic lacquers imparting toughness, flexibility, low-moisture vapor transfer, heat and light stability. Also useful for low molecular weight polystyrene.

"Santicizer 165": Mixed-alcohol phthalate used as plasticizer for vinyl resins and nitrocellulose.

"Santicizer 602":

Properties: Clear oily liquid.

Uses: A primary plasticizer for polyvinyl chloride with lower volatility than dioctyl phthalate (DOP), resistant to soapy water extraction and alkali. Used in vinyl floor tile, plastisols, film and sheeting.

"Santicizer 603":

Properties: Clear oily liquid free of sediment or turbidity; odor, characteristically mild.

Uses: Low cost primary plasticizer for polyvinyl chloride and copolymer type resins, in calendered vinyl products such as film and sheeting for shower curtains, drapes and upholstery.

"Santicizer 630": Modified-phthalate plasticizer more volatile than dioctyl phthalate.

"Santicizer 636": 2-Ethylhexyl isodecyl phthalate. Nearly colorless liquid miscible with common solvents, thinners, and oils. Used as plasticizer.

"Santobane." ⁵⁸ Trademark for DDT.

"Santobrite." ⁵⁸ Trademark for sodium pentachlorophenate, technical.

"Santocel." ⁵⁸ Trademark for silica aerogel.

Properties: Colors, white, transparent in vehicles, absolute density 17.1 lb/gal, 0.0585 gal/lb; refractive index 1.464, oil absorption 2.5 g oil/g.

Typical analysis: SiO_2 , 90% min; Na_2SO_4 , 2.7% max; Al_2O_3 and Fe_2O_3 , 1.0%, volatile 4.0-6.0%; pH (4.0 g in 100 cc H_2O) 3.5-4.0. Volatile portion is water, alcohol and acetaldehyde.

Grades: "Santocel" 54, "Santocel" C, "Santocel" CX, "Santocel" CS, "Santocel" DCS, "Santocel" CF (upground, crude).

Containers: Multiwall bags, net 20-lbs for 54; 25-lbs for C, CS and DCS; 15-lbs for CX.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Flatting agent to produce matte finishes in coatings of all types (lacquers, varnishes, vinyl resin coatings and resin dispersions); bodying agent in printing inks; bulking agent for dry powders; free-flowing and anticaking agent for dry powders; insecticide for stored industrial grains; application aid for rubber cements; reinforcing agent for silicone rubbers; bodying agent to make lubricating greases; dry grinding aid for DDT and other sticky powders; to raise head distortion point, as in molded brake linings; mold lubricants for hard rubber; bodying agent for paint removers; antisetling agent for pigments; antislip agent in paste floor waxes; flatting agent for free film and textile coatings; thixotropic agent for polyester and epoxy resins, dispersions and solutions.

"Santochlor." ⁵⁸ Trademark for para-dichlorobenzene.

"Santocure." ⁵⁸ Trademark for N-cyclohexyl-2-benzothiazole-sulfenamide.

Properties: Tan or buff powder, m.p. 94°C; sp.gr. 1.27; soluble in ethyl ether.

Containers: 50-lb bags, 150-lb drums.

Use: Rubber accelerator.

"Santocure" NS. ⁵⁸ Trademark for N-tert-butyl-2-benzothiazole-sulfenamide.

Properties: Light tan or buff powder; m.p. 105°C min; sp.gr. 1.29, ether insoluble 0.5% max.

Use: Rubber accelerator.

"Santoflex" 75. ⁵⁸ Trademark for a mixture of N,N'-diphenyl-para-phenylenediamine (DPPD), 75%, and 6-dodecyl-1,2-dihydro-2,2,4-trimethylquinoline ("Santoflex" DD), 25%. Dark flakes, used for reducing aging and oxidation effects of rubber.

"Santoflex" AW. ⁵⁸ Trademark for 6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline.

Properties: Dark, viscous liquid, sp.gr. 1.04 at 45°C, benzene insoluble, trace max. Causes discoloration and staining.

Uses: Antioxidant and flex-cracking inhibitor for rubber.

"Santoflex" DD. ⁵⁸ Trademark for 6-dodecyl-1,2-dihydro-2,2,4-trimethylquinoline. A dark, viscous liquid. Used for inhibiting flex-cracking and oxidation of rubber.

"Santolene." ⁵⁸ Trademark for a line of fuel oil additives of which the following are examples.

"Santolene" C:

Properties: Oily liquid, viscosity (SU) 250 sec. at 100°F, flash point 150°F min; neutralization number 84-100.

Containers: 55-gal steel drums, tank cars.

Uses: Corrosion and rust inhibitor for use in light petroleum products.

"Santolene" F:

Properties: Oily liquid; viscosity (SU) 75 sec (210°F); sp.gr. 0.98 (60/60°F); sulfur 1.9%; barium 7.5%.

Containers: 55-gal steel drums; tank cars.

Uses: Sludge inhibitor for fuel oils to prevent burner screen clogging and reduce rusting.

"Santolite" MS. ⁵⁸ Trademark for light colored viscous resin made by condensation of formaldehyde with aromatic sulfonamides.

Free-flowing above 20°C. Used for spraying, dipping and brushing lacquer. Compatible with nitrocellulose and cellulose acetate; miscible with common organic solvents except hydrocarbons; not miscible with varnish and paint oils.

Containers: 5-, 55-gal drums.

"Santolube." ⁵⁸ Trademark for a series of oil additives.

"Santolube" 70: A rust inhibitor for turbine oils. Oily viscous liquid; sp.gr. 0.926 (60/60°F); Saybolt Universal viscosity 240 seconds at 210°F.

Containers: 55-gal steel drums.

"Santolube" 203-C: A detergent-dispersant additive for motor oils and heavy duty oils of the MIL-L-2104A type. Barium concentration 10%; sp.gr. 0.981 (60/60°F); Saybolt Universal viscosity 450 seconds at 100°F.

Containers: 55-gal drums; tank cars.

"Santolube" 333: A detergent-dispersant additive for heavy duty motor oils, MIL-L-2104A, Supplement I and Series III oils; a phenate. Barium concentration 10%; sp.gr. 1.01 (60/60°F), viscosity at 210°F 11 centistokes.

Containers: 55-gal drums; tank cars.

"Santolube" 392: An inhibitor and motor oil antioxidant for upgrading the quality of straight base oils when used alone or in combination with detergent-dispersant additives. Flash point 330°F; phosphorus 7.3%, sulfur 15.2% zinc 6.3%; viscosity at 100°F 1260 SUS, at 210°F 60 SUS; sp.gr. 1.104 (60/60°F).

Containers: 55-gal drums; tank cars.

"Santolube" 393: Zinc dialkyl dithiophosphate. **Properties:** Liquid, viscosity at 100°F 150 centistokes; flash point 260°F; sp.gr. 1.120 (60/60°F).

Containers: 55-gal black iron drums; tank cars.

Uses: Antioxidant and bearing corrosion inhibitor for lubricating oils.

"Santolube" 394-C: An antioxidant and bearing corrosion inhibitor for engine lubricating oils. Amber, viscous liquid; viscosity 15-25 cts. (210°F); sp.gr. 1.02 (60/60°F); phosphorus 4.7%, sulfur 13.1%.

"Santolube" 395-X: An oxidation and bearing corrosion inhibitor for crankcase oils. Amber liquid; viscosity 12-18 cts (210°F); sp.gr. 1.005 (60/60°F); phosphorus 3.7%; sulfur 11% and barium 1.1%.

"Santolube" 401: A detergent-dispersant-inhibitor additive which when used alone or in combination with inhibitor ("Santolube" 392 or 393) permits the compounding of single and cross-graded motor oils of the MIL-L-2104A and Supplement I types. Liquid; viscosity at 100°F 1153.2 SUS, at 210°F 113.3 SUS; sp.gr. 1.0151 (60/60°F); barium 8.4%; sulfur 3.5%; zinc 0.80%.

"Santolube" 410: A detergent-dispersant additive used in varying concentrations to formulate motor oils meeting performance

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

requirements of the military and automotive industries. Liquid; viscosity at 100°F 1350 SUS, at 210°F 148 SUS; flash point 380°F; barium 9.5% and sulfur 1.82%.

"Santomask" II. ⁵⁸ Trademark for an odor-masking agent.

Properties: Clear, light yellow liquid; pleasant characteristic odor; flash point approx 210°F (Cleveland open cup method); flow point below 0°C; wt/gal approx. 8.7 lbs.

Containers: 33- and 5-gal drums.

Uses: Odor-masking ingredient for interior paints, printing inks, and similar products having objectionable natural odors. Will not affect drying time, color durability and other characteristics of paints and inks.

"Santomersee." ⁵⁸ Trademark for alkyl aryl sulfonates available in the following types:

"Santomersee" No. 1. Neutral flakes and granular form, 40% active.

"Santomersee" No. 80. Neutral flakes, 80% (min) active.

"Santomersee" No. 3. Neutral powder, 100% active.

"Santomersee" No. 3. Paste (75% "Santomersee" No. 3 in water).

Containers: "Santomersee" No. 1: 75-lb bags; 175-, 220- and 225-lb drums. "Santomersee" No. 80: 200-lb drums. "Santomersee" No. 3: (powder) 115-lb drums. "Santomersee" No. 3: (paste) 175-lb steel drums.

Uses: Surface-active wetting, spreading, penetrating, emulsifying agents and detergents used in the following industries: textile, paper, leather, adhesive, rubber, insecticide, dust collection; soap, cosmetic, ceramic, detergent, metal cleaning, plating, emulsions, dyes, pharmaceutical, embalming fluid, laundry, steel, paint, cement, glue, felt, color, etc.

santonica (levant worm-seed, cina; worm-seed).

Derivation: Dried, unexpanded flower heads of *Artemisia maritima*.

Occurrence: Iran, Turkestan and Russia.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

santonin $C_{15}H_{16}O_3$. The inner anhydride of santoninic acid.

Properties: Glossy, colorless crystals or white powder, turning yellow on exposure to light; odorless; tasteless at first, then bitter; poisonous! Soluble in chloroform, alcohol, alkalies and most volatile and fatty oils; very slightly soluble in water. Solutions are levorotatory. Sp.gr. 1.187; m.p. 170-173°C; b.p. sublimes; specific rotation -170 to -175° (2 g/100 ml alcohol).

Derivation: By extraction from *Artemisia cina*, *Artemisia maritima*, or other species of *Artemisia*.

Grades: Technical; N.F. XI.

Containers: Bottles; cans.

Use: Medicine.

"Santonox." ⁵⁸ Trademark for antioxidant for polyethylene. Light gray to light tan

powder; m.p. 150°C min.; readily soluble in methanol, ethanol, acetone; insoluble in benzene, ether, carbon tetrachloride and water.

Containers: 150-lb fiber containers.

"Santophen" 1 Germicide. ⁵⁸ Trademark for ortho-benzyl-para-chlorophenol.

"Santophen" 1 Solution. ⁵⁸ Trademark for 75% "Santophen" 1 and 25% isopropanol.

Used as the germicidal active principle, or as an enhancing agent for disinfectant.

"Santopoid." ⁵⁸ Trademark for a series of oil additives for compounding gear lubricants meeting Military Specification MIL-L-2105. Properties: Dark oily liquids, some of which are foam-inhibited, some have rust prevention properties. Flash points 250-300°F; typical viscosities 435 and 750 SUS at 100°F, 60 and 87 SUS at 210°F; sp.gr. (60/60°F) average 1.13, 1.15, 1.29.

Typical analyses:

"Santopoid" 22: S 12.0%; Cl 16.5%; P 3.3%; Zn 3.5%.

"Santopoid" 22-RI: S 13.3%; P 4.0%; Cl 14.5%; Zn 3.7%.

"Santopoid" 23-RI: S 13.3%; Cl 14.0%; P 4.1%; Zn 3.7%.

"Santopoid" 33: S 8.5%; Cl 26.0%; P 0.56%.

"Santopoid" 35: S 8.4%; Cl 26%; P 0.54%.

Containers: 55-gal drums; tank cars.

"Santopoid" S. ⁵⁸ Trademark for a chlornaphtha xanthate meeting Federal Specification VV-L-761.

Properties: Dark, oily, viscous liquid, sp. gr. approx. 1.19 (60°F); flash point 250°F, viscosity 63 centistokes at 100°F.

Containers: 55-gal steel drums; tank cars.

Uses: Additive for lubricants for hypoid and other gears, for extreme pressure lubricants when compounded with mineral oil.

"Santopour" C. ⁵⁸ Trademark for pour point depressant for wax-bearing oils.

Properties: A dark liquid; flash point 360°F; viscosity 1020 SUS at 210°F; sp.gr. 0.910 (60/60°F).

Containers: 55-gal drums; tank cars.

"Santoquin." ⁵⁸ Trademark for 6-ethoxy-1,2-dihydro-2,2,4-trimethyl quinoline (q.v.).

Santorin cement. See pozzolana cement.

Santorin earth. A variety of pumice mined on Santorin Island (Greece) and used in making pozzolana cement.

"Santosite." ⁵⁸ Trademark for sodium sulfite anhydrous, technical.

"Santotan" KR. ⁵⁸ Trademark for basic chrome sulfate containing approximately 50% $Cr_2(SO_4)_2(OH)_2$.

Properties: Dark green crystals; basicity (Cr_2O_3/SO_3) 101-105; basicity (Schorlemmer) 37.3-39.7; chromium as Cr_2O_3 23.9% min; clear solution in water (5:500).

Uses: In chrome tanning of calf, cow and horse hides and sheepskins.

Containers: 100-lb paper bags.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Santovar" A. ⁵⁸ Trade name for 2,5-di-tert-amylhydroquinone.
 Properties: Buff powder; m.p. 172°C min; sp.gr. 1.05; soluble in acetone.
 Uses: Antioxidant for rubber and adhesives.

"Santowax" R. ⁵⁸ Trademark for mixed terphenyls. Yellowish-white, non-crystalline flaked solid. Used as extender for polystyrene.
 Containers: 75-lb bags; 225-lb fiber drums.

"Santowhite" Crystals. ⁵⁸ Trademark for (essentially) 4,4'-thiobis-(6-tert-butyl-meta-cresol).
 Properties: Light gray to tan powder; m.p. 140°C min; sp.gr. 1.097; soluble in acetone and alcohol.
 Uses: Rubber antioxidant.

"Santowhite" L. ⁵⁸ Trademark for thiobis-(di-sec-amylphenol).
 Properties: Dark, viscous liquid; softening point 0°C max; sp.gr. 0.98.
 Use: Rubber antioxidant.

"Santowhite" MK. ⁵⁸ Trademark for a reaction product of 6-tert-butyl-meta-cresol and SCl_2 .
 Properties: Dark viscous liquid; sp.gr. 1.06; soluble in acetone, alcohol, benzene, and carbon tetrachloride; softening point 20-30°C.
 Use: Rubber antioxidant, especially for uncured GRS latex compounds.

"Santowhite" Powder. ⁵⁸ Trademark for 4,4'-butylidene-bis(6-tert-butyl-meta-cresol).
 Properties: White powder; m.p. 109°C, sp.gr. 1.02.
 Containers: 125-lb drums.
 Uses: Antioxidant, non-staining, in rubber compounding.

saponaria (soapwort; soaproot; fuller's herb bruise wort).

Derivation: Rhizome and roots of perennial herb, *Saponaria officinalis*.

Occurrence: United States; Europe; middle Asia.

Uses: Source of saponin which constitutes about one-third of the root; medicine; detergent.

saponification. The chemical reaction or process in which an ester is heated with aqueous alkali such as sodium hydroxide, in order to form an alcohol and the sodium salt of the acid corresponding to the ester. The process is most frequently carried out on fats, which are glyceryl esters of fatty acids. The sodium salts formed in this case are soaps, which circumstance leads to the use of the term saponification.

saponification number. The number of milligrams of potassium hydroxide required to saponify 1 gram of a sample of an ester (glyceride; fat) or mixture.

saponified acetate fiber. Regenerated cellulose fibers obtained by complete saponification of highly oriented cellulose acetate fibers. Available in continuous filament form having a high degree of crystallinity and great

strength.

Properties: Tensile strength (psi) 136,000-155,000; elongation 6%; sp.gr. 1.5-1.6; moisture regain 9.6-10.7%; decomposes about 300°F; burns readily. Similar to cotton in chemical resistance, dyeing, and resistance to insects and mildew.

Uses: Balloon fabric; cargo-parachutes; typewriter ribbons; fire hose; belts; webbing; tapes; carpet backing.

saponin

1. A general term applied to two groups of plant glucosides that on shaking with water form colloidal solutions giving soapy lathers. They also have the ability to hemolyze red blood corpuscles at very great dilutions. The two groups are:

A. Triterpenoid saponins. This group of saponins is derived from soap wort, soap roots and soap barks. These noncardiac-active saponin preparations find use as detergents, medicinals, foaming agents in fire extinguishers and fish poisons. Hydrolysis yields sugars and naphthalene and picrotoxin derivatives. Structure is not fully known.

B. Steroid saponins. These cardiac-active saponins were isolated originally from plants of the digitalis series, have also been separated from California soap-root, Mexican sarsaparilla root and a number of Mexican plants of the lily family. They are used for the synthesis of sex hormones. Hydrolysis yields various sugars and steroids.

2. Specific term. Saponin derived from *saponaria* or quillaja.

Properties: White, amorphous glucoside; pungent, disagreeable taste and odor, poisonous! It foams very strongly when shaken with water. Soluble in water.

Chief constituents: Sapotoxin, lactosin, quillaic acid.

Grades: Crude; purified; highest purity.

Containers: 1-, 5-lb bottles; 1-, 5-, 10-lb cans; 25-, 50-lb boxes; 100-lb kegs.

Uses: Foam producer in beverages; detergent in the textile industries; sizing; substitute for soap; fire extinguishers; emulsification agent for fats and oils.

Shipping regulations: None.*

SAPP. Abbreviation for sodium acid pyrophosphate. See sodium pyrophosphate, acid.

sappan wood. Heartwood of the tree, *Caesalpinia sappan*.

Occurrence: China, Japan and India.

Grades: Technical.

Containers: Bags.

Uses: Textile dyeing, as a substitute for logwood; medicine.

Shipping regulations: None.*

sapphire. For the naturally occurring material, see corundum. Synthetic sapphires are now made from aluminum oxide by the single crystal growing technique for use as gems, as support rods in fine apparatus, as windows and domes for microwave and infrared systems. Their advantages are flexural

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

strength at elevated temperatures, good dielectric properties, small-diameter rigidity, low loss characteristics, and zero porosity.

"SAPP No. 4." ¹⁷² Trade name for a grade of sodium acid pyrophosphate possessing an unusually slow rate of reaction necessary when manufacturing canned biscuit doughs.

Derivation: Dehydration of NaH_2PO_4 .

Containers: Bags.

Uses: Leavening agent in refrigerated biscuits.

"Saraloy." ²³³ Trademark for a thermoplastic flashing material based on a saran copolymer. It is both flexible and elastic.

saran. Generic term for thermoplastic resins obtained by the polymerization of vinylidene chloride or copolymerization of vinylidene chloride with lesser amounts of other unsaturated compounds. Sarans are available with softening points from 70° to 175°C. They have excellent chemical resistance to most acids and alkalis (except ammonium hydroxide) and are unaffected by most solvents. They are softened by some chlorinated hydrocarbons and dissolve in cyclohexanone and dioxane. Available as oriented fibers, films, and extruded or molded forms.

Uses (nonfiber): Packaging film; pipes and fittings for chemical processing equipment; bristles; latex coatings.

saran fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 80% by weight of vinylidene chloride units ($-\text{CH}_2\text{CCl}_2-$) (Federal Trade Commission).

Properties (of fiber): Tenxile strength (psi) 15, -45,000; elongation 15-30%; moisture regain, none; sp. gr. 1.65-1.75; softens at 240-280°F, nonflammable. Highly resistant to most chemicals and solvents, to weather, moths and mildew; flameproof.

Uses: Screens; upholstery, curtain and drapery fabrics; rugs and carpets; awnings; filter cloth.

sarcolysin (para-d₁(2-chloroethyl)aminophenyl-alanine)
(ClCH_2CH_2)₂ $\text{NC}_6\text{H}_4\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A nitrogen mustard (q.v.). Crystals; m.p. 180°C. Used in medicine.

sarcosine (methyl glycocoll, methyl amino-acetic acid) $\text{CH}_3\text{NHCH}_2\text{COOH}$.

Properties: Deliquescent crystals with sweet taste; m.p. 210-215°C (dec). Very soluble in water; slightly soluble in alcohol.

Derivation: Decomposition of creatine or caffeine.

Containers: Up to tank cars.

Grades: Technical.

Use: Synthesis of foaming antienzyme compounds for toothpaste.

sard. A variety of quartz (q.v.).

Color: Brownish red, similar to but darker

than carnelian, classed by some as carnelian.

Use: Gem stone.

sardine meal. Dry fish scrap, approx. 11.5% nitrogen, used for animal and poultry feed.

sardine oil.

Properties: Pale golden-yellow liquid.

Soluble in alcohol, ether, chloroform, benzene and carbon disulfide.

Constants: Sp. gr. 0.9274-0.9330; m.p. 28-36°C; acid value 4-25; Hehner value 95-97; saponification value 189-193; iodine value 181-193; refractive index 1.4802-1.4808.

Derivation: By chopping up sardines and subjecting them to boiling and pressing.

Grades: Crude; refined.

Containers: Wooden barrels; steel drums.

Uses: Soap; leather stuffing; lubricant.

Shipping regulations: None.*

sardonyx. A natural crystalline variety of silica, with rather uniform layers of red, white, brown and black; waxlike luster; and may be transparent or translucent.

Sarin (methylisopropoxyfluorophosphine oxide) ($\text{C}_3\text{H}_7\text{O})(\text{CH}_3)\text{FPO}$. A nerve gas.

"Sarkosyl." ²¹⁹ Trademark for a series of surface active acylated sarcosines available in several types:

NL-30: 30% aqueous sodium lauroylsarcosinate; water white, odorless, practically tasteless, low in toxicity, anti-corrosive, anti-enzyme.

L: lauroyl sarcosine free acid.

LC: cocoyl (whole coconut) sarcosine free acid.

O: oleoyl sarcosine free acid.

S: stearoyl sarcosine free acid.

Uses: Tooth pastes, cosmetics, and pharmaceuticals (anti-enzyme); corrosion inhibitors; lubricants and greases; anti-oxidants; inks.

sarsaparilla. The dried root of *Smilax aristolochiaefolia* (Mexican sarsaparilla) and other *Smilax*.

Occurrence: Southern United States; Honduras; Jamaica, Mexico; Guatemala; Brazil.

Grades: N.F. XI.

Containers: Honduras, 160-lb bales; Mexican, 200-lb bales; bags and bales of variable size.

Uses: Medicine; soft drinks.

Shipping regulations: None.*

"Sartorius No. 1." ¹⁸⁸ Trademark for a grade of ylang ylang oil.

SAS. Abbreviation for sodium aluminum sulfate. See aluminum sodium sulfate.

S.A.S. baking powder. A baking powder containing sodium aluminum sulfate (S.A.S.), as well as sodium bicarbonate and starch.

sassafras bark (saxifrax; ague tree; cinnamon wood) The dried bark of the root of *Sassafras albidum*.

Occurrence: North America.

Grades: Technical; N.F. XI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 150-lb bales; bags and bales of variable size.

Uses: Medicine; flavoring; perfumery.

Shipping regulations: None.*

sassafras oil.

Properties: Yellowish or reddish-yellow volatile liquid oil; pungent, aromatic odor and warm, aromatic taste. Sp. gr. 1.065-1.077 (25/25°C); optical rotation +2 to +4°; refractive index 1.5250-1.5350 (20°C). Soluble in alcohol, ether, chloroform, glacial acetic acid and carbon disulfide.

Chief constituents: Safrol, eugenol, camphor, pinene, phellandrene.

Derivation: Steam distillation of the root of *Sassafras albidum*.

Method of purification: Rectification.

Impurities: Terpenes.

Grades: Technical; N.F. XI.

Containers: Glass bottles; cans; drums.

Uses: Flavoring; perfumery; medicine.

May not be used in foods or beverages (FDA).

Shipping regulations: None.*

"Sassafrol." ¹⁸⁸ Trademark for a substitute for oil of sassafras.

sassolite H_3BO_3 . A natural boric acid found as pearly yellowish-white scale on native sulfur in the crater of Vulcano (Lipari Isles) and as a sublimation around Vesuvian fumaroles. Also forms a small proportion of the boron compounds in Californian borax localities. See boric acid.

satin spars. See calcite and gypsum.

"Satintone." ⁹⁹ Trademark for anhydrous aluminum silicate pigments derived from water-washed kaolin by calcination and grinding. Available in three particle size grades: "Satintone" Special, "Satintone" #1, and "Satintone" #3. Used in coatings for roofing granules and as a hiding extender in paints. Also used as a polishing and cleaning agent.

Typical analysis: Silica 52.1-52.3%, alumina 44.4-44.6%, L.O.I. 0.5-0.9%; iron oxide trace; titanium dioxide 2.0%, manganese none.

satin white. See calcium sulfate.

saturation.

1. The state in which all available valence bonds of an atom (esp. carbon) are attached to other atoms. The straight-chain paraffins are typical saturated compounds.
2. The state of a solution when it holds the maximum equilibrium quantity of dissolved matter at a given temperature.

satureja. See savory.

"Savelite." ¹⁴¹ Trade name for an interior white finish for ceilings, walls and the interior of warehouses, storehouses and factories.

savin (sabina).

Derivation: Tops of evergreen shrub *Juniperus sabina*.

Occurrence: Europe; northern Asia, North

America south to New York and Montana.

Grades: Technical.

Containers: Bags.

Uses: Medicine; savin oil.

Shipping regulations: None.*

savin oil.

Properties: Colorless to pale yellow liquid; soluble in alcohol, ether, and chloroform.

Chief known constituents: Sabinol; cadinene; pinene.

Constants: Sp. gr. 0.910-0.930; optical rotation +40 to +60°.

Derivation: Distilled from the fresh leaves and twigs of *Juniperus sabina*.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-, 5-lb bottles; 11-, 25-lb tins.

Use: Medicine.

Shipping regulations: None.*

"Savonafix." ¹⁸⁸ Trademark for a perfume specialty with fixation properties used in the perfuming of soaps.

savory (summer savory; *satureja*).

Derivation: Dried leaves of *Satureia hortensis*, an aromatic mint of the United States and Europe. Also applied to the essential oil derived from these leaves.

Uses: Medicine; flavors, perfumes.

savory, summer. See savory.

saw palmetto. See *serenoa*.

saw palmetto berries. See *serenoa*.

saxifrax. See sassafras bark.

Sb. Symbol for antimony.

SBA. Abbreviation for sec-butyl alcohol (q.v.).

SBR. Abbreviation for styrene-butadiene rubber (q.v.).

"S-B Zinc." ⁷² Trade name for a semi-bright (dull) zinc plating process, composed of zinc cyanide, sodium cyanide, sodium hydroxide and addition agents. High surface activity for subsequent surface conversion coatings.

Sc. Symbol for scandium.

"SC-50." ²⁴⁵ Aqueous solutions of alkali-metal salts of hydrocarbon-substituted silanols used for treating various surfaces to render them water-repellent and to improve other properties of such surfaces.

scammony resin. A mixture of resins obtained by extraction from scammony root.

Properties: Soluble in alcohol.

Use: Medicine.

scammony root. Root of *Convolvulus scammonia*.

Occurrence: Asia Minor and Greece.

Containers: Bags.

Use: Source of scammony resin.

See also *ipomea*.

scandia. See scandium oxide.

scandium **Sc.** Element of atomic number 21; Group III of the periodic table.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** Metal; m.p. 1550-1600°C; b.p. 2470°C; density 3.02g/cc; colorless salts.
- Source:** Occurs in certain uncommon minerals as wolframite, thortveitite, euxenite. It is not a member of the rare earth elements, though it is rare in the sense of not being abundant, and occurs associated with the rare earth elements.
- Derivation:** From the oxide, by way of the fluoride, which is reduced to the metal.
- Distillation** gives 99+% pure scandium.
- scandium antimonide** ScSb. Used as a high-purity semiconductor.
- scandium arsenide** ScAs. Used as a high-purity semiconductor.
- scandium borate** ScBO₃.
Properties: White powder; soluble in dilute acid.
Derivation: By fusing scandia and boric acid.
Shipping regulations: None.*
- scandium oxide** (scandia) Sc₂O₃.
Properties: White amorphous powder resembling magnesia. Soluble in hot acids, less so in cold acids. Sp.gr. 3.864; specific heat 0.153 (0-100°C).
Derivation: From thortveitite, an ore.
Uses: Manufacture of scandium; ceramics.
Shipping regulations: None.*
- scandium phosphide** ScP. Used as a high-purity semiconductor.
- scandium sulfide** Sc₂S₃.
Properties: Light yellow powder decomposed by boiling water and by dilute acids with evolution of hydrogen sulfide.
Derivation: By heating the sulfate in hydrogen sulfide.
Shipping regulations: None.*
- scapolite**, common. See wernerite.
- scarlet corns**. See kermes.
- scarlet red** (Biebrich red; Sudan IV) C₂₄H₂₀ON₄. ortho-Tolueneazo-ortho-tolueneazo-beta-naphthol. A red dye.
Properties: Dark brown odorless powder; m.p. 181-188°C; decomposes before boiling; insoluble in water; soluble in oils; slightly soluble in alcohol; somewhat soluble in chloroform.
Derivation: From beta-naphthol and ortho-amino-azo-toluene.
Uses: Medicine (in ointments); biological stain for fats.
 Also refers to red varieties of ferric oxide. See iron oxide reds.
- scavengers**. From a chemical point of view this term may be used for any chemical which is added to a system or mixture in order to consume or convert to inactive form small quantities of impurities or undesired materials. In metallurgical operations active metals are added to combine with oxygen and nitrogen in the molten metal, and so cause removal into the slag. A more recent use is the addition of oxygen, iodine, or more complex materials which combine with free radicals in a mixture, and make possible the measurement of these radicals.
- Schaeffer's acid**. See 2-naphthol-6-sulfonic acid.
- Schaeffer's salt** C₁₀H₆OHSO₃Na. Sodium salt of 2-naphthol-6-sulfonic acid (q.v.).
Uses: Intermediate for organic chemicals.
Containers: (Paste) drums; (powder) bags.
- Schaffer's salt**. See Schaeffer's salt.
- Scheele's green**. See copper arsenite.
- scheelite** CaWO₄. A natural calcium tungstate, found in igneous rocks, usually with granite. Some molybdenum may replace tungsten.
Properties: Color white, yellow, green, brown; luster vitreous to adamantine; hardness 4.5-5; sp.gr. 5.9-6.1; usually fluorescent in ultraviolet light.
Occurrence: Nevada, California, Arizona, Utah, Colorado; New Zealand; Europe.
Use: Ore of tungsten; phosphor.
- Schiff bases**. The class of compounds derived by chemical reaction (condensation) of aldehydes or ketones with primary amines. The general formula is RR'C=NR".
Properties: Usually colorless crystalline solids, although some are dyes. Very weakly basic and hydrolyzed by water and strong acids to carbonyl compounds and amines.
Uses: Accelerators for vulcanization of rubber; dyes, for example phenylene blue, toluylene blue, and naphthol blue; intermediates in the preparation of many organic compounds. Those prepared from ortho-hydroxyacetophenone and diamines such as ethylenediamine are oil-soluble sequestering agents which are used to inhibit the undesirable effects of trace metal ions in mineral oils and gasoline.
- Schlippe's salt**. See livers of antimony.
- Schoch process**. A process for making acetylene by passing hydrocarbons through an electric arc.
- Schoelkopf's acid**. See 1-naphthylamine-8-sulfonic acid; and 1-naphthol-4,8-disulfonic acid.
- schoenite** MgSO₄·K₂SO₄·6H₂O. Natural salt obtained from Stassfurt, Germany, salt deposits, and an important source of potassium compounds.
- schorlite**. A black iron-bearing variety of tourmaline (q.v.).
- schradan**. Generic name for octamethyl pyrophosphoramidate.
- schroekingite** NaCa₃(UO₂)(CO₃)₃(SO₄)F·10H₂O. A natural hydrated fluocarbonate-sulfate of sodium, calcium and uranium.
Properties: Color greenish yellow; luster vitreous; hardness 2.5; sp.gr. 2.51; fluorescent in ultraviolet light; radioactive.
Occurrence: Wyoming, Utah, Arizona; Europe.
Use: Ore of uranium.

schwartzite. A mercury-bearing variety of tetrahedrite (q.v.).

Schweinfurth green. See copper acetoarsenite.

Schweitzer's reagent. A reagent used in analytical chemistry as a test for wool. It dissolves cotton, silk and linen and consists of a solution of copper hydroxide in strong ammonia.

scilla. See squill.

scintillation counter. A form of detector of ionizing radiations much used in work with nuclear radiations. It depends on the property possessed by many transparent substances of emitting visible or near ultraviolet light when traversed by an ionizing particle. By mounting the scintillating material on the face of a photomultiplier tube, the pulse of light produced by the radiation is converted to an electrical pulse which in turn may be amplified and counted. For work with short range, densely ionizing radiations like alpha particles, the scintillator may be finely crystalline zinc sulfide coated in a thin layer on the face of the photomultiplier tube. For more penetrating radiations like gamma rays the scintillator is usually a large single crystal of sodium iodide activated with a trace of thallium iodide. Recent developments in the field include the discovery of clear plastic materials with this scintillating property, which may be molded into required complex shapes, and the use of solutions of substituted oxazole compounds dissolved in toluene into which radioactive material may be dissolved to measure their radioactivity. Various complex solutions are used, adjusted to have a scintillation spectrum matched to the spectral sensitivity of the photomultiplier by a proper choice of scintillating compounds in the solvent.

The oxazole compounds in such use are commonly known by their abbreviations, as DPO, BBO, POPOP, NOPON, BOPOB. Some of the other materials used in scintillation counting are terphenyl, quaterphenyl, tetraphenylbutadiene, diphenylacetylene, diphenylstilbene, and of the older materials, anthracene and naphthalene.

scleroproteins (albuminoids). A large class of proteins that have a supporting or protective function in tendons, bones, cartilages, ligaments and other hard or tough parts of the animal body. They include the collagens of skin, tendons and bones, as well as the elastic proteins known as elastins, and the keratins. Specific examples are the keratin of hair, hoofs and horns and fibroin from silk. Collagens are the material from which gelatin is produced when protein materials are boiled with water.

scoparius (broom; green broom; Scotch broom; Irish broom; hogweed).

Derivation: Dried tops of shrub *Cytisus scoparius*.

Occurrence: Western Asia; southern and

western Europe; cultivated in the United States.

Grades: Technical.

Containers: Bags.

Uses: Medicine; perfumery.

Shipping regulations: None.*

scopola (Japanese belladonna).

Derivation: Dried rhizome of *Scopola carniolica*.

Occurrence: Japan; Germany; Austria; Hungary; Russia.

Grades: Technical.

Containers: Bags.

Use: Medicine, source of alkaloids.

Shipping regulations: None.*

scopolamine. See hyoscine.

scopolamine hydrobromide. The U.S.P. XVI name for hyoscine hydrobromide (q.v.).

scopolamine methylbromide. See methscopolamine bromide.

scopolamine methylnitrate. See methscopolamine nitrate.

scopoline (oscine) $C_8H_{13}O_2N$.

Properties: White crystals; m.p. 108-109°C when crystallized from ether; b.p. 248°C; soluble in water, acetone, ether, and alcohol.

Derivation: An alkaloid obtained by hydrolysis of scopolamine with dilute alkali.

Use: Medicine.

"Scorbord." ²³³ Trademark for an expanded polystyrene plastic product used as insulating material.

scorodite. Natural ferric arsenate,

$Fe_2O_3 \cdot As_2O_5 \cdot 4H_2O$.

Properties: Color, pale leek-green or liver-brown.

Occurrence: Utah and Washington.

Use: A lesser ore of arsenic.

Scotch broom. See *scoparius*.

"Scotch-em Aerosol Insecticide." ²⁰⁴ Trademark for a mixture containing allethrin, DDT, and methoxychlor. For space spraying to control flying insects.

"Scotchgard" Leather Protector. ¹⁵⁸ Brand name for fluorochemical applied to leather. Properties: Colored liquid with a specific gravity of 1.0 is 30 percent solids in isopropyl alcohol. When applied to leather, the fibers react with the fluorochemicals and become permanently bound. Soluble in water, the chemical develops qualities of repellency upon drying. Does not affect color, hand or porosity of the leather. Containers: 5-gal pails; 15- and 55-gal drums. Uses: Imparts repellency to water and oil and resistance to chemicals (including acids and alkalis) and soil resistance to brushed pigskins, suedes and side leathers. Applied after the fatliquoring run (in the same equipment) at the tannery. Also makes garment leather drycleanable.

"Scotchgard" Stain Repeller. ¹⁵⁸ Brand name for a group of textile chemicals (available

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in various formulations for different types of fabric applications including cationic and non-ionic stabilized emulsion of fluorochemical resins and solvent soluble solutions of fluorochemical resins).

Properties: The fluorochemicals are liquids, generally composed of about 28 per cent solids.

Containers: 5-gal pails and 30-gal drums.

Uses: Imparts oil and water repellency to a wide range of fabrics and textile blends as well as resistance to dust and dry soil.

scotophors. Materials which are sensitive to cathode-ray beams and respond by a change in opacity or light-transmission properties. Are useful in screens for television. Crystals of alkali halides are used.

scouring agents. Compounds used to remove the natural oils and fats from raw wool; also used to remove lubricants applied to rayon yarns or fabrics during such operations as throwing, winding, weaving, knitting, etc.

scram. A colloquialism that has come into general use to mean the rapid shut-down of a nuclear reactor, used both as a verb and as a noun. An accidental scram is a shut-down by the safety circuits, though it may also be scrambled by intentionally dropping in the control rods.

"Scriptite" 33. ⁵⁸ Trademark for a dry, finely divided melamine formaldehyde powder paper treating resin; used to provide wet strength in paper.

Containers: 50-lb polyethylene-lined multi-wall bags.

"Scriptite" 40. ⁵⁸ Trademark for a liquid urea-formaldehyde resin used for coating paper to achieve wet strength and printability.

Containers: 525-lb drums.

"Scriptite" Series 50-52-54. ⁵⁸ Trademark for styrene copolymers (dry powders), used as paper coating resins with or without clay to improve surface printability and wax hold-out properties.

Containers: Bags and drums.

scrubbing. Process for removing one or more components from a mixture of gases and vapors by its passage upward and usually countercurrent to and in intimate contact with a stream of descending liquid, the latter being chosen so as to dissolve the desired components and not others. The gas or vapor may be broken into fine bubbles upon entering a tower filled with liquid, but more frequently the tower is filled with coke, broken stone or other packing, over which the liquid flows while exposing a relatively large surface to the rising gas or vapor. See also absorption.

scrubbing oil. See absorption oils.

"Scutamol." ²⁰⁶ Brand name for organic mercury used for control of slime in paper mills.

"SD-75." ⁴³⁰ Trade name for alkenyl dimethyl ethyl ammonium bromide. Used primarily as an algicide in water towers and swimming pools.

SDA No. 1. Specially denatured alcohol (government regulation formula). It consists of 5 gal wood alcohol added to 100 gal 95% ethyl alcohol. See denaturants for alcohol; denatured alcohol.

Se. Symbol for selenium.

Seaboard process. Method of removing hydrogen sulfide from a gas by absorption in sodium carbonate solution. Sodium bicarbonate and sodium hydrosulfide are formed. By blowing air through this solution, hydrogen sulfide is released and carried off, and the sodium carbonate is regenerated.

"SeaKem." ¹²⁴ Trade name for a line of carrageenan extractives, hydrocolloids which may be derived from a number of sea plants in the class of Rhodophyceae, order of Gigartinales, principally, Irish moss sea plants. Used in the food, pharmaceutical and cosmetic industries as gelling agents; stabilizers for emulsions, suspensions, foams; binding agents; viscosity producers; as emollients.

"Sealstix." ¹⁸ Trademark for a cement of the deKhotinsky type (q.v.) which adheres to almost any surface. Insoluble in all common reagents except alcohol, strong caustics and chromic acid cleaning solution.

Uses: Cementing glass, in air, vacuum, or under water, for sealing cracks and pinholes in vacuum systems; corrosion protection; insulation for exposed conductors.

"Sealz." ²⁴⁸ Trademark for a line of thermoplastic rubber compounds which are used as additives for asphalt and tar products to raise softening point, improve low temperature flexibility, enhance adhesive qualities and increase elasticity.

"Seam-It." ⁶⁵ Trademark for a material comprising, in part, natural latex, stabilizers and vulcanizing ingredients for binding carpets.

sea onion. See squill.

Searles Lake brine. Source of trona (q.v.). In California.

sea salt. The actual content of various salts in sea water is as follows, the values being grams per liter, i.e., approximately grams per thousand grams: NaCl (sodium chloride) 27.319; MgCl₂ (magnesium chloride) 4.176; MgSO₄ (magnesium sulfate) 1.668; MgBr₂ (magnesium bromide) 0.076; CaSO₄ (calcium sulfate) 1.268; Ca(HCO₃)₂ (calcium bicarbonate) 0.178; K₂SO₄ (potassium sulfate) 0.869; B₂O₃ (boron oxide) 0.029; SiO₂ (silica) 0.008; iron and alumina (R₂O₃) (iron and aluminum oxide) 0.022.

Salt recovered from sea water by the usual evaporation methods contains 96-99% NaCl and small amounts of CaSO₄, MgCl₂

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

schwartzite. A mercury-bearing variety of tetrahedrite (q.v.).

Schweinfurth green. See copper acetoarsenite.

Schweitzer's reagent. A reagent used in analytical chemistry as a test for wool. It dissolves cotton, silk and linen and consists of a solution of copper hydroxide in strong ammonia.

scilla. See squill.

scintillation counter. A form of detector of ionizing radiations much used in work with nuclear radiations. Seaboard process. Method of removing hydrogen sulfide from a gas by absorption in sodium carbonate solution. Sodium bicarbonate and sodium hydrosulfide are formed. By blowing air through this solution, hydrogen sulfide is released and carried off, and the sodium carbonate is regenerated.

"SeaKem." ¹²⁴ Trade name for a line of carrageenan extractives, hydrocolloids which may be derived from a number of sea plants in the class of Rhodophyceae, order of Gigartinales, principally, Irish moss sea plants. Used in the food, pharmaceutical and cosmetic industries as gelling agents; stabilizers for emulsions, suspensions, foams; binding agents; viscosity producers; as emollients.

"Sealstix." ¹⁸ Trademark for a cement of the deKhotinsky type (q.v.) which adheres to almost any surface. Insoluble in all common reagents except alcohol, strong caustics and chromic acid cleaning solution.

Uses. Cementing glass, in air, vacuum, or under water, for sealing cracks and pinholes in vacuum systems; corrosion protection; insulation for exposed conductors.

"Sealz." ²⁴⁸ Trademark for a line of thermoplastic rubber compounds which are used as additives for asphalt and tar products to raise softening point, improve low temperature flexibility, enhance adhesive qualities and increase elasticity.

"Seam-It." ⁶⁵ Trademark for a material comprising, in part, natural latex, stabilizers and vulcanizing ingredients for binding carpets.

sea onion. See squill.

Searles Lake brine. Source of trona (q.v.). In California.

sea salt. The actual content of various salts in sea water is as follows, the values being grams per liter, i.e., approximately grams per thousand grams: NaCl (sodium chloride) 27.319; MgCl₂ (magnesium chloride) 4.176; MgSO₄ (magnesium sulfate) 1.668; MgBr₂ (magnesium bromide) 0.076; CaSO₄ (calcium sulfate) 1.268; Ca(HCO₃)₂ (calcium bicarbonate) 0.178; K₂SO₄ (potassium sulfate) 0.869; B₂O₃ (boron oxide) 0.029; SiO₂ (silica) 0.008; iron and alumina (R₂O₃) (iron and aluminum oxide) 0.022.

Salt recovered from sea water by the usual evaporation methods contains 96-99% NaCl and small amounts of CaSO₄, MgCl₂

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

and MgSO_4 , varying with the degree of evaporation and methods of handling and washing.

"Sea Sorb." ⁵⁵ Brand name for patented grades of magnesite, MgO , with specific adsorption characteristics.

Properties: White powder or granules; iodine number 80-90; surface area 120 sq m/g; bulk density 35-40 lbs/cu ft; ignition loss 6-7%; particle size 12% + 200 mesh, max. Grades: 43 (powder); 53 (granules). Containers: 200-lb fiber drums (43); 250-lb steel drums (53).

Uses: Wide applications involving catalysts, chromatography, purification, decolorization, and dehumidification.

sea weed. See kelp.

sebacic acid (octanedicarboxylic acid; sebacylic acid; decanedioic acid) $\text{COOH}(\text{CH}_2)_8\text{COOH}$.

Properties: White leaflets; m. p. 133°C; b. p. 295.0°C (100 mm), refractive index 1.422 (133.3°C); slightly soluble in water; soluble in alcohol and ether.

Derivation: From butadiene via dichlorobutene and its nitrile derivatives; dry distillation of castor oil with alkali.

Containers: Fiber drums; bags.

Grades: C.P. and purified.

Uses: In plasticizers; alkyd resins; fibers; paint products; candles and perfumes; low temperature lubricants and hydraulic fluids, manufacture of certain kinds of nylon.

Shipping regulations: None.*

"Sebacol." ¹⁷³ Trademark for a tanners' depilatory containing sodium hydrosulfite suitably stabilized for use in alkaline unhairing systems.

sebaconitrile $\text{NC}(\text{CH}_2)_8\text{CN}$.

Properties: Straw-colored oily liquid; b. p. 199°C (15 mm).

Use: As chemical intermediate for drugs, dyes and high polymers.

sebacoyl chloride (n-octane-1,8-dicarboxylic acid dichloride) $\text{ClOC}(\text{CH}_2)_8\text{COCl}$.

Properties: Liquid; b. p. 137-140°C (3 mm); 97% pure. Decomposes slowly in cold water; soluble in hydrocarbons and ethers.

Containers: Bottles; carboys; 55-gal drums.

Use: Organic intermediate.

sebacylic acid. See sebacic acid.

sec-. Abbreviation for secondary, as applied to names of organic compounds. See primary. In this book the prefix sec- is ignored in the alphabetical arrangement.

secale cornutum. See ergot.

secobarbital $\text{C}_{12}\text{H}_{18}\text{N}_2\text{O}_3$. 5-Allyl-5(1-methylbutyl) barbituric acid.

Properties: White, amorphous, odorless powder with slightly bitter taste. M. p. about 82°C. Very soluble in alcohol and ether; very slightly soluble in cold water.

Grade: U.S.P. XVI.

Use: Medicine.

secobarbital sodium $\text{C}_{12}\text{H}_{17}\text{N}_2\text{NaO}_3$. Sodium 5-allyl-5-(1-methylbutyl)barbiturate.

Properties: White, hygroscopic odorless

powder with bitter taste. Very soluble in water; soluble in alcohol; practically insoluble in ether; pH (5% solution) 9.8-10.1.

Grade: U.S.P. XVI.

Use: Medicine.

"Seconal." ¹⁰⁰ Trade name for secobarbital [5-allyl-5-(1-methylbutyl)barbituric acid].

"Seconal Sodium." ¹⁰⁰ Trademark for secobarbital sodium, U.S.P.

secondary. Term used to characterize certain types of compounds. See primary; see also sec-.

secondary azo dyes. Azo dyes derived from secondary amines.

secondary calcium phosphate. See calcium phosphate, dibasic.

sedimentary rocks. Rocks derived from the disintegration and weathering of older rocks, and deposited in layers by water, wind or ice. Common sedimentary rocks are sandstone, limestone, shale, conglomerate.

sedimentation. The settling of finely divided suspended solid particles from a liquid.

"Sedulon." ¹⁹⁰ Trademark for a brand of dihyprylone (q. v.).

seed oil. See cottonseed oil.

seed oil cake. See cottonseed cake.

"Seedrin." ¹⁴⁷ Brand name for an insecticidal seed treatment containing aldrin.

Containers: "Seedrin W75" - 50-lb bags;

"Seedrin Liquid" 55-gal drums.

Uses: "Seedrin Liquid" is used for seed treatment of rice; "Seedrin W75" for rice, wheat, oats, barley, corn, milo and sorghum.

Seger cones. See pyrometric cones.

Seidlitz powders (Seidlitz mixtures). Two powders to be mixed in water and drunk while effervescing.

In the blue paper: 3 parts Rochelle salt with 1 part sodium bicarbonate.

In the white paper: Tartaric acid.

Containers: Fiber drums.

Use: Medicine.

seignette salt. See potassium-sodium tartrate.

"Seismex." ²⁸ Trademark for an ammonia dynamite for seismic prospecting.

"Seismogel." ²⁸ Trademark for a straight gelatin dynamite for seismic prospecting.

"Selectacel." ²³¹ Trademark for ion-exchange cellulose products which are derived from purified wood pulp by chemical reaction and substitution. White fibrous powders packed in glass, plastic and fiber drums. Used for the isolation and purification of proteins.

selenious acid. See selenous acid.

selenite. Single crystals of gypsum (q. v.).

selenium Se. A nonmetallic element, atomic number 34, in Group VI of the periodic table. It is similar to sulfur and occurs

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with it in sulfide ores as well as in certain soils. It seems to be an essential nutrient in minute amounts, but is toxic in larger amounts.

Properties: Steel-gray, nonmetallic rods or buttons; very high luster; crystalline surface on being broken. Also occurs in the form of dark red crystals or powder; soluble in carbon disulfide, concentrated sulfuric acid; insoluble in water and alcohol. Selenium burns in air with a bluish-red flame, forming selenium dioxide. Its electrical conductivity increases with increasing brightness of any light irradiating it. Selenium and its compounds are quite poisonous, like arsenic. Sp.gr. 4.26-4.28; m.p. 217°C; b.p. 690°C.

Derivation: From anode mud of electrolytic copper refining process, or from flues of pyrites burners.

Method of purification: By sublimation and reduction by means of an aqueous solution of sulfur dioxide.

Grades: Selenium is available as a powder and in the form of small cast sticks or cakes. Various grades of selenium may be obtained but the usual quality is 99% Se. A high purity grade (impurities less than 10 ppm) is now available. There is also a lower grade 97.5-99%. The powdered selenium may be obtained in various grades of fineness, the usual classifications being 40 mesh (through 40 on 120), 120 mesh (through 120 on 200) and 200 mesh (through 200).

Containers: Glass bottles, drums.

Uses: The allotropic, red powder form is used in microscopy as an imbedding material. Selenium is used in the glass industry for making red glass; in the rubber industry as a vulcanizing agent; in electrical rectifiers, photoelectric cells, as a stabilizer in lubricating oils; stainless steels; xerography (q.v.), an inkless printing process based on the electrical properties of this element.

Shipping regulations: None.*

selenium diethyldithiocarbamate

Properties: Orange-yellow color; sp.gr. (20/20°C) 1.32; melting range 63-71°C (commercial grade); characteristic odor. Soluble in carbon disulfide, benzol, chloroform; insoluble in water.

Containers: 5-, 50-, 100-lb drums.

Use: Vulcanization agent without added sulfur or as a primary or secondary accelerator with sulfur. Functions at relatively low temperatures.

selenium dimethyldithiocarbamate. See

"Methyl Selenac."

selenium dioxide (selenous acid anhydride; selenous anhydride) SeO_2 .

Properties: White or yellowish white to slightly reddish, lustrous, crystalline powder or needles; sp.gr. 3.954 (15/15°C); m.p. 340°C; b.p. 317°C (sublimes); soluble in alcohol, water.

Grades: Technical.

Uses: Analysis (testing for alkaloids); medicine; an oxidizing agent; as an anti-oxidant in lubricating oils; catalyst.

selenium disulfide. See selenium sulfide.

selenium sulfide (selenium disulfide) SeS_2 .

Properties: Bright orange powder; faint odor at most. Practically insoluble in water and organic solvents.

Grade: U.S.P. XVI.

Use: Medicine.

1,4-selenothiane $\text{SeCH}_2\text{CH}_2\text{SCH}_2\text{CH}_2$.

Properties: Thin, colorless leaflets; b.p. 86.5°C (97 mm), m.p. 107°C.

Derivation: By boiling an aqueous solution of sodium selenide with dichloroethyl sulfide.

selenous acid (selenious acid) H_2SeO_3 .

Properties: Transparent, colorless deliquescent crystals, soluble in water and alcohol; insoluble in ammonia. Sp.gr. 3.0066; m.p. decomposes.

Derivation: By the action of hot nitric acid on selenium.

Method of purification: Sublimation.

Grades: Technical.

Containers: Glass bottles.

Use: Chemical reagent.

Shipping regulations: None.*

selenous acid anhydride. See selenium dioxide.

selenous anhydride. See selenium dioxide.

"Sellogen." ⁷⁸ Trademark for a series of detergent, emulsifying, and wetting agents used in the textile industry and in the manufacture of cosmetics.

"Selsun." ³ Trademark for selenium sulfide preparation used to control dandruff. Not a cure.

semecarpus nut (acajou nut; bhlawan nut; malacca nut, marany nut, marking nut, mangle). The fruit of *semecarpus anacardium*, oriental cashew nut. Properties and uses similar to cashew nut. See cashew nutshell liquid.

"Semesan." ²⁸ Trademark for seed disinfectant and turf fungicide containing hydroxymercurichlorophenol.

Containers: 4-oz cans, 12-oz cans and 25-lb pails.

Use: For dust or dip treatment to control seed-borne diseases, reduce seed decay, and check damping-off of seedlings of vegetable, flower, and other crop seeds, bulbs, corms, roots and tubers. Also for prevention and control of brown patch and other fungus diseases on fine turf of lawns and golf greens.

"Semesan Bel." ²⁸ Trademark for dip disinfectant containing hydroxymercurinitrophenol and hydroxymercurichlorophenol.

Containers: 3-oz, 1- and 4-lb cans; 40-lb pails.

Use: For dip treatment of Irish and sweet potatoes (seed pieces or slips) to protect against decay and control certain surface-borne diseases.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

semicarbazide hydrochloride (amidourea hydrochloride; carbamylhydrazine hydrochloride; aminourea hydrochloride)
 $\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$.

Properties: Snow-white crystals; m.p. 172-175°C (dec); soluble in water; insoluble in absolute alcohol and ether; soluble in diluted alcohol.

Derivation: From hydrazine sulfate, potassium or sodium cyanate and sodium carbonate, or electrolytically by the reduction of nitro-urea.

Grades: C. P.; technical.

Containers: Bottles; fiber drums of all sizes.

Uses: Reagent for aldehydes and ketones; isolation of hormones and isolation of certain fractions from essential oils.

Shipping regulations: None.*

semiconductor. A material with an electrical conductivity greater than that of insulators or dielectrics, but far less than the conductivity of true conductors such as metals. The range of conductivity of a semiconductor is usually 10^{-6} to 10^{-3} mhos/cm, but a wider range is sometimes included. The most common semiconductors are highly purified silicon and germanium, but slight traces (parts per million or billion) of selected impurities and/or crystal imperfections must be present to produce semiconductor properties. Without the impurities the materials are insulators.

These impurities cause either (1) loosely bound electrons that can move and carry some current, or (2) the impurities remove electrons from their normal place in the lattice and so form a "hole" which can be filled by an adjacent electron whose movement creates a new hole which is in turn filled. The resulting movement of the hole is the equivalent of electrical conduction in a direction opposite to that occurring when electrons move. The conductivity of a semiconductor usually varies rapidly with temperature. The most important semiconductors are silicon, germanium, selenium, cuprous oxide (Cu_2O), lead sulfide, silicon carbide, lead telluride and other intermetallic compounds. The production of these materials with suitable ultra high purity and with appropriate controlled impurities has become a significant segment of industrial chemistry. Applications are as rectifiers, modulators, detectors, thermistors, photocells and transistors in electrical circuits.

See also transistor.

semidrying oils. See drying oils.

senarmonite (antimony trioxide, octahedral)
 Sb_2O_3 .

Properties: White or gray mineral with white streak and resinous, almost adamantine luster. Yellow on melting. Insoluble in water; slightly soluble in sulfuric or nitric acids; soluble in hydrochloric acid, alkali hydroxides or sulfides. Sp.gr. 5.2-5.3; hardness 2-2.5. See valentinite.

Occurrence: Europe and northern Africa.

Uses: As a paint pigment and in flame-proofing.

Seneca oil. A term sometimes applied to petroleum in colonial days, when it was used in medicine.

Seneca root. See senega.

senega (senega snakeroot; Seneca root; rattle-snake root).

Derivation: Dried root of *Polygala senega*.

Occurrence: North America (Canada to South Carolina, west to Wisconsin).

Grades: Technical.

Containers: Bales; bags of variable size.

Use: Medicine.

Shipping regulations: None.*

Senegal gum. See arabic gum.

senega snakeroot. See senega.

senna.

Derivation: Dried leaflets of *Cassia acutifolia* (Alexandria senna) or of *Cassia angustifolia* (Tinnevely senna).

Occurrence: Nubia; Barbary; Abyssinia; Egypt; southern India.

Grades: Technical; N.F. XI.

Containers: Bales, powder in boxes and barrels.

Use: Medicine.

Shipping regulations: None.*

"Sentry," ²¹⁴ Trademark for sorbic acid and potassium sorbate (q.v.). Used in fungistats for the control of certain molds and yeasts in foods.

"Separan," ²³³ Trademark for synthetic flocculating agents.

"Separan" NP10: Synthetic nonionic, water soluble polymer of acrylamide.

Uses: Thickening and filtration of ore slurries; clay slurries and flotation concentrates; flocculation of solids in the lime-sulfur process; clarification of potash brines; removal of ferric hydroxide in manganese purification; filtration of coal-washery slimes; disposal of tailings; filtration of gypsum in wet-process phosphoric acid plants.

"Separan" NP20: Nonionic polyacrylamide polymer.

Uses: As for "Separan" NP10.

"Separan" AP30: Synthetic anionic polymer.

Uses: Clarification of coal tar.

sepiolite.

1 A reddish-brown pigment prepared from the ink of the cuttlefish. It is a mixture of calcium carbonate, magnesium carbonate, melanin, and an organic black coloring matter.

2. Pulverized bones of the cuttlefish, used as a polishing agent, as an ingredient of tooth powders, and for jewelry models.

sepiolite. See meerschaum.

"Septo-Sour," ²⁴⁴ A proprietary product consisting chiefly of zinc salts of fluorine compounds.

Properties: White, dustless crystals; readily

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

soluble in water; neutralizing value 25.6 oz sodium bicarbonate per lb.

Containers: 10-lb net corrugated paper drums; 60-lb net plywood drums; 150- and 300-lb net fiber drums.

Uses: Laundry sour, especially for goods washed at low temperatures.

"Seqonyx." ³²⁸ Trademark for a heavy crystalline sodium phosphoborate product that is most soluble in water at 90°F. Used as a processing assistant in the manufacture of light weight papers such as towelling tissue, crepe papers, bleached and unbleached sulfite newsprint, and bleached bond papers; also a dispersant in pitch control.

sequestration. (See also chelate). Usually the coordination complex of certain phosphates with metallic ions in solution so that the usual precipitation reactions of the latter are no longer possible. Thus, calcium soap precipitates are not produced from hard water treated with hexametaphosphates. The term sequestration may be used for any instance in which an ion is prevented from exhibiting its usual properties due to close combination with an added material.

Phosphates (see sodium metaphosphate) are the most widely used inorganic sequestering agents. Two groups of organic sequestering agents (chelates in these examples) of economic importance are the aminopolycarboxylic acids such as ethylenediaminetetraacetic acid and the hydroxycarboxylic acids such as glucoric, citric, and tartaric acids.

"Sequet." ²⁴⁴ Trademark for a compound consisting of complex phosphate base and an anionic surface active agent.

Properties: Soluble in water; stable, high sudsing, mildly alkaline compound, white, dedusted mechanical mixed powder.

Containers: 120-lb plywood drums; 300-lb wooden barrels.

Uses: Bottle washing additive for free rinsing operations in all hard water areas.

"Serene Green." ¹⁴¹ Trade name for color pigments made from benzidine yellow and phthalocyanine blue.

"Serenium." ⁴¹² Trademark for ethoxazene (q.v.).

serenoa (saw palmetto; sabal).

Derivation: Partly dried ripe berries of *Serenoa repens* or *S. serrulata*.

Occurrence: South Carolina to Florida and West Indies.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

"Serfin." ³³⁰ Trademark for reserpine.

"Serichrome." ²⁴³ Trademark for mordant acid dyes for wool.

serine (beta-hydroxyalanine; alpha-amino-beta-hydroxypropionic acid)
 $\text{HOCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A nonessential

amino acid occurring naturally in the L(-) form.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether; optically active; DL-serine, m.p. 246°C with decomposition; D(+)-serine, m.p. 228°C with decomposition; L(-)-serine, m.p. 228°C with decomposition.

Derivation: Hydrolysis of protein (especially silk protein); organic synthesis.

Containers: Bottles.

Use: Biochemical and nutritional studies; culture media; microbiological tests; feed additive. Available commercially in all three forms.

"Serizyme." ¹⁷³ Trademark for a standardized bacterial proteolytic enzyme preparation intended for removal of gelatin and similar protein type sizes from fabrics. Also used to assist the degumming of natural silk. Available as a liquid or as a highly concentrated powder.

"Seromycin." ¹⁰⁰ Trademark for cycloserine (q.v.).

serotonin (5-hydroxytryptamine; 5-hydroxy-3-(beta-aminoethyl)indole) $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}$.

A powerful vasoconstrictor found in the blood serum and the platelets of bone marrow in mammals. It also causes other smooth muscle to contract. It has been isolated from beef serum and may be synthesized from 5-benzyloxyindole. It is recovered as a complex with creatinine sulfate, $\text{C}_{14}\text{H}_{17}\text{N}_5\text{O}_7\text{S}$, m.p. (decomposes) 215°C, soluble in water, glacial acetic acid, sparingly soluble in methanol; insoluble in acetone, ether, benzene, absolute alcohol, chloroform, and ethyl acetate.

"Serpasil." ³⁰⁵ Trademark for reserpine, U.S.P.

"Serpasilin." ³⁰⁵ Trademark for a compound containing reserpine U.S.P. and methylphenidate hydrochloride N.N.D.
 Use: Medicine.

serpentine. A natural hydrated magnesium silicate corresponding to the formula $3\text{MgO} \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$, sometimes containing small amounts of nickel and with partial replacement of magnesium by ferrous oxide.

Properties: Dark to blackish-green, brownish-red or yellow. White streak; greasy; waxy, subresinous luster. Sp.gr. 2.5-2.65, hardness 2.5-4.

Varieties:

Antigorite: Platy or massive variety.

Chrysotile: Fibrous variety. See asbestos.

Occurrence: United States; Austria; Russia; Norway, Sweden; Scotland; England; Germany, Siberia

Use: Serpentine has been suggested as a source of magnesium compounds.

serpentine asbestos. See asbestos.

SES (sesone, sodium 2,4-dichlorophenoxyethyl sulfate) $\text{C}_6\text{H}_3\text{Cl}_2\text{OCH}_2\text{CH}_2\text{SO}_3\text{Na}$. Used in sprays for pre-emergence weed control; is

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

toxic to germinating seeds but harmless to many established plants.

sesame oil (benne oil; beni oil; teal oil; teel oil; til oil; gingelly oil; gingily oil; gingili oil; gigily oil).

Properties: A fixed, bland, yellow, almost odorless liquid oil. Does not readily become rancid; sp. gr. 0.9187 (25/25°C), solidifying point -5°C; m. p. 26-32°C (for free fatty acids); *Hehner* value 95.7; saponification value 188-193; iodine value 103-114; refractive index 1.4748-1.4762. Soluble in chloroform, carbon disulfide, ether, and benzene; slightly soluble in alcohol.

Chief known constituents: Olein (75%); stearin; palmitin; myristin; linolein, and sesamin.

Derivation: By pressing from *Sesamum indicum* (orientale).

Occurrence: China, Japan; East Indies, South America.

Method of purification. Filtration.

Grades: Edible, should contain less than 1% free fatty acids, semi-refined; coast, U.S.P. XVI.

Containers: Drums.

Uses: Manufacture of oleomargarine, soap, cosmetics, etc; general use similar to olive and almond oils which are frequently adulterated with sesame oil; medicine, insecticides.

Shipping regulations: None.*

"Sesamex." (Sesoxane). Is 2-(2-ethoxyethoxy)-ethyl-3,4-methylenedioxyphenyl acetal of acetaldehyde. A synergist for pyrethrins and methoxychlor.

sesamol $C_{22}H_{18}O_7$ [2-(3,4-methylene-dioxyphenoxy)-6-(3,4-methylenedioxyphenyl)cis-3,7-dioxobicyclo(3.3.0)octane]. A constituent of sesame oil which is the most powerful pyrethrum synergist known. A 1:1 mixture of pyrethrum and sesamol has 31 times the insecticidal activity of pyrethrum alone.

sesone. See SES.

Sesoxane. See "Sesamex".

"Sesquilate." ²⁴⁴ Trademark for a buffered, inhibited, alkaline cleaning compound with low sudsing characteristics.

Uses: Mechanical washing of dairy cans; spray washing of equipment in dairies and food plants.

"Setit." ³³⁷ Tradename for an aluminum hydrate containing 48.2% Al_2O_3 . Buff colored powder, sp. gr. 2.5, particles are of colloidal dimensions; insoluble in water and alkalis; slightly soluble in dilute mineral acids and hot concentrated sulfuric acid; soluble in hydrofluoric acid. Used to aid in suspension of nonplastic porcelain enamels, glazes, and polishing slurries, often as a partial replacement for colloidal clays in suspending titania frits.

Containers: 50-lb paper bags; 40,000-lb carloads.

"Setole." ⁴² Proprietary products. Thermo-plastic resin type emulsions.

Properties: White emulsion; dispersible in water at 20°C.

Containers: 55-gal steel drums.

Use: Finishing agents for all types of textile fabrics imparting "firm to medium hand" as desired by amount used.

"Setrete." ⁴⁹ Trademark for a seed disinfectant containing phenyl mercuric ammonium acetate. Used for cereal grains and cotton seed.

"Setsit 5." ⁶⁹ Trademark for an activated dithiocarbamate liquid accelerator; 100% active.

Properties: Reddish brown liquid miscible with water.

Uses: Ultra accelerator for natural and synthetic latex films and adhesives. Fast pre-cure rate.

"Setsit 9." ⁶⁹ Trademark for an activated dithiocarbamate liquid accelerator; 100% active.

Properties: Amber to brown liquid miscible with water.

Uses: Ultra accelerator for natural and synthetic latex films, adhesives, and foams. Slow pre-cure rate.

"Sevin." ²¹⁴ Trademark for 1-naphthyl N-methyl carbamate (q.v.); an insecticide.

"Sevron." ²⁸ Trademark for a line of cationic dyes especially suited for dyeing "Orlon" acrylic fiber, having outstanding fastness properties on this fiber.

sewage pitch. See stearin and fatty acid pitches.

sewage sludge. An organic material obtained by purifying city sewage. Obtained in two varieties:

(a) Imhoff sludge: A low-grade sludge containing from 2 to 3% ammonia and about 1% phosphoric acid.

(b) Activated sludge: A high-grade sludge containing from 5.0 to 7.5% ammonia and from 2.5 to 4.0% phosphoric acid.

Derivation: (a) By running sewage through settling tanks without the access of air. The sludge, or solid matter, is settled by the aid of anaerobic bacteria. (b) By running sewage through settling tanks and forcing air in through porous plates at the bottom of the tanks. 20% of the current "make" is also added. The action of the bacteria causes the solid organic matter to coagulate and settle. It is subsequently filtered and dried.

Use: Fertilizer.

Shipping regulations: None.*

See also milorganite.

sewer pipe clay. These clays are similar in characteristics to those used for paving brick. They must contain enough silica and stand sufficient heat to combine with the salt fumes to produce the required glaze. A high percentage of iron is also necessary since it aids in the formation

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

of the salt glaze. A high percentage of soluble salts is desirable.

SFS. Abbreviation for sodium formaldehyde sulfoxylate.

shaddock oil. See grapefruit oil.

shale oil. A crude oil obtained from oil shale (q.v.) by destructive distillation.

shark liver oil (shark oil; dog fish oil).

Properties: Yellow to red-brown liquid; characteristic odor, not disagreeable if oil is refined; sp.gr. 0.917-0.928. Soluble in ether, chloroform, benzene, and carbon disulfide.

Derivation: By expression from shark and dogfish livers.

Method of purification: Chilling and filtration.

Grades: Crude; refined.

Containers: Wooden barrels.

Uses: Leather dressing; oil tannage; paints and varnishes; soaps; source of vitamins A and D.

shark oil. See shark liver oil.

sharps. A term used in flour-milling. It is synonymous with middlings (q.v.).

shatterproof glass. See glass, safety.

"Shed-A-Leaf." ¹⁴⁷ Trademark for a chlorate-borate defoliant and desiccant.

Containers: 5-, 30-, 55-gal drums (liquid), dust and powder; 50-lb bags.

Uses: To hasten maturity of crops and reduce late insect infestation especially for cotton and beans.

sheep berry. See *viburnum prunifolium*.

sheep dip. See tar acids.

"Shell A-A Weed Seed Killer." ¹²⁵ A preplant herbicide containing not less than 98 wt % allyl alcohol (propen-1-ol-3) and not more than 2 wt % inert ingredients.

Properties: Colorless, mobile liquid, boiling range 95-98°C; characteristic, irritating odor; lachrymal vapor at, and above, a concentration of 10 ppm; miscible with water and with most common organic solvents.

Containers: 55-gal unlined metal drums (389 lb net).

Hazards: Warning! Poisonous by skin contact, inhalation or swallowing. Rapidly absorbed through skin. Wash thoroughly with soap and water after handling and before eating or smoking. Keep away from heat and open flame.

Shipping regulations: Class B poison label; package in metal drums.*

shellac (lac; garnet lac; gum lac; stick lac).

Derivation: A resin secreted by the insect *Laccifer lacca* (coccus lacca) and deposited on the twigs of various species of trees in India, Siam, and Indo-China. When collected and dried it is known as stick lac. This is ground and washed to remove an adherent red dye (lac dye), after which it is known as seed lac. The seed lac is refined by melting and straining and is then poured

in thin films over cylinders or plates and allowed to cool. When it hardens and scales off in thin flakes, it is known as shellac, or it is poured into molds to form "button" or garnet lac. This is the orange shellac of commerce. White shellac is made by bleaching orange shellac with sodium hypochlorite.

Properties: Insoluble in water; soluble in alcohol.

Grades (partial list): Garnet; button; orange lemon; lemon; bleached bonedry; bleached refined; bonedry.

Containers: Bags; kegs; barrels.

Uses: Paints; stains; varnishes; leather dressing; polishes; phonograph records; dielectric compositions; general binder; engraving and lithography; sealing wax; inks; rubber; match heads; paper; felt and crepe stiffeners.

Shipping regulations: Liquid solutions: Flammable liquid. Red label.*

"Shellacol." ³¹⁹ Trademark for a proprietary alcohol-type solvent, available in anhydrous form.

Uses: Solvent for resins, shellac, dyes, inks, and oils, as a substitute for denatured alcohols.

"Shell Catalysts 105 and 205." ¹²⁵ Trademark

for iron oxide catalysts promoted with potassium carbonate and chromium oxide; they are dehydrogenation catalysts used in the selective dehydrogenation of olefins to the corresponding diolefins and of ethyl-substituted aromatic compounds to the corresponding vinyl compounds. The basic difference between these two catalysts is the greater potassium carbonate content of the Shell 205 which makes it possible for the dehydrogenation process to operate at lower steam dilution ratios.

Containers: 41-gal fiber drums.

Caution! Dust may cause irritation of eyes and respiratory passages.

Shipping regulations: None.*

"Shell Isoprene Rubber." ¹²⁵ A synthetic elastomer possessing a close molecular similarity to natural rubber. Chemically, it is a stereospecific isoprene polymer which has been reacted to a high structural purity of about 92% cis-1,4-polyisoprene. The weight average molecular weight of the polymer is about 2.75×10^6 , and the number average molecular weight is about 2.5×10^6 . Compatible with natural and synthetic polymers (SBR, nitrile, neoprene, etc.) and may be blended with them in any proportion. The specific gravity of the polymer is 0.92 or about the same as that of natural rubber.

"Shell-S-Polymers." ¹²⁵ Manufactured by copolymerizing the two monomers, styrene and butadiene, under suitable conditions in a soap emulsion solution in which small amounts of other chemicals are present. Hot polymers, reacted at about 120°F, and cold polymers, reacted at about 40°F, can be prepared. Choice of reaction temperature, type of soap, chemical additives and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

reaction time determine many of the properties of the final copolymer. After polymerization to a predetermined point, the reaction is terminated, and unreacted monomers are removed from the emulsion. At this stage the emulsion is called latex and can be used in this form. To produce dry rubber, a stabilizer is added to the latex which is then coagulated in crumb form. The rubber crumb is filtered, washed, dried and compressed into bales for shipment.

sherardizing. The process by which steel is coated with zinc powder. The metal forms an alloy with the steel surface and produces a thin tightly adherent coating.

"Sherbelizer." ³²² A trademark for an alginate derivative-vegetable gum composition. Properties: A cream colored, highly refined powder passing essentially through 20 mesh and having a moisture content of about 13%; dissolves in hot or cold water to give viscous solutions. Soluble in milk or ice cream products.

Grades: Refined (complies with N. F. requirements).

Containers: 10-, 50-, 100-, and 300-lb drums.

Uses: Stabilizer for sherbets, water ices, frozen fruits, syrups, purees, chocolate ice cream.

"Sherdye." ¹⁴¹ Trade name for textile pigment emulsions used for impregnating fabrics by means of pad dyeing and by printing on said fabrics.

shield fern. See *aspidium*.

"Shirlan." ²⁸ Trademark for a group of products which have bacteriostatic or fungicidal properties. Included in this group are products based on salicylanilide which are used to impart mildew resistance to textiles, paints, and varnish.

"Shirlan." ²⁰⁶ Brand name for a powerful fungicide for use in sizing and finishing recipes to prevent the development of mildew. It is neither volatile nor injurious to the fabric, and is claimed to be superior to zinc chloride in this respect and in fungicidal action. Specially recommended for the treatment of tent cloth. It is marketed in paste and powder form.

"Shirlan" NA. ²⁰⁶ Brand name for a water-soluble form of "Shirlan."

shorts. A term used in flour-milling. Shorts are that part of the husk or outer coat of the wheat finer than bran (q.v.).

shot metal. See lead shot metal.

"Showertex." ³⁰⁷ Trademark for a water repellent, an emulsion of wax and metal salts; 28% solids content.

Properties: Creamy white emulsion; dispersible in water, sp. gr. 1.03-1.04.

Uses: Non-durable water repellent for long liquor or pad application on cotton, wool, rayon and mixed fiber fabrics.

Si. Symbol for silicon.

"SiC, H-W." ⁴⁴⁶ See "Harbide."

siderite (chalybite; spathic iron ore) FeCO_3 , usually with some Ca, Mg, or Mn. Spherosiderite is a secondary siderite occurring in basalt cavities. The term siderite is also used for an iron alloy found in meteorites.

Properties: Gray, yellow, brown, green, white or brownish-red mineral, vitreous inclining to pearly luster, white streak; sp. gr. 3.83-3.88; hardness 3.5-4.

Occurrence: United States (Vermont, Massachusetts, Connecticut, New York, North Carolina, Pennsylvania, Ohio), England; Wales; Germany; Austria; Switzerland; France.

Use: An ore of iron; when high in manganese, used in the manufacture of spiegeleisen.

sienna. A yellowish clay which is colored due to the presence of the oxides of iron and manganese. Raw sienna is a brown-tinted ferruginous manganiferous yellow ochre occurring in Alabama, California, Pennsylvania, Cyprus and Italy. Burnt sienna is an orange-brown pigment made by carefully calcining raw sienna. See also ochre.

Containers (raw or burnt): Paper bags.

"Sierrallite." ³⁸ Trade name for hydrous magnesium-aluminum silicate derived from the mineral prochlorite. Used in ceramics in the preparation of synthetic cordierite for high resistance to heat shock. Supplied as 200 mesh powder.

"Sight Savers." ¹⁴⁹ Trademark for silicone treated polishing tissues used for the polishing of glass and other vitreous surfaces.

sigma particle. See fundamental particle.

"Signemycin." ²⁹⁹ Trademark for an antibiotic combination containing tetracycline hydrochloride and triacetyloleandomycin.

silane SiH_4 , the simplest silicon hydride.

Properties: A gas with repulsive odor.

Solidifies at about -200°C , b.p. -112°C , stable at ordinary temperatures. Slowly decomposes in water; insoluble in alcohol, ether, benzene, chloroform, and silicon tetrachloride.

"Silaneal." ¹⁴⁹ Trademark for organo polysiloxanes used for making materials water-repellent.

silanes. Compounds of silicon and hydrogen of the formula $\text{Si}_n\text{H}_{2n+2}$ analogous to the alkanes or saturated hydrocarbons. SiH_3 - is called silyl (analogous to methyl), and Si_2H_5 - is disilanyl (analogous to ethyl). A cyclic silicon and hydrogen compound having the formula $(\text{SiH}_2)_n$ is called a cyclosilane. See also silicone.

"Silastic." ¹⁴⁹ Trademark for compositions in physical character comparable to milled and compounded rubber prior to vulcanization but containing organosilicon polymers. Parts fabricated of "Silastic" are

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

serviceable from -100 to 500°F, retain good physical and dielectric properties in such service; show excellent resistance to compression set, weathering, and corona. Thermal conductivity is high; water absorption low.

Uses: Diaphragms, gaskets and seals, O-rings, hose, coated fabrics, wire and cable, and insulating components for electrical and electronic parts.

"Silastic" Gums. ¹⁴⁹ Trade name for unvulcanized organopolysiloxane elastomers, for compounding silicone rubber. Reinforced gum with low shrink and low compression set characteristics, partly filled with silica to minimize compounding time, and sulfur-vulcanizable gum for blending with sulfur-vulcanizable organic rubber.

"Silastic" R Tape. ¹⁴⁹ Trade name for electrical insulating tape of glass cloth coated with semi-vulcanized silicone rubber. It is easily applied by wrapping, and vulcanization is completed by heating for a short time, to form a resilient, void-free, moisture-proof and oil resistant jacket with excellent dielectric properties. It is a Class H insulating material designated for hottest spot temperatures of 180°C.

silberol (silver phenolsulfonate, silver sulfophenylate, silver sulfocarbolate)
 $C_6H_4(OH)SO_3Ag$

Properties: Crystalline powder. Contains 28% silver. Undergoes spontaneous decomposition. Has antiseptic properties of silver without its corrosive action. Soluble in water and alcohol.

Derivation: By the interaction of silver oxide and phenolsulfonic acids.

Containers: Blue glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Silco-Flex." ¹¹⁶ Trademark for a silicone-rubber insulation for use on large motors and generators.

Properties: Good dielectric properties at operating temperatures; resistance to thermal degradation, good flexibility, strength and resilience, high thermal conductivity, low moisture absorption; high resistance to ionic discharge; abrasive resistant; chemically inert.

"Silene." ¹⁷⁷ Trademark for a white, highly absorptive, finely divided, precipitated, hydrated calcium silicate.

Properties: (typical analysis) SiO_2 64%; CaO 18%; loss on ignition 15%; pH in water suspension 10; sp. gr. 2.1, refractive index 1.47; density (lbs/cu ft) 12, oil absorption (rub-in method) 120 g; average particle size 0.03 micron.

Grades: "Silene" EF, "Silene" JA.

Containers: 50-lb paper bags.

Uses: In rubber compounding to improve physical properties of non-black products, as partial stabilizer and reinforcing filler in vinyl floor tile and highly loaded rubber, in printing inks; to prevent caking in table salt and other granular materials.

"Silene" JA is used in paper manufacture to impart opacity and to improve formation and finish.

"Silflake." ³¹ Trademark for silver flakes made by milling a chemical precipitate in a lubricant to impart a leaf-like quality to the silver particle. Available as:

"Silflake" 131. A dry flake used as a pigment for silver conductive coatings.

"Silflake" 135. A dry flake for the same purpose. It has appreciably higher conductivity in air dry silver paints than "Silflake" 131.

"Silflake" 850. An 85% silver paste with denatured alcohol or solvent of choice. Used as a pigment in air dry silver conductive coatings.

Containers: 100- and 750-troy ounce cans.

"Silfrax." ²⁸⁰ Trademark for bonded refractories containing from 40% to 78% silicon carbide.

Properties: High refractoriness; great strength; high thermal conductivity; freedom from spalling; resistance to clinker adhesion; and resistance to mechanical and flame abrasion.

Uses: Bricks for boiler and furnace installations; kiln furniture in ceramic kilns; shapes for boiler furnaces, air-cooled furnace linings, glass lehrs, pit furnaces, and enameling furnace ware supports.

silica (silicon dioxide) SiO_2 . Occurs in nature as quartz, sand, flint, chalcedony, opal, agate, diatomite, and numerous less common modifications. May also be made from a soluble silicate such as water glass by acidification, thorough washing and ignition to drive off water. Silicon dioxide combines chemically with most metallic oxides in many different proportions. See also silicic acid and quartz.

Properties: Colorless, transparent crystals, or white tasteless powder, sp. gr. 2.2-2.6; insoluble in water and acids except hydrofluoric; soluble in molten alkali when finely divided and amorphous. Silica melts to a glass with the lowest known coefficient of thermal expansion. M.p. 1710°C (cristobalite modification), b.p. 2230°C.

Containers: Paper bags.

Uses: Manufacture of glass, water glass, ceramic products and enamel ware; abrasives, foundry molds, carborundum; ferro-silicon and elemental silicon; filler, ingredient of concrete and mortar. Fused silica is used as a protectant in rockets. Powdered silica is used as a filler or bodying agent in cosmetics, pharmaceuticals, paper, insecticides, as a plasticizer in resins, flattening agent; thermal insulator. See also the minerals listed above (especially quartz), silica gel, and silicic acid.

silica gel. A regenerative adsorbent, consisting of amorphous silica.

Grades: Commercial grades capable of withstanding temperatures up to 500-600°F are supplied in the following mesh sizes: 3-8, 6-16, 14-20, 14-42, 28-200 and through 325.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 1-, 5-, 10-, 25-, 100-lb, and 120-lb, air tight metal containers.

Uses: Dehumidifying and dehydrating agent; in air-conditioning and in the drying of compressed air and other gases, liquids, such as refrigerants, and oils containing water in solution and in suspension; recovery of natural gasoline from natural gas; also used as a carrier for active catalysts, in some cases as a catalyst itself; in chromatography; anticaking agent in cosmetics and pharmaceuticals; in waxes to prevent slipping.

See silicic acid.

silicate. Any member of the very widely occurring compounds characterized by the presence of the elements silicon, oxygen, and one or more metals with or without hydrogen. Infrequently, the silicon and oxygen are combined with organic radicals to form silicate esters. Most common rocks (except limestone and dolomite) and many minerals are silicates or mixtures thereof, as are ordinary glass, water glass, and common bricks. The silicates may be considered as salts or esters of one or another of the many hypothetical silicic acids derived from varying proportions of silica and water. An alternative is to consider them as resulting from the union of silica and various metallic oxides, sometimes with water also present.

silicate cotton. See mineral wool.

silicate of soda. See sodium silicate.

siliceous earth. See diatomite.

siliceous earth, purified. See diatomite.

siliceous limestone. See limestone.

silicic acid (hydrated silica). This term is applied to the jelly-like precipitate obtained when sodium silicate solution is acidified. The formula H_2SiO_3 is often used for convenience but no such compound has been isolated, and $SiO_2 \cdot nH_2O$ is the proper formula. The proportion of water varies with the conditions of preparation and decreases gradually during drying and ignition, until relatively pure silica, SiO_2 , remains. During drying the jelly is converted to a white amorphous powder or lumps. In this form the material has great surface area and adsorbing power and is therefore used for decolorizing (bleaching) oils, fats and waxes, as a catalyst, carrier or base for other catalysts and for chromatographic adsorption, and recovery of gases and vapors including moisture from air or gas streams. The adsorbent properties may be regenerated by heating to 300°F. See silica gel.

The term silicic acid is also sometimes applied to various hypothetical acids of silica such as H_4SiO_4 , $H_2Si_2O_5$, etc.

silicochloroform. See trichlorosilane.

silicofluoric acid. See fluosilicic acid.

silicomanganese. Alloys consisting principally of manganese, silicon and carbon. Three

forms are usually marketed having approximately the following analyses:

- (1) C 1.00 (max), Mn 65-70, Si 20-25%;
- (2) C 2.00 (max), Mn 65-70, Si 16-20%;
- (3) C 2.5 (max), Mn 65-70, Si 16-20%.

Forms available: In crushed form or in lumps up to 75 lbs.

Uses: For making low-carbon steel in which silicon is not objectionable, silicomanganese may be used effectively for the introduction of manganese because of its low carbon content. It is also used effectively for 13% manganese steel when large quantities of returned scrap are in the charge. Makers of low carbon-chromium and manganese steels favor it because of the low carbon to manganese ratio. Silicon manganese steels are used for springs and high strength structural steels.

See also manganese steels and ferromanganese.

silicon. Nonmetallic element with atomic number 14; group IV of the periodic table. In trade, the element is commonly referred to as silicon metal. Silicon in organic compounds is the basis for a considerable industry; see silicone; silanes.

Properties: (a) Dark brown, amorphous, nonmetallic powder, which burns in air when ignited. (b) Also obtained as hard, lustrous, crystalline leaflets which do not burn in air. This latter form is a conductor of electricity. Both forms are soluble in hydrofluoric acid and alkalis, insoluble in water, nitric acid and hydrochloric acid.

Constants: (a) Sp.gr. 2.00; (b) 2.49; m.p. 1410°C; b.p., 2480°C; hardness 7 on Mohs scale; thermal conductivity 0.39 cal/cm/sec/°C, thermal expansion $4.15 \times 10^{-6}/°C$; specific heat 0.168 at 25°C; dielectric constant 13 at 9.37×10^9 cps; elastic modulus 19×10^6 psi; flexural strength 20,000 psi.

Occurrence: Second to oxygen in abundance. Never found in free state in nature, but composes a major portion of silicate rocks and of quartz, sand, sandstone, clay, granite, feldspar, mica, and many other common minerals.

Derivation: (a) By heating sand with coke in an electric furnace. (b) Heating sand with powdered magnesium and treating the mixture with water.

Method of purification: Treatment with hydrochloric and hydrofluoric acids. For semiconductor transistor and rectifier grades very high purity is achieved by operations such as distillation of silicon tetrachloride, tetraiodide or silane, reduction to silicon by use of ultrapure zinc, and vacuum or argon zone refining and special single crystal-growing techniques.

Purity: Total impurities are estimated to be as low as 10 parts per billion in some semiconductor grades, boron content being reduced to 1 part per billion.

Impurities of technical grades: Iron; carbon. Grades: Ferrosilicon (50% Si), regular (97% Si), and semiconductor or hyperpure (for

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

electronic devices). Available in crystalline or powdered form.

Containers: 500-lb barrels; drums.

Uses: Manufacture of silicon tetrachloride, silicon-bronze, silicon-copper and ferro-silicon; production of halogenated silanes; organo-silicon compounds; rectifiers and transistors; photocell elements; electrodes; solar battery. Silicon is combined with certain high temperature refractory ceramic materials to give cermets and other special refractories that are advantageous because the silicon confers higher thermal conductivity, better resistance to thermal shock, and resistance to oxidation.

Shipping regulations: None.*

silicon bromide. See silicon tetrabromide.

silicon-bronze. An alloy of copper, tin and silicon used for telephone and telegraph wires.

silicon carbide SiC . One of the hardest substances known.

Properties: Bluish black iridescent crystals, very hard (Mohs' scale hardness 9); sp. gr. 3.17; sublimes with decomposition at about 2210°C . Insoluble in water and alcohol, soluble in fused alkalis.

Derivation: Heating of carbon and silica sand in a horizontal resistance furnace.

Containers: Bags, barrels, drums.

Uses: Abrasive; heat refractory material.

Single high-purity crystals are now used as semiconductors, specially suitable for high temperatures.

silicon chloride. See silicon tetrachloride.

silicon-copper (copper silicide).

Properties: A hard, tough, bronze-like alloy containing 10-30% silicon.

Derivation: From silicon and copper electrolytically.

Grades: Technical.

Containers: Boxes.

Use: Manufacture of silicon-bronze.

Shipping regulations: None.*

silicon dioxide. See silica.

silicone. Group name for semi-inorganic polymers made up of a skeleton structure of alternate silicon and oxygen atoms with various organic groups attached to the silicon. (See, for example, dimethyl silicone.) Silicones always include organic groups; siloxanes may be completely inorganic. Silicones range from low molecular weight volatile materials to cyclic, linear and cross-linked high molecular weight polymers. Produced in the basic forms of fluids, resins and elastomers, they are also further compounded to yield greases, rubbers, protective coatings and foamable powders. In general, silicone products are characterized by an unique combination of properties. They are heat-stable, serviceable over a wide temperature span, water repellent, resistant to oxidation and weathering. They retain good physical and dielectric properties in severe operating conditions.

Uses: As adhesives, compressible fluids, cosmetic ingredients, damping media, dielectric fluids and compounds, diffusion pump fluids, defoamers, heat transfer media, protective coatings, surface treatments for glass and ceramics, textile finishes, leather tanning, lubricants, release agents, water repellents, electrical insulating materials and extreme temperature rubber.

See also siloxanes.

silicone, carbon-functional. Designation for silicon compounds containing at least one hetero atom or nonbenzenoid unsaturated linkage attached to silicon through carbon, in contrast to better known silicon compounds in which reactive groups are attached directly to silicon (see silicones). Examples are dichlorophenyltrichlorosilane ($\text{Cl}_2\text{C}_6\text{H}_3\text{SiCl}_3$), which is an intermediate for superior high temperature lubricants, and vinyltrichlorosilane ($\text{CH}_2\text{CHSiCl}_3$), used in novel gums and finishes for glass cloth. Carbon-functional groups modify the physical properties of silicones and increase their reactivity, permitting new syntheses.

silicone fluids. Organosiloxane polymers, commercially available in a range of viscosities from 0.65 to over 1,000,000 centistokes; include methyl and phenyl polysiloxanes. Characterized by heat stability, water repellency, good dielectric properties, and incompatibility with many organic polymers which make them effective release agents. See also silicone.

silicone resins. Organosiloxane polymers, generally supplied as solvent solutions, used in formulating protective coatings, in making glass cloth laminates, and as electrical insulating varnishes. Are characterized by unusual heat stability; resistance to oxidation, weathering and corrosive chemicals; and retention of dielectric properties in high temperature service.

silicone rubber. A silicone or siloxane of such structure and molecular weight as to have many properties characteristic of rubber. Vulcanized and cured, the silicones produce rubbery products serviceable from -150 to 600°F , retain good electrical properties at elevated temperatures, maintain resistance to compression set over a wide temperature range, and resist the effect of ozone, aging, sunlight, weathering, oil and water.

Available as pure gum, reinforced gum, and compounded in various ways.

Used in molded, extruded, and calendered form for high-temperature electrical and electronic insulation, and in the formation of O-rings, gaskets, seals, cushions, hot air ducts and hose, and insulating tapes.

silicon, ferro-. See ferrosilicon.

silicon fluoride. See silicon tetrafluoride.

silicon-gold alloy. See gold-silicon alloy.

silicon nitride Si_3N_4 . An important refractory. Properties: Greyish powder (can be prepared

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

as crystals); sublimes at 1900°C; density 3.44 g/cu m; bulk density 70-75 lb/cu ft, depending on mesh; Mohs' hardness 9+; modulus of rupture (room temperature) 10,000 psi; modulus of elasticity (room temperature) 13.4×10^6 psi; thermal conductivity 10.83 Btu/in/sq ft/hr/°F at 400-2400°F. Resistant to oxidation, various corrosive media, molten aluminum, zinc lead and tin. A beta-phase variety has unusual thermal shock resistance.

Derivation: One method involves the reaction of powdered silicon and nitrogen gas in an electric furnace.

Uses: Coatings; bonding of silicon carbide; mortars; abrasives; thermocouple tubes in molten aluminum; crucibles for zone-refining germanium; rocket nozzles.

silicon steel. Fourteen to sixteen per cent silicon steels are used for corrosion resistance to some inorganic acids and other chemicals. These contain 1% or less of carbon. Such alloys are not machinable except for limited turning with tungsten carbide tools, generally finished by grinding. Used for erosion resistance as well as corrosion resistance.

Silicon to the extent of 0.5-5% in iron makes good electrical iron. It has low hysteresis and eddy current losses, and satisfactory permeability. Used as armatures and transformer coils.

Silicon is also used as a general deoxidizer in steel manufacture; its presence strengthens low alloy steels, increases hardenability and improves oxidation resistance.

See also ferrosilicon.

silicon tetrabromide (silicon bromide) SiBr_4 .

Properties: Fuming, colorless liquid. Turns yellow in air. Disagreeable odor. Decomposed by water with evolution of heat.

Sp.gr. 2.82 (0°C); b.p. 153°C; m.p. 5°C.

silicon tetrachloride (silicon chloride) SiCl_4 .

Properties: A clear, colorless, exceedingly mobile, fuming liquid; suffocating odor. Since it is decomposed by water to yield silicic acid and hydrochloric acid, it is quite corrosive to most metals when water is present with it. In the absence of water it has practically no action on iron, steel, or the common metals and alloys, and can be stored and handled in metal equipment without danger. Sp.gr. 1.48 (68/60°F); wt 12.4 lbs/gal; m.p. -70°C; b.p. 57.6°C, refractive index (n_D20/D) 1.412. Miscible in all proportions with carbon tetrachloride, tin tetrachloride, titanium tetrachloride, and sulfur mono- and di-chlorides. Decomposed by water and alcohol.

Derivation: Silicon carbide is packed around a resistor and electrically heated, whereupon chlorine is passed through the mass and the silicon tetrachloride condensed from the escaping gas.

Impurities: Silicon hexachloride.

Grades: Technical; 99.5%; C.P. (99.8%).

Containers: Iron drums; bottles; tank cars.

Uses: Smoke screens in warfare; raw

material in making ethyl silicate and similar compounds which result from the reaction between anhydrous alcohols and silicon tetrachloride; production of silicones; source of pure silicon and silica; convenient source of hydrogen chloride.

Shipping regulations: Corrosive liquid.

White label.*

silicon tetrafluoride (silicon fluoride) SiF_4 .

Properties: Colorless gas; suffocating odor similar to hydrogen chloride; fumes strongly in air; m.p. -95.7°C; b.p. -65°C (181 mm). Absorbed readily in large quantities by water with decomposition.

Derivation: (a) Action of hydrofluoric acid or concentrated sulfuric acid and a metallic fluoride on silica or silicates. (b) Direct synthesis.

Grades: Pure, 99.5% min.

Containers: Gas cylinders.

Uses: Manufacture of fluosilicic acid; chemical analysis; to seal water out of oil wells during drilling.

Shipping regulations: Nonflammable gas.

Green gas label.*

silicothermic process. See Pidgeon process.

silicotungstic acid (silicowolframic acid)

$\text{SiO}_2 \cdot 12\text{WO}_3 \cdot 26\text{H}_2\text{O}$ (approximately). Composition is probably 12 molecules of tungsten trioxide to one molecule of silicon dioxide with varying amounts of water.

Properties: White to yellowish-white crystals; soluble in water and alcohol.

Derivation: By heating ammonium silicotungstate with aqua regia.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Kegs; glass bottles.

Uses: Chemical reagent for alkaloids, mordant for basic dyes.

Shipping regulations: None.*

silicowolframic acid. See silicotungstic acid.

"Silicure." ⁷⁴ Trademark for a series of catalysts for curing silicone resins and rubbers. They consist of iron, lead, tin, zirconium and zinc octoates, and zinc stearate.

silikatcement. See pozzolana cement.

"Silimite." ¹⁶⁶ Trademark for a high magnesium dolomitic lime used for silica reduction in hot process water softening equipment.

silk. An animal fiber secreted as a continuous filament by the silkworm, *Bombyx mori*. Silk consists essentially of the protein fibroin and, in the raw state, is coated with a gum, which is usually removed before spinning the filaments into threads. The important characteristics of silk are high strength, luster, and moisture absorbency, and fineness of the filaments. The principal sources are Japan, Italy, France, India, and China.

Uses: Apparel; parachute fabrics; bolting cloth.

silk, artificial. See fibers, synthetic.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Silk-O-Fast FF." ³²⁸ A brand product consisting of urea-polypeptide-formaldehyde condensate. It provides a durable body to silk and other textile fabrics.

"Silk-O-Ray." ³²⁸ Trademark for a textile finishing and scrooping agent consisting of fatty esters in dispersible form.

sillimanite [The refractory material.]

An aluminum silicate. A high heat-resisting material containing a maximum amount of mullite, developed from the alteration of andalusite during firing. This necessitates firing above 1550°C for the development of a suitable crystalline structure.

Uses: Spark plugs; chemical laboratory ware; pyrometer tubes; special porcelain shapes; furnace patch and refractories.

sillimanite [The mineral.] (fibrolite)

Al_2OSiO_4 . A silicate of aluminum with the same formula as andalusite and cyanite (q.v.). See also mullite. Used in refractories.

Properties: Color white, gray, brown, or greenish; vitreous luster; hardness 6-7; sp. gr. 3.23; usually found as fine fibrous masses.

Occurrence: Massachusetts, Connecticut, New Hampshire, Pennsylvania, South Carolina, Georgia; India; Brazil; Australia.

"Sil-O-Cel." ²⁴⁷ Trademark for a type of diatomaceous earth products used in filtration and insulation.

siloxanes (oxosilanes; polysiloxanes). Compounds of silicon, oxygen, usually also containing carbon and hydrogen, and containing in their molecules the structural unit R_2SiO in which R is usually CH_3 but may be H, C_2H_5 , C_6H_5 or more complex substituents. Disiloxane ($\text{H}_3\text{Si-O-SiH}_3$) and trisiloxane ($\text{H}_3\text{Si-O-SiH}_2\text{-O-SiH}_3$) are the simplest examples, but the most interesting are those of higher molecular weight and having the composition $(\text{R}_2\text{SiO})_n$. These are polyorganosiloxanes or silicones (q.v.) whose molecules consist of chains of alternate silicon and oxygen atoms

with the free valences of the silicon atoms joined usually to hydrocarbon (R) groups but also to some extent to oxygen atoms that are joined to (cross-linked) silicon atoms in a second chain. The properties of the resulting materials vary from relatively mobile fluids through oils, greases, rubbers, to resins or plastics, depending on the length of the chain, the nature of the R groups, and the extent of crosslinking. In commercial silicones R is usually CH_3 , i.e., they are methyl siloxanes. See also silicones.

"Silpaints." ³³¹ Trademark for a series of conductive coatings pigmented with metallic silver together with bonding agents. Available in two classes: (a) Fire-on-types for

base material that can withstand heating in range 750-1700°F. (b) Air dry types for organic base materials that are usually force-dried in range of room temperature to 800°F.

Containers: 25- and 50-oz jars.

Use: To make conductive surfaces on non-conductive materials such as ceramics, glass, quartz, mica, plastics and paper.

"Silpowder." ³¹ Trademark for series of silver powders, available as:

"Silpowder" No.	Average Particle Size (microns)	% Silver
120	5.0-10.0	99.9
130	0.6- 2.0	99.6
131	1.0- 5.0	99.6
150		99.9

Containers: 100- to 150- troy ounce metal containers.

Uses: Powder metallurgy; electrical contacts; battery plates.

"Sil-Temp." ³⁴⁹ Trademark for a substantially pure fibrous SiO_2 for use in rocket and missile constructions and for high temperature insulation of motor components and similar applications. As a construction material it is used in laminate form impregnated and bonded with high temperature resin systems.

"Silvace." ¹²⁹ Trademark for a series of wood fibers prepared from western softwood species by use of a defibrating process that separates individual fibers of the wood rather than cutting or grinding. Various grades are prepared according to degree of fiber separation and the chemical treatment that is used during manufacture. Fiber and fiber bundle lengths range up to $\frac{3}{4}$ in. long and down to less than $\frac{1}{8}$ in. Usually shipped in tightly compressed bales. When fluffed, the fibers form a woolly mass resistant to settling or compression.

Properties: Natural wood color, fineness variable according to grade, moisture content as desired, grades treated with chemicals may have special properties including fire resistance.

Uses: Insulation; pulp molding; special papers and boards where high bulk and absorbent qualities are desirable, filter aid and filter media; treatment of oil well drilling muds.

"Silvacon." ¹²⁹ Trademark for a series of products made from Douglas fir (*Pseudotsuga taxifolia*) bark. The basic constituents of the bark are pliable spongy flakes (cork), tough needle-like fibers and a fine amorphous powder. The "Silvacon" products are purified constituents or blends and are available in different particle sizes. The basic constituents vary in properties, the fibers being largely cellulose (65%) and the cork and powder constituents largely lignin-like polyphenols with tannins, natural waxes, and resins present in fair quantity.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Color from buff to dark brown; sp. gr. (ultimate) 1.32-1.47; particle size of powder is 95% minus 200 mesh and cork particles are up to $\frac{3}{8}$ in. diameter; acidic (pH about 3.6); low solubility in water or dilute acids (15% or less); soluble in caustic solution up to 90% of cork but only 25% of fiber.

Uses: Phenolic adhesive extender; molding compound component; conditioner for fertilizer, insecticides, etc; burnout material in foundry sands; rubber sponge manufacture; other vinyl and rubber compounds; treatment of oil well drilling fluids; replacement for European cork in various applications.

silver Ag. A metallic element, atomic number 47, in Group I of the periodic table.

Properties: Soft, ductile and malleable, lustrous white metal. Best metallic conductor of heat and electricity. Resists oxidation, but tarnishes slightly in ordinary air through reaction with atmospheric sulfur compounds. Sp. gr. 10.53; m.p. 961°C , b.p. 1950°C . Soluble in nitric acid, hot sulfuric acid, and alkali cyanide solutions; insoluble in water and alkalies.

Derivation: Most silver production comes as a by-product of operations on copper, zinc, lead, or gold ores, but some smelters still operate on silver ores. The recovery ranges from 166 ounces per ton to a few thousandths of an ounce per ton. The chief silver ores are native silver, argentite (silver sulfide) and cerargyrite or horn silver (silver chloride).

Forms available: Pure ("fine"), sterling (7.5% Cu), various alloys, silver plate, ingot, bullion, coins, moss, sheet, including porous silver sheets, wire, tubing, castings; powder; high purity (impurities less than 10 ppm).

Uses: Pure silver is used for the manufacture of silver bromide, photographic chemicals, etc.; for lining vats, tanks, barrels, cans, pipes, autoclaves, stills, condensers and other equipment for distilling water, processing organic acids, aldehydes and food products. Other major uses of the pure metal are heavy electric conductors, such as bus bars, and silver plating. Alloys containing a relatively high proportion of silver are used for low temperature brazing alloys, table cutlery, decorative and ornamental objects, jewelry, dental, medical and scientific equipment, coinage, electrical contacts as in relays, and for bearing metal. High purity silver is used in electronics.

silver acetate CH_3COOAg .

Properties: White crystals or powder; sp. gr. 3.26. Moderately soluble in hot water; soluble in nitric acid.

Use: Medicine (external).

silver arsenite Ag_3AsO_3 .

Properties: Fine, yellow powder. Sensitive to light. Caution! Poisonous! Soluble in acetic acid, ammonium hydroxide, and nitric acid; insoluble in alcohol and water.

M.p. 150°C (decomposes).

Use: Medicine.

Shipping regulations: Poison, class B. Poison label.*

silver arsphenamine (silver diaminodihydroxy-arsenobenzene, sodium salt; silver di-arsenol).

Properties: Brownish-black powder (containing approximately 20% arsenic, 15% silver) for which the exact molecular formula has not been established. Unstable in air. Soluble in water.

Derivation: By the action of silver salts on arsphenamine, converting the product to the disodium salt and precipitating with alcohol, acetone, or ether.

Grades: Medicinal.

Containers: Ampules.

Use: Medicine.

Shipping regulations: None.*

silver bichromate. See silver dichromate.

silver bromate AgBrO_3 .

Properties: White powder. Caution! Keep in amber bottle! Soluble in ammonium hydroxide; slightly soluble in water (hot). Decomposed by heat. Sp. gr. 5.2.

Caution: Poison label. Protect from contact with organic matter.

silver bromide AgBr .

Properties: Pale yellow crystals or powder, darkening on exposure to light, finally turning black. Sp. gr. 6.473; m.p. 432°C ; b.p. decomposes at 700°C . Soluble in potassium bromide, potassium cyanide and sodium thiosulfate solutions; very slightly soluble in ammonia water; insoluble in water.

Derivation: Silver nitrate is dissolved in water and a solution of alkali bromide added slowly. The precipitated silver bromide is washed repeatedly with hot water; the whole operation must be carried on in a dark-room under a ruby-red light.

Impurities: Silver nitrate; alkali bromide.

Grade: Technical.

Containers: Amber or black glass bottles. Poison label.

Use: Silver bromide is the light sensitive material on ordinary photograph film and plates.

Shipping regulations: None.*

silver carbonate Ag_2CO_3 .

Properties: Yellow to yellowish-gray, crystalline powder. Contains 78% (approx.) silver. Caution! Keep away from light! Soluble in ammonium hydroxide, nitric acid; insoluble in alcohol and water. Sp. gr. 6.077; m.p. 220°C (decomposes).

silver chloride AgCl .

Properties: White granular powder, which darkens on exposure to light, finally turning black. Exists in several modifications differing in conduct toward light and also in their solubility in various solvents. Soluble in ammonium hydroxide, concentrated sulfuric acid and sodium thiosulfate and potassium bromide solutions; very slightly

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

soluble in water. Sp.gr. 5.56; m.p. 445°C; b.p. 1550°C.

Derivation: Silver nitrate solution is heated and hydrochloric acid or salt solution added. The whole is boiled, then filtered, all in the dark or under a ruby-red light. **Method of purification:** Re-solution in ammonium hydroxide and precipitation by hydrochloric acid.

Impurities: Silver nitrate.

Grades: Technical; C.P., single pure crystals.

Containers: Amber or black glass bottles. Poison label.

Uses: Photography; photometry and optics; silver plating; production of pure silver; medicine. Single crystals are used for infrared absorption cells and lens elements.

Shipping regulations: None.*

silver chromate Ag_2CrO_4 .

Properties: Dark, brownish-red, crystalline powder. Soluble in acids, ammonium hydroxide, potassium cyanide, solutions of alkali chromates; insoluble in water. Sp.gr. 5.625.

Use: Reagent.

Shipping regulations: None.*

silver, colloidal. Metallic silver, insoluble silver salts and silver protein precipitates in sufficiently finely divided form to assume the colloidal state and form permanent suspensions in water. They are prepared either by means of chemical reactions or electrolytically and are used in medicine. See, for example, silver protein, mild; and silver protein, strong.

silver cyanide AgCN .

Properties: White, odorless, tasteless powder which darkens on exposure to light. Soluble in ammonium hydroxide, dilute boiling nitric acid and potassium cyanide and sodium thiosulfate solutions; insoluble in water. Sp.gr. 3.95; decomposes at 320°C.

Derivation: By adding sodium or potassium cyanide to a solution of silver nitrate.

Grade: Technical.

Containers: Amber or black glass bottles. Poison label.

Uses: Medicine; silver plating.

Shipping regulations: None.*

silver diaminodihydroxyarsenobenzene sodium salt. See silver arsphenamine.

silver diarsenol. See silver arsphenamine.

silver dichromate (silver bichromate)

$\text{Ag}_2\text{Cr}_2\text{O}_7$.

Properties: Dark red, almost black, crystalline powder; sp.gr. 4.770; soluble in ammonium hydroxide and nitric acid; slightly soluble in water.

silver fluoride $\text{AgF} \cdot \text{H}_2\text{O}$.

Properties: Yellow, or brownish, crystalline masses. Very hygroscopic. Becomes dark on exposure to light. Caution! Keep away from light! Soluble in water. Sp.gr. 5.852 (dehydrated); m.p. 435°C

(dehydrated).

Use: Medicine.

silver glance. See argentite.

silver haloids, natural. A series of natural isomorphous haloids of silver forming a class of secondary minerals commonly found in the upper parts of silver deposits and occurring massive or in crusts with the consistency and luster of horn or wax, hence the term "horn silver." They may consist of the simple chloride, bromide or iodide, or may be mixed in varying proportions. The principal members of this series are cerargyrite, bromyrite, embolite, iodargyrite, iodembolite.

silver iodate AgIO_3 .

Properties: White powder; decomposed by sulfuric acid. Soluble in ammonium hydroxide, nitric acid, solution of potassium iodide (conc.); slightly soluble in water.

Constants: Sp.gr. 5.65; m.p. above 200°C.

Use: Medicine.

silver iodide AgI .

Properties: Pale yellow, odorless, tasteless powder, darkening on exposure to light.

Soluble in hydriodic acid, potassium iodide, potassium cyanide, ammonium hydroxide, sodium chloride and sodium thiosulfate solutions; insoluble in water. Sp.gr. 5.675; m.p. 556°C.

Derivation: Silver nitrate solution is heated, alkali iodide solution added and the precipitate washed with boiling water in the dark or under ruby-red illumination.

Impurities: Silver nitrate and alkali iodide.

Grades: Technical; pure.

Containers: Amber or black glass bottles.

Poison label.

Uses: Medicine; photography; artificial rain-making.

Shipping regulations: None.*

silver lactate $\text{CH}_3\text{CHOHCOOAg} \cdot \text{H}_2\text{O}$.

Properties: White to gray crystals; affected by light. Slightly soluble in water and alcohol.

Use: Medicine.

silver leaf. See stillingia.

silver, light ruby. See proustite.

"Silver-Lume." ⁷² Trade name for a bright silver plating process. Prepared from silver cyanide, potassium cyanide, potassium carbonate and organic addition agents. Solution has exceptional throwing power and deposits are hard, wear resistant with high protective value and tarnish resistance. Produces bright deposits directly.

silver-mercury iodide. See mercuric-silver iodide.

silver methylarsonate (methaneearsonic acid, disilver salt) $\text{CH}_3\text{AsO}_3\text{Ag}_2$.

Derivation: Reaction of disodium methylarsonate with silver salts.

Use: Algicides.

silver nitrate AgNO_3 .

Properties: Colorless, transparent, tabular,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

rhombic crystals, becoming gray or grayish-black on exposure to light in the presence of organic matter; odorless; bitter, caustic metallic taste; corrosive and poisonous! Soluble in cold water; more soluble in hot water, glycerol and hot alcohol; slightly soluble in ether. Sp.gr. 4.328; m.p. 212°C; b.p. decomposes.

Derivation: Silver is dissolved in dilute nitric acid and the solution evaporated. The residue is heated to a dull red-heat to decompose any copper nitrate, dissolved in water, filtered and recrystallized.

Grades: Technical; C.P.; U.S.P. XVI.
Containers: 16-, 50-, 80-, 100-, 160-, 200-oz amber or black glass bottles.

Uses: Photography; hair dyeing; mother of pearl; reagent in chemical laboratories; silver plating; indelible ink; silver salts; glass manufacture; silvering mirrors, medicine (external); germicide (as a wall spray).

Warning: May cause burns. Poison label. MCA warning label.

Shipping regulations: Oxidizing material. Yellow label.*

silver nitrate, fused (lunar caustic; silver nitrate, toughened).

Properties: White, hard pencils or cones containing not less than 94.5% silver nitrate. Odorless; bitter, caustic, and strongly metallic taste. Becomes gray or grayish-black on exposure to light in the presence of organic matter. Solubilities similar to silver nitrate (q.v.).

Derivation: (a) By adding hydrochloric acid (4 parts) to silver nitrate (100 parts), melting and pouring into molds. (b) By melting silver nitrate (95 parts) and potassium nitrate (5 parts) together and pouring into molds.

Grades: U.S.P. XVI.

Containers: Amber or glass bottles.

Use: Medicine (external).

Warning: May cause burns. Poison! MCA warning label.

Shipping regulations: Oxidizing material. Yellow label.*

silver nitrate, toughened. See silver nitrate, fused.

silver nitrite AgNO_2 .

Properties: Small, yellow or grayish-yellow needles. Become gray on exposure to light. Contain 70% (approx.) silver. Decomposed by acids. Soluble in (hot) water, insoluble in alcohol. Decomposes at 140°C. Sp.gr. 4.4.

Grade: Technical.

Uses: Organic synthesis, standardizing potassium permanganate solutions; water analysis, analysis (testing for alcohols).

silver ore, brittle. See stephanite.

silver ore, dark ruby. See pyrargyrite.

silver ore, light ruby. See proustite.

silver oxide (argentous oxide) Ag_2O .

Properties: Dark brown odorless powder;

metallic taste; must not be triturated with organic matter; may cause explosions. Soluble in ammonium hydroxide, potassium cyanide solution, nitric acid and sodium thiosulfate solution; very slightly soluble in water; insoluble in alcohol. Sp.gr. 7.14; m.p. decomposes when heated above 300°C.

Derivation: Silver nitrate and alkali hydroxide solutions are mixed, the precipitate filtered and washed.

Grades: Technical; 92.5% silver, particle size 2-3 micron.

Containers: Glass bottles; 100-, 500-oz cans.

Uses: Medicine, polishing glass; coloring glass yellow; catalyst; purifying drinking water; battery plates; silver paint.

Caution: A powerful oxidizing agent. Caution should be exerted when silver oxide is brought into contact with ammonia or combustible solvents. An ammoniacal solution of a silver salt is potentially explosive and this hazard increases with standing time.

Shipping regulations: None.*

silver oxide battery. See zinc-silver oxide battery.

silver oxide, divalent (argentic oxide) Ag_2O .

Made by chemical precipitation. Average particle size, 1.5-3.0 microns. Fineness 730.0 Ag pts/1000 (min) (73% Ag).

Containers: 80-oz jars in metal outer-containers.

Caution: Do not mix with any organic material.

silver permanganate AgMnO_4 .

Properties: Violet, crystalline powder.

Contains 47.5% (approx.) silver. Decomposed by alcohol. Caution! Keep in dark-colored bottle! Soluble in water.

Grade: Technical.

Use: Gas masks; medicine.

silver phenolsulfonate. See silberol.

silver phosphate (silver orthophosphate)

Ag_3PO_4 .

Properties. A yellow powder, turns brown when heated or on exposure to light. Soluble in acids, potassium cyanide solution, ammonium hydroxide, ammonium carbonate, and acetic acid; very slightly soluble in water. Sp.gr. 6.37, m.p. 849°C.

Derivation: By the interaction of silver nitrate and sodium phosphate.

Grade: Technical.

Containers: Amber or black glass bottles.

Poison label.

Uses: In photographic emulsions, catalyst; pharmaceuticals.

Shipping regulations: None.*

silver picrate $\text{C}_6\text{H}_2\text{O}(\text{NO}_2)_3\text{Ag}\cdot\text{H}_2\text{O}$.

Properties. Yellow crystals containing 30% silver; soluble in water; slightly soluble in alcohol and acetone; insoluble in ether and chloroform.

Use: Medicine.

silver-potassium cyanide $\text{KAg}(\text{CN})_2$.

Properties: White crystals; sensitive to light, exceedingly poisonous! Soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water and alcohol; insoluble in acids.

Derivation: By adding silver chloride to a solution of potassium cyanide.

Impurities: Silver.

Grade: Technical.

Containers: Glass bottles. Poison label.

Uses: Silver plating; bactericide, antiseptic.

Shipping regulations: Poison, class B. Poison label.*

silver protein, mild (protargin, mild). See also silver protein, strong. Silver rendered colloidal by the presence of, or combination with, protein. Contains 19-23% silver.

Properties: Brown or black shining scales or granules; odorless; hygroscopic; affected by light. Must be freshly prepared. Soluble in water but almost insoluble in alcohol, chloroform, or ether.

Containers: 16-oz bottles.

Grade: N.F. XI.

Use: Medicine.

silver protein, strong (protargin, strong) See also silver protein, mild. The strong variety contains 7.5-8.5% silver, but since this is principally in ionic form, it is more irritating and a stronger germicide than the mild.

Properties: Orange to black, odorless powder; somewhat hygroscopic; affected by light. Must be freshly prepared. Soluble in water but almost insoluble in alcohol, chloroform, and ether.

Use: Medicine.

silver salt. See anthraquinone-2-sodium sulfonate.

silver-sodium chloride (sodium-silver chloride) $\text{AgCl} \cdot \text{NaCl}$.

Properties: Hard, white crystals. Decomposed by water. Soluble in solution of sodium chloride (conc.).

silver-sodium thiosulfate (sodium-silver thiosulfate) $\text{Ag}_2\text{S}_2\text{O}_3 \cdot 2\text{Na}_2\text{S}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White or gray, crystalline powder. Sweet taste, soluble in water.

silver sulfate (silver sulfate, normal) Ag_2SO_4 .

Properties: Small, colorless, lustrous crystals or crystalline powder. Contains 69% (approx.) silver. Turns gray on exposure to light. Soluble in ammonium hydroxide, nitric acid, sulfuric acid, (hot) water, insoluble in alcohol. Sp.gr. 5.45, b.p. 1085°C (decomposes); m.p. 652°C.

Grades: Technical; C.P.

Use: Analysis.

silver sulfate, normal. See silver sulfate.

silver sulfide Ag_2S .

Properties: A grayish-black, heavy powder. Soluble in concentrated sulfuric and nitric acids; insoluble in water. Sp.gr. 6.85-7.32; b.p. decomposes; m.p. 825°C.

Derivation: By passing hydrogen sulfide gas into silver nitrate solution, washing and drying.

Grade: Technical.

Containers: Glass bottles.

Uses: Inlaying in niello metal-work; ceramics.

Shipping regulations: None.*

silver sulfocarbolate. See silberol.

silver sulfophenylate. See silberol.

silvichemicals. Chemicals made from wood.

They include: alcohol (ethyl), lignins, lignosulfonates (from spent sulfite liquor); vanillin, yeast (from fermentation of wood sugars); tall oil, sulfate turpentine; bark extracts; phenolic materials.

"Silvol." ³³⁰ Trademark for silver protein, mild, N.F.

silyl. See silane.

simaroubidin. See simarubidin.

simaroubin. See simarubin.

simarubidin (simaroubidin) $\text{C}_{22}\text{H}_{32}\text{O}_9$.

Properties: Tasteless, crystallizes as needles. M.p. 260-261°C. Soluble in glacial acetic acid, pyridine.

Derivation: Bark and wood of Simaruba amara.

Use: Medicine.

simarubin (simaroubin) $\text{C}_{22}\text{H}_{30}\text{O}_9$.

Properties: Needle-like crystals; m.p. 230-231°C; slightly soluble in water; soluble in alcohol, acetone, pyridine, glacial acetic acid, methanol. Insoluble in benzene, ether, and chloroform.

Simons process. ... electrochemical fluorination process which makes fluorocarbons by passing an electric current through a mixture of the organic starting compound and liquid anhydrous hydrogen fluoride. The products are hydrogen and the desired fluorocarbon.

simple distillation. Distillation in which no appreciable rectification of the vapor occurs i.e., the vapor formed from the liquid in the still is completely condensed in the distillate receiver and does not undergo change in composition due to partial condensation or contact with previously condensed vapor.

sinapis alba. See mustard, white.

sinapis nigra. See mustard, black.

sinapis oil. See mustard oil, volatile.

single nickel salt. See nickel sulfate.

"Singoserp." ³⁰⁵ Trademark for syrosingopine N.N.D.

Use: Medicine.

sinopis. A variety of red hematite (q.v.) used as a pigment.

sintered carbides. See cemented carbides.

sintering. The partial welding together of powder particles at temperatures below the melting point. Occurs in both powder metallurgy and ceramic firing with or without the presence of liquid. While heat and pressure encourage the process, the driving force results from the decrease in surface area

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(see Rittinger's law). Sintering produces greater strength, conductivity, and density.

"Si-O-Lite." ³²⁹ Trademark for a pure, bulky, precipitated silica hydrogel.

SIPP. Abbreviation for sodium iron pyrophosphate.

sisal. Hard, strong, light-yellow to reddish fibers obtained from the leaves of *Agave sisilana*. It is inferior to abaca in strength and water resistance.

Source: Africa; Java; Haiti; Bahama.

Grades: Based on country of origin, color, and length of fibers.

Containers: 400-lb bales.

Uses: Binder twine; rope; sacking; upholstery.

sisserskite. A natural alloy of osmium and iridium, with osmium predominating.

"Sitol." ²⁸ Trademark for sodium salt of nitrobenzene-meta-sulfonic acid.

Properties: Cream-colored powder.

Use: As a protective oxidizing agent in discharge printing.

beta-sitosterol $C_{27}H_{48}O$. 22, 23-Dihydrostigmasterol.

Properties: Waxy white solid, almost odorless and tasteless; insoluble in water, soluble in benzene, chloroform, carbon disulfide and ether. Can be crystallized from ether as anhydrous needles, or from aqueous alcohol as leaflets with one molecule of water.

Derivation: See sitosterols.

Uses: Sitosterol differs from cholesterol by a C_2H_5 group at the 24 position and has some properties and uses in common.

See sitosterols.

sitosterols. The N.F. XI grade is a mixture of beta-sitosterol and certain saturated sterols. It contains not less than 95% total sterols nor less than 85% unsaturated sterols calculated as beta-sitosterol (q.v.).

Properties: White, nearly odorless, tasteless powder or waxy white solid. Insoluble in water; soluble in chloroform, benzene and carbon disulfide. Specific rotation (2% solution) -25° to -38° . Melting range $136-142^\circ C$.

Derivation: From soybeans.

Uses: Medicine, additive in cosmetics and emulsions; intermediate.

"Six-Twelve." ²¹⁴ See "6-12."

size oils. The same as throwing oils (q.v.).

sizing compounds. Materials applied to yarns, fabrics, paper, leather and other products to improve or increase their stiffness, strength, smoothness or weight; materials used to modify the cooked starch solutions applied to warp ends prior to weaving.

skatole (3-methylindole; beta-methylindole) C_9H_8N .

Properties: A white crystalline substance, browning upon aging, and having an extremely fecal odor. M.p. 93° to $95^\circ C$;

b.p. $265^\circ C$. Soluble in hot water, alcohol, benzene. Gives violet color in potassium ferrocyanide and sulfuric acid.

Use: Sparingly in perfumery as a fixative and for artificial civet.

"Skellysolve." ⁴⁰⁹ Proprietary name applied to any one of a series of highly refined petroleum hydrocarbon fractions manufactured in various grades having closely specified and controlled boiling ranges, gravity, evaporation rates, etc. for uses in the oil, fat, rubber, paint, polish, ink, insecticide, and other chemical industries. The various grades are designated "Skellysolve"-B, -C, -F, etc. as follows.

"Skellysolve" B. Normal hexane-type solvent with low evaporation residue and freedom from greasy ends and odor. Used in rubber compounding, vegetable extraction, manufacture of cans, and as a petroleum ether. Produced by exhaustive chemical treatment.

Typical specifications:

Sp.gr. ($60^\circ F$) 0.683.

Reid vapor pressure, psi ($100^\circ F$) 5.1.

Evaporation rate at $68^\circ F$: 50%, 1.80 minutes; 100%, 4.30 minutes.

Evaporation residue % by weight 0.0003.

Flash point (Tag closed cup) $-25^\circ F$.

Aniline point $142.5^\circ F$.

Kauri butanol value 30.5.

% sulfur by weight 0.0040.

A.S.T.M. distillation I.B.P., $146^\circ F$; 20%, $149^\circ F$; 40%, $149^\circ F$; 60%, $150^\circ F$; 80%, $151^\circ F$; 95%, $153^\circ F$; dry point, $156^\circ F$.

Acidity of residue from distillation, neutral.

"Skellysolve" C. Low evaporation residue and slower evaporation rate than "Skellysolve"-B. Used in rubber compounding, meat scrap extraction, manufacture of cans, adhesive tape.

Typical specifications:

Sp.gr. ($60^\circ F$) 0.726.

Reid vapor pressure, psi ($100^\circ F$) 2.2.

Evaporation rate at $68^\circ F$: 50%, 4.00 minutes; 100%, 9.80 minutes.

Evaporation residue % by weight 0.0005.

Flash point (Tag closed cup) $+13^\circ F$.

Aniline point $130.2^\circ F$.

Kauri butanol value 36.2.

% sulfur by weight 0.0060.

A.S.T.M. distillation I.B.P., $190^\circ F$; 20%, $196^\circ F$; 40%, $197^\circ F$; 60%, $199^\circ F$; 80%, $200^\circ F$; 95%, $203^\circ F$; dry point, $208^\circ F$.

Acidity of residue from distillation, neutral.

"Skellysolve" F. A petroleum ether naphtha. Used as a laboratory reagent, in aerosol-type insecticides, herbicide formulations. Meets petroleum ether specifications for the American Chemical Society, for the American Oil Chemists' Society and for Federal Specification O-E-751b.

Typical specifications:

Sp.gr. ($60^\circ F$) 0.643.

Reid vapor pressure, psi ($100^\circ F$) 13.5.

Evaporation rate at $68^\circ F$:

50%, 0.80 minutes; 100%, 2.40 minutes.

Evaporation residue % by weight 0.0003.

Flash point (Tag closed cup) $-70^\circ F$.

Kauri butanol value 26.4.
% sulfur by weight 0.0040.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

A.S.T.M. distillation I.B.P., 96°F;
20%, 100°F; 50%, 103°F; 80%, 110°F;
90%, 116°F; 95%, 126°F; dry point,
136°F.

Acidity of residue from distillation, neutral.
"Skellysolve" H. Has complete absence of foreign taste or odor. Used in rubber compounding, ink manufacture, pharmaceutical, edible, and inedible oil extraction, and in the manufacture of tape.

Typical specifications:

Sp.gr. (60°F) 0.704.

Reid vapor pressure, psi (100°F) 4.0.

Evaporation rate at 68°F:

50%, 1.80 minutes; 100%, 5.50 minutes.

Evaporation residue % by weight 0.0005.

Flash point (Tag closed cup) -20°F.

Aniline point, 136.0°F.

% sulfur by weight 0.0040.

A.S.T.M. distillation, I.B.P. 156°F,

20%, 168°F; 50%, 175°F; 80%, 188°F;

90%, 194°F; 95%, 200°F; dry point 205°F.

Acidity of residue from distillation, neutral.

"Skellysolve" H, Special. Has extremely low evaporation residue. Used for paint formulations, rubber cements, tapes, ink diluent, edible and inedible oil extraction.

Typical specifications:

Sp.gr. (60°F) 0.685.

Reid vapor pressure, psi (100°F) 5.42.

Evaporation rate at 68°F:

50%, 1.70 minutes; 100%, 4.10 minutes.

Evaporation residue % by weight 0.0004.

Flash point (Tag closed cup) -24°F.

Aniline point, 141.4°F.

% sulfur by weight 0.0018.

A.S.T.M. distillation, I.B.P. 147°F, 20%

150°F; 50%, 152°F; 80%, 155°F; 95%,

164°F; dry point, 174°F.

Acidity of residue from distillation, neutral.

"Skellysolve" L. Meets U.S. Government Paint Specification TT-N-95a, Type I.

Typical specifications:

Sp.gr. (60°F) 0.733.

Reid vapor pressure, psi (100°F) 2.0.

Evaporation rate at 68°F:

50%, 4.40 minutes; 100%, 12.50 minutes.

Evaporation residue % by weight 0.0007.

Flash point (Tag closed cup) +17°F.

Aniline point, 130.4°F.

% sulfur by weight 0.005.

A.S.T.M. distillation, I.B.P. 202°F,

20%, 206°F; 50%, 210°F; 60%, 211°F,

90%, 217°F; 95%, 221°F; dry point 229°F.

Acidity of residue from distillation, neutral.

"Skellysolve" R. A rubber naptha with uniform evaporation rate and freedom from heavy greasy ends. High initial boiling point helps eliminate excessive evaporation losses.

Typical specifications:

Sp.gr. (60°F) 0.711.

Reid vapor pressure, psi (100°F) 4.4.

Evaporation rate at 68°F:

50%, 2.30 minutes; 100%, 9.80 minutes.

Evaporation residue % by weight 0.0013.

Flash point (Tag closed cup) -18°F.

Aniline point 137.0°F.

% sulfur by weight 0.0080.

A.S.T.M. distillation, I.B.P., 132°F;

20%, 174°F; 50%, 196°F; 80%, 218°F;

90%, 228°F; 95%, 235°F; dry point, 244°F.

Acidity of residue from distillation, neutral.

"Skellysolve" S. Meets specifications for both mineral spirits and Stoddard solvent. Used in the paint and protective coatings industry, the dry cleaning industry, in wood treating, in wax formulations, in metal and tool cleaning and in the chemical industry.

Meets U.S. Government Paint Specification

TT-291a and also Federal Specification

PS-661b, Type I. Also meets Stoddard

Solvent ASTM Specification D484-52.

Typical specifications:

Sp.gr. (60°F) 0.780.

Reid vapor pressure, psi (100°F) 0.1.

Evaporation rate at 68°F:

50%, 70.0 minutes; 100%, 300.0 minutes.

Evaporation residue % by weight 0.0050.

Flash point (Tag closed cup) 105°F.

Aniline point 138.0°F.

% sulfur by weight 0.0200.

A.S.T.M. distillation, I.B.P., 305°F;

20%, 321°F; 50%, 334°F; 80%, 351°F;

95%, 368°F; dry point, 375°F.

Acidity of residue from distillation, neutral.

"Skellysolve" SI. Narrow boiling range and controlled front end distillation points.

Meets U.S. Government Paint Specification

TT-291a and Federal Specification PS-661b,

Type I.

Typical specifications:

Sp.gr. (60°F) 0.785.

Reid vapor pressure, psi (100°F) 0.1.

Evaporation rate at 68°F:

50%, 110.0 minutes; 100%, 340.0 minutes.

Evaporation residue % by weight 0.0060.

Flash point (Tag closed cup) 118°F.

Aniline point, 138.0°F.

% sulfur by weight 0.0180.

A.S.T.M. distillation, I.B.P. 330°F;

20%, 340°F; 50%, 344°F; 80%, 351°F;

95%, 365°F; dry point, 370°F.

Acidity of residue from distillation, neutral.

"Skellysolve" S2. Mineral spirits type with extremely short boiling range and minimum

flash of 100°F. Used in dry cleaning, in

manufacture of waxes, in paint formulations

and in cloth impregnation. Meets U.S.

Government Paint Specification TT-291a,

Federal Specification PS-661b, Type I, and

Stoddard Solvent ASTM Specification

D484-52.

Typical specifications:

Sp.gr. (60°F) 0.775.

Reid vapor pressure, psi (100°F) 0.2.

Evaporation rate at 68°F:

50%, 80.0 minutes; 100%, 210.0 minutes.

Evaporation residue % by weight 0.0015.

Flash point (Tag closed cup) 101°F.

Aniline point, 137.0°F.

% sulfur by weight 0.0160.

A.S.T.M. distillation, I.B.P. 305°F; 20%,

311°F; 50%, 314°F; 80%, 318°F; 95%,

323°F; dry point, 327°F.

Acidity of residue from distillation, neutral.

"Skellysolve" T. A 140°F flash-type naphtha.

Gives a longer wet edge in paint and pro-

tection formulations. Meets Federal

Specification PS-661b, Type II.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Typical specifications:

Sp.gr. (60°F) 0.796.

Reid vapor pressure, psi (100°F) 0.05.

Evaporation rate at 68°F:

50%, 299.0 minutes; 100%, 1040.0 minutes.

Evaporation residue % by weight 0.015.

Flash point (Tag closed cup) 141°F.

Aniline point 143.0°F.

% sulfur by weight 0.0360.

A.S.T.M. distillation, I.B.P., 360°F;

20%, 369°F; 50%, 374°F; 80%, 381°F;

95%, 389°F; dry point, 400°F.

Acidity of residue from distillation, neutral.

"Skellysolve" V. A VMP naphtha with sweet naphtha-like odor, free from oiliness or heavy greasy ends. Used in the paint and protective coatings industry as a diluent, in rubber compounding, tape manufacture, and as a base for cigar and cigarette lighter fluid.

Typical specifications:

Sp.gr. (60°F) 0.750.

Reid vapor pressure, psi (100°F) 0.8.

Evaporation rate at 68°F:

50%, 13.00 minutes; 100%, 38.00 minutes.

Evaporation residue % by weight 0.0010.

Flash point (Tag closed cup) 54°F.

Aniline point, 137.5°F.

% sulfur by weight 0.0090.

A.S.T.M. distillation, I.B.P., 242°F;

20%, 255°F; 60%, 265°F; 90%, 280°F;

95%, 285°F; dry point, 290°F.

Acidity of residue from distillation, neutral.

"Skellysolve" X. A high-flash, long wet-edge mineral spirits solvent, used as an industrial cleaning solvent, insecticide formulation diluent and in paint formulations.

Typical specifications:

Sp.gr. (60°F) 0.813.

Flash point (Tag closed cup) 141°F.

Aniline point 151.9°F.

% sulfur by weight 0.0700.

A.S.T.M. distillation, I.B.P., 345°F;

20%, 408°F; 50%, 436°F; 80%, 461°F;

95%, 485°F, end point, 508°F.

Acidity of residue from distillation, neutral.

"Skilabaryt." ¹²³ Trademark for a chemical preparation used in x-ray examinations.

"Skiodan." ¹⁶² Trademark for methiodal sodium.

Skraup synthesis. Synthesis of quinoline or its derivatives by heating aniline or an aniline derivative, glycerol and nitrobenzene in the presence of sulfuric acid.

skutterudite (Co,Ni)As₃. A natural cobalt-nickel arsenide with cobalt in excess of nickel. Chloanthite and smaltite (q.v.) are similar species.

Properties: Color tin white to silver gray; luster metallic; hardness 5.5-6; sp.gr. 6.5.

Occurrence: Colorado; Canada; Norway.

Use: Minor ore of cobalt and nickel.

"Skydrol." ⁵⁸ Trademark for fire resistant jet aircraft hydraulic fluid.

"Skydrol" 500-A. A clear, purple liquid; operational at -65°F; moisture 0.20%

max; sp.gr. (25°/25°C) 1.060-1.066.

"Skydrol" 7000. A clear green liquid; moisture 0.25% max; sp.gr. (25°/25°C) 1.080-1.086.

"S. L." ³²⁹ (Standard Luminescent) Trademark for chemicals specially developed and standardized to meet the exacting requirements of phosphor manufacturers.

slag. The fused product which separates in metal smelting and floats on the bath of metal. Formed by combination of flux with gangue of ore, ash of fuel, and perhaps furnace lining. The slag is often the medium by means of which impurities may be separated from metal. A nonreactive slag or cover, such as glass, may be used to protect the melt from the furnace atmosphere in melting brass. Cinder is a term used interchangeably with slag. Contains compounds derived from silica (SiO₂), lime (CaO), alumina (Al₂O₃), magnesia (MgO), manganese (Mn), phosphorus (P), sulfur (S) as well as the major elements of the ore or metal being refined.

Uses: Railroad ballast; material for highway construction; concrete aggregate; raw material for Portland cement; raw material for glass fibers (see mineral wool); fertilizer.

slag cement (lime slag cement). Cement prepared either by mixing granulated and finely ground blast-furnace slag with slaked lime or by spraying the granulated slag with a solution of alum, magnesium sulfate or other salt, and grinding the product with lime and gypsum. Slag cements contain less lime and much more alumina than Portland cement and are usually blue gray in color but may be brown due to the presence of manganese. They are also slow setting but attain maximum hardness faster than Portland cement. They are well suited for underwater work but poor when exposed to the atmosphere. The setting time may be decreased by adding caustic soda, potash, or soda ash.

slag wool. See mineral wool.

slaked lime. See calcium hydroxide; lime hydrated.

slate. A fine grained metamorphic rock which breaks into thin slabs or sheets. Color usually gray to black, sometimes green, yellow, brown, or red. Slates are composed of micas, chlorite, quartz, hematite, clays, and other minerals.

Occurrence: Pennsylvania, Vermont, Maine, Virginia, California, Colorado; Europe.

Uses: Roofing; blackboards; decorative stone; various building applications such as stair treads, shower stalls, walks; in crushed form on shingles; filler in paint, linoleum, rubber; abrasive; pigment.

slate black. See mineral black.

slip clay. A type of clay containing such a high percentage of fluxing impurities and of such a texture that it melts at a relatively low

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

temperature to a greenish or brown glass, thus forming a natural glaze. It must be fine-grained, free from lumps or concretions, show a low air-shrinkage and mature in burning at as little above 1300°F as possible.

"Slipicone." ¹⁴⁹ Trademark for fluid silicone compositions to prevent the adhesion of materials to one another. Used on food processing and packaging equipment.

"Slipkote." ⁵¹ Trademark for a smooth, buttery lubricant for application to the hardened base coat on ship launching ways. It has a low coefficient of friction, is water-repellent and adhesive to the base coat, and may be easily applied in cold weather.

slippery elm. See *ulmus*.

slip stains. See pottery body stains.

sloe. See *viburnum prunifolium*.

sludge. A soft mud, slush, or mire; for example, the solid product of a filtration process before drying (filter cake). See also sewage sludge.

sludge acid. Waste or spent sulfuric acid, usually that from refining petroleum oils or crude benzenes.

Shipping regulations: Corrosive liquid. White label.*

sludge asphalt. Asphalt-like products obtained by separation from the acid sludge produced in the refining of petroleum.

Shipping regulations: None.*

slurry. A thin watery suspension; for example, the feed to a filter press or other filtration equipment.

slushing compound. A nondrying oil, grease or similar organic compound which, when coated over a metal, affords at least temporary protection against corrosion.

Sm. Symbol for samarium.

smalt.

Properties: Blue powder.

Derivation: A potash-cobalt glass made by fusing pure sand and potash with cobalt oxide, grinding and powdering.

Grades: Technical.

Containers: Wooden kegs; multiwall paper sacks.

Uses: Paint pigments; ceramic industries (pigment); coloring glass; bluing paper, starch and textiles; coloring rubber.

Shipping regulations: None.*

smaltite (Co,Ni)As₂. A natural cobalt-nickel arsenide, with cobalt in excess of nickel. Skutterudite and chloanthite (q.v.) are similar species.

Properties: Color tin white to silver gray; luster metallic; hardness 5.5-6; sp.gr. 6.5.

Occurrence: Canada; Chile; Europe.

Use: Minor ore of cobalt and nickel.

smelting. Melting or fusing of an ore to separate and refine the metal. Roasting

and subsequent reduction are usually involved.

"Smentox." ²³⁶ Brand name for a chemical compound for reconditioning cement-contaminated drilling mud, or for preventing mud from becoming cement-contaminated, since contact with cement flocculates untreated drilling mud, rendering it unfit for use by causing the solids to settle out and raising the water loss to an impractical level.

smithsonite (dry-bone) ZnCO₃.

Properties: A white mineral often colored yellow or brown by iron. Vitreous to dull luster. Contains 64.8% of zinc oxide.

Distinguished from other carbonates by its hardness. Soluble in acids. Many zinc deposits consist in their upper portions of smithsonite and calamine. Sp.gr. 4.3-4.5; hardness 5.

Occurrence: United States (Mississippi valley, New Mexico); Poland.

Use: Source of zinc.

smog. An aerosol (q.v.). Household rubbish burners and automobile exhaust gases are known to be contributing factors to eye-irritating city smogs.

smokeless powder. Nitrocellulose containing about 13.1% nitrogen, produced by blending material of somewhat lower (12.6%) and slightly higher (13.2%) nitrogen content, converting to a dough with alcohol-ether mixture, extruding, cutting and drying to a hard horny product. Small amounts of stabilizers (amines) and plasticizers are usually present, as well as various modifying agents (nitrotoluene, nitroglycerine salts).

"S Monel." ²⁸³ Trademark for a cast age-hardenable alloy containing approximately 65% nickel, 30% copper, and 4% silicon.

Use: Valve seats, pump impellers, and other sliding or moving elements.

smudge oil. An oil burned in fruit orchards to prevent frost from injuring the trees.

No. 3 fuel oil is typical of oils used.

Shipping regulations: None.*

Sn. Symbol for tin.

snake root. See *rauwolfia*.

snake-root oil. See *asarum* oils.

snake-root oil, Canada. See *asarum canadense* oil.

snake-weed. See *euphorbia*.

snapping hazel. See *hamamelis*.

SN numbers (survey numbers). A designation adopted by the antimalarial commission of the Office of Scientific Research and Development for identification of the compounds tested by that body during World War II.

"Snodotte." ²²¹ Trademark for a mixture of fatty acids (C₁₄ to C₂₂) which are 97.6% saturated. Its snow-white color makes

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

it very useful in candles, shaving cream and cream shampoos as well as metallic stearates, buffing compounds, lubricating greases, and plastic molding.

"Sno-Gon." ¹⁰⁸ A chloride-free ice-melting compound, colorless, odorless, non-toxic, non-flammable, non-corrosive to aluminum and ferrous metals.

Containers: 100-lb bags.

"S-1 Non-Ionic Surfactant." ¹⁰⁸ A non-ionic surfactant in liquid form.

Containers: 40-lb cans; 425-lb drums.

Uses: To increase flood-water injectivity rate in secondary oil recovery.

snowball bush. See *viburnum opulus*.

"Snowdros." ²³² Brand name for a proprietary product of the hydrosulfite class.

snuff bean. See *tonka*.

"SOA." ²¹⁴ Trademark for sucrose octaacetate (q.v.).

"Soak-Eze." ¹⁰⁸ Concentrated highly active crystalline compound specifically designed for pre-soaking of wares prior to machine washing.

Containers: 4-lb boxes.

soap. Ordinary soap is a mixture of the sodium salts of various fatty acids of natural oils and fats. Thus common soap is largely a mixture of the sodium salts of palmitic, stearic, and oleic acids. The term soap is also applied to the individual components such as sodium palmitate, sodium stearate, etc. In case some other metal or basic radical is present instead of sodium a modified term such as potash soap, calcium soap or amine soap is used. See also, soaps, metallic.

A great variety of special soaps are produced, which are for the most part variations of ordinary sodium soaps. Hard soap contains a relatively large proportion of sodium stearate.

Rosin soaps as used for laundry purposes are made by adding a soap made from rosin, or rosin itself, to an ordinary soap. Castile or Marseilles soaps are made from olive oil. Mottled soaps are produced by the addition of small amounts of ferrous sulfate, ferric oxide or ultramarine. Transparent soaps are made from decolorized fats with the addition of glycerol or sugar, or both. Liquid soap is usually a potash soap dissolved in water, containing from 8 to 30% soap; the solutions of 30% and higher contain alcohol.

See also detergents, synthetic.

soap bark. See *quillaja*.

soap builder. Any material mixed with soap to improve the cleaning properties, modify the alkali content, or confer water-softening characteristics.

soap, green. See soap, soft.

soap, hard (neutral soap). An N.F. XI grade of soap containing no heavy metal soap or

alkaline salts. Generally it contains not more than 0.05% of free caustic alkali to prevent its turning rancid due to free fatty acids being formed.

soaproot. See *saponaria*.

soaps, metallic. A term usually limited to insoluble soaps of such easily available fatty acids as stearic, naphthenic, octoic or 2-ethylhexoic, rosin (resinates), or tall oil (tallates) with the heavier metals such as aluminum, calcium, cadmium, copper, iron, lead, tin, or zinc. A pure compound is seldom required. For descriptions and properties, see names of individual metallic soaps.

Derivation: (a) The fusion method, by heating a fatty acid with a metallic oxide, carbonate, etc. (b) The precipitation process, by the reaction of soluble sodium or potassium soaps with solutions of heavy metal salts.

Uses: Waterproofing; gels; conditioning agents in cements, paints, plastics; fungicides; lubricants; driers.

soap, soft (green soap).

Properties: A yellowish-green or brownish slippery soft mass with a slight characteristic odor, and an alkaline taste; made from vegetable oil and potassium hydroxide; soluble in hot water and hot alcohol.

Containers: 5-, 25-lb tins; 150-lb kegs.

Grades: U.S.P. XVI specifies vegetable oil excluding coconut and palm kernel oil.

Uses: In medicine as a detergent, antiseptic and disinfectant; also as a lubricant.

soapstock. See *foots*.

soapstone. See *talc*.

soapwort. See *saponaria*.

soda. Any one of the forms of sodium carbonate (q.v.); also used loosely as equivalent to the word sodium in compounds.

soda alum. See aluminum sodium sulfate.

soda amatol.

Shipping regulations: Explosive, Class A. High explosive label.*

soda ash. Na_2CO_3 (soda, calcined; sodium carbonate, anhydrous). The crude sodium carbonate of commerce.

Properties: A grayish-white powder or lumps containing up to 99% sodium carbonate. Soluble in water; insoluble in alcohol.

Derivation: By the Solvay ammonia soda process (q.v.). Over 90% of the world's production is made by this process. Appreciable amounts are recovered from natural deposits or brines particularly in California and Wyoming (see Trona process) and by passing carbon dioxide into the negative electrode chamber of the diaphragm-type cells used for the electrolytic production of chlorine (see diaphragm cell).

Impurities: Sodium chloride, sodium sulfate, calcium carbonate and magnesium carbonate, sodium bicarbonate.

Grades: Dense 58%; light 58%; extra light; natural; refined.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Bags; barrels; drums; bulk.
Uses: Glass; ceramics; soap; detergents; cleaners; water softening; petroleum refining; aluminum production; textiles; pulp and paper; metals processing; caustic soda; sodium bicarbonate; sodium nitrate; and miscellaneous other uses.

Shipping regulations: None.*

"Soda Ash, Foundry Grade." ²⁴⁴ Available as Foundry Grade #1, #2, and Briquettes. Grades #1 and #2 are hard, dustless, and free flowing, readily adaptable to automatic feeding equipment. Briquettes are adaptable to automatic feeding; can also be used directly in a cupola. They are dependable desulfurizing agents, being 100% active materials.

Containers: 100-lb Kraft multiwall bags; bulk shipments.

soda, baking. See sodium bicarbonate.

Potassium bicarbonate is sometimes used in baking but is not, strictly speaking, baking soda.

soda Bordeaux (Burgundy mixture). A fungicide mixture made by mixing copper sulfate and sodium carbonate solutions, and used similarly to ordinary Bordeaux mixture.

"Soda Briquettes." ¹⁷⁷ Trademark for soda ash held in walnut-size pellet form by a hydrocarbon bonding material. Packed in 100-lb paper bags. Used extensively in desulfurizing and cleansing pig iron; speeds up these operations and brings about sulfur reduction of 30 to 70%, as well as physically cleaning the iron.

soda, calcined. See soda ash.

soda, caustic. See sodium hydroxide.

soda crystals. See sodium carbonate monohydrate.

soda lime. A mixture of calcium hydroxide with sodium or potassium hydroxide intended for the absorption of carbon dioxide gas and water vapor.

Properties: White or grayish-white granules unless colored by a specified indicator. Must be kept in air tight containers.

Grades: Technical; U.S.P. XVI. Usually % moisture and mesh size are stated.

Uses: Drying agent and carbon dioxide absorbent for technical laboratory and medical work.

soda lime glass. See glass.

sodalite $3\text{NaAlSi}_3\text{O}_8 \cdot \text{NaCl}$. A mineral found in igneous rocks.

Properties: Color blue, white, gray; luster vitreous; hardness 5.5-6; sp.gr. 2.1-2.3.

Occurrence: Montana, Maine; Canada; Europe.

Use: Gem stone.

sodamide. See sodium amide.

soda monohydrate. See sodium carbonate, monohydrate.

soda niter. See sodium nitrate.

"Sodaphos." ⁵⁵ Brand name for glassy sodium tetrphosphate (q.v.).

soda pulp. See wood pulp.

soda saltpeter. See caliche.

sodas, modified. Combinations of soda ash and bicarbonate of soda in definite proportions marketed for purposes where an alkali is needed ranging in causticity between bicarbonate of soda and soda ash. Modified sodas are white crystalline powders, readily soluble and possessing valuable cleansing and purifying properties. They are prepared in various strengths both as to alkalinity and causticity.

Containers: See soda ash.

Uses: Washing powders; laundry sodas; wool scouring powders; bottle cleansers; textile sodas, mild detergents.

Shipping regulations: None.*

sodas, natural. See trona; thermonatrite.

soda, washing. See sal soda.

sodio-cupric chloride. See copper-sodium chloride.

alpha-sodio-sodium acetate (sodium alpha-sodioacetate) $\text{NaCH}_2\text{COONa}$.

Properties: Free flowing powder; stable in dry air; decomposes slowly in moist air. Decomposes 280°C without melting. Insoluble in ethers and hydrocarbons, reacts mildly with water. It is a strong base and should be handled with caution like sodium hydroxide.

Grades: 80-85% pure. Impurities are sodium acetate, sodium amide and sodium hydroxide.

Uses: Organic intermediate; drying agent for organic solvents.

Caution! Exposure to alpha-sodio sodium acetate dust should be avoided. Wash affected areas of skin with plenty of water.

"Sodite." ²⁵³ Brand name for an insecticide product containing arsenic trioxide.

sodium (natrium) Na. A metallic element; atomic number 11, group I of the periodic table. Long handicapped by its reactivity and the danger involved in handling it, sodium is now sold in tonnage lots and is finding many uses.

Properties: Light, soft, ductile, malleable, silver-white metal, oxidizing rapidly in air; of wax-like consistency at ordinary temperatures, but brittle at low temperatures; must be kept immersed in naphtha or other similar liquid which does not contain water or free oxygen. Sp.gr. 0.9712; m.p. 97.6°C ; b.p. 892°C . Decomposes water on contact with vigorous evolution of hydrogen and forms sodium hydroxide; insoluble in benzene, kerosene, and naphtha.

Derivation: (a) Electrolysis of a fused mixture of sodium chloride and calcium chloride (see also Downs cell); (b) sodium amalgams are produced by electrolysis of sodium hydroxide or sodium chloride solutions in mercury cells (see Castner cell;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chlorine); (c) thermochemical reduction of sodium carbonate or sodium hydroxide with carbon or iron-carbon mixtures.

Method of purification: Distillation.

Grades: Technical; brick; amalgam; coated powders; dispersions (in oils, etc).

Containers: 1-, 5-lb tins in cases; 290-lb steel barrels; 80,000-lb tank cars.

Uses (in approximate order of volume):

Tetraethyl lead; chemical reductions, particularly of fats for detergent production; sodium cyanide; sodium peroxide; sodium hydride; pharmaceuticals; petroleum refining; metallurgy of titanium; heat transfer medium; as a component in non-glare street lights; in fluidized beds for desulfurization of benzene and toluene; in small nuclear reactors as a cooling agent.

Danger: Reacts violently with water liberating and igniting hydrogen. May cause burns. MCA warning label.

Shipping regulations: Flammable solid.

Yellow label.*

See also sodium dispersions.

sodium abietate (rosin soap; sodium resinate) $C_{19}H_{29}COONa$.

Properties: White powder. Soluble in water. Derivation: By leaching rosin with sodium hydroxide solution.

Uses: Medicine; soap making; paper coating. (See also soap.)

sodium acetate (a) $NaC_2H_3O_2$; (b) $NaC_2H_3O_2 \cdot 3H_2O$.

Properties: Colorless, odorless crystals, efflorescent; very soluble in water; slightly soluble in alcohol; soluble in ether.

Constants: Sp.gr. 1.4; m.p. (a) $324^\circ C$; (b) $58^\circ C$.

Derivation: (1) Neutralization of acetic acid with sodium carbonate, concentration of the solution, crystallization and centrifuging; (2) calcium acetate is treated with sodium sulfate and a little soda, the solution filtered, evaporated to dryness, the residue heated to about $250^\circ C$, dissolved in water, filtered, concentrated and crystallized.

Method of purification: Recrystallization.

Grades: Highest purity; pure fused; C.P.; N.F. XI (the trihydrate); technical.

Containers: Bags; drums.

Uses: Intermediates; dyes; manufacture of dry colors; pharmaceuticals; cinnamic acid; acetic anhydride; copper acetate; mordant; soaps; photography; purification of glucose; meat preservation; medicine; Schweinfurth green; textile printing; separation of the opium alkaloids; rubber industry; electroplating reagent; preserving meats; tanning; dehydrating agent.

Shipping regulations: None.*

sodium N-acetoacetyl-para-sulfanilate

$CH_3COCH_2CONHC_6H_4SO_3Na$.

Properties: Available in the form of a red colored 40% aqueous solution. Sp.gr. 1.203.

sodium acetone bisulfite (acetone-sodium bisulfite) $(CH_3)_2CONaHSO_3$.

Properties: Crystalline material; soluble in

water; decomposed by acids; slightly soluble in alcohol.

Derivation: Interaction of sodium bisulfite and acetone.

Grades: Technical.

Uses: Chemical (pure acetone); photography; textile (dyeing and printing).

sodium acetrizate $NaOCC_6H_4NHCOCH_3$.

Sodium 3-acetyl-amino-2,4,6-triiodobenzoate. Marketed as a solution.

Properties: Aqueous solutions are clear and practically colorless. U.S.P. XVI solution has pH 7.0-7.5. (The free acid is a white powder which decomposes at $278-283^\circ C$ and is soluble in alcohol, slightly soluble in water and ether.)

Grade: U.S.P. XVI.

Use: Medicinal.

sodium-para-acetylaminophenylantimoniate

(stibetyl) $CH_3CONHC_6H_4SbO_3HNa \cdot H_2O$.

Properties: Light yellow powder; antimony content is 35%; soluble in water.

Use: Medicine.

sodium para-acetylaminophenylarsonate. See arsacetin.

sodium acetylarsanilate. See arsacetin.

sodium acetylformate. See sodium pyruvate.

sodium acetylde (disodium acetylde) $NaC:CNa$.

Use: Intermediate.

sodium acetylsulfanilate $C_6H_4(NHCH_3CO)SO_3Na$.

Properties: White crystals. Soluble in water, slightly soluble in alcohol; insoluble in ether.

Derivation: By heating together glacial acetic acid and sulfanilic acid.

Use: Medicine.

sodium acid carbonate. See sodium bicarbonate.

sodium acid fluoride. See sodium bifluoride.

sodium acid phosphate. See sodium phosphate, monobasic.

sodium acid pyrophosphate. See sodium pyrophosphate, acid.

sodium acid sulfate. See sodium bisulfate.

sodium acid sulfite. See sodium bisulfite.

sodium acid tartrate. See sodium bitartrate.

Sodium "Aerofloat" Promoters. ⁵⁷ Trademark for dry, water-soluble reagents containing the active promoting constituent of liquid "Aerofloat" promoters. Strong zinc sulfide promoters are also extensively used in flotation of gold, silver, and copper sulfide minerals in the presence of pyrite, which they do not actively promote.

sodium alginate. See algin; algin fibers.

sodium allylisopropylbarbiturate. See

5-allyl-5-isopropylbarbituric sodium.

sodium allylmercaptopmethyl penicillin. See sodium penicillin O, under penicillin.

sodium 5-allyl-5(1-methylbutyl)-2-thiobarbiturate. See thiamylal sodium.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sodium alum. See aluminum sodium sulfate.

sodium aluminate $\text{Na}_2\text{Al}_2\text{O}_4$ or NaAlO_2 .

Properties: White powder. Soluble in water; insoluble in alcohol; aqueous solution strongly alkaline. M.p. 1650°C.

Derivation: By heating bauxite with sodium carbonate and extracting the sodium aluminate with water.

Grades: Technical; reagent, also 27° Bé solution.

Containers: Wooden kegs; bags; multiwall paper sacks.

Uses: Mordant; zeolites; water purification; sizing paper; manufacture of milk-glass, soap and cleaning compounds, hardening building stones.

Shipping regulations (solution): Corrosive liquid. White label.*

sodium-aluminum chloride. See aluminum-sodium chloride.

sodium aluminum fluoride. See cryolite, synthetic.

sodium aluminum hydride NaAlH_4 .

Properties: White crystalline material, sp. gr. 1.24 g/cc. Stable in dry air at room temperature but very sensitive to moisture. Begins to melt at 183°C with decomposition to evolve hydrogen. Soluble in tetrahydrofuran, dimethyl "Cellosolve."

Derivation: By reaction of aluminum chloride with sodium hydride.

Containers: Glass bottles.

Uses: As a reducing agent similar to lithium aluminum hydride.

Shipping regulations: Flammable solid. Yellow label.*

sodium aluminum phosphate

$\text{NaH}_2\text{Al}_2(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Dry, white powder having a neutralizing strength or baking value of 100% expressed in units of bicarbonate of soda.

Containers: Drums and bags.

Uses: As a slow acting baking acid in the manufacture of preleavened flour mixtures, in baking powder and in commercial bakery cake operations.

Shipping regulations: None.*

sodium aluminum silicofluoride $\text{Na}_5\text{Al}(\text{SiF}_6)_4$.

Sodium aluminum fluosilicate.

Properties: White powder, somewhat soluble in cold water; corrosive to galvanized iron.

Uses: Moth proofing and insecticides; also to obtain acid medium in dyebath.

sodium aluminum sulfate. See aluminum sodium sulfate.

sodium amalgam Na_xHg_x .

Properties: A silver-white, porous, crystalline mass, containing 2-10% of metallic sodium. Decomposes water.

Derivation: Mercury is heated to about 200°C and sodium, in small pieces, added slowly. Also formed at one stage of process for making chlorine and sodium hydroxide by mercury cell process.

Grades: 2, 3, 4, 5, 6, 7, 8, 9, 10, and 20%.

Containers: Glass bottles.

Uses: Preparation of hydrogen; reduction of metal halogen compounds and organic compounds; reagent in analytical chemistry.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.*

Yellow label.*

sodium amide (sodamide) NaNH_2 .

Properties: White crystalline powder. Decomposes in water.

Constants: M.p. 210°C, b.p. 400°C.

Derivation: Dry ammonia gas is passed over metallic sodium at 350°C.

Grades: Technical.

Containers: Wooden kegs.

Use: Manufacture of sodium cyanide; organic synthesis.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label.*

sodium para-aminobenzenesulfonate. See sodium sulfanilate.

sodium para-aminobenzoate (PABA sodium)

$\text{NH}_2\text{C}_6\text{H}_4\text{COONa}$. Sodium salt of para-aminobenzoic acid.

Properties: Crystals; soluble in water; slightly soluble in alcohol; nearly insoluble in ether.

Use: Medicine.

sodium para-aminohippurate

$\text{NH}_2\text{C}_6\text{H}_4\text{CONHCH}_2\text{COONa}$. Water soluble salt.

Grade: N.N.D.

Use: Clinical test (medicine).

sodium aminophenylarsenate. See sodium arsanilate.

sodium para-aminosalicylate (PAS sodium)

$\text{NaOCC}_6\text{H}_3(\text{OH})\text{NH}_2$.

Properties: White to pale yellow crystalline powder. Practically odorless, with sweet saline taste. Freely soluble in water; sparingly soluble in alcohol; very slightly soluble in ether and chloroform; 2% solution is clear and colorless and has pH 7.0-7.5. Solutions decompose slowly and darken in color.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine.

sodium-ammonium hydrogen phosphate. See sodium-ammonium phosphate.

sodium-ammonium phosphate (microcosmic

salt; sodium-ammonium hydrogen phosphate; salt of phosphorus; phosphorus salt) $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Transparent, colorless, odorless, efflorescent, monoclinic crystals. Gives off water and ammonia on heating, leaving NaPO_3 . Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 1.57; m.p. about 79°C with decomposition.

Derivation: Mixing solutions of sodium phosphate and ammonium chloride.

Grades: Granular; C.P.; technical.

Containers: 1-, 5-lb bottles; 1-, 5-lb cans;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

25-, 50-, 150-lb kegs; 300-lb barrels.

Use: Analytical reagent.

sodium-ammonium sulfate (ammonium-sodium sulfate) $\text{Na}_2\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: White powder; soluble in water.

sodium anilinesulfonate. See sodium arsanilate.

sodium anilinesulfonate. See sodium sulfanilate.

sodium antimonate (antimony sodiate) NaSbO_3 . Other forms are sodium metaantimonate $2\text{NaSbO}_3 \cdot 7\text{H}_2\text{O}$ and sodium pyroantimonate $\text{Na}_2\text{H}_2\text{Sb}_2\text{O}_7 \cdot \text{H}_2\text{O}$.

Properties: White, granular powder; slightly soluble in water and alcohol. Insoluble in dilute alkalies, mineral acids, but soluble in tartaric acid.

Grades: Technical.

Containers: 500-lb barrels; 100-lb paper lined burlap bags.

Uses: Opacifier in enamels, for cast iron and glass; ingredient of acid-resisting sheet steel enamels.

sodium antimony bis-pyrocatechol-2,4-disulfonate. See stibophen.

sodium antimonyl tartrate. See antimony sodium tartrate.

sodium arsanilate (sodium anilinesulfonate; sodium aminophenylarsenate) $\text{C}_6\text{H}_5\text{NH}_2(\text{AsO} \cdot \text{OH} \cdot \text{ONa})$, often with 1 or more H_2O .

Properties: White, crystalline, odorless powder; faint salty taste; poisonous! May produce optic atrophy. Soluble in water.

Derivation: By dissolving arsenic acid in sodium carbonate solution and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; medicinal.

Containers: Tins; glass bottles.

Uses: Medicine; veterinary medicine; organic synthesis.

sodium arsenate $\text{Na}_2\text{AsO}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Clear, colorless crystals; mild alkaline taste; poisonous! Soluble in water; slightly soluble in alcohol; insoluble in ether.

Constants: Sp. gr. 1.7593; m. p. 86°C .

Derivation: (a) Arsenic trioxide is heated with sodium nitrate, dissolved in water and crystallized. (b) Arsenic trioxide is dissolved in sodium carbonate solution, sodium nitrate is added, the solution evaporated to dryness, the residue calcined, dissolved in water and crystallized.

Method of purification: Recrystallization.

Impurities: Sodium binarsenate.

Grades: Highest purity; pure crystals; pure dry; C. P.; technical (60% arsenic pentoxide).

Containers: 1-lb bottles; wooden kegs; multi-wall paper sacks; 100-lb drums.

Uses: Medicine; insecticides; dry color; textiles (mordant and assist in dyeing and printing); making other arsenates; germicide.

Shipping regulations: Poison, class B. Poison label.*

sodium arsenite (sodium metaarsenite)

NaAsO_2 .

Properties: Grayish-white powder, which absorbs carbon dioxide from the air; poisonous! Soluble in water. Sp. gr. 1.87.

Derivation: Arsenic trioxide is dissolved in a solution of sodium carbonate or hydroxide and boiled for some time.

Grades: Crude; pure; 75% arsenious oxide.

Containers: 1-, 5-lb bottles; drums.

Uses: Manufacture of arsenical soaps for taxidermists; antiseptic; dyeing; insecticides; hide preservation; herbicide.

Shipping regulations: Solution: Poison, class B. Poison label.*

sodium arsphenamine (sodium salt of 3-diamino-4-dihydroxy-1-arsenobenzene)

$\text{C}_{12}\text{H}_{10}\text{O}_2\text{N}_2\text{As}_2\text{Na}_2$.

Properties: Bright yellow powder containing not less than 19% arsenic; very unstable in air; poisonous! Soluble in water.

Containers: Ampules.

Use: Medicine.

sodium ascorbate

$\text{CH}_2\text{OH}(\text{CHOH})_2\text{COHCOHCOONa}$. The sodium salt of ascorbic acid.

Properties: White odorless crystals or powder; m. p. 218°C (dec); stable under ordinary conditions; soluble in water; insoluble in alcohol.

Derivation: By reacting ascorbic acid with hot methyl alcohol and a warm solution of sodium methylate and stirring until the stable crystalline salt is formed.

Containers: Bottles; drums.

Grade: N. N. D.

Use: Vitamin therapy; antioxidant for foods.

sodium auribromide. See gold-sodium bromide.

sodium aurichloride. See gold-sodium chloride.

sodium aurothiosulfate. See gold-sodium thiosulfate.

sodium azide NaN_3 .

Properties: Highly poisonous, colorless, hexagonal crystals; decomposes at about 300°C ; sp. gr. 1.846; soluble in water and in liquid ammonia; slightly soluble in alcohol; insoluble in ether.

Use: Preparation of lead azide explosives, medicinals.

Shipping regulations: Poison, class B.

Poison label.*

sodium benzenesulfonchloramine. See chloramine-B.

sodium benzoate $\text{C}_6\text{H}_5\text{COONa}$.

Properties: White, amorphous, crystalline or granular, odorless powder; sweetish, astringent taste. Soluble in water and alcohol.

Derivation: Benzoic acid is neutralized with sodium bicarbonate solution, the solution filtered, concentrated and allowed to crystallize.

Method of purification: Recrystallization.

Grades: U. S. P. XVI; technical.

Containers: Cartons; bottles; boxes; kegs; 5 to 175-lb drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Food preservative (its use for this purpose being limited by law in most countries); antiseptic; medicine; tobacco; pharmaceutical preparations; intermediate for manufacture of dyes; rust and mildew inhibitor.

Shipping regulations: None.*

sodium benzosulfimide. See saccharin, sodium.

sodium benzyl succinate

Properties: White amorphous or crystalline powder having a slight benzyl odor and cool salty taste. Soluble in hot and cold water.

sodium-beryllium fluoride. See beryllium-sodium fluoride.

sodium bicarbonate (baking soda; sodium acid carbonate) NaHCO_3 .

Properties: White powder or crystalline lumps; cooling, slightly alkaline taste.

Soluble in water; insoluble in alcohol.

Stable in dry air, but slowly decomposes in moist air.

Constants: Sp.gr. 2.20; m.p., loses carbon dioxide at 270°C .

Derivation: Principally, by treating a saturated solution of soda ash with carbon dioxide to precipitate the less soluble bicarbonate, also by purifying the crude product from the Solvay process.

Method of purification: Recrystallization.

Impurities: Sulfuric acid, chlorine; silica; heavy metals; sodium thiosulfate, sodium carbonate; potassium salts; ammonium salts.

Grades: Commercial, pure, reagent; highest purity, C.P.; U.S.P. XVI.

Containers: Bottles and cartons; 100-lb bags; drums.

Uses: Manufacture of effervescent salts and beverages, artificial mineral waters, baking powder; reagent in analytical chemistry; gold and platinum plating; tanning industry; treating wool and silk, fire extinguishers, medicine; ceramics; preserving butter, prevention of timber mold.

Shipping regulations: None.*

sodium bichromate. See sodium dichromate.

sodium bifluoride (sodium acid fluoride)

Properties: White, crystalline powder, poisonous! Soluble in water. Decomposed on heating.

Grades: Technical.

Containers: Tins; 125-, 375-lb drums.

Uses: For neutralizing last traces of alkali in laundry rinsing operations; preservative, for zoological and anatomical specimens; etching glass; antiseptic, production of tinplate.

Shipping regulations: None.*

sodium binoxide. See sodium peroxide.

sodium biphosphate. See sodium phosphate, monobasic.

sodium bismuthate NaBiO_3 .

Properties: Yellow or brown, amorphous

powder. Slightly hygroscopic.

Grades: Technical.

Uses: Analysis (testing for manganese in iron, steel and ores); reagent; pharmaceuticals.

sodium bisulfate (sodium acid sulfate; niter cake; nitre cake) NaHSO_4 or $\text{NaHSO}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or white, fused lumps; aqueous solution is strongly acid. Soluble in water.

Constants: Sp.gr. 2.742; m.p. 315°C with decomposition.

Derivation: A by-product in the manufacture of hydrochloric and nitric acids.

Method of purification: Recrystallization.

Impurities: Heavy metals; chlorides; arsenic; potassium bisulfate; sulfuric acid.

Grades: Pure crystals; pure fused; pure dry; reagent; crude; C.P.; technical; cakes; ground.

Containers: 1-, 5-lb bottles; 100-lb kegs; various sizes of drums to 500-lb barrels; bulk in cars.

Uses: Flux for decomposing minerals; substitute for sulfuric acid in dyeing; disinfectant; dyeing; manufacture of sodium sulfate and soda alum; liberating carbon dioxide in CO_2 baths; in thermophores; carbonizing wool; manufacture of magnesia cements, paper, soap, perfumes, brick, glue; in general, as a strong solid acid.

Shipping regulations: None.*

sodium bisulfide. See sodium hydrosulfide.

sodium bisulfite (sodium acid sulfite; leucogen) NaHSO_3 .

Properties: White crystals or crystalline powder; slight sulfurous odor; disagreeable taste; soluble in water; insoluble in alcohol. Unstable in air.

Constants: Sp.gr. 1.48; m.p., decomposes.

Derivation: Sodium carbonate solution is saturated with sulfur dioxide gas and the solution crystallized.

Method of purification: Recrystallization.

Grades: Crystals; pure dry; commercial dry (this consists chiefly of sodium meta-bisulfite); reagent; commercial solution 35°Bé ; powder (67% SO_2); C.P.; U.S.P. XVI.

Containers: Commercial, dry: 25-lb boxes; 100-lb kegs; 500-lb barrels, 500-, 600-lb drums; solution: 500-lb barrels. C.P: 1-, 5-lb cans and bottles.

Uses: Chemicals (sodium salts, cream of tartar), dyes, intermediates; organic chemicals; perfumery; wood pulp (digestion); leather (depilatory, tanning); textiles (antichlor, mordant, discharge), food preservative, bleaching straw and cork, photographic reducing agent, fermentation industries; medicine; glucose and sugar syrups; brewing (cask sterilization); copper and brass plating; rubber (coagulating latex); general antiseptic; analytical reagent; pesticides; source of sulfur dioxide.

Shipping regulations: None.*

sodium bitartrate (acid sodium tartrate)

Properties: White, crystalline powder.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in water (aqueous solution is acid); slightly soluble in alcohol.

Grades: C.P.; technical; reagent.

Uses: Analysis (testing for potassium); effervescing mixtures.

sodium borate (sodium tetraborate; sodium borate (2, 4, 7); sodium pyroborate; borax) $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$. See also borax, dehydrated; borax, pentahydrate.

Properties: White crystals or powder; odorless; sp. gr. 1.73 (20/4°C); loss of water of crystallization when heated, with melting, between 75 and 200°C; fuses to a glassy mass at red heat (borax glass); effloresces slightly in warm, dry air. Soluble in water and glycerol; insoluble in alcohol.

Derivation: In California, by fractional crystallization from Searles Lake brine; or by solution of kernite ore followed by crystallization. Also obtained from colemanite, natural borax, ulexite, and other borates.

Grades: Crystal; granulated, powdered (refined, U.S.P. XVI), C.P.; technical.

Containers: 1-, 5-lb bottles; 100-lb kegs; 100-lb sacks; 340-, 390-lb barrels; bulk (granulated).

Uses (in approximate order of volume):

Glass; porcelain enamel, starch and adhesives; detergents; herbicides; fertilizers; rust inhibitors; pharmaceuticals; leather; photography; bleaches; paint; boron compounds; smelters, insulation materials.

sodium borate perhydrate $\text{NaBO}_2 \cdot \text{H}_2\text{O}_2$.

Properties: Free-flowing, white powder.

Dissolves readily in water to produce mildly alkaline peroxide solution. Active oxygen content, 15.5% min.

Containers: 125-lb nonreturnable fiber drums.

Uses: In dentrifices; hair wave kits, bleaching; oxidation of dyestuffs; stain remover for plastic dishes.

See also sodium perborate.

sodium boroformate

$\text{NaH}_2\text{BO}_3 \cdot 2\text{HCOOH} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline product.

Soluble in water; m.p. 110°C.

Grades: Technical.

Containers: Barrels, bags; kegs.

Uses: An excellent buffering agent toward both acid and alkali in the range of pH 8.5. Useful in textile treating and tanning baths.

sodium borohydride NaBH_4 .

Properties: White crystalline powder; soluble in water, ammonia, amines, and dimethyl ether of diethylene glycol; insoluble in other ethers, hydrocarbons and alkyl chlorides. Sp. gr. 1.07; hygroscopic; stable in dry air to 300°C, decomposes slowly in moist air or in vacuum at 400°C.

Derivation: By reaction of sodium hydride and trimethyl borate.

Grades: Technical, powdered; pellets.

Containers: Glass bottles; and in polyethylene bags in from 1-gal to 55-gal metal containers.

Uses: Source of hydrogen and other borohydrides. Reduces aldehydes, ketones and acid chlorides; blowing agent for plastics.

Shipping regulations: Flammable solid. Yellow label.*

sodium borohydride SWS. A stabilized water solution of sodium borohydride.

Properties: Sp. gr. 1.4; viscosity (23°C) 79.0 cps; approx. composition 12% NaBH_4 , 40% NaOH , 48% H_2O ; decomposes very slowly with evolution of hydrogen.

Containers: 1-gal polyethylene containers and 55-gal drums with polyethylene liners.

Use: Reducing agent for aldehydes and ketones.

Shipping regulations: Corrosive liquid. White label.*

sodium bromate NaBrO_3 .

Properties: White odorless crystals or crystalline powder. Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 3.339; m.p. 381°C (dec).

Derivation: By passing bromine into a solution of sodium carbonate, sodium bromide and sodium bromate being formed which are separated by crystallization.

Method of purification: Recrystallization.

Grades: Pure, reagent; C.P.

Containers: Glass bottles; 25-lb tin boxes.

Use: Analytical reagent.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

sodium bromide (a) NaBr , (b) $\text{NaBr} \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder or granules, saline and somewhat bitter taste; absorbs moisture from the air, becoming very hard. Keep well stoppered. Soluble in water, moderately soluble in alcohol.

Constants: Sp. gr. (a) 3.208, (b) 2.176; m.p. (a) 757.7°C; b.p. (a) 1455°C.

Derivation: Occurs naturally in some salt deposits. Made synthetically by first causing iron to react with bromine and water. The resulting ferrous-ferri bromide is dissolved in water, sodium carbonate added, the solution filtered and evaporated.

Method of purification: Recrystallization.

Grades: C.P.; crystalline, powdered; commercial, pure; highest purity.

Containers: 1-, 5-lb bottles; 25-, 50-, 100-lb boxes, 100-lb kegs; 500-lb barrels; drums.

Uses: Photography; medicine; preparation of bromides; organic chemicals; source of bromine.

Shipping regulations: None.*

sodium cacodylate (sodium dimethylarsenate) $(\text{CH}_3)_2\text{AsOONa} \cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous crystals or powder; deliquescent; poisonous! Melts about 60°C. Soluble in water and alcohol.

Derivation: Oxidation and neutralization of cacodyl oxide.

Grades: Technical.

Containers: Vials; bottles.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Poison, class B.
Poison label.*

sodium caprylate $\text{CH}_3\text{CH}_2(\text{CH}_2)_4\text{CH}_2\text{COONa}$.

Properties: Cream-colored granules. Freely soluble in water; sparingly soluble in alcohol.

Grade: N. N. D.

Use: Medicine (topical).

sodium carbolate. See sodium phenate.

sodium carbonate (soda). See soda ash; sal soda; sodium bicarbonate; sodium carbonate, monohydrate; sodium sesquicarbonate.

sodium carbonate, anhydrous. See soda ash.

sodium carbonate, decahydrate. See sal soda.

sodium carbonate, monohydrate (crystal carbonate; soda monohydrate; soda crystals).

Properties: A crystalline sodium carbonate containing one molecule of water ($\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$). White; odorless; small crystals or crystalline powder; alkaline taste; sp. gr. 1.55. Soluble in water. M. p. 109°C (loses water), 851°C .

Grades: U. S. P. XVI, technical.

Containers: 100-lb bags.

Uses: Medicine, photography; cleaning and boiler compounds, pH control of water.

Shipping regulations: None.*

sodium carbonate peroxide

$2\text{Na}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}_2$ or $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}_2 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: White crystalline powder. Soluble in water. Stable at room temperature when dry, decomposes rapidly at 100°C , evolving oxygen. Active oxygen content 14% min. Soluble in water; pH of saturated solution 10.2.

Derivation: Crystallization from solution of soda ash and hydrogen peroxide.

Grade: Technical.

Containers: 100-lb fiber drums.

Uses: Source of hydrogen peroxide; household detergents, dental cleansers; bleaching and dyeing, modification of starch.

sodium carboxymethylcellulose (CMC, sodium cellulose glycolate; cellulose gum). A synthetic cellulose gum containing 0.4 to 0.5 sodium carboxymethyl groups ($-\text{CH}_2\text{COONa}$) per glucose unit of the cellulose. These added groups have each replaced an hydroxyl hydrogen to form ether linkages along the cellulose chain.

Properties: Colorless, odorless, tasteless, non-toxic, hygroscopic powder or granules, readily dispersible in hot or cold water, pH (1% solution) 6.5-8.0, stable in pH range 2-10. Viscosity (1% solution) 5-2000 cps, depending upon the number of hydroxyl radicals of the cellulose that have been etherified. Insoluble in most organic liquids. In water solution it is a colloidal electrolyte which reacts with heavy metal salts to give films insoluble in water, colorless, transparent, relatively tough, and unaffected by common organic solvents, oils, fats, and greases. Many of the colloidal properties are similar or superior to those of water-soluble starches,

gelatins, gums, and other hydrophilic colloids in thickening and stabilizing solutions and dispersing and suspending particles. It is also thixotropic.

Derivation: By reaction of alkali cellulose and sodium chloroacetate.

Grades: Crude; technical (about 75% pure); high viscosity; low viscosity; semirefined; refined (99.5+% pure); U. S. P. XVI.

Containers: 13-, 51-gal drums; 50-lb bags.

Uses: As water binder, thickener, suspending agent, film-former, and emulsion stabilizer for detergents and soaps; textile and paper sizing; latex paints; drilling muds; medicine; foods (especially ice cream); pharmaceuticals; adhesive; as a protective colloid in general, replacing or in combination with natural water-soluble gums.

sodium caseinate. See casein-sodium.

sodium catechol disulfonate. See disodium 1,2-dihydroxybenzene-3,5-disulfonate.

sodium cellulose glycolate. See sodium carboxymethylcellulose.

sodium chlorate NaClO_3 .

Properties: Colorless, odorless crystals; cooling, saline taste; must not be triturated with any combustible substance. Soluble in water and alcohol. Sp. gr. 2.490; m. p. 255°C ; b. p., decomposes.

Derivation: A concentrated acid solution of sodium chloride is heated and electrolyzed, the chlorate crystallizing out.

Method of purification: Recrystallization.

Grades: Technical; C. P.; crystals; powder.

Containers: Bottles; cartons; boxes, 100 to 600-lb drums.

Uses: Oxidizing agent and bleach (especially to make chlorine dioxide) for paper pulps; ore processing; herbicide and defoliant; medicine, substitute for potassium chlorate, being more soluble in water; matches; explosives; recovery of bromine from natural brines; leather tanning and finishing; textile mordant; to make perchlorates.

Warning: Strong oxidant, contact with other material may cause fire. MCA warning label.

Shipping regulations: Oxidizing material. Yellow label.*

sodium chloraurate. See gold-sodium chloride.

sodium chloride (table salt; sea salt; common salt; rock salt) NaCl .

Properties: Colorless, transparent crystals or white, crystalline powder; occurs in nature as the mineral halite (q. v.); somewhat hygroscopic; soluble in water and glycerol; very slightly soluble in alcohol. Sp. gr. 2.161; m. p. 804°C ; b. p. 1490°C .

Derivation: (a) By solution of rock salt in water, filtration, and crystallization.

(b) By evaporation and crystallization of naturally occurring brines. (c) By evaporation of sea water by the heat of the sun and crystallization.

Method of purification: Recrystallization.

Impurities: Sulfates; heavy metals; alkaline earths; magnesium salts; ammonium salts.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Highest purity medicinal, crystals; highest purity, dried; highest purity, fine powder; highest purity, fused; reagent; reagent, fused; sea evaporated; ground; powdered; table salt; rock salt; C.P.; U.S.P. XVI; single pure crystals.

Containers: Bottles; cartons; kegs; 100-, 200-lb bags; 280-lb barrels; bulk in cars.

Uses: Chemical (sodium salts, especially soda ash, and hydrochloric acid, chlorine, metallic sodium); dyes; ceramic glazes; metallurgy (silver, gold, copper, zinc); refrigeration; glass; leather; food preservative; mineral waters; soap (salting out); cattle foods; fertilizers; production of sodium light for polariscopic, spectroscopic and other similar work; medicine; analytical chemistry; photography; paper; seasoning of foods; source of chlorates; butter, salting out dyestuffs; freezing mixtures. Single crystals are used for spectroscopy, ultraviolet and infrared transmission.

Shipping regulations: None.*

sodium chlorite NaClO_2

Properties: White crystals or crystalline powder; slightly hygroscopic; soluble in water.

Grades: Technical; reagent.

Containers: Drums.

Uses: For improving taste and odor of potable water (as an oxidizing agent); bleaching agent for textiles, paper pulp, edible and inedible oils, shellacs, varnishes, waxes and straw products; oxidizing agent, reagent.

Caution! Strong, oxidizing material, decomposes with evolution of heat at about 175°C. Extremely explosive in contact with combustible material.

Shipping regulations: Oxidizing material. Yellow label.*

sodium chloroacetate $\text{ClCH}_2\text{COONa}$

Properties: White nonhygroscopic powder, odorless, easier to handle than chloroacetic acid. Soluble in water; slightly soluble in methanol, insoluble in acetone, benzene, ether, and carbon tetrachloride.

Grades: Technical.

Containers: 300-lb drums.

Use: Manufacture of weed killers, dyes, vitamins, pharmaceuticals, other organics; also a defoliant.

sodium chloroaurate. See gold-sodium chloride.

sodium para-chloro-meta-cresolate. A water-soluble preservative for cutting oils.

sodium chloroplatinate. See platinum-sodium chloride.

sodium chloroplatinite. See platinum-sodium chloride.

sodium ortho-chlorotoluene-para-sulfonate $\text{NaSO}_3\text{C}_6\text{H}_3(\text{CH}_3)\text{Cl}$

Properties: Gray to light tan powder; soluble in water and organic solvents.

Derivation: Made by sulfonation of ortho-chlorotoluene, neutralized to form the sodium salt.

Containers: 250-lb drums.

Uses: In the synthesis of dyes, intermediates and drugs.

sodium chromate $\text{Na}_2\text{CrO}_4 \cdot 10\text{H}_2\text{O}$

Properties: Yellow, translucent, efflorescent crystals. Soluble in water; slightly soluble in alcohol.

Constants: Sp.gr. 1.483; m.p. 19.92°C.

Derivation: Chrome iron ore is melted in a reverberatory furnace with lime and soda, in presence of air. The melt is dissolved in water, a small amount of sodium carbonate added, the solution decanted, acidified with acetic acid, concentrated and crystallized.

Method of purification: Recrystallization.

Grades: Pure neutral, highest purity; technical; C.P.; reagent.

Containers: Bottles; 100-lb bags; 100-, 400-lb drums; barrels.

Uses: Inks; dyeing, paint pigment; leather tanning; other chromates; protection of iron against corrosion and rusting; wood preservative; starting material for making chromium metal.

Shipping regulations: None.*

Anhydrous sodium chromate is also available commercially.

sodium chromate, tetrahydrate (chromate of soda) $\text{Na}_2\text{CrO}_4 \cdot 4\text{H}_2\text{O}$

Properties: Yellow crystals; deliquescent; soluble in water.

Grade: Technical.

Containers: Multiwall paper bags, 100 lb net; fiber drums, 400 lbs net; special packages upon request.

Uses: Pigments manufacture; corrosion inhibition, leather tanning; raw material for other chromium chemicals.

Hazards: Harmful dust; avoid breathing or prolonged contact; wash thoroughly after contact; avoid ingestion.

sodium cinchophenate $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NCOONa} \cdot \text{H}_2\text{O}$

Properties: Yellowish white powder; solubility in water, 1 part in 3 parts water.

Derivation: From cinchophen by neutralizing with sodium hydroxide.

Grade: Pharmaceutical.

Containers: Drums.

Use: In medicine.

Shipping regulations: None.*

sodium citrate $\text{C}_6\text{H}_5\text{O}_7\text{Na}_3 \cdot 2\text{H}_2\text{O}$

Properties: White crystals or granular powder; odorless; stable in air; pleasant acid taste. Soluble in water; insoluble in alcohol.

Constants: M.p., loses $2\text{H}_2\text{O}$ at 150°C; b.p. decomposes at red heat.

Derivation: Sodium sulfate solution is treated with calcium citrate, filtered, concentrated and crystallized.

Method of purification: Recrystallization.

Impurities: Calcium citrate; sodium sulfate.

Grades: Highest purity, medicinal; pure; commercial; C.P.; U.S.P. XVI; technical.

Containers: Bottles; 50-lb cans; 100-, 250-lb drums; bags.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Uses:** Medicine; soft drinks; photography; in special cheeses; in electroplating.
Shipping regulations: None.*
- sodium coerulein sulfate.** See indigo carmine.
- sodium columbate.** Obsolete name for sodium niobate.
- sodium copper chloride.** See copper sodium chloride.
- sodium-copper cyanide (copper-sodium cyanide).**
Properties: White, crystalline, double salt of copper cyanide and sodium cyanide.
Copper content (as Cu) 28.7%; **free NaCN** 0.4-2.0%.
Containers: 100-lb drums.
Uses: For preparing and maintaining cyanide copper plating baths based on sodium cyanide.
- sodium cyanate NaOCN.**
Properties: White crystalline powder; soluble in water; insoluble in alcohol and ether.
Special specifications: 0.5% max moisture content; purity 94.5% min.
Containers: Fiber drums; bottles.
Uses: Organic synthesis; heat treating of steel; intermediate for manufacture of medicinals.
Shipping regulations: None.*
- sodium cyanide NaCN.**
Properties: White deliquescent, crystalline powder; exceedingly poisonous! Soluble in water; slightly soluble in alcohol, m.p. 563°C. The aqueous solution is strongly alkaline and decomposes rapidly on standing.
Derivation: (a) Sodamide is produced from sodium and ammonia. The sodamide is heated with charcoal and the resultant soda cyanamide is then heated with an excess of charcoal resulting in the formation of sodium cyanide. (b) By the fusion of calcium cyanamide, common salt and a small amount of calcium carbide. (c) By absorption of hydrocyanic acid in a solution of sodium hydroxide.
Method of purification: Recrystallization.
Impurities: Sodium cyanate; sodium carbonate.
Grades: 30% solution; 73 to 75%; 96 to 98%; reagent; technical; briquettes; granular.
Containers: 25-lb packages; 100-, 160-, 200-lb drums.
Uses: Extraction of gold and silver from ores; electroplating; heat treatment of metals; making hydrocyanic acid; insecticide; cleaning metals; fumigation; manufacture of dyes and pigments; nylon intermediates; chelating compounds.
Danger: Contact with acid liberates poisonous gas. (MCA warning label) Keep dry.
Shipping regulations: Poison, class B. Poison label (both in solid and liquid form).*
- sodium cyclamate (sodium cyclohexylsulfamate) $C_6H_{11}NHSO_3Na$.**
Properties: White, crystalline, practically odorless powder with very sweet taste.
Freely soluble in water; practically insoluble in alcohol, benzene, chloroform and ether; pH (10% solution) 5.5 - 7.5.* Sweetening power approximately 30 times that of sucrose.
Grade: N.F. XI.
Containers: 100-lb drums.
Uses: Sweetening agent in certain soft drinks and in low-calorie and diabetic diets.
- sodium cyclohexylsulfamate.** See sodium cyclamate.
- sodium decaphosphate.** A sodium phosphate glass similar in a general way to sodium hexametaphosphate, but having a higher ratio of Na_2O to P_2O_5 . There is considerable confusion and uncertainty as to the precise meaning of this term. See sodium metaphosphate.
- sodium dehydroacetate $C_6H_7NaO_4 \cdot H_2O$.**
Properties: Tasteless white powder. Soluble in water and propylene glycol. Insoluble in most organic solvents. See also dehydroacetic acid.
Uses: Fungicide; plasticizer; antienzyme toothpaste; pharmaceutical.
- sodium deoxycholate.** See deoxycholic acid.
- sodium 3,5-diacetamido-2,4,6-triiodobenzoate.** See sodium diatrizoate.
- sodium diacetate $CH_3COONa \cdot x(OH_2COOH)$, anhydrous, or $CH_3COONa \cdot x(CH_3COOH) \cdot yH_2O$, technical.**
Properties: White crystals, soluble in water; slightly soluble in alcohol; insoluble in ether.
Containers: 5- to 250-lb drums.
Uses: Buffer; mold inhibitor; souring agent; intermediate for acid salts; mordants, varnish hardeners; antitarnishing agents.
- sodium diatrizoate (sodium 3,5-diacetamido-2,4,6-triiodobenzoate) $C_6I_3(COONa)(NHCOCH_3)_2$.**
Properties: White crystals; soluble in water. Solutions are radio-opaque.
Grade: U.S.P. XVI (as solution for injection).
Use: Radiopaque medium.
- sodium alpha, beta-dichloroisobutyrate.** Used as a plant growth regulator.
- sodium dichloroisocyanurate (sodium salt of dichloro-s-triazine-2,4,6-trione) $NaNC(O)NCIC(O)NCIC(O)$.**
Properties: White, slightly hygroscopic, crystalline powder; loose bulk density (approx.) powder 37 lb/cu. ft., granular 57 lb/cu. ft. Active ingredient: approx 60% available chlorine.
Containers: 200-lb fiber drums.
Uses: Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers, swimming pool disinfectants, water treatment, replacement of calcium hypochlorite.
- sodium 2,4-dichlorophenoxyacetate (2,4-D, sodium salt) $C_6H_3(OCH_2COONa)Cl_2$.**
Properties: Crystalline solid. Decomposes at 215°C. Slightly soluble in water.
Use: Herbicide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium 2,4-dichlorophenoxyethyl sulfate. See SES.

sodium 2,2-dichloropropionate (alpha, alpha-dichloropropionic acid sodium salt)
 $\text{CH}_3\text{CCl}_2\text{COONa}$.

Properties: Crystals; decompose 174-176°C; salty taste. Corrosive to iron. Soluble in water; aqueous solutions hydrolyze above 70°C.

Caution: Causes skin irritation. MCA warning label.

Use: Herbicide, narrow-leaved grasses.

sodium dichromate (sodium bichromate; bichromate of soda) $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Red or red-orange deliquescent crystals. Sp.gr. 2.52; m.p. 320°C; decomposes at 400°C; loses $2\text{H}_2\text{O}$ on prolonged heating at 105°C. Very soluble in water; insoluble in alcohol.

Derivation: (a) Manufactured from chromite ore by alkaline roasting and subsequent leaching; (b) action of sulfuric acid on sodium chromate.*

Method of purification: Recrystallization.

Grades: Technical crystalline; technical liquor containing 69-70% $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Containers: Crystals; multiwall paper bags, 100 lbs net; fiber drums, 400 lbs net. Liquor: tank cars or tank trucks.

Uses: Chemical reactant for oxidation reactions; raw material for other chromium chemicals; corrosion inhibitor; manufacture of pigments; tanning of leather; electroplating; mordanting.

Warning: Harmful dust. May cause rash or external ulcers. MCA warning label.

sodium dihydrogen phosphate. See sodium phosphate (monobasic).

sodium dihydroxyethylglycine. A chelating* agent similar to EDTA.

sodium dimethylarsenate. See sodium cacodylate.

sodium dimethyldithiocarbamate $(\text{CH}_3)_2\text{NCS}_2\text{Na}$.

Properties: 40% solution is amber to light green; sp.gr. 1.17-1.20 (25/25°C).

Derivation: Reaction of dimethylamine, carbon disulfide and caustic.

Containers: 5-gal cans; 55-gal drums; tanks (solution).

Uses: Fungicide; corrosion inhibitor; rubber accelerator; intermediate.

sodium dinitro-ortho-cresylate.

Properties: Brilliant orange-yellow dye which may stain clothing and wood.

Derivation: By treating 4,6-dinitro-ortho-cresol with sodium hydroxide.

Caution: Continued inhalation of sprays containing the compound may cause toxic effects; dust masks or respirators should be worn as a safety precaution when spray is used on large scale.

Uses: Herbicide (control of mustard and other susceptible weeds); fungicide.

See also 4,6-dinitro-ortho-cresol.

sodium dioxide. See sodium peroxide.

sodium dipropionamido-2,4,6-triiodobenzoate. See sodium diprotrizoate.

sodium diprotrizoate (sodium 3,5-dipropionamido-2,4,6-triiodobenzoate)

$(\text{C}_2\text{H}_5\text{CONH})_2\text{C}_6\text{I}_3\text{COONa}$. Marketed as a solution. Aqueous solutions are clear and colorless; solution has a pH of 7.0-7.4.

Grade: U.S.P. XVI.

Use: Medicinal.

sodium dispersions. Stable suspensions of microscopic sodium particles in inert hydrocarbon or other media which boil at temperatures above the melting point of sodium (97.5°C), e.g., heptane, n-octane, toluene, xylene, naphtha, kerosene, mineral oil, n-butyl ether, etc. Particles range in size from submicron to 30 microns depending on the method of preparation. Dispersions contain up to 50% (by weight) of sodium metal.

Uses: For chemical reactions where advantages of controlled reaction rate, lower reaction temperature, increased yields, or substitution for more expensive reagents can be achieved.

sodium dithionate (sodium hyposulfate)

$\text{Na}_2\text{S}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Large transparent crystals; bitter taste. Soluble in water; insoluble in alcohol and concentrated hydrochloric acid. Sp.gr. 2.175.

Grade: Technical.

Containers: Glass bottles.

Use: Chemical reagent.

Shipping regulations: None.*

sodium dithionite. See sodium hydrosulfite.

sodium diuranate (uranium yellow)

$\text{Na}_2\text{U}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow-orange solid, insoluble in water; soluble in dilute acids.

Derivation: By treating a solution of a uranyl salt with sodium hydroxide.

Uses: Ceramics, to produce colored glazes; manufacture of fluorescent uranium glass.

sodium dodecylbenzene sulfonate

$\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{SO}_3\text{Na}$.

Properties: White to light yellow flakes, granules, or powder.

Derivation: Benzene is alkylated with a 12-carbon straight- or branched-chain olefin, to yield dodecylbenzene, which is then sulfonated with oleum and neutralized with caustic soda.

Grades: 30%, 40%, 65%, 85%, 96% active ingredient.

Uses: Detergent.

sodium dodecyldiphenyl oxide disulfonate

$\text{C}_{24}\text{H}_{34}\text{O}(\text{SO}_3)_2\text{Na}_2$. M.p. 150°C (dec); dry form 90% min active; solution (45%), sp.gr.

1.1. Very soluble in water, strong acids, bases and electrolytes; stable to oxidation.

See "Dowfax" 2A1.

sodium erythorbate (sodium isoascorbate)

$\text{NaC}_6\text{H}_7\text{O}_6$. White, free-flowing crystals.

Used as an antioxidant.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium ethoxide. See sodium ethylate.

sodium ethylate (sodium ethoxide; caustic alcohol) C_2H_5ONa .

Properties: White powder, sometimes having brownish tinge. Decomposed by moisture or moist living tissue into alcohol and sodium hydroxide.

Derivation: By carefully adding small amounts of sodium to absolute alcohol kept at a temperature of $10^{\circ}C$, heating carefully to $37.7^{\circ}C$, again carefully adding sodium, cooling to $10^{\circ}C$, and adding the same quantity of absolute alcohol as was used originally.

Uses: Organic synthesis.

sodium ethylene bisdithiocarbamate. See nabam.

sodium 2-ethylhexyl sulfoacetate

$C_8H_{17}OOCCH_2SO_3Na$.

Properties: Light cream colored flakes, highly soluble. Good foaming properties and excellent resistance to hard water. Solutions practically neutral and stable to mineral acids.

Uses: Solubilizing agent, particularly adapted for soapless shampoo compositions, as an electroplating assistant by virtue of its ability to lower the surface tension of plating solutions.

sodium ethylmercurithiosalicylate. See thimerosal.

sodium 5-ethyl-5(1-methyl-1-butenyl) barbiturate. See vinbarbital sodium.

sodium ethyl oxalacetate. See ethyl sodium oxalacetate.

sodium ferric EDTA. See ethylenediamine-tetraacetic acid salts.

sodium ferricyanide (red prussiate of soda)
 $Na_3Fe(CN)_6 \cdot H_2O$.

Properties: Ruby-red, deliquescent crystals; poisonous! Soluble in water, insoluble in alcohol.

Derivation: Chlorine is passed into sodium ferrocyanide solution, crystals of the ferricyanide separating out.

Method of purification: Recrystallization.

Impurities: Sodium ferrocyanide; sodium chloride.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles; wooden kegs.

Uses: Production of pigments; dyeing; printing.

Shipping regulations: None.*

sodium ferrocyanide (yellow prussiate of soda)
 $Na_4Fe(CN)_6 \cdot 10H_2O$.

Properties: Yellow, semi-transparent crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.458.

Derivation: "Spent oxide" from illuminating gas manufacture is treated first with water and then with carbon disulfide to remove ammonium and other soluble salts and sulfur. The residue is mixed with lime and heated in closed pans yielding ammonia and calcium ferrocyanide solution. A boiling solution of sodium chloride is added and the

precipitate formed is heated with a solution of sodium carbonate. The solution is filtered, concentrated and crystallized.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Bags.

Uses: Photography; manufacture of sodium ferricyanide; blue pigments; blueprint paper; metallurgy; tanning; dyes.

Shipping regulations: None.*

sodium fluoaluminate. See cryolite, synthetic.

sodium fluoborate $NaBF_4$.

Properties: White powder; bitter acid taste; slowly decomposed by heat; m.p. $384^{\circ}C$; transparent, rectangular prisms. Soluble in water; slightly soluble in alcohol.

Derivation: By heating sodium fluoride and hydrofluoboric acid and cooling slowly to form crystals of sodium fluoborate.

Uses: Sand agents in casting of aluminum and magnesium; in electrochemical processes; oxidation inhibitor; fluxes for nonferrous metals; fluorinating agent.

sodium fluophosphate. See fluophosphoric acids.

sodium fluoride NaF .

Properties: Clear, lustrous crystals or white powder or balls, poisonous, avoid breathing dust! Insecticide grade frequently dyed blue. Soluble in water; slightly soluble in alcohol.

Constants: Sp. gr. 2.766; m.p. $993^{\circ}C$.

Derivation: By adding sodium carbonate to hydrofluoric acid.

Grades: Pure; C.P.; U.S.P. XVI; technical; single pure crystals.

Containers: 100-lb multiwall paper bags; 125-, 400-lb drums.

Uses: Fluoridation of municipal water supplies, insecticide (not to be used on living plants and animals), fungicide, and rodenticide; metallurgy (rimmed steel); chemical cleaning; electroplating; glass manufacture; vitreous enamels; preservative for adhesives and wood; dentistry; single crystals used as windows in ultraviolet and infrared radiation detecting systems.

Warning! May be fatal if swallowed. MCA warning label.

Shipping regulations: None.*

sodium fluoroacetate (also known as 1080)

FCH_2COONa .

Properties: Fine, white, odorless powder; soluble in water. Nonvolatile and not irritating to the skin. Decomposes at $200^{\circ}C$; soluble in water; insoluble in most organic solvents.

Derivation: Ethyl chloroacetate and potassium fluoride react to form ethyl fluoroacetate, which is then treated with a methanol solution of sodium hydroxide.

Containers: 8-oz cans, 2, 25, or 50 per case; 1-lb cans, 16 or 64 per case.

Uses: Rodenticide.

Warning: For use by trained operators only!

Poisonous if swallowed! U.S. Pesticides Regulations.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium fluosilicate (sodium silicofluoride; salufer) Na_2SiF_6 .

Properties: White, odorless, tasteless, granular, free-flowing, amorphous powder; sp. gr. 2.7; m. p., decomposes at red heat; very slightly soluble in cold water; insoluble in alcohol.

Derivation: By neutralization of fluosilicic acid with sodium carbonate, or addition of sodium chloride to the acid.

Grades: Technical; C.P.

Containers: 100-lb multiwall bags; 100-, 400-lb fiber drums; various sized barrels.

Uses: Fluoridation of drinking water; laundry soaps; opalescent glass; vitreous enamel frits; latex foam rubber; metallurgy of aluminum and beryllium; insecticides and rodenticides; chemical intermediate; glue, leather and wood preservative.

Warning: May be fatal if swallowed. MCA warning label.

Shipping regulations: None.*

sodium formaldehyde bisulfite $\text{HOCH}_2\text{SO}_3\text{Na}$.

Properties: White water-soluble solid.

Derivation: Action of sodium bisulfite, formaldehyde and water.

Use: Textile stripping agent.

See also hydrosulfite-formaldehyde compounds.

sodium formaldehyde sulfoxylate (SFS)

$\text{HCHO} \cdot \text{HSO}_2\text{Na}$.

Properties: White solid; m. p. 64°C ; soluble in water.

Purity: Usually admixed with a sulfite.

Containers: Drums.

Use: Stripping and discharge agent for textiles; bleaching agent for molasses, soap.

See also hydrosulfite-formaldehyde compounds.

sodium formate HCOONa .

Properties: White, slightly hygroscopic, crystalline powder, slight odor of formic acid; soluble in water; slightly soluble in alcohol; insoluble in ether.

Constants: Sp. gr. 1.919; m. p. (dec) 245°C .

Derivation: Carbon monoxide and sodium hydroxide are heated under pressure.

Method of purification: Recrystallization.

Grades: Technical; C.P.

Containers: Bags.

Uses: Reducing agent; medicine; manufacture of formic acid and oxalic acid; intermediates; organic chemicals; mordant; tanning of leather; wallpaper printing; plating.

Shipping regulations: None.*

sodium gentisate $\text{C}_7\text{H}_5\text{O}_4\text{Na}$. The sodium salt of gentisic acid.

Properties: Crystallizes with $5.5 \text{ H}_2\text{O}$ from water; loses $3\text{H}_2\text{O}$ rapidly upon exposure to air; soluble in water.

Containers: Drums.

Use: Medicine.

sodium glucoheptonate $\text{HOCH}_2(\text{CHOH})_5\text{COONa}$.

A sequestering agent for polyvalent metals. Used in metal cleaning; bottle washing; kier boiling; mercerizing; caustic boiloff.

sodium gluconate $\text{NaC}_6\text{H}_{11}\text{O}_7$.

Properties: White to yellowish, crystalline powder; readily soluble in water.

Derivation: From glucose by fermentation.

Method of purification: Crystallization.

Grades: Purified and technical.

Containers: Fiber drums; bags.

Uses: Foods and pharmaceuticals; sequestering agent; to prevent precipitation by alkalies of iron, aluminum, etc., from solution.

Shipping regulations: None.*

sodium glucosulfone $\text{C}_{24}\text{H}_{34}\text{N}_2\text{Na}_2\text{O}_{18}\text{S}_3$. para.

para'-Diaminodiphenylsulfone-N, N'-di-

(dextrose sodium sulfonate). The U.S.P.

XVI grade is an aqueous solution (for injection), clear and pale yellow; pH 5.5-6.5.

Used in medicine.

sodium glutamate (monosodium glutamate;

MSG) $\text{COOH}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{COONa}$. Sodium salt of glutamic acid, one of the common naturally occurring amino acids. Has meat-like taste.

Properties: White crystalline powder; m. p., decomposes; soluble in water and alcohol.

Shows optical activity. Enhances food tastes without contributing any noticeable odor or taste of its own. Most effective between pH 6 and 8.

Derivation: (a) Alkaline hydrolysis of the waste liquor from beet sugar refining; (b) a similar hydrolysis of wheat or corn gluten; (c) organic synthesis based on acrylonitrile.

Grade: Technical, 99%; N.N.D.

Containers: Bottles, cans, fiber drums; retail shaker cans; paper bags.

Use: Valuable as a flavor intensifier, especially for meats.

See also glutamic acid.

sodium glycerinophosphate. See sodium glycerophosphate.

sodium glycerophosphate (sodium glycerinophosphate) $\text{Na}_2\text{C}_3\text{H}_5(\text{OH})_2\text{PO}_4$.

Properties: White crystals or powder; saline taste. Soluble in water; insoluble in alcohol.

Derivation: By neutralizing glycerophosphoric acid with sodium carbonate.

Grade: Technical.

Containers: Solution: Bottles, 50-lb carboys; crystals: cans, 25 to 250-lb barrels and drums.

Use: Medicine.

Shipping regulations: None.*

sodium-gold chloride. See gold-sodium chloride.

sodium gynocardate (sodium hydnocarpate). Sodium salt of the fatty acids in chaulmoogra oil.

Properties: Yellow powder. Soluble in alcohol, water. Aqueous solution slightly alkaline.

Use: Medicine.

sodium heptaphosphate. A sodium phosphate glass similar in a general way to sodium

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hexametaphosphate, but having a higher ratio of Na_2O to P_2O_5 . There is considerable confusion and uncertainty as to the precise meaning of this term. See sodium metaphosphate.

sodium hexametaphosphate (Graham's salt; sodium (1:1) phosphate glass; sodium polyphosphate; glassy sodium phosphate).

Derivation: Soluble Na_2O (1:1) P_2O_5 glass derived from monobasic sodium phosphate by prolonged fusion and rapid cooling of the melt. The degree of association is probably greater than indicated by the subscript 6 in the formula $(\text{NaPO}_3)_6$ commonly used in the past for this glass. The molecule is now considered to be a linear polymer.

Forms and Uses: See "Metafos."

For more about structure, see sodium metaphosphate.

sodium hexylene glycol monoborate

$\text{C}_6\text{H}_{12}\text{O}_3\text{BNa}$.

Properties: Amorphous white solid, bulk density 0.25 g/cc, m.p. 426°C . Very soluble in nonpolar solvents up to 35% by weight.

Purity: Minimum 98%.

Uses: Corrosion inhibitor to organic systems; additive to lubricating oils; flame retardant additive; siloxane resin additive.

sodium hydnocarpate. See sodium gynocardate.

sodium hydrate. See sodium hydroxide.

sodium hydride NaH .

Properties: Microcrystalline dispersion of gray powder in oil. Particle size range 5-50 μ . Concentration approximately 50% by weight. The sodium hydride starts to decompose with evolution of hydrogen at about 255°C . The hydride is insoluble in all inert organic solvents.

Preparation: By reaction of sodium metal with hydrogen.

Containers: The dispersion is packed in polyethylene bags in a metal can. Packaging ranges from 1 pint to 55-gallon drums.

Uses: As a basic condensing or alkylating agent. Particularly useful for alkylation of amines.

Hazards: Reacts vigorously with water, liberating hydrogen. Should not be separated from oil.

Shipping regulations: Flammable solid. Yellow label.*

sodium hydride descaling. Sodium and hydrogen are reacted in situ forming sodium hydride which first dissolves in a non-electrolytic carrier bath of fused sodium hydroxide, and then reacts to reduce scale to lower oxides or free metal.

Uses: Removing oxide scale from steel, copper, and other ferrous and nonferrous metals and alloys.

sodium hydrosulfide (sodium sulfhydrate; sodium bisulfide) $\text{NaSH}\cdot 2\text{H}_2\text{O}$.

Properties: Colorless needles to lemon colored flakes. Soluble in water, alcohol,

and ether.

Typical specifications: 70-72% NaSH ; m.p. 55°C ; water of crystallization 26-28%.

Derivation: Obtained from calcium sulfide by treating it in the cold with sodium bisulfate.

Grades: Technical; flake, 70-72%; solution, 40-44%.

Containers: 90-, 350-lb drums; tank cars.

Uses: Chemical intermediate for dyestuffs and various organic chemicals; leather (depilatory); desulfurizing viscose rayon; bleaching agent.

Danger! Contact with acid liberates poisonous gas. Burns skin and eyes. MCA warning label.

sodium hydrosulfite (sodium hyposulfite; hydrosulfite, sodium dithionite) $\text{Na}_2\text{S}_2\text{O}_4$ or $\text{Na}_2\text{S}_2\text{O}_4\cdot 2\text{H}_2\text{O}$.

Properties: Light lemon-colored solid in powder or flake form or white to grayish-white crystalline powder; m.p. 55°C .

Soluble in water; insoluble in alcohol.

Derivation: Zinc is dissolved in a solution of sodium bisulfite, the zinc-sodium sulfite precipitated by milk of lime leaving the hydrosulfite in solution. On adding salt, the hydrosulfite, containing water of crystallization, is precipitated. The latter is removed by treatment with hot alcohol. An equivalent simpler process is employed for making solutions to be used in situ.

Grades: Technical; reagent.

Containers: 50-lb pails and 250-lb drums.

Uses: As a strong reducing agent, in stripping dyes and discharge printing of textiles; bleaching sugar, soap, oils, minerals, straw, etc.

Caution: Subject to fire if allowed to become damp.

Shipping regulations: Flammable solid. Yellow label.*

sodium hydroxide (caustic soda, sodium hydrate; lye, white caustic) NaOH . The most important commercial caustic.

Properties: White, deliquescent pieces, lumps or sticks; crystalline fracture.

Keep well stoppered, absorbs water and carbon dioxide from the air. Handle with care; it destroys organic tissue. Sp.gr. 2.13; m.p. 318°C ; b.p. 1390°C . Soluble in water, alcohol, and glycerol.

Derivation: (a) By the electrolysis of sodium chloride; (b) by treating a solution of soda ash with a solution of lime commonly called "milk of lime." The lime and soda ash combine to form caustic soda and calcium carbonate. The former is soluble and remains in the solution while the latter is insoluble and is precipitated out of the solution.

The precipitated calcium carbonate (lime mud) is removed from the caustic soda solution by filtration or decantation, thus leaving a clear solution of caustic soda.

Method of purification: Solution in alcohol, in which the carbonate, chloride and sulfate are practically insoluble, evaporation of the alcohol, followed by fusion.

Grades: Commercial; ground; flake;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

granulated (60% and 76% Na_2O); rayon (low in iron, copper, and manganese); solution (50% and 73% NaOH); purified by alcohol (sticks, lumps, and drops); reagent; highest purity; C.P.; U.S.P. XVI.

Containers: U.S.P., C.P.: 1-lb bottles; 5-, 10-lb cans; commercial: drums and barrels; solution: drums; 8000-gal tank cars; barges.

Uses (in approximate order of volume): Manufacture of other chemicals; rayon and film; petroleum refining; pulp and paper; detergents; soap; textile processing; vegetable oil refining; reclaiming rubber.

Caution: Causes severe burns to skin and eyes. MCA warning label.

Shipping regulations: Solution: Corrosive liquid. White label.*

sodium hypochlorite NaOCl .

Properties: This salt is unstable in air unless mixed with sodium hydroxide. It is usually stored and used in solution, known as Labarraque's solution (q.v.) having a disagreeable, sweetish odor and a pale greenish color. Soluble in cold water; decomposed by hot water.

Constants: M.p., decomposes.

Derivation: By electrolyzing a cold dilute solution of salt, sometimes seawater.

Grades: Technical.

Containers: 5-, 13-gal carboys; 30-gal drums.

Uses: Bleaching paper pulp, textiles, etc., intermediate; organic chemicals; water purification, medicine, manufacture of indigo; fungicides.

Shipping regulations: None.*

See also Javelle water.

sodium hypophosphite $\text{NaH}_2\text{PO}_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, pearly, crystalline plates or white, granular powder, saline taste. Keep well stoppered. May explode if heated, or if mixed with oxidizing agents. Deliquescent. Soluble in water, alcohol, and glycerol.

Derivation: By neutralizing hypophosphoric acid with sodium carbonate.

Grades: Technical; C.P.

Containers: Glass bottles; 25-, 50-, 100-lb drums.

Use: Medicine.

Shipping regulations: None.*

sodium hyposulfate. See sodium dithionate.

sodium hyposulfite. See sodium thiosulfate, or sodium hydrosulfite.

sodium indigotindisulfonate. The U.S.P. XVI name for indigo carmine (q.v.).

sodium iodate NaIO_3 .

Properties: White crystals; sp.gr. 4.28. Soluble in water and acetone; insoluble in alcohol.

Derivation: Interaction of sodium chlorate and iodine in presence of nitric acid.

Grades: C.P.; reagent; technical.

Containers: 1-lb bottles.

Use: Medicine; disinfectant.

sodium iodide (a) NaI (b) $\text{NaI} \cdot 2\text{H}_2\text{O}$.

Properties: White cubical crystals or powder, or colorless, odorless, crystals; slowly becomes brown in air; deliquescent; saline, somewhat bitter taste. Soluble in water, alcohol, and glycerin.

Constants: Sp.gr. (a) 3.665; (b) 2.67. M.p. (a) 653°C ; b.p. (a) 1350°C .

Derivation: Ferroso-ferric iodide, prepared from iron, iodine and water, is treated with pure sodium carbonate, filtered, the solution concentrated and crystallized.

Method of purification: Recrystallization.

Impurities: Sodium iodate.

Grades: Technical; C.P.; U.S.P. XVI.

Containers: 25-, 100-, 300-lb drums.

Uses: Photography; solvent for iodine; organic chemicals; reagent in analytical chemistry; medicine.

Shipping regulations: None.*

sodium iodide, thallium activated.

Grades: Single pure crystals.

Uses: Scintillation.

sodium iodipamide $\text{C}_{20}\text{H}_{12}\text{I}_6\text{N}_2\text{Na}_2\text{O}_6$. N,N'-diisopropyl-bis(3-amino-2,4,6-triiodobenzoic acid), disodium salt. See iodipamide for formula.

Properties: Radiopaque; water soluble.

Available as a 20% solution for injection as a clear colorless to pale yellow, slightly viscous liquid.

Derivation: Prepared by dissolving the free acid in dilute sodium hydroxide and buffering to pH 6.5-7.7.

Grade: N.F. XI, N.N.D.

Use: Roentgenographic contrast medium.

sodium iodomethamate $\text{C}_8\text{H}_5\text{I}_2\text{NNa}_2\text{O}_5$.

Disodium 1-methyl-3,5-diiodo-4-pyridone-2,6-dicarboxylate.

Properties: White, odorless, powder or crystals, soluble in water; slightly soluble in alcohol; insoluble in ether and chloroform.

Grade: N.F. XI.

Use: Medicine.

sodium iodomethanesulfonate. See methiodal sodium.

sodium 5-iodo-2-thiouracil. See iothiouracil sodium.

sodium-iridium chloride. See iridium-sodium chloride.

sodium iron pyrophosphate (SIPP)

$\text{Na}_8\text{Fe}_4(\text{P}_2\text{O}_7)_5 \cdot x\text{H}_2\text{O}$.

Properties: 300 mesh powder, tan in color, insoluble in water but soluble in dilute acid. Minimum 14.5% iron. Iron is in complex form and will not catalyze oxidation reactions.

Derivation: By reacting tetrasodium pyrophosphate with a soluble iron salt.

Containers: Drums.

Uses: For iron enrichment; particularly in flours and cereals where there is a possibility of rancidity development.

sodium isoascorbate. See sodium erythorbate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium isopropyl xanthate.

Properties: Light yellow crystals soluble in water.

Uses: Chemical weed killer of seeded crops; fortifying agent for certain oils; flotation reagent for base and precious metal ores.

sodium isovalerate. See sodium valerate.**sodium lactate** $\text{CH}_3\text{CHOHCOONa}$.

Properties: Colorless or yellowish syrupy liquid, very hygroscopic. Soluble in water. M.p. 17°C .

Derivation: Interaction of lactic acid with sodium carbonate.

Grades: Technical; U.S.P. XVI (solution with pH 6.0 to 7.3).

Uses: Medicine; hygroscopic agent; glycerine substitute; plasticizer; corrosion inhibitor in alcohol antifreeze.

Shipping regulations: None.*

sodium N-lauroyl sarcosinate $\text{C}_{15}\text{H}_{28}\text{NO}_4\text{Na}$.

Used in oral dentifrices.

sodium lauryl sulfate $\text{NaC}_{12}\text{H}_{25}\text{SO}_4$.

Properties: Small, white or light yellow crystals; slight characteristic odor. Soluble in water, forming an opalescent solution.

Grades: U.S.P. XVI; technical.

Containers: 55-gal drums; tank cars.

Use: Wetting agent in textiles; detergent in toothpaste; food additive.

sodium lead alloys. An alloy, usually containing 10% sodium and 90% lead, was used in the manufacture of lead tetraethyl. An alloy containing 2% sodium is used as a deoxidizer and homogenizer in nonferrous metals where lead is a constituent. A sodium lead alloy is used as a stabilizer and deoxidizer for lead in cable sheathing.

sodium-lead hyposulfite. See lead-sodium thiosulfate.

sodium-lead thiosulfate. See lead-sodium thiosulfate.

sodium levothyroxine (sodium thyroxine)

$\text{HOC}_6\text{H}_4\text{I}_2\text{OC}_6\text{H}_4\text{I}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COONa} \cdot 5\text{H}_2\text{O}$.

Sodium salt of levo isomer of thyroxine.

Properties: Light yellow to buff, odorless, tasteless powder. Very slightly soluble in chloroform and ether; slightly soluble in alcohol and water. Hygroscopic; stable in dry air and at room temperature; pH (saturated solution) 8.35-9.35.

Grade: U.S.P. XVI.

Use: Medicine.

sodium lignosulfonate.

Properties: Available as a tan, free-flowing spray-dried powder, containing wood sugars.

Containers: 50-lb bags.

Uses: Dispersant, emulsion stabilizer,

chelating agent.

See also lignin sulfonates.

sodium liothyronine

$\text{NaOOCCH}(\text{NH}_2)\text{CH}_2\text{C}_6\text{H}_4\text{I}_2\text{OC}_6\text{H}_4\text{IOH}$.

Sodium L-3[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]alanine.

Properties: Light tan, odorless, crystalline

powder. Very slightly soluble in water.

Slightly soluble in alcohol, practically insoluble in most other organic solvents.

Grade: U.S.P. XVI.

Use: Medicine (a thyroid hormone).

sodium-magnesium sulfate (magnesium-sodium sulfate) $\text{Na}_2\text{SO}_4 \cdot \text{MgSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water.

Sodium MBT. ²⁸ A 50% water solution of sodium mercaptobenzothiazole of high purity.

Use: Corrosion inhibitor for anti-freeze.

sodium mercaptoacetate. See sodium thio-glycolate.

sodium meta-antimonate. See sodium antimonate.

sodium meta-arsenite. See sodium arsenite.

sodium metabisulfite (sodium pyrosulfite)

$\text{Na}_2\text{S}_2\text{O}_5$. Chief constituent of commercial dry sodium bisulfite, with which most of its properties and uses are practically identical.

sodium metaborate NaBO_2 .

Properties: White lumps. Soluble in water.

Solution alkaline. M.p. 966°C .

Derivation: By fusing sodium carbonate and borax.

Containers. Bags.

Use: Herbicide.

Also available commercially as octahydrate and tetrahydrate.

sodium metaborate peroxyhydrate. See sodium perborate.

sodium metanilate $\text{NaSO}_3\text{C}_6\text{H}_4\text{NH}_2$.

Derivation: The meta-sodium sulfonate of aniline sold as a solid or 20% aqueous solution prepared by neutralizing metanilic acid.

Grades: Technical; 99%; also 20% solution.

Containers: Barrels.

Use: In manufacture of synthetic dyestuffs and drugs.

sodium metaperiodate. See sodium periodate.

sodium metaphosphate NaPO_3 , or possibly some multiple thereof such as $(\text{NaPO}_3)_3$. Sodium metaphosphate exists in a large number of forms and varieties, and in addition certain mixtures are known by this name or some derivation of it. As a result there is considerable confusion and difficulty in properly associating names, compositions and properties. The terms mono-metaphosphate, di-, tri-, tetra-, penta-, hexa-, hepta-, octa-, deca-, dodeca- and tetradecametaphosphate have all been used, and unfortunately are not clearly and uniquely associated with particular compounds. Based chiefly on x-ray diagrams, six different crystalline sodium metaphosphates have been shown to exist, and in addition there is a sodium phosphate glass of the same composition which is one of the series of glasses with varying ratios of Na_2O to P_2O_5 . As a result, the following

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nomenclature has been proposed:

- (a) For sodium hexametaphosphate (Graham's salt), commonly assigned the formula $(\text{NaPO}_3)_6$, the name and formula sodium (1:1) phosphate glass $[\text{Na}_2\text{O}(1:1)\text{P}_2\text{O}_5]_n$ are suggested.
- (b) For sodium trimetaphosphate, commonly assigned the formula $(\text{NaPO}_3)_3$, the names and formulas sodium metaphosphate I (NaPO_3 I), sodium metaphosphate I' (NaPO_3 I'), and sodium metaphosphate I'' (NaPO_3 I'') are suggested.
- (c) For Maddrell's salt, commonly assigned the formula NaPO_3 , the names and formulas sodium metaphosphate II (NaPO_3 II) and sodium metaphosphate III (NaPO_3 III) are suggested.
- (d) For Kurrol's salt, commonly assigned the formula NaPO_3 , the name and formula sodium metaphosphate IV (NaPO_3 IV) are suggested.

Uses: Principally as sequestering agents. See sequestration.

sodium metasilicate, anhydrous Na_2SiO_3 .

A crystalline silicate.

Properties: Dustless white granules; m.p. 1089°C ; total Na_2O content 51.5%, percent of total Na_2O in active form 48.6%; density 2.61 or 75 lb/cu ft. Soluble in water, precipitated by acids and by alkaline earth and heavy metal ions; pH of 1% solution 12.6.

Derivation: Crystallized from a melt of Na_2O and SiO_2 below 1089°C .

Containers: 100-lb bags; 125-lb fiber drums; 400-lb fiber drums.

Uses: Laundry, dairy and metal cleaning, floor cleaning; base for detergent formulations.

Shipping regulations: None.*

sodium metasilicate, pentahydrate

$\text{Na}_2\text{SiO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: Dustless white granular crystals, m.p. 72.2°C ; total Na_2O content 29.3%; percent of total Na_2O in active form 27.8%; density 1.75, or 55 lb/cu ft. Soluble in water; pH of 1% solution 12.5.

Derivation: Crystallization from aqueous solution.

Containers: 100-lb bags, 125-, 300-, 400-lb fiber drums.

Uses: Laundry and dairy cleaning, metal cleaning, paper mills; textile finishing; base for cleaning compounds; bleaching aid; deinking paper.

sodium metavanadate NaVO_3 , often with $4\text{H}_2\text{O}$.

Properties: Colorless, monoclinic, prismatic crystals, or pale green crystalline powder. Soluble in hot water. M.p. 630°C .

Derivation: Sodium hydrate and vanadium pentoxide in water solution.

Method of purification: Recrystallization.

Grades: Technical; C.P.

Containers: Glass bottles; compressed paper drums.

Uses: Inks; fur dyeing; therapeutics; in photography to impart a red tone to films and plates; inoculation of plant life;

mordants and fixers; corrosion inhibitor in gas-scrubbing systems.

Shipping regulations: None.*

sodium methacrylate $\text{CH}_2=\text{C}(\text{CH}_3)\text{COONa}$.

Containers: Drums.

Uses: Water-soluble polymerizable monomer; chemical intermediate.

sodium methanearsonate. See disodium methylarsonate.

sodium methoxide. See sodium methylate.

sodium methylate (sodium methoxide) CH_3ONa .

Properties: White, amorphous, free-flowing powder, sensitive to oxygen; decomposed by water. Soluble in methyl and ethyl alcohol. Decomposes in air above 260°F .

Containers: 10-lb pails; 25 to 200-lb steel drums; also 25% solution in methanol, 425-lb drums.

Uses: Condensation reactions in general; catalyst for treatment of edible fats and oils, especially lard; intermediate for sulfa drugs and other pharmaceuticals.

Shipping regulations: Solid: Flammable solid. Yellow label. Alcohol mixture: Flammable liquid. Red label.*

sodium methyl carbonate CH_3OCOONa .

Properties: White powder; m.p. 330°C (decomposes); density 1.66; purity 90% min.

sodium N-methyl-N-oleoyl taurate (oleyl methyl tauride) $(\text{CH}_3)(\text{CH}_2)_7\text{CHCH}(\text{CH}_2)_7\text{CON}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{SO}_2\text{ONa}$.

Properties: Fine white powder. Pleasant, slight, sweet odor. Nontoxic.

Grades: Technical, 32% purity (remainder is mainly sodium sulfate).

Use: Detergent; pesticide adjuvant.

sodium N-methyltaurate. See N-methyltauride.

sodium molybdate. As an article of commerce, usually the normal molybdate Na_2MoO_4 or its dihydrate (called sodium molybdate crystals). Chemically, however, a wide variety of complex molybdates with sodium are known.

Properties: Small, lustrous, crystalline plates,* soluble in water; m.p. 687°C ; sp.gr. 3.28.

Derivation: By the action of sodium hydroxide on molybdenum trioxide. Complex molybdates are prepared by dissolving large amounts of molybdenum trioxide in solutions of normal molybdates.

Grades: Anhydrous; crystals.

Containers: 100-, 150-, 200-, 375-lb drums.

Uses: Reagent in analytical chemistry; medicine; casein glues; paint pigment; production of molybdate orange, molybdated toners and other colors; metal finishing; fertilizer; brightening agent for zinc plating; corrosion inhibitor; catalyst in dye and pigment production.

Shipping regulations: None.*

sodium molybdophosphate. See sodium phosphomolybdate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium monoxide (sodium oxide) Na_2O .

Properties: A white powder, soluble in molten caustic soda or potash. Converted to sodium hydroxide by water.
Containers: 60-lb pails; 300-lb drums.
Uses: As a condensing or polymerizing agent in organic reactions; as a dehydrating agent; strong base.

sodium naphthalenesulfonate $\text{C}_{10}\text{H}_7\text{SO}_3\text{Na}$.

Properties: Yellowish, crystalline plates, or white, odorless scales. Soluble in water; insoluble in alcohol.
Derivation: Naphthalene sulfonic acid is prepared by sulfonating naphthalene with sulfuric acid. The solution is treated with sodium carbonate, filtered, concentrated and crystallized.
Method of purification: Recrystallization.
Grades: Technical.
Containers: 360-, 500-lb barrels.
Uses: Organic preparations, liquefying agent in animal glue preparations; naphthols.
Shipping regulations: None.*

sodium naphthenates. A white paste. The most important of the naphthenic acid salts. Commercial soaps have consistency of grease, but this will vary with source and manner of processing. Combine excellent emulsifying and foam producing properties with a low hydrolytic dissociation, and are of value as mild detergents. Very powerful emulsifying agents for water-mineral oil systems. Possess marked disinfectant properties. Also used in manufacture of driers. See naphthenic acid.

sodium naphthionate (sodium alpha-naphthylaminesulfonate) $\text{NH}_2\text{C}_{10}\text{H}_6\text{SO}_3\text{Na} \cdot 4\text{H}_2\text{O}$.

Properties: White crystals, become violet on exposure to light. Soluble in water; insoluble in ether.
Derivation: Alpha-naphthylamine is fused and poured into concentrated sulfuric acid, heated to 180°C , then oxalic acid is added. The molten mass is poured on lead plates and baked for 8 hours to 180°C . When cold the porous mass is neutralized with hot caustic soda solution, filtered, concentrated and crystallized.

Method of purification: Recrystallization.
Grades: Technical (paste, crystals).
Containers: Paste: 235-, 300-, 500-lb barrels; crystals: 340-lb barrels.
Uses: For Riegler's reagent for nitrous acid, manufacture of dyestuffs.
Shipping regulations: None.*

sodium beta-naphtholate (beta-naphthol sodium, microcidine) $\text{C}_{10}\text{H}_7\text{ONa}$.

Properties: White powder, non-caustic, non-toxic. More powerful than phenol. Soluble in water.
Use: Medicine.

sodium naphthylaminesulfonate. See sodium naphthionate.**sodium niobate** (sodium columbate)

$7\text{Na}_2\text{O} \cdot 6\text{Nb}_2\text{O}_5 \cdot 31\text{H}_2\text{O}$. Sodium niobate is of importance technologically in the purification of niobium materials. The crystalline

compound forms when a niobium compound is treated with hot concentrated sodium hydroxide. It is sparingly soluble in water.

sodium nitrate (soda niter) NaNO_3 . Chile saltpeter (caliche) is impure natural sodium nitrate.

Properties: Colorless, transparent, odorless crystals; saline, slightly bitter taste; sp.gr. 2.267; m.p. 308°C ; b.p., decomposes. Soluble in water and glycerol; slightly soluble in alcohol.

Derivation: From nitric acid and sodium carbonate; and from Chile saltpeter.

Method of purification: Recrystallization.

Grades: Granular, sticks, powder; crude; 95%; double refined; recrystallized; C.P.; technical; reagent; diuretic.

Containers: Tins; glass bottles; multiwall paper sacks; bags up to 100-lb; bulk.

Uses: Manufacturing sulfuric and nitric acids and potassium nitrate; oxidizing agent; oxidizer in solid rocket propellants; fertilizer; flux; glass manufacture; pyrotechnics; reagent in analytical chemistry; medicine; refrigerant; matches; dynamites; military explosives and gases; manufacturing sodium salts, dyes, pharmaceuticals; food preservative; enamel for pottery, modifying burning properties of tobacco.

Caution: Fire hazard; dangerous! In contact with organic or other readily oxidizable (combustible) substances it will cause violent combustion or ignition.

Shipping regulations: Oxidizing material. Yellow label.*
See also caliche.

sodium nitrite (diazotizing salts) NaNO_2 .

Properties: Slightly yellowish or white crystals, pellets, sticks or powder. Oxidizes on exposure to air. Soluble in water; slightly soluble in alcohol and ether. Sp.gr. 2.157; m.p. 271°C , b.p., decomposes at red heat above 320°C .

Grades: Reagent; technical, U.S.P. XVI.

Containers: 25-, 100-lb drums; 150-lb kegs; 400-lb barrels.

Uses: Dyestuff manufacture, for diazotizing; organic synthesis, preparation of nitric oxide; reagent in analytical chemistry, pharmaceuticals; photographic reagent; pickling meat; medicine; dyeing and printing textile fabrics, bleaching flax, silk and linen; rustproofing; prevention of corrosion; metal cleaner; in cutting oils.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

sodium nitroferricyanide (sodium nitroprussiate; sodium nitroprusside) $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$.

Properties: Red, transparent crystals; sp.gr. 1.72. Soluble in water, with slow decomposition; slightly soluble in alcohol.

Grades: Reagent; technical.

Use: Analytical reagent.

sodium nitroprussiate. See sodium nitroferricyanide.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium nitroprusside. See sodium nitro-ferricyanide.

sodium nucleate. See sodium nucleinate.

sodium nucleinate (sodium nucleate).

Properties: Yellowish-white almost odorless powder containing approximately 4.5% sodium. Soluble in water; insoluble in alcohol.

Derivation: From yeast.

Use: Medicine.

Shipping regulations: None.*

sodium oleate $C_{17}H_{33}COONa$.

Properties: White powder; slight tallow-like odor. Soluble in water with partial decomposition; soluble in alcohol.

Derivation: Action of alcoholic sodium hydroxide on oleic acid.

Containers: 100-lb bags; 180-lb barrels; 200-lb drums.

Use: Medicine; ore flotation; waterproofing textiles.

Shipping regulations: None.*

sodium orthophosphate, primary, secondary and tertiary. See sodium phosphate, mono-, di-, and tribasic.

sodium orthosilicate $Na_2SiO_3 \cdot 2NaOH$ or other proportions such as $2Na_2O \cdot SiO_2$ (anhydrous) or $2Na_2O \cdot SiO_2 \cdot 5.4H_2O$.

Properties: (Composition $2Na_2O \cdot SiO_2$) Dustless white, flaked product, density 75 lbs/cu ft; total Na_2O content 60.8%; percent of total Na_2O in active form 59.0%. Soluble in water; pH of a 1% solution 13.0.

Derivation: Crystallized from anhydrous melts. Commercial products are mixtures of anhydrous metasilicate and sodium hydroxide, (either crystallized integrally or compounded) or an integral mixture of sodium hydroxide with the metasilicate pentahydrate.

Containers: 100-lb bags; 100-, 275-, 400-lb fiber drums.

Uses: Commercial laundries; metal cleaning; heavy duty cleaning.

Warning: Causes severe burns to skin and eyes. MCA warning label.

sodium orthovanadate Na_3VO_4 .

Properties: Colorless hexagonal prisms.

Soluble in water; insoluble in alcohol.

M. p. $866^\circ C$.

Derivation: Fusion of vanadium pentoxide and sodium carbonate.

Method of purification: Recrystallization.

Containers: Glass bottles.

sodium-osmic chloride. See osmium-sodium chloride.

sodium oxalate $Na_2C_2O_4$.

Properties: White, crystalline powder; poisonous! Soluble in water; insoluble in alcohol.

Derivation: Oxalic acid is dissolved in water, neutralized with sodium carbonate, the solution filtered, concentrated, and crystallized.

Method of purification: Recrystallization.

Impurities: Sodium carbonate; sodium

binoxalate; chlorine; sulfates; iron salts; potassium salts; organic impurities.

Grades: Reagent; technical, 88%, 99%.

Containers: 100-lb bags; 225-lb barrels.

Uses: Reagent in analytical chemistry; textile finishing; pyrotechnics; leather tanning and finishing; blue printing.

Shipping regulations: None.*

sodium oxide. See sodium monoxide.

sodium palconate. The sodium salt of an acid that may be extracted with alkali from redwood dust. The dark reddish brown material consists mainly of a partially methylated phenolic acid containing aliphatic hydroxyls, phenolic hydroxyls and carboxyl groups in the ratio 2:4:3. The viscosity of aqueous solutions rises rapidly with concentration.

Uses: It is used to control viscosity and water loss in drilling muds, and is also useful as a dispersing agent.

sodium-palladium chloride. See palladium-sodium chloride.

sodium penicillin G. See penicillin.

sodium penicillin O. See penicillin.

sodium pentaborate $Na_2B_{10}O_{16} \cdot 10H_2O$.

Properties: White crystals; free-flowing; stable under ordinary conditions; solubility in water, 15.40% ($20^\circ C$), increasing with temperature, sp. gr. 1.72; pH of solution approx 7.5.

Containers: 100-lb paper bags.

Uses: Weed killer, in cotton defoliant and fireproofing compositions; in glass manufacture; boron supplement for tree fruit and truck crops.

sodium pentachlorophenate C_6Cl_5ONa .

Properties: Tan powder; soluble in water, ethanol, and acetone; insoluble in benzene.

Containers: 50-lb bags; 60-, 70-, 100-, 200-lb drums.

Grades: Technical, powder, pellets, or briquettes.

Caution: Avoid skin contact and inhalation of dust.

Uses: Used as a fungicide, herbicide, for control of algae and slime; and as a fermentation disinfectant, especially in finishes and papers, including food packaging.

sodium perborate (peroxydol; sodium metaborate peroxyhydrate) $NaBO_2 \cdot H_2O_2 \cdot 3H_2O$. Often described as sodium perborate tetrahydrate, $NaBO_3 \cdot 4H_2O$, see also sodium borate perhydrate.

Properties: White, odorless crystals or powder; salty taste. Stable in cool, dry air but decomposes with the evolution of oxygen in warm or moist air. Moderately soluble in water (with decomposition) and glycerol. pH of aqueous solutions 10.0 to 10.3. Active oxygen content 10% min.

Derivation: (a) Electrolysis of a solution of borax and soda ash; (b) crystallization from solution of borax or boric acid, sodium peroxide, and hydrogen peroxide.

Method of purification: Recrystallization.

Grades: Technical; C. P.; N. F. XI (as

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

$\text{NaBO}_3 \cdot 4\text{H}_2\text{O}$).

Containers: Cartons; boxes; bags.

Uses: Developing vat dyes; textile bleaching; household bleaches and detergents; neutralizing cold wave preparations; dental compositions; electroplating; laboratory reagent; germicide; deodorant; general applications as a mild, alkaline oxidizing agent.

Shipping regulations: None.*

sodium perchlorate NaClO_4 , sometimes with H_2O .

Properties: White deliquescent crystals; must not be triturated with organic or combustible substances, may cause explosions; explosive in contact with concentrated sulfuric acid! Soluble in water and alcohol. M.p. 482°C ; b.p., decomposes; sp. gr. 2.02.

Derivation: (a) Sodium chlorate and sodium chloride are mixed and heated until fused. The unchanged chloride is leached out. (b) A cold solution of sodium chlorate is electrolyzed, the solution concentrated and crystallized.

Method of purification: Recrystallization.

Impurities: Sodium chloride, sodium chlorate.

Grades: Technical.

Containers: Glass bottles; wooden kegs.

Use: Explosives, jet fuel, analytical reagent.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

sodium periodate (sodium metaperiodate)

(a) NaIO_4 ; (b) $\text{NaIO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals; sp. gr. (a) 4.172 (25°C), (b) 3.219 (18°C); m.p. (a) 300°C (dec), (b) 175°C (dec). Very soluble in water.

Containers: Glass bottles, steel pails.

Uses: Source of periodic acid, analytical reagent.

Shipping regulations: Oxidizing material.

Yellow label.*

sodium permanganate $\text{NaMnO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Purple to reddish-black crystals or powder, soluble in water. M.p., decomposes.

Derivation: Sodium manganate is dissolved in water and a current of chlorine or ozone passed in. The solution is concentrated and crystallized.

Method of purification: Recrystallization.

Impurities: Sodium hydroxide; sodium manganate.

Grades: Technical, sold commercially in solution.

Containers: Wooden barrels, steel drums; 1-, 5-, and 10-lb glass bottles.

Uses: Oxidizing agent; disinfectant; bactericide; manufacture of saccharin; antidote for poisoning by morphine, curare and phosphorus.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

sodium peroxide (sodium dioxide; sodium superoxide, q.v., a misnomer) Na_2O_2 .

Properties: Yellowish-white powder, turning yellow when heated. Keep away from alcohol and other similar flammable liquids, as it will cause ignition, particularly in presence of water. Absorbs water and carbon dioxide from air. Active oxygen content approximately 20% by weight; sp. gr. 2.805; m.p. 660°C (approx) with decomposition. Soluble in cold water developing great heat; decomposed in water.

Derivation: Metallic sodium is heated at 300°C in aluminum trays in a retort in a current of dry air, from which the carbon dioxide has been removed.

Grades: Technical; reagent.

Containers: 20-, 75-lb pails, 280-, 400-lb drums.

Uses: Oxidizing agent; bleaching agent in paper and textile industries; deodorant; germicide; antiseptic; disinfectant; medicine, purifying air in sick rooms; bleaching fats, oils, resins, waxes, bones, gelatin, bristles, straw, ivory, sponges, feathers; medicinal soaps; organic chemicals; peroxides; water purification; pharmaceuticals; oxygen generation for diving bells, submarines, etc, textile dyeing and printing; ore processing; analytical reagent; calorimetry.

Caution: Fire hazard: Dangerous, does not burn or explode itself but mixtures of sodium peroxide and combustible substances are explosive and ignite very easily, particularly if moisture is present.

Shipping regulations: Oxidizing material.

Yellow label.*

sodium peroxydisulfate. See sodium persulfate.

sodium persulfate (sodium peroxydisulfate) $\text{Na}_2\text{S}_2\text{O}_8$.

Properties: White, crystalline powder, soluble in water, decomposed by alcohol.

Uses: Analytical, bleaching agent (fats, oils, soap), battery depolarizers; medicine.

sodium phenate (sodium phenolate; sodium carbolate; phenol sodium) $\text{C}_6\text{H}_5\text{ONa}$.

Properties: White, deliquescent crystals. Keep well stoppered. Soluble in water and alcohol; decomposed by carbon dioxide of the air.

Derivation: Phenol is dissolved in caustic soda solution, concentrated and crystallized.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Antiseptic; in military gas-masks with charcoal and hexamethylenetetramine as absorbent for phosgene; salicylic acid; organic synthesis.

Shipping regulations: None.*

sodium phenobarbital. See phenobarbital sodium.

sodium phenolate. See sodium phenate.

sodium phenolsulfonate (sodium sulfocarbolate) $\text{HOC}_6\text{H}_4\text{SO}_3\text{Na} \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals or granules, slightly efflorescent; chars at high

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

temperature, evolving phenol. Soluble in water, hot alcohol, and glycerol.

Containers: 25-, 100-, 200-, 275-lb drums.

sodium phenoneacetate. See guaiaceticin.

sodium N-phenylglycinamide-para-arsonate.
See tryparsamide.

sodium ortho-phenylphenate (sodium ortho-phenylphenolate) $C_6H_4(C_6H_5)ONa \cdot 4H_2O$.
Properties: Practically white flakes. Bulk density 38-43 lb/cu ft; pH of saturated solution in water 12.0-13.5. Soluble in water, methanol, acetone.

Uses: Industrial preservative (as a bactericide and fungicide.)

sodium ortho-phenylphenolate. See sodium ortho-phenylphenate.

sodium phenylphosphinate $C_6H_5PH(O)(ONa)$.
Properties: Crystals; m.p. 355°C (decomposes to give phenylphosphine); stable, non-hygroscopic at room temperature; soluble in water.

Uses: Antioxidant; heat and light stabilizer.

sodium phosphate. See sodium hexametaphosphate; sodium metaphosphate; sodium phosphate, dibasic; sodium phosphate, hemibasic; sodium phosphate, monobasic; sodium phosphate, tribasic; sodium pyrophosphate; sodium pyrophosphate, acid.

sodium phosphate, dibasic (DSP; disodium phosphate; hydrodisodium phosphate, sodium orthophosphate, secondary; disodium orthophosphate) (a) Na_2HPO_4 ; (b) $Na_2HPO_4 \cdot 2H_2O$; (c) $Na_2HPO_4 \cdot 7H_2O$, (d) $Na_2HPO_4 \cdot 12H_2O$.

Properties: Colorless, translucent crystals or white powder; cooling, saline taste. Soluble in water; very slightly soluble in alcohol.

Constants: (a) Hygroscopic; converted to sodium pyrophosphate at about 240°C. (b) M.p. loses H_2O at 92.5°C, sp.gr. (15°C) 2.066; (d) M.p. 35°C; sp.gr. 1.5235. Readily loses $5H_2O$ on exposure to air at ordinary temperature; loses $12H_2O$ at 100°C.

Derivation: (1) By treating phosphoric acid with a slight excess of soda ash, boiling the solution to drive off carbon dioxide, and cooling to permit the dodecahydrate to crystallize; (2) by precipitating calcium carbonate from a solution of dicalcium phosphate with soda ash.

Method of purification: Recrystallization.

Grades: Commercial; food; N.F. XI (c). Containers: 100-lb paper bags; 100-, 300-, 400-lb fiber drums; 300-lb barrels.

Uses: Chemicals; dyes; fertilizers; pharmaceuticals; medicine; textiles (weighting silk, dyeing and printing, fire-proofing); fire-proofing wood, paper and other products; ceramic glazes; tanning; paint pigments; baking powders; galvano-plastics; soldering enamels; analytical reagent; cheese; detergents; water treatment.

Shipping regulations: None.*

sodium (1:1) phosphate glass. See sodium hexametaphosphate.

sodium phosphate, glassy. See sodium tetraphosphate.

sodium phosphate, hemibasic $NaH_2(PO_4)_2$.

Properties: A hygroscopic, strongly acid salt. Soluble in water.

Grades: Technical.

Containers: 350-, 500-lb barrels (moisture-proof liner).

Uses: Treating silage; contact tinning of brass; boiler-water treatment. Useful wherever a strong acid is desired in solid form.

sodium phosphate, monobasic (sodium acid phosphate; sodium biphosphate; sodium orthophosphate, primary) (a) NaH_2PO_4 , (b) $NaH_2PO_4 \cdot H_2O$.

Properties: (a) White crystalline powder, slightly hygroscopic; very soluble in water; has acid reaction; forms sodium acid pyrophosphate at 225-250°C and sodium metaphosphate at 350-400°C; (b) large, transparent crystals; m.p., loses H_2O at 100°C; sp.gr. 2.040; very soluble in water; insoluble in alcohol.

Derivation: By treating disodium phosphate with proper proportion of phosphoric acid.

Method of purification: Recrystallization.

Grades: Commercial, food; (b) U.S.P. XVI.

Containers: 100-lb paper bags; 125-lb drums; 350-lb barrels.

Uses: Boiler water treatment, electroplating; dyeing; acid cleansers; baking powders; cattle food supplement.

Shipping regulations: None.*

sodium phosphate, tribasic (TSP; trisodium orthophosphate; trisodium phosphate; tertiary sodium phosphate, sodium orthophosphate, tertiary) $Na_3PO_4 \cdot 12H_2O$.

Properties: Colorless crystals; soluble in water. Sp.gr. 1.618-1.645; m.p. 77°C; b.p., loses $11H_2O$ at 100°C.

Derivation: By mixing soda ash and phosphoric acid in proper proportions to form disodium phosphate, and then adding caustic soda.

Method of purification: Recrystallization.

Grades: Commercial; highest purity; C.P.

Anhydrous salt, Na_3PO_4 , also available.

Containers: 1-, 5-lb bottles; 350-, 500-lb barrels; bags.

Uses: Water softeners; boiler compounds; detergent; metal cleaner; textiles; manufacture of paper, laundering; tanning industry; sugar purification; photographic developers, medicine; paint removers; industrial cleaners.

sodium phosphate, tribasic, monohydrate (trisodium phosphate monohydrate) $Na_3PO_4 \cdot H_2O$.

Properties: White powder. Absorbs water as water of crystallization. Soluble in water. Density 65 lb/cu ft.

Containers: 100-lb bags, 125-, 400-lb drums.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Water softening; detergents; industrial cleaners. See preceding article.

sodium phosphite $\text{Na}_2\text{HPO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White, crystalline powder. Hygroscopic. Caution! Keep well stoppered! Soluble in water; insoluble in alcohol. M.p. 53°C.

Use: Medicine; antidote in mercuric chloride poisoning.

sodium phosphoaluminate. White powder composed primarily of sodium aluminate (hydrated), sodium phosphate (ortho) and small amounts of sodium carbonate and sodium silicate. Used primarily in the paper industry as a sizing adjunct, as an aid in retention of filler and fiber and in control of the pH of the stock. Also used in boiler feed water treatment.

sodium phosphomolybdate (sodium molybdo-phosphate) $\text{Na}_3\text{PO}_4 \cdot 12\text{MoO}_3$.

Properties: White crystals; soluble in water. Grades: Technical.

Uses: Analysis; neuromicroscopy.

sodium phosphotungstate (sodium phospho-wolframate) $\text{Na}_3\text{PO}_4 \cdot 12\text{WO}_3 \cdot 18\text{H}_2\text{O}$.

Properties: White, granular powder. Soluble in water.

Derivation: By neutralizing phosphotungstic acid with sodium carbonate.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Reagent for detecting and determining alkaloids, uric acid, potassium.

Shipping regulations: None.*

sodium phosphowolframate. See sodium phosphotungstate.

sodium picramate $\text{NaOC}_6\text{H}_2(\text{NO}_2)_2\text{NH}_2$.

Derivation: Yellow, water-soluble salt resulting from neutralization of picramic acid with caustic soda.

Grades: Technical.

Containers: Drums.

Uses: Manufacture of dye intermediates; organic chemicals; synthesis.

Shipping regulations: Wet with 20% of

•water: Flammable solid. Yellow label.*

sodium platnichloride. See platinic-sodium chloride.

sodium platinochloride. See platinous-sodium chloride.

sodium plumbate $\text{Na}_2\text{PbO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Fused, light-yellow lumps.

Hygroscopic. Decomposed by water.

Caution! Keep well stoppered!

Grades: Technical.

sodium plumbite. See doctor treatment.

"Sodium Polyphos." ⁸⁴ Brand name for a water-soluble glassy sodium phosphate of standardized composition, $(\text{Na}_{12}\text{P}_{10}\text{O}_{31})$ analyzing 63.5% P_2O_5 (ratio of $\text{Na}_2\text{O}:\text{P}_2\text{O}_5$ is 1.2:1). It is closely similar to sodium hexametaphosphate and sodium tetraphosphate; frequently the three names are used interchangeably.

Grades: Ground; walnut-size lumps; and pea-size lumps.

Containers: 100-lb bags; 100-, and 350-lb drums.

Uses: Boiler water compounds; detergents; textiles; leather tanning; photographic film developing; deflocculation of clays; flotation and desliming of minerals; dispersion of pigments; paper processing; conditioning agent for oil well drilling muds; industrial and municipal water treatment.

sodium polyphosphate. See sodium hexametaphosphate; sodium tetraphosphate.

sodium polysulfide Na_2S_x .

Properties: Yellow-brown granular free-flowing material; density 56 lbs/cu ft.

Containers: 100-lb, 400-lb drums.

Uses: Manufacture of sulfur dyes and colors, insecticides, synthetic rubber, petroleum additives; electroplating.

sodium-potassium alloy. See NaK.

sodium potassium carbonate (potassium-sodium carbonate) $\text{NaKCO}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals. The double salt fuses more readily than the single salts; sp.gr. 1.6344; m.p. 135°C (dec). Soluble in water.

Derivation: Mixture of potassium and sodium carbonates.

Grades: Technical.

Use: Analysis (flux).

sodium-potassium phosphate (potassium-sodium phosphate) $\text{NaKHP}_2\text{O}_4 \cdot 7\text{H}_2\text{O}$.

Properties: White powder; stable in air.

Soluble in water.

sodium-potassium tartrate. See potassium-sodium tartrate.

sodium propionate $\text{CH}_3\text{CH}_2\text{COONa}$ or $\text{C}_2\text{H}_5\text{COONa} \cdot x\text{H}_2\text{O}$.

Properties: Transparent crystals or granules; almost odorless; deliquescent in moist air; very soluble in water, slightly soluble in alcohol.

Grades: N.F. XI.

Containers: 25-, 100-, 250-lb drums.

Uses: Fungicide, mold preventative, widely used in foods.

sodium prussiate, red. See sodium ferricyanide.

sodium prussiate, yellow. See sodium ferrocyanide.

sodium pyroantimonate. See sodium antimonate.

sodium pyroborate. See sodium borate.

sodium pyrocatechin acetate. See guaiaceticin.

sodium pyrophosphate (tetrasodium pyrophosphate; sodium pyrophosphate, normal; TSPP) (a) $\text{Na}_4\text{P}_2\text{O}_7$; (b) $\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$.

Properties: Colorless, transparent crystals or white powder; mild on the hands (has a pH of only 10.2 in 1% solutions). (a) M.p. 988°C; sp.gr. 2.45; soluble in water; decomposes in alcohol; (b) m.p. 94°C; sp.gr. 1.82; soluble in water; insoluble in alcohol and ammonia.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By fusing disodium phosphate.

Grades: Pure crystals; dried; fused; C.P.

Containers: Bottles; 100-lb paper bags; drums; bulk cars; 350-lb barrels.

Uses: Water softener; soap and synthetic detergent builder; dispersing and emulsifying agent; metal cleaner; boiler water treatment; viscosity control of drilling muds; de-inking news print; synthetic rubber manufacture; textile dyeing; scouring of wool.

Shipping regulations: None.*

sodium pyrophosphate, acid (disodium pyrophosphate; sodium acid pyrophosphate; SAPP) $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$.

Properties: White crystalline powder; m.p. (dec) 220°C , sp.gr. 1.862; soluble in water.

Derivation: Incomplete decomposition of monobasic sodium phosphate.

Grades: Technical, food.

Containers: 100-lb bags, 125-, 350-lb drums.

Uses: Electroplating; metal cleaning and phosphatizing; conditioning agent for drilling muds; baking powders and leavening agent.

Shipping regulations: None.*

sodium pyrophosphate, normal. See sodium pyrophosphate.

sodium pyrophosphate peroxide

$\text{Na}_4\text{P}_2\text{O}_7 \cdot 2\text{H}_2\text{O}_2$.

Properties: White powder, apparent bulk density 73 lb/cu ft. Active oxygen minimum 9.0% by wt. Water soluble; mildly alkaline.

Containers: Fiber drums.

Uses: Denture cleaners, dentifrices, household and laundry detergents.

sodium pyroracemate. See sodium pyruvate.

sodium pyrosulfite. See sodium metabisulfite.

sodium pyrovanadate $\text{Na}_2\text{V}_2\text{O}_7 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless six-sided plates.

Soluble in water; insoluble in alcohol; m.p. (anhydrous) 654°C .

Derivation: Sodium hydroxide and vanadium pentoxide in water solution.

Method of purification: Recrystallization.

sodium pyruvate (sodium pyroracemate, sodium acetylformate) NaOCCOCH_3 . White powder; apparent melting point 205°C . Very soluble in water.

Use: Biochemical research.

sodium radio-chromate $\text{Na}_2\text{Cr}^{51}\text{O}_4$. A radioactive form of sodium chromate which uses chromium 51 as a biological tracer. See chromium 51.

Grade: U.S.P. XVI (as injection).

sodium radio-iodide NaI^{131} . A radioactive form of sodium iodide containing iodine 131 which can be used as a tracer. See iodine 131.

Grade: U.S.P. XVI (as capsules or solution).

sodium radio-phosphate. N.N.D. 1960 solution contains sodium phosphate monobasic, $\text{NaH}_2\text{P}^{32}\text{O}_4$, and sodium phosphate dibasic, $\text{Na}_2\text{HP}^{32}\text{O}_4$, and has a pH of 5.0-6.0. See

phosphorus 32.

Grades: N.N.D.; U.S.P. XVI.

Use: Medicine.

sodium resinate. See sodium abietate.

sodium rhodanate. See sodium thiocyanate.

sodium rhodanide. See sodium thiocyanate.

sodium ricinoleate $\text{C}_{17}\text{H}_{33}\text{OHCOONa}$.

Properties: White or slightly yellow, odorless or nearly odorless powder; soluble in water or alcohol; the aqueous solution being alkaline and the alcoholic solution not alkaline.

Derivation: Sodium salt of the fatty acids from castor oil.

Uses: Emulsifying agent in making special soaps. Also used in medicine.

sodium salicylate $\text{HOC}_6\text{H}_4\text{COONa}$.

Properties: Lustrous, white, crystalline scales or amorphous powder; sweetish, saline taste. The salt prepared from natural salicylic acid has a faint, aromatic odor. Soluble in water, alcohol and glycerol.

Derivation: By heating sodium phenate in an autoclave with carbon dioxide, dissolving and crystallizing.

Method of purification: Recrystallization.

Grades: Technical; C.P.; U.S.P. XVI.

Containers: 25-, 50-, 100-, 200-, 300-lb drums; barrels.

Uses: Medicine; production of salicylic acid; preservative for paste, mucilage, glue and hides.

Shipping regulations: None.*

sodium sarcosinate (sodium sarcosine)

$\text{CH}_3\text{NHCH}_2\text{COONa}$.

Grade: 33% aqueous solution.

Use: Intermediate, stabilizer for diazonium salts, chelating agent.

sodium sarcosine. See sodium sarcosinate.

sodium selenate $\text{Na}_2\text{SeO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water. Poisonous!

Grades: Technical; reagent.

Uses: Medicine, reagent; as an insecticide for nonedible plants.

sodium selenite $\text{Na}_2\text{SeO}_3 \cdot 5\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water; insoluble in alcohol; poisonous!

Derivation: By neutralizing selenious acid with sodium carbonate and crystallizing.

Method of purification: Recrystallization.

Grades: Reagent; technical.

Containers: Glass bottles; wooden kegs.

Uses: Glass manufacture; reagent in bacteriology; testing germination of seeds; decorating porcelain.

Shipping regulations: None.*

sodium sesquicarbonate

$\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White needle-shaped crystals; sp.gr. 2.112; m.p., decomposes; composition Na_2CO_3 46.90%; NaHCO_3 37.17%; H_2O 15.93%; Na_2O 41.15%. Soluble in water. Less alkaline than sodium carbonate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Derivation: By crystallization of a solution containing equimolar quantities of sodium carbonate and sodium bicarbonate.

Grades: Technical.

Containers: Wooden barrels and kegs; paper or burlap bags; fiber drums.

Uses: Detergent and soap builder in laundries; mild alkaline agent for general cleaning and water softening; bath crystals; alkaline agent in leather tanning, cream neutralizer in butter making.

sodium sesquicarbonate, native. Soda occurring in nature as the sesquicarbonate.

Occurrence: Extensive deposits of this mineral, known as natrona, trona, or urao, are found in California; Wyoming, Hungary; Egypt; and the deserts of Africa, Asia, South America.

sodium sesquisilicate. Formula given variously as $\text{Na}_4\text{SiO}_4 \cdot \text{Na}_2\text{SiO}_3 \cdot \text{H}_2\text{O}$; $\text{Na}_3\text{HSiO}_4 \cdot 5\text{H}_2\text{O}$; $3\text{Na}_2\text{O} \cdot 2\text{SiO}_2 \cdot 11\text{H}_2\text{O}$, $\text{Na}_2\text{SiO}_3 \cdot \text{NaOH} \cdot 5\text{H}_2\text{O}$.

Properties: White, granular powder; soluble in water; pH of 1% solution 12.7.

Derivation: Obtained by crystallization from solutions obtained by heating silica or sodium metasilicate with sodium hydroxide. Intermediate in composition between ortho- and metasilicates; less alkaline than sodium orthosilicate.

Containers: Bags, barrels and fiber drums.

Uses: Heavy duty cleaning (metals, laundries), ingredient in cleaning compounds, textile processing.

Shipping regulations: None.*

sodium silicate (soluble glass; silicate of soda, liquid glass; water glass). See also the other soluble sodium silicates, sodium metasilicate anhydrous, sodium metasilicate pentahydrate, sodium sesquisilicate, sodium orthosilicate.

Formulas: Products varying in ratio from $\text{Na}_2\text{O} \cdot 3.75 \text{SiO}_2$ to $2\text{Na}_2\text{O} \cdot \text{SiO}_2$ and with various proportions of water.

Properties: Lumps of greenish glass soluble in steam under pressure, white powders of varying degrees of solubility, or liquids cloudy or clear and varying from highly fluid to extreme viscosity; viscosity range from 0.4 to 600,000 poises, f.p. slightly lower than water; miscible with some polyhydric alcohols, partially miscible with primary alcohols and ketones. Gels form with acids between pH 3 and 9, coagulated by brine, precipitated by alkaline earth and heavy metal ions.

Containers: Paper bags; barrels, drums, tank trucks.

Uses: Textiles (fire-proofing; weighting silk, resist in dyeing and printing; boiling of cotton); manufacture of corrugated paper-board, mailing tubes, veneer products, etc.; greaseproofing paper containers, etc.; manufacture of cements; concrete hardeners, etc.; manufacture of cold water paints; filling for soap; cementing stones, waterproofing in hydraulic and acidproof mortars; dyeing and bleaching; cottonseed-oil refining; cementing-pipe insulations; preservative for eggs; in medicine for

fastening splints; manufacture of abrasive wheels, stones, etc; adhesive preparations; refining petroleum; ore flotation; lining Bessemer converters; stainproofing wood; sizing paper; boiler compounds; binder; digester linings; acid concentrator linings; ceramic cements; artificial stones; purification of fats and oils; sizing fertilizer bags; inks; paint removers; tanning; drilling mud; manufacture of silica gel.

Shipping regulations: None.*

Sodium Silicate "B-W." ²⁰¹ Trade name for a specific grade of sodium silicate, 58.5° Bé liquid, $\text{SiO}_2 : \text{Na}_2\text{O} = 1.60$. Other grades in the series are:

"C." 59.3° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 2.00.

"D." 50.5° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 2.00.

"E." 40.0° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 3.22.

"G." Hydrated powder, 18.5% H_2O ;

$\text{SiO}_2 : \text{Na}_2\text{O}$, 3.22.

"GD." Hydrated powder, 18.5% H_2O ;

$\text{SiO}_2 : \text{Na}_2\text{O}$, 2.00.

"K." 47.0° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 2.90.

"N." 41° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 3.22.

"O." 42.2° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 3.22.

"RU." 52° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 2.40.

"S 35." 35.0° Bé liquid; $\text{SiO}_2 : \text{Na}_2\text{O}$, 3.75.

"SS." Anhydrous glass and powders;

$\text{SiO}_2 : \text{Na}_2\text{O}$, 3.22.

sodium silicofluoride. See sodium fluosilicate.

sodium-silver chloride. See silver-sodium chloride.

sodium-silver thiosulfate. See silver-sodium thiosulfate.

sodium alpha-sodioacetate. See alpha-sodio-sodium acetate.

sodium sorbate $\text{CH}_3\text{CH}:\text{CHCH}:\text{CHCOONa}$. Used as a food preservative. See sorbic acid.

sodium stannate (preparing salt) $\text{Na}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White to light tan crystals; soluble in water; insoluble in alcohol; decomposes in air. Aqueous solution slightly alkaline.

Derivation. (a) By fusion of metastannic acid and sodium hydroxide. (b) By boiling tin scrap and sodium plumbate solution.

Grades: Technical, C.P.

Containers: 1-lb bottles; 100-, and 350-lb drums.

Uses: Mordant in dyeing; ceramics, glass, source of tin for electroplating and immersion plating, textile fireproofing.

Shipping regulations: None.*

sodium stearate $\text{NaOCC}_{17}\text{H}_{35}$.

Properties: White powder with fatty odor.

Soluble in hot water and hot alcohol; slowly soluble in cold water and cold alcohol; insoluble in many organic solvents.

Impurities: The commercial article contains varying quantities of sodium palmitate.

Grades: U.S.P. XVI; technical.

Containers: 150-lb drums; 200-lb barrels.

Uses: Medicine; waterproofing and gelling agent, in toothpaste and cosmetics; as stabilizer in plastics.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sodium subsulfite. See sodium thiosulfate.

Sodium "Sucaryl." ³ Trademark for sodium cyclamate (q. v.).

sodium succinate $\text{Na}_2\text{C}_4\text{H}_4\text{O}_4 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals or odorless granules; soluble in water.

Use: Medicine.

Shipping regulations: None.*

"Sodium Sulamyd." ³²¹ Brand name for sulfacetamide sodium.

sodium 2-sulfanilamidothiazole. See sulfathiazole sodium.

sodium sulfanilate (sodium anilinesulfonate; sodium para-aminobenzenesulfonate)
 $\text{NaC}_6\text{H}_4(\text{NH}_2)\text{SO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White, lustrous, crystalline leaflets. Soluble in water.

Derivation: Sulfanilic acid is dissolved in a solution of sodium hydroxide, or carbonate, concentrated and crystallized.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles; barrels.

Uses: Medicine; organic synthesis.

Shipping regulation: None.*

sodium sulfantimonate. See livers of antimony.

sodium sulfate. See sodium sulfate, anhydrous, sodium sulfate, decahydrate; thenardite, mirabilite; salt cake.

sodium sulfate, anhydrous (sodium sulfate, exsiccated) Na_2SO_4 . See also salt cake.

Properties: White crystals or powder; odorless; bitter saline taste; sp. gr. 2.671; m. p. 888°C; soluble in water and glycerol; insoluble in alcohol.

Derivation: (a) As a byproduct of hydrochloric acid production from salt and sulfuric acid. (b) By sintering a mixture of soda ash and sulfur (product used for kraft paper process only). (c) By passing hot sulfur dioxide and air over salt (Hargreaves process), and (d) By purification of natural sodium sulfate from deposits or brines.

Grades: Technical; C. P., detergent, rayon, glass makers.

Containers: 100-, 200-lb bags; 100-, 350-lb drums.

Uses: In manufacturing of kraft paper, paperboard, and glass; detergents; sodium salts, ceramic glazes; processing textile fibers, dyes, tanning; stock tonic, pharmaceuticals; freezing mixtures; miscellaneous.

Shipping regulations: None.*

sodium sulfate, crystals. See sodium sulfate decahydrate.

sodium sulfate decahydrate (sodium sulfate, crystals, Glauber's salt) $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$.

Properties: Large transparent crystals, small needles, or granular powder, sp. gr. 1.464 (crystals); m. p. 33°C (liquefies); loses water of hydration at 100°C. Soluble in water and glycerin; insoluble in alcohol.

Derivation: Crystallization of sodium sulfate from water solutions. The name Glauber's salt carries the connotation of the

manufactured salt; the natural variety is mirabilite.

Grades: Technical; N. F. XI.

Uses: Textile dyeing; many uses same as for anhydrous variety.

sodium sulfate, exsiccated. See sodium sulfate, anhydrous.

sodium sulfhydrate. See sodium hydrosulfide.

sodium sulfide (sodium sulfuret) Na_2S or $\text{Na}_2\text{S} \cdot 5\text{H}_2\text{O}$ or $9\text{H}_2\text{O}$.

Properties: Yellow or brick-red lumps or flakes or deliquescent crystals; sp. gr. 1.856; m. p. 920°C; soluble in water; slightly soluble in alcohol; insoluble in ether; largely hydrolyzed to sodium acid sulfide and sodium hydroxide.

Derivation: By heating sodium acid sulfate with salt and coal to above 950°C, extraction with water and crystallization.

Method of purification: Recrystallization.

Impurities: Ammonium salts; sodium sulfite, ferrous sulfide.

Grades: Flake; fused; chip sulfide (60% Na_2S), 60% fused and broken; 30% crystals; liquid.

Containers: Barrels; drums.

Uses: Organic chemicals; dyes (sulfur); intermediates, rayon (denitrating); leather (depilatory); dyeing; paper pulp; solvent for gold in hydrometallurgy of gold ores; sulfiding oxidized lead and copper ores preparatory to flotation; flotation processes for lead and copper ores, calico printing; sheep dips; photographic reagent; engraving and lithography; analytical reagent, soap; rubber. Danger: Contact with acid liberates poisonous gas. Burns skin and eyes. MCA warning label.

Shipping regulations: Flammable solid. Yellow label, except when crystallized or fused solid in metal container.*

sodium sulfite (a) Na_2SO_3 (b) $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$.

Properties: White crystals or powder; saline, sulfurous taste. Soluble in water; sparingly soluble in alcohol.

Constants: Sp. gr.: (a) 2.6334; (b) 1.5939. M. p.: (a) decomposes; (b) loses $7\text{H}_2\text{O}$ at 150°C.

Derivation: Large sodium carbonate crystals are placed in a lead-lined vat on a perforated false bottom, a current of sulfur dioxide is passed up through the crystals, a solution of sodium bisulfite collecting at the bottom of the vat. This is saturated with sodium carbonate, concentrated and allowed to crystallize.

Method of purification: Recrystallization.

Impurities: Heavy metals; arsenic.

Grades: Reagent; technical.

Containers: 100-, 200-lb bags; 234-, 450-lb barrels; 100-, 375-, 400-lb drums.

Uses: Dyes; intermediates; organic chemicals; sodium thiosulfate; textiles (bleaching delicate fabrics, antichlor); chemical reducing agent; preservative, especially in foods; photography (developer); engraving and lithography; medicine; silvering mirrors; treating rubber latex; sterilizing beer kegs;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

permanent wave solutions.
Shipping regulations: None.*

sodium sulfofocarbolate. See sodium phenolsulfonate.

sodium sulfocyanate. See sodium thiocyanate.

sodium sulfocyanide. See sodium thiocyanate.

sodium sulfonates. Class name for various sulfonates derived from petroleum. Some specific sulfonates are sodium tert-butylbenzenesulfonate; sodium hexylbenzenesulfonate; sodium toluenesulfonate.
Typical specifications: Equivalent weight, min. 450; inorganic salts (as Na_2SO_4) max 0.8% by weight; sulfonate content (water-free basis) min. 62% by weight; water content 3.0-5.0% by weight.
Uses: In textile processing oils; oils for metal-working (emulsifying and antirust agents); lubricating oils; as emulsifiers for insecticides, herbicides, fungicides; as a preparation of dyes and intermediates; a hydrotropic solvent; in some cases for coatings in food packaging.

sodium sulforicinoleate.
Derivation: Product of successive sulfonation (partial) and saponification of castor oil. Composition indefinite.
Use: As emulsifying and wetting agent.

sodium sulfoxone ($\text{NaO}_2\text{SCH}_2\text{NHC}_6\text{H}_4\text{SO}_2$. Di-sodium sulfonylbis(para-phenyleneimino) di(methanesulfinate).
Properties (of U.S.P. XVI mixture containing buffers, inert ingredients, and 73-81% sodium sulfoxone): White to pale yellow powder, with characteristic odor. Very soluble in water, yielding a clear, pale yellow solution; slightly soluble in alcohol.
Grade: U.S.P. XVI.
Use: Medicine.

sodium sulfoxylate. See sodium formaldehyde sulfoxylate.

sodium sulfoxylate formaldehyde. See sodium formaldehyde sulfoxylate.

sodium sulfuret. See sodium sulfide.

sodium superoxide NaO_2 . Contains O_2 group.

sodium suramin (suramin) $\text{C}_{51}\text{H}_{34}\text{N}_6\text{O}_{23}\text{S}_6\text{Na}_6$.
Properties: White or slightly pink powder; odorless; slightly bitter taste, very hygroscopic and affected by light. Soluble in water; slightly soluble in alcohol; insoluble in ether, chloroform, and benzene.
Grade: U.S.P. XVI.
Use: Medicine.

sodium tartrate (sal tartar) $\text{Na}_2\text{C}_4\text{H}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$.
Properties: White crystals or granules. Soluble in water; insoluble in alcohol. Sp. gr. 1.794.
Derivation: Neutralization of tartaric acid with sodium carbonate, concentration and crystallization.
Method of purification: Recrystallization.
Grades: Technical; C.P.; reagent.
Containers: 1-lb bottles; wooden kegs.
Use: Medicine; chemical reagent.

Shipping regulations: None.*

sodium tartrate, acid. See sodium bitartrate.

sodium TCA. See sodium trichloroacetate.

sodium tellurate Na_2TeO_4 .
Properties: White powder; soluble in water.
Use: Medicine.

sodium tellurite (sodium tellurite, normal) Na_2TeO_3 .
Properties: White powder; soluble in water.
Grade: Technical.
Use: Bacteriology.

sodium tellurite, normal. See sodium tellurite.

sodium tetraborate. See sodium borate.

sodium 2, 3, 4, 6-tetrachlorophenate $\text{C}_6\text{HCl}_4\text{ONa} \cdot \text{H}_2\text{O}$.
Properties: Buff to light brown flakes; bulk density 26-29 lb/cu ft; pH of water-saturated solution 9.0-13.0. Soluble in water, methanol, acetone.
Use: Industrial preservative (as a bactericide and fungicide).

sodium tetradecyl sulfate $(\text{CH}_3)_{13}\text{CH}_2\text{CH}_2\text{CH}(\text{OSO}_3\text{Na})\text{CH}_2\text{CH}_2\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2(\text{CH}_2)_2\text{CH}_3$. Sodium 7-ethyl-2-methyl-4-hendecanol sulfate.
Properties: White, waxy, odorless solid. Soluble in alcohol, ether, and water. 5% solution is clear and colorless. pH (5% solution) 6.5-9.0.
Grade: N.N.D.
Use: Medicine; wetting agent.

sodium tetraiodophenolphthalein. See iodophthalein sodium.

sodium tetraphosphate (sodium polyphosphate; glassy sodium phosphate). A sodium phosphate glass similar in a general way to sodium hexametaphosphate, but having a higher ratio of sodium oxide (Na_2O) to phosphorus pentoxide (P_2O_5). There is a considerable confusion and uncertainty as to the precise meaning of this term. For more about structure, see sodium metaphosphate.
Forms and uses: See "Quadrafos."

sodium tetrasulfide Na_2S_4 .
Properties: Yellow, hygroscopic crystals or clear dark red liquid, m.p. of crystals 275°C .
Grade: Aqueous solution containing 40% by weight of compound.
Containers: Glass bottles; carboys; 700-lb drums.
Uses: Reducing organic nitro bodies; manufacture of sulfur dyes, insecticides and fungicides; ore flotation agent; soaking hides and skins; preparation of metal sulfide finishes.
Shipping regulations: None.*

sodium theophylline glycinate. See theophylline sodium glycinate.

sodium thiocyanate (sodium sulfocyanate; sodium sulfocyanide; sodium rhodanate; sodium rhodanide) NaSCN .
Properties: Colorless, deliquescent crystals

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or white powder; m.p. 287°C, poisonous! Soluble in water and alcohol. Hygroscopic and affected by light.

Derivation: By boiling sodium cyanide with sulfur.

Method of purification: Crystallization.

Grades: Technical; pure, crystal or dried; C.P.

Containers: 1-, 5-lb bottles; tins; drums.

Uses: Analytical reagent; dyeing and printing textiles; medicine; black nickel plating; in manufacturing other thiocyanate salts; in manufacturing of artificial mustard oil, in treatment of rubber; solvent for polyacrylates.

sodium thioglycolate (sodium mercaptoacetate) $\text{HSCH}_2\text{COONa}$. The sodium salt of thioglycolic acid.

Properties: Crystals; characteristic odor; hygroscopic; discolors on exposure to air or iron; soluble in water; slightly soluble in alcohol.

Containers: Bottles; 6-, 13-gal carboys.

Uses: Bacteriology; cold waving of hair, depilatory; analytical reagent.

sodium thiosulfate (sodium hyposulfite; antichlor; sodium subsulfite; hypo) $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$. The anhydrous salt is also commercially available.

Properties: White, translucent crystals or coarse, crystalline powder; cooling taste and bitter after-taste. Soluble in water and oil of turpentine; insoluble in alcohol; deliquescent in moist air; efflorescent above 33°C in dry air. Sp.gr. 1.69; m.p. 48°C; b.p., decomposes.

Derivation: (a) Combination of sulfur and sodium sulfite in aqueous solution; (b) as a by-product in the manufacture of sodium sulfide; a sulfide-carbonate liquor is converted to sodium thiosulfate by reaction with sulfur dioxide; (c) as a by-product in sulfur dye manufacture; (d) from the reaction of sulfur and sodium bisulfite, which is obtained from reaction of soda ash and sulfur dioxide.

Method of purification: Recrystallization.

Impurities: Sulfates; sulfites; free alkali, calcium sulfides.

Grades: Technical; crystals; granulated, photographic; C.P.; pure; U.S.P. XVI.

Containers: 1-, 5-lb bottles; 100-lb bags; 175-lb drums; 375-lb barrels.

Uses: Photography (fixing agent to dissolve unchanged silver salts from exposed negatives), chrome tanning; removing chlorine in bleaching and papermaking; extraction of silver from its ores; dechlorination of water; mordant in dyeing; reagent in analytical chemistry; medicine; bleaching bone, straw, ivory, reducing agent in chrome dyeing.

Shipping regulations: None.*

sodium thyroxine. See sodium levothyroxine.

sodium titanate (sodium trititanate) $\text{Na}_2\text{Ti}_2\text{O}_7$.

Properties: White crystals. Insoluble in water.

Containers: Cartons, drums.

Use: Welding.

sodium toluenesulfonate (para-toluenesulfonic acid, sodium salt) $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{Na}$.

Properties: Crystals; very soluble in water.

Use: Dye chemistry; hydrotropic solvent.

sodium para-toluenesulfonchloramine. See chloramine T.

sodium trichloroacetate (sodium TCA)

CCl_3COONa .

Containers: 10-lb cans; 50- and 100-lb drums.

Uses: Grass killer, pesticide.

Warning: Irritating to skin and eyes. May cause burns. MCA warning label.

sodium 2,4,5-trichlorophenate

$\text{C}_6\text{H}_2\text{Cl}_3\text{ONa} \cdot 1\frac{1}{2}\text{H}_2\text{O}$.

Properties: Buff to light brown flakes; bulk density 28-33 lb/cu ft; pH of water-saturated solution 11.0-13.0. Soluble in water, methanol, acetone.

Use: Industrial preservative (as a bactericide and fungicide).

sodium tridecylbenzenesulfonate. A synthetic detergent. See sodium dodecylbenzenesulfonate.

sodium trimetaphosphate (NaPO_3)₃, or better NaPO_3 I, I' or I'' according to the particular form involved. There is some evidence to justify the subscript 3 for the molecular formula, but the names sodium metaphosphate I, I', and I'' are preferable. NaPO_3 I is the crystalline form resulting from experiments in which the preparation is heated to temperatures just below the melting point (627.6°C), while NaPO_3 I' and I'' result from carefully controlled cooling of molten sodium metaphosphate. All three forms are crystalline, soluble in water, and yield $\text{NaPO}_3 \cdot 2\text{H}_2\text{O}$ when the solution crystallizes at room temperature.

See sodium metaphosphate.

sodium triphosphate. See sodium tripolyphosphate.

sodium tripolyphosphate (STPP; sodium triphosphate, pentasodium triphosphate)

$\text{Na}_5\text{P}_3\text{O}_{10}$.

Properties: Powdered or granular form; soluble in water; pH (1% solution) 9.75; is chelating agent for certain metals in solution.

Derivation: Slow crystallization from a heated mixture of mono- and disodium phosphates, made from proper amounts and concentrations of phosphoric acid and soda ash.

Containers: Bulk cars; 100-lb paper bags.

Uses: Soap builder; manufacture of detergents, water softeners; purification of china clay, conditioning oil drilling muds; particularly effective in bar soaps-will not crystallize or bloom; disperses soap curds in hard water and eliminates scum; clay dispersant; antipitch agent in paper making; textile processing; dispersant in cements.

sodium trititanate. See sodium titanate.

sodium tungstate (sodium wolframate)

$\text{Na}_2\text{WO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; soluble in

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water; insoluble in alcohol and acids. Sp. gr. 3.245; m.p., loses $2\text{H}_2\text{O}$ at 100°C and then melts at 692°C .

Derivation: By dissolving tungsten trioxide in caustic soda solution, concentration and crystallization.

Method of purification: Recrystallization.

Impurities: Chlorine; sulfates.

Grades: Technical; C.P.; crystalline.

Containers: 1-, 5-lb bottles; 25-, 50-lb cans; 100-lb kegs.

Uses: Intermediate in manufacture of tungsten, tungstic acid and oxides; reagent in analytical chemistry; production of phosphotungstates and borotungstates; fireproofing fabrics and cellulose.

Shipping regulations: None.*

sodium undecylenate $\text{CH}_2\text{CH}(\text{CH}_2)_9\text{COONa}$.

Properties: A fine, white powder; decomposes above 200°C ; limited solubility in most organic solvents; soluble in water.

Uses: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

sodium uranate. See sodium diuranate, the compound which is considered better to represent the pigment, uranium yellow.

sodium uranium acetate. See uranyl sodium acetate.

sodium valerate (sodium isovalerate)

$\text{C}_4\text{H}_9\text{COONa}$.

Properties: White deliquescent mass. Soluble in water or alcohol; m.p. 140°C .

Use: Medicine.

Shipping regulations: None.*

sodium vanadate. See sodium orthovanadate; sodium metavanadate.

sodium wolframate. See sodium tungstate.

sodium xylene sulfonate (dimethylbenzenesulfonic acid, sodium salt)
 $(\text{CH}_3)_2\text{C}_6\text{H}_4\text{SO}_3\text{Na} \cdot \text{H}_2\text{O}$.

Use: Hydrotropic solvent, used in detergents, etc.

sodium zirconium glycolate

$\text{NaH}_3\text{ZrO}(\text{H}_2\text{COCO})_3$. Available as a clear, light straw-colored solution, sp.gr. 1.28-1.30, containing 35.7-38.6% solids; 12.5-13.5% ZrO_2 .

Containers: 5-gal pails, 50-gal drums.

Uses: Personal deodorant; astringent; germicide; sequestrant; fire retardant.

sodium zirconium lactate

$\text{NaH}_3\text{ZrO}(\text{CH}_3\text{CHOCO})_3$. Available as a clear, straw colored solution, sp.gr. 1.28-1.30, containing 12.5-13.5% ZrO_2 , equivalent to 42.5-45.9% sodium zirconium lactate, pH 7.5-8.0.

Containers: 5-gal pails, 50-gal drums.

Uses: Personal deodorant and antiperspirant.

sod oil. See degrass.

soft coal. See bituminous coal.

"Soft-Cote." ¹⁷³ Trademark for a soft finish water repellent. A clear light amber liquid, may be used with either petroleum or synthetic solvent to convey soft flexible

water repellent finish to any garment or textile.

softening agents. Substances used (in many industries) for the purposes of promoting and increasing softness of products such as textiles, leather, paper and rubber. They may be added during the processing for facilitating operations or they may be present in the finished product.

Rubber softeners are usually added to lubricate the rubber mass on the compounding mills, thus effecting reduction in power consumption in the milling operation; to increase the dispersion of pigments; or to prevent premature vulcanization during processing. Greater smoothness of finish may also result from their use. Rubber softeners are composed chiefly of the following single materials or their mixtures: coal-tar resins (indene-coumarone types); mixtures of mineral and vegetable oils, asphalts and pitches, petroleum, derivatives, etc.

Textile softeners are used primarily to counteract the stiffness and harshness which may be imparted to yarns and fabrics by other finishing materials or operations. Such softeners are based on solubilized castor oil (ricinoleates) or on emulsions or dispersions of synthetic fatty bodies, or stearic acid; on sulfonated oils, sulfated fatty alcohols or quaternary ammonium salts, usually referred to as cationic agents. Silicenes and polyoxyethylenes are also used.

"Solifume." ⁵⁵ Brand name for highly effective soil fumigant against root-knot nematodes, wireworms and seed-corn maggots. Active ingredient is ethylene dibromide.

Caution: Vapor harmful; avoid breathing vapor.

soil stabilizers. Chemicals which can alter an engineering property of a natural soil to suit an intended use of the soil. Usually refers to chemicals which convert sandy soils to satisfactory traffic-bearing materials.

soja-bean oil. See soy-bean oil.

sol. A liquid colloidal suspension or solution; a colloidal dispersion that is a liquid.

"Solacet." ²⁰⁶ Brand name for a line of soluble dyestuffs for acetate materials.

"Solantine." ²⁴³ Trademark of fast to liquid direct dyes for cellulose.

"Solar." ¹⁵² Trade name for a series of surfactants and emulsifying agents that range from anionic to nonionic and are available in solid and liquid forms. Activity of these products ranges from 20% active to 100% active. Used as base materials in the manufacture of various types of detergents and cleaning compounds and in a large variety of industrial applications.

Containers: 25-lb packages; 50-lb bags; 100-, 200-lb drums; 30-, 55-gal drums for liquids.

"Solar." ³⁰⁷ Brand name of proprietary line of phosphotungstic and phosphomolybdic lakes

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in dispersed powder form.

Use: For the coloring of various grades of paper.

solar cell. A device which converts light energy directly into electrical energy by use of a p-type semiconductor. An example is a pure silicon crystal in the form of a thin wafer, which has been treated with small amounts of impurities which cause positive and negative charges to collect on opposite surfaces of the wafer. Radiant energy, such as sunlight, impinging on the positive surface disturbs the electrical balance causing a current flow through the wafer and then to any circuit desired.

"Solastral." ²⁴³ Trademark for phthalocyanine pigments.

solder. An alloy of relatively low melting point, used for joining other metals of higher melting point. The term applies particularly to lead tin alloys.

soldering acid. See hydrochloric acid.

"Soledon." ²⁰⁶ Brand name for solubilized vat dyestuffs and accessory materials.

"Solfast Blue." ¹⁴¹ Trade name for phthalocyanine blue pigments.

Properties: Excellent light resistance, excellent heat resistance; excellent resistance to acids, alkalis and organic solvents. Non-bleeding in water and organic solvents.

Grades: Red shade, medium shade and green shade blues; non-crystallizing and non-flocculating types.

Uses: Paints; enamels; lacquer; printing inks; rubber, plastic, wallpaper, textiles, floor covering and paper coatings.

"Solfast Green." ¹⁴¹ Trade name for chlorinated copper phthalocyanine pigments.

Properties: Bright green shades with excellent resistance to light, heat, acid and alkali. Non-bleeding in water, alcohol, lacquer or petroleum solvents. Good resistance to crystallization and flocculation.

Grades: Yellow shade green and blue shade green.

Uses: Paints, enamels, lacquer, printing inks, rubber, plastic, wallpaper, textiles, floor coverings and paper coatings.

"Solfast Methyl Violet." ¹⁴¹ Trade name for violet pigment produced by precipitation of the basic methyl violet dyestuff with phosphotungstic acid.

Properties: Brilliant shade; very high strength; good lightfastness. Produces very clean tints. Non-bleeding in oil, water, and paraffin.

Uses: Printing inks.

"Solfast Red." ¹⁴¹ Trade name for precipitated azo pigments derived from beta-hydroxynaphthoic acid.

Properties: Good resistance to light, good heat resistance, non-bleeding in water and organic solvents.

Grades: Medium shade red and dark shade red.

Uses: Printing inks, paints, enamels, lacquers, rubber, plastics, and floor coverings.

"Solfast Victoria Blue." ¹⁴¹ Trade name for blue pigment produced by precipitation of basic Victoria Blue dye with phosphotungstic acid.

Properties: Brilliant shade; very high strength; fairly good lightfastness; good bleed resistance.

Uses: Printing inks.

"Solganal." ³²¹ Brand name for aurothiogluconose.

"Solidogen." ³⁰⁷ Trademark for a group of dye fixing agents.

"Solidogen LT-13." Resinous type compound; 35% active; cationic.

Properties: Aqueous solution; sp. gr. 1.13-1.15.

"Solidogen WF." Resinous type compound; 100% active; cationic.

Properties: Fine, white powder; soluble in water; compatible with urea-formaldehyde resin finishes.

Uses: Fixing agent for direct dyestuffs; improves their water fastness on cotton, rayon and other cellulosic fibers; can be applied in long liquor ratios or by padding; can be used with copper salts to improve wash fastness of direct cellulosic fibers.

"Solid Phosphoric Acid Condensation Process."

⁴¹⁶ Patented process for polymerization or alkylation of hydrocarbons employing a solid phosphoric acid catalyst (specially treated mixtures of phosphoric acid and a diatomaceous earth such as kieselguhr). Mixtures of olefins may be polymerized to form so-called "polymer gasoline" or propylene may be polymerized to form propylene dimer, trimer, tetramer, etc., as examples of the polymerization application of the process. Under other process conditions and with additional equipment, benzene may be alkylated with propylene tetramer to form dodecylbenzene, or with ethylene to form ethylbenzene, or with propylene to form cumene.

solid propellants. See rocket propellants.

solid solution. A homogeneous crystalline material containing two or more substances in variable proportions.

solid state physics. The explanation and understanding of the physical properties of solids through knowledge of the arrangement and behavior of the atoms and molecules, of ions and electrons in the individual crystals composing the solid, and particularly the effect of imperfections in the arrangements of the atoms, etc., in these crystals. There are important applications in metallurgy, ceramics, glass technology, high polymer properties, semiconductors, magnetic materials, and corrosion. See crystal.

"Solinox." ⁶⁴ Trademark for a line of modified linseed and soybean oil plasticizers used in lacquers and coatings.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solions. Circuit control elements in which the charge carriers are ions in solution rather than electrons as in vacuum tubes, or electrons and "holes" as in transistors.

"Solithane 113." ²⁷ An extremely versatile liquid urethane prepolymer that can be cured to produce solid materials for many applications. Depending upon the selection of curing system, polymerized urethane adducts will range from very soft rubbery compounds to products of a rigid nature.

Properties: Abrasion and impact resistance; negligible shrinkage at room temperature; good dielectric properties; good adhesion; good resistance to most chemicals; complete compatibility with colorants.

Uses: Protective coatings for metallic and non-metallic surfaces; fabric coatings; encapsulating; potting; printing rolls; casting of components.

"Solivap." ²⁰⁶ Brand name for a proprietary green dye for use in solar evaporation of sea water.

"Solka." ²³¹ Trademark for a purified wood cellulose.

"Solka-Floc." ²³¹ Trademark for flock, alpha flock, or powdered cellulose products which are derived by mechanical comminution of purified wood pulp. Available in various fiber lengths including dense free-flowing powders.

Properties: White in color; brightness up to 92, particle size 40 to 165 microns; moisture 5-7%; sp. gr. 1.58; apparent density 9-34 lbs/cu ft; relatively inert to acids, alkalies and solvents; practically ashless; and when bone dry is 99.5+ % cellulose. Soft, adsorbent and non-abrasive.

Containers: Multiwall bags.

Uses: Filter aid; raw material for cellulose derivatives; processing aid in rubber; component in welding rod coatings; inert bulking agent in food products.

"Solochromate." ²⁰⁶ Brand name of proprietary line of mordant dyestuffs particularly suitable for application to wool, by the one bath method; yielding results of excellent fastness to light, washing, milling, etc.

"Solochrome." ²⁰⁶ Brand name for mordant dyestuffs for wool.

"Solox." ¹⁹² Proprietary product said to consist of 100 parts of specially denatured alcohol No. 1, to which is added 1 part of ethyl acetate, 1 part of aviation gasoline and 2 parts denaturing grade wood alcohol. Also available in anhydrous form, characterized by mild odor.

Regular, 190°.

Constants: Sp. gr. 0.8158 (60/60°F); acidity, free acid as acetic, not more than 0.02 g/100 cc; odor mild, non-residual; purity not less than 87.1% ethyl alcohol by volume; color water-white; non-volatile matter not more than 0.003 g/100 cc. Apparent proof at 60/60°F 190.0; flash point approx 71°F; water solubility at 25°C: 100 cc of "Solox"

yields a clear solution with 70 cc of water, above these limits turbidity develops. Wt/gal (60°F) 6.79 lbs.

Anhydrous 200°.

Constants: Sp. gr. 0.7962 (60°F); acidity, free acid as acetic not more than 0.015 g/100 cc; odor mild, non-residual; purity not less than 91.5% ethyl alcohol by volume; dryness miscible without turbidity with 20 vols. 60° B_e. gasoline at 20°C; non-volatile matter not more than 0.003 g/100 cc; color water-white. Apparent proof 199.0 (60/60°F); flash point approx. 71°F; water solubility: 100 cc (25°C) of anhydrous "Solox" yields a clear solution with 80 cc of water, above these limits turbidity develops; wt/gal (60°F) 6.63 lbs.

Containers: 1-gal cans; 5-, 55-gal steel drums; 30,000-lb drum cars; 6000- and 8000-gal tank cars.

Uses: Solvent (household and industrial); solvent mixtures with ethylene dichloride for cellulose acetobutyrate lacquers; solvent mixtures with toluene ("Solox" 20%, toluol 80%) for ethyl cellulose; resin solvent; lacquers, paints, varnishes, coating compositions; ethyl cellulose adhesives; solvent-cleaner for watches, jewelry, electrical equipment, delicate parts, etc.; dry-cleaning fluids; aviation ice-formation; aniline. Shipping regulations: Flammable liquid. Red label.*

"Solozone." ²⁸ Trademark for sodium peroxide. Pale yellow beadlike particles; stable when dry, readily dissolves in cold water to form alkaline hydrogen peroxide solution. Na₂O₂ content min 96%; active oxygen content approx 20% by weight. Dustless and free-flowing; bulk density approx. 95 lb/cu ft; melting point above 450°C.

Containers: 75-lb pails; 400-lb drums.

Uses: Bleaching textiles and wood pulp; de-inking waste papers; purification of metal salt solutions; manufacture of hydrogen peroxide and organic peroxides; general oxidizing agent.

Shipping regulations: Oxidizing material. Yellow label.*

"Solricin" 135. ²⁰² Trademark for an aqueous solution of potassium ricinoleate containing approximately 32% of the soap and 3% glycerine.

Derivation: From castor oil.

Containers: 5-gal cans; 55-gal drums.

Uses: Emulsifier and stabilizer in foamed rubber, cleaning compounds; germicides.

"Solricin" 285. ²⁰² Trademark for an 85% aqueous solution of ammonium ricinoleate; used as a rust proofing agent.

"Solros." ⁷⁹ Trademark for a special "FF" wood rosin, containing no lime or other inorganic chemicals, which is distinguished by its excellent solubility in a wide range of solvents.

Constants: M.p. (capillary tube) 53°C; m.p. (ball and ring) 72°C; acid number 125; unsaponifiable matter 22.0%; color "FF."

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Adhesive tape; artificial Burgundy pitch; belt dressings; branding paint; core oil; electric insulating compounds; pitch; printing ink; rock wool; roofing cement; rubber cement; shellac diluent; smoking molds; spirit varnishes; sticky fly paper; synthetic rosin oil; tree banding; Venice turpentine; wire coating compounds.

"Soltrols." ³⁰³ Trademark for complex mixtures of saturated branch-chain hydrocarbons, having extremely low odors.

Properties: (Soltrol 130): Boiling range 168-210°C; sp. gr. (60/60°F) 0.7539; flash point 57°C; (Soltrol 170): Boiling range 215-246°C; sp. gr. (60/60°F) 0.7745; flash point 85°C.

Containers: Drums and tank cars.

Uses: Odorless solvents in paint and insecticide formulations.

soluble blue.

1. Soluble Prussian blue, made by precipitating a ferric salt with potassium or sodium ferrocyanide or by pressing Prussian blue to a firm pulp and working in oxalic acid or ammonium oxalate. The pulp becomes runny and is then dried on lead or lead-lined pans.
2. An organic dye, C.I. 707, based on triphenylmethane.

soluble glass. See sodium silicate.

soluble glucide. See saccharin sodium.

soluble indigo. See indigo carmine.

soluble guncotton. See pyroxylin.

soluble iodophthalein. See iodophthalein sodium.

soluble oils. These oils are known as emulsifying oils, since they are normally bright, clear oils which, when mixed with water, produce milky emulsions. In some soluble oils the emulsion is so fine that instead of milky solutions in water, amber colored transparent solutions are formed. Typical examples are sodium and potassium petroleum sulfonates. See detergents, synthetic (1).

Uses: The soluble oils, when mixed in appropriate proportions with water are used as metal cutting lubricants; textile lubricants, metal boring lubricants; emulsifying agents.

soluble saccharin. See saccharin, sodium.

soluble starch (thin boiling starch). Starch that has been modified by oxidizing agents, acids, glycerin, enzymes or other agents or treatments so that the product is soluble or dispersible in hot water. Such starches have relatively little adhesive character.

Uses: For sizing paper and textiles; chemical indicator.

"Solu-Rez." ¹⁷⁰ Trademark for a modified polyvinyl resin emulsion designed as a multi-purpose packaging adhesive.

Properties: White liquid, dries colorless, of varied viscosities with excellent mechanical stability. Will not build up or change viscosity on prolonged machining. Skin formulations will redissolve on agitation. Can

be pumped through circulating systems.

Uses: High speed carton sealing, carton forming, tube winding, bag seaming, sealing, and tight-wrapping machines.

"Solutax" Poster Paste. ¹⁷⁰ Trademark for a dehydrated vegetable cellulose compound designed as a cold water poster gum for outdoor advertising poster pasting. Material remains uniform even upon freezing and thawing, therefore affords adhesion through all types of weather.

solute. A dissolved substance, or a substance that is to be dissolved in another substance. Usually the solution components present in relatively small concentration are called solutes. See solvent, solution.

solution. A true solution is a homogeneous mixture of two or more substances that has the following characteristics: (1) spontaneous formation; (2) subdivision down to molecular magnitudes; (3) absence of settling; and (4) no fixed proportions of the component substances. The best known examples of solutions are cases in which solids are dissolved in liquids (salt or sugar in water) but solutions of liquids in liquids, gases in liquids, gases in solids and solids in solids are also known.

solutrope. Ternary mixtures having two liquid phases between which one component is distributed in an apparent ratio varying with concentration from less than one to more than one. In other words, the solute may be selectively dissolved in one or the other of the phases or solvents depending on the concentration. This phenomenon has been compared to azeotropic behavior.

"Solvat." ²⁴³ Trademark of leuco esters of vat dyes used for wool, cellulose and synthetic fibers.

"Solvay Nitrox." ²⁹² Trademark for a product designed to provide in a single operation the cleansing and neutralizing action of caustic soda and the corrosion protection properties of sodium nitrite. It is produced in a fused, flake form to insure a uniform, free-flowing, non-caking product. Used in cleaning, protection and neutralizing of iron and steel during processing and storage.

Solvay process (ammonia soda process). Manufacture of sodium carbonate (soda ash, Na_2CO_3) from salt, ammonia, carbon dioxide and limestone by an ingenious sequence of reactions involving recovery and reuse of practically all the ammonia and part of the carbon dioxide. Limestone is heated to produce lime and carbon dioxide. The latter is dissolved in water containing the ammonia and salt, with resultant precipitation of sodium bicarbonate. This is separated by filtration, dried and heated to form the normal sodium carbonate. The liquor from the bicarbonate filtration is heated and treated with lime to regenerate the ammonia. Calcium chloride is a major byproduct.

See also soda ash.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Solvay Snowflake Crystals." ²⁹²

($\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$). Trademark for small white sparkling needle-like crystals uniform in size which will not cake under ordinary conditions. Used in general cleaning where mild alkaline action is desired; as a laundry detergent and as a base for bath crystals, both foaming and nonfoaming types.

Also applied to cleansers containing the crystals.

"Solvenol No. 1." ²⁶⁶ Trademark for monocyclic terpene hydrocarbons with minor amounts of terpene alcohols and ketones; clear, colorless liquid; sp. gr. 0.8560 (15.6/15.6°C); ASTM distillation range, 5-95%, 174-184°C.

"Solvenol No. 2." ²⁶⁶ Trademark for monocyclic terpene hydrocarbons with minor amounts of terpene alcohols and ketones; clear colorless liquid.

solvent. That component, usually liquid, that is present in excess in a solution. The term may however be also applied to a substance frequently used as a solvent, such as water or alcohol, even though the proportion is less than indicated above. When no one substance is present in excess, the choice of solvent is arbitrary and unnecessary. In principle, one of the gases in a gaseous mixture, or one of the solids comprising a solid solution may be designated as the solvent.

solvent extraction. See extraction, liquid-liquid.

solvent naphtha. See naphtha, solvent.

"Solvesso." ⁵¹ Trademark for aromatic solvents prepared from petroleum. Grades available include "Solvesso" Toluol, "Solvesso" Xylol, "Solvesso" 100 and "Solvesso" 150.

"Solvotone." ²¹⁴ Trademark for mixture of low boiling alcohols and ketones, including isopropanol and acetone.

"Solway." ²⁰⁶ Brand name for anthraquinone acid dyestuffs for wool, and animal fibers.

Soman (methyl-1, 2, 2-trimethylpropoxy-fluorophosphine oxide) $(\text{CH}_3)(\text{C}_6\text{H}_{13}\text{O})\text{FPO}$. A German nerve gas.

somatotropic hormone (STH; somatotropin; growth hormone). One of the hormones secreted by the anterior lobe of the pituitary gland. It causes an increase in general body growth and also has an effect on carbohydrate and lipid metabolism. It is a protein which has been crystallized in pure form.

somatotropin. See somatotropic hormone.

"Sonaquol." ⁴⁵ Trademark for a water-miscible mineral oil which is emulsifiable in either cold or warm water, without the aid of alkali or sulfonated oils.

Uses: Cosmetics.

"Sono-Jell." ⁴⁵ Trademark for a balanced blend of white mineral oils and waxes of U.S.P. purity.

Properties: Smooth, white, non-sweating cream base.

Uses: Waterless type cleaning creams; pharmaceutical ointments.

soot. A finely divided powder produced during the combustion of coal or wood, consisting essentially of carbon but containing some tar, ash, ammonium salts, etc.

Uses: Used in agriculture as a fertilizer, and as a slug and snail repellent.

Shipping regulations: None.*

"Sopanax." ⁵⁸ Trademark for ortho-tolyl biguanide (q.v.).

"Sorapon" SF-78. ³⁰⁷ Trademark for an anionic surfactant, sodium alkyl aryl sulfonate; 85% active.

Properties: Flaky, off-white powder; density 0.43; soluble in water; stable to acid, alkali and hard water.

Uses: Wetting, emulsifying and dispersing agent used in textile processing as a detergent, dyeing and bleaching assistant, and lime soap dispersant; detergent base for industrial cleaning compounds.

sorbic acid (2,4-hexadienoic acid)

$\text{CH}_3\text{CH}=\text{CHCH}=\text{CHCOOH}$.

Properties: White, crystalline solid. M.p. 134.5°C; b.p. 228°C (dec), 153°C (50 mm); flash point (open cup) 260°F. Slightly soluble in water; soluble in many organic solvents.

Derivation: Trimerization of acetaldehyde and catalytic air oxidation of the resulting hexadienal. Found in berries of mountain ash, *Sorbus aucuparia* L.

Containers: Glass bottles; fiber cans.

Uses: Fungicide and food preservative; copolymerization; upgrading of drying oils; cold rubber additive; intermediate for plasticizers and lubricants.

Shipping regulations: None.*

sorbide (dianhydrosorbitol) $\text{C}_6\text{H}_8\text{O}_2(\text{OH})_2$.

Generic name for anhydrides (dicyclic ether dihydric alcohols) derivable from sorbitol by the removal of two molecules of water.

The name is also applied to specific commercial varieties. One of these is crystalline, m.p. 62°C. Soluble in water, the lower alcohols, and in ethylene glycol; insoluble in most other solvents. Used as conditioning agent and in medicine.

"Sorbistat." ²⁹⁹ Trademark for sorbic acid.

"Sorbistat-K." ²⁹⁹ Trademark for potassium sorbate.

"Sorbit" AC. ²¹⁹ Trademark for sodium dibutyl naphthalene sulfonate

$(\text{C}_4\text{H}_9)_2\text{C}_{10}\text{H}_7\text{SO}_3\text{Na}$, 65% active light tan paste. Highly soluble in water, polar organic solvents, strong electrolytes. Stable to acid and alkali. Wetting agent and penetrant; hydrotrope; dispersant and thinning agent. Used in detergents.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sorbitan (monoanhydrosorbitol) $C_6H_8O(OH)_4$.

Generic name for anhydrides (cyclic ether tetrahydric alcohols) derivable from sorbitol by the removal of one molecule of water. (Some derivatives are marketed as "Spans" and "Tweens.")

The name is also applied to specific commercial varieties. One of these is crystalline, m.p. 110°C; b.p. 225-250°C; soluble in water and acetic acid.

sorbitan mono-oleate polyoxyethylene. See polysorbate 80.

sorbitan monostearate. Sold in large amounts, as is the tristearate, as an emulsifying agent. Can be used in foods.

Containers: Drums.

sorbitan polyoxyethylene fatty acid esters.

See polyoxyethylene sorbitan fatty acid esters.

d-sorbitol. See sorbitol.

sorbitol (d-sorbitol; d-sorbitol; sorbol; hexahydric alcohol) $C_6H_8(OH)_6$.

Properties: White, odorless, crystalline powder of faint, sweet, cooling taste. Soluble in water; slightly soluble in methanol, ethanol, acetic acid, phenol and acetamide. Almost insoluble in most other organic solvents. M.p. 93-97.7°C (hydrate); 110°C (anhydrous). Sp.gr. 1.47 (-5°C).

Derivation: By pressure hydrogenation of dextrose with nickel catalyst. Occurs in small amounts in various fruits and berries.

Grades: Crystals; technical; 70% aqueous solution (U.S.P. XVI); resin; powder.

Containers: Powder, pellets, 150- to 325-lb drums; tank cars; tank trucks.

Uses: Explosive manufacture; ascorbic acid (vitamin C) fermentation. In solution form, for moisture-conditioning and otherwise improving quality of cosmetic creams and lotions, toothpaste, tobacco, gelatin, glue specialites; as bodying agent for paper, textiles, and liquid pharmaceuticals, such as elixirs, syrups, etc; softener for candy, shredded sweetened coconut and other confections; sugar crystallization inhibitor. Also used for synthesis of resins, surface active agents, varnishes.

"Sorbo." ⁸⁹ Trademark for 70% sorbitol solution. Meets the Toilet Goods Association and U.S.P. XVI standards.

"Sorbo-Cel." ²⁴⁷ Trademark for a special chemical coated diatomite filter aid used for selectively removing traces of oil from oil-in-water emulsions. Effective for removing other trace components from free or emulsified systems.

Use: In conditioning of boiler feed water.

sorbol. See sorbitol.

L(-)-sorbitol $HOCH_2CO(CHOH)_4CH_2OH$.

Properties: White crystalline powder; sweet taste; m.p. 159-161°C; soluble in water; slightly soluble in ethyl or isopropyl alcohol, insoluble in ether, acetone, benzene, chloroform.

Derivation: Made from sorbitol by submerged culture aerobic fermentation.

Grades: Technical; reagent.

Uses: In the manufacture of ascorbic acid (vitamin C) and for preparation of special diets and media for the study of metabolism in animals and microorganisms.

Sorel cement. See magnesium oxychloride cement.

sorghum syrup. Syrup produced from a cane-like grass (sorghum, kafir, Indian millet) resembling maize in appearance and cultivated in the United States. The grass yields a sugar-containing juice from which the syrup is made. It is used for food.

"Sorolene G Paste." ³²⁸ A dark amber paste with green fluorescence—the sodium salt of an alkyl-naphthalene sulfonic acid, of approximately 28% activity.

Uses: Agricultural dispersions; cleaning compounds; wall paper removers; pigment dispersions; flotation agent in refining operations; and foaming agent for rubber, insulation, and concrete.

"Soromine." ³⁰⁷ Trademark for a series of softening agents.

"Soromine AT." Complex fatty amido compound; 20% active; amphoteric.

Properties: White paste; density 0.91; readily dispersible in warm water; functions as a cationic softening agent in acid liquors and a nonionic and/or anionic softener in neutral or alkaline liquors.

Uses: Softener for animal, cellulosic and synthetic fibers; applied on quetch or pad, in package machines, jigs, overhead reel machines, etc.; does not discolor whites nor adversely affect dyed fabrics.

"Soromine BSA." Alkyl biguanidine; 73% active; cationic.

Properties: Brown paste; density 0.90; soluble in water, compatible with urea formaldehyde resins.

Uses: Highly substantive softening agent for cellulosic fibers which is applied in long liquors or by padding; improves water and perspiration fastness of direct dyeings; anti-static agent for polyester fibers and polyacrylonitrile fibers.

"Soromine FW." Sodium salt of a fatty amide complex; anionic.

Properties: Off-white, gritty paste; density 1.19; soluble in water; compatible with starch, gelatine, sulfonated oils.

Uses: A cellulosic fiber softening agent which causes no discoloration of bleached white or dyed yarns, stock or piece goods; does not yellow during high temperature drying; applied by padding, in package machines and in conventional long liquor dyeing equipment.

sorrel salt. See potassium binoxalate.

"Sotex." ⁸³ Trade name for a series of dispersing agents based on long chain fatty acid esters.

Soudan coffee. See cola.

sour. Any substance used in textile or laundry operations to neutralize residual alkali or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

decompose residual hypochlorite bleach. The commonly used sours are sodium bifluoride and sodium fluosilicate.

sour gas. Slang for either natural gas or a gasoline contaminated with odor-causing sulfur compounds. In natural gas the contaminant is usually hydrogen sulfide, which can be removed by passing the gas mixture through carbonate solutions containing special metal or organic activators. In gasolines, the sour contaminants are usually mercaptans, which are removed in the doctor treatment (q.v.) or by ethylene oxide with a phenolic catalyst. The improved gas or gasoline is known as sweet gas.

sour-spine. See barberry.

sowberry. See barberry.

"S.O. Wetting Agent S." ¹⁵¹ Trademark for paste type sulfonate derived from "Alkane" detergent intermediate and used for the preparation of commercial and industrial detergents.

soya bean oil. See soybean oil.

soybean cake. The press cake resulting from the extraction of soybeans for their oil. The crushed press cake is termed soybean oil meal (q.v.).

soybean oil (soja-bean oil; soya bean oil; Chinese bean oil; soy oil).

Properties: Pale, yellow, fixed oil. Soluble in alcohol, ether, chloroform and carbon disulfide.

Constants: Sp. gr. 0.924-0.929; m p. 22-31°C, refractive index 1.4760-1.4775; solidifying point -15 to -8°C; Hehner value 94-96; saponification value 190-193; iodine value 137-143.

Derivation: Soya-beans (*Soja hispida*, *S. japonica* or *Phaseolus hispida*) are crushed, packed into jute bags, heated over jets of steam and pressed. Solvent extraction is now extensively used both alone and after pressing.

Method of purification: Oil to be used for edible purposes is bleached with fuller's earth; oil for technical use is purified with chemicals.

Grades: Coast; refined (salad); crude; foots (for soapstock); clarified.

Containers: 75-lb cases; 375-, 400-lb barrels; 8000-gal tank cars.

Uses: Soap manufacture; foods (this oil has always been one of the chief articles of diet in China, Japan, etc.); inks; adulterant and substitute for linseed oil in paints and varnishes; cattle feeds; butter substitutes and salad dressings; resins; linoleum.

Shipping regulations: None.*

soybean oil meal (soybean cake). The crushed residue from the extraction of soybeans. Extraction by the hydraulic or expeller process produces normally a meal with approximately 6% residual oils while from the solvent process approximately 1% residual oil. Typical analyses show crude

protein 43%; crude fiber 5.5%; nitrogen-free extract 30%; ash 6% and oil content between 1 and 6%. The total digestible nutrients approximate 75%.

Containers: Bulk or bags.

Uses: Animal feeds; manufacture of plastics; meat substitutes; medium for bacitracin production.

Shipping regulations: None.*

soy oil. See soybean oil.

sozolidolic acid (2,6-diiodophenol-4-sulfonic acid) $C_6H_2I_2(OH)(SO_3H) \cdot 3H_2O$.

Properties: White odorless crystals; m.p. 120° (anhydrous). Soluble in water, alcohol and ether.

Use: Medicine (radiopaque medium).

space velocity. The volume of gas or liquid, measured at specified temperature and pressure, (usually standard conditions) passing through unit volume in unit time. Used in comparing flow processes involving different conditions, rates of flow, and sizes or shape of containers.

spalling. Chipping an ore for crushing; or the cracking, breaking or splintering of materials due to heat.

"Span." ⁸⁹ Trademark for each member of a series of general purpose emulsifiers and surface active agents. They are fatty acid partial esters of hexitol anhydrides (or sorbitan). Generally insoluble or dispersible in water and soluble in most organic solvents.

spandex. Generic name for a manufactured fiber in which the fiber-forming substance is a long chain synthetic polymer comprised of at least 85% of a segmented polyurethane (Federal Trade Commission). Adds elasticity to garments. See, for example, "Lycra."

Spanish blistering flies. See cantharides.

Spanish chamomile. See pyrethrum root.

Spanish flies. See cantharides.

Spanish grass. See esparto.

Spanish lavender oil. See lavender-spike oil.

Spanish oxide. See iron oxide reds.

Spanish pellitory. See pyrethrum root.

Spanish saffron. See crocus.

Spanish spike oil. See lavender-spike oil.

Spanish white. See bismuth subnitrate.

spar, adamantine. See corundum.

spar, dogtooth. See calcite.

spar, Greenland. See cryolite.

spar, heavy. See barite.

spar, ice. See feldspar.

spar, Iceland. See calcite.

"Sparine" Hydrochloride. ²⁴ Trademark for promazine hydrochloride (q.v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sparking metal. See pyrophoric alloy.

spar, nailhead. See calcite.

spar, satin. See calcite; also gypsum.

sparteine $C_{15}H_{26}N_2$ (lupinidine).

Properties: Colorless, thick, oily, liquid alkaloid; bitter taste; distinctive peculiar odor; usually used in the form of the sulfate, hydriodide, hydrochloride and triiodide; poisonous! Soluble in alcohol and ether; very slightly soluble in water.

Constants: B.p. 173°C ; sp.gr. 1.027.

Derivation: By extraction of the tops of *Spartium scoparium* (broom) with alcohol and evaporation of the latter.

Grades: Technical.

Containers: Glass bottles; cans (sparteine sulfate).

Use: Medicine.

Shipping regulations: None.*

spar varnish. A very durable, water resistant varnish for severe service on exterior exposure. It consists of one or more drying oils: for example, linseed, tung or dehydrated castor oil; one or more resins: rosin, ester gum, phenolic resin or modified phenolic resin; one or more volatile thinners: turpentine or petroleum spirits; and driers: linoleates, resinates or naphthenates of lead, manganese and cobalt. It is classed as a long-oil varnish and generally consists of 45-50 gallons of oil to each 100 lb of resin.

See also varnish.

spathic iron ore. See siderite.

"SPDX-GH." ⁹⁴ Trade name for a rubber accelerator, composed of the lead salt of dithiocarbamate mixed with a diphenyl ethylenediamine radical, blended with selected oils.

Properties: Light grey soft granules; sp.gr. 1.51; m.p., decomposes before melting; insoluble in water, acetone, benzol, and gasoline; odorless; non-toxic; disperses well; excellent storage stability.

Use: Mechanicals, heels and soles, hose, insulation, tires, tubes, and tire repair stock. Also available as "SPDX GL" for use in latex.

spearmint.

Derivation: Dried leaves and tops of the herb *Mentha spicata* or *cardiaca*.

Occurrence: Europe; Asia; eastern and central United States, and the Yakima valley, Washington.

Grade: N.F. XI.

Containers: Bales.

Uses: Flavoring material; source of spearmint oil.

spearmint oil.

Properties: Colorless to pale yellowish liquid; characteristic odor and taste: Soluble in alcohol, ether, and chloroform.

Chief known constituents: Carvone (40-60%); linalool; pinene.

Constants: Sp.gr. 0.930-0.940; optical rotation -48° to -59° ; refractive index about

1.4910.

Derivation: By distillation of spearmint leaves.

Method of purification: Rectification.

Grades: Technical; N.F. XI.

Containers: 5-, 10-lb bottles; 20-, 25-lb tins; drums.

Use: Flavoring.

Shipping regulations: None.*

"Special Dynamite." ⁴¹³ Brand name applies to a series of ammonia type dynamites. They are more economical, less flammable, and relatively safer than nitroglycerine dynamites. Made in strengths from 15 to 60%.

Containers: Packaged in cartridges $\frac{7}{8}$ " diameter and up, in 50-lb shipping cases.

Uses: Open pit mining; quarrying; construction projects and general blasting.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

"Special Gelatin." ⁸⁴ Brand name applied to a series of an ammonia gelatin type dynamites. Economical and relatively safe. Made in strengths from 30 to 90%.

Containers: Packaged in cartridges $\frac{7}{8}$ " in diameter and up, in 50-lb shipping cases.

Uses: Open pit mining; underground metal mining; quarrying; construction projects; primers for non-sensitive explosives compositions.

Fire hazards: Dangerous.

Shipping regulations: Explosives. Red label.*

specific activity. See radioactivity.

specific gravity. The weight of a particular volume of any substance, compared with the weight of an equal volume of water. Since these weights will vary differently with the temperature, it is necessary to specify both temperatures involved, except for rough or approximate values. Thus the specific gravity of alcohol should be given as 0.7893 at $20/4^{\circ}\text{C}$, the first temperature referring to the alcohol and the latter to the water.

specific heat. The ratio of the heat capacity of a substance to the heat capacity of water; or the quantity of heat required for a one degree temperature change in a unit weight of material. Commonly expressed in Btu/lb/ $^{\circ}\text{F}$ or in cal/g/ $^{\circ}\text{C}$. For a gas the specific heat at constant pressure is greater than that at constant volume by the amount of heat needed for expansion.

specific impulse. See rocket propellants.

specific volume. The volume of unit weight of a substance, as cubic feet per pound, or gallons per pound, but more frequently milliliters per gram. The reciprocal of density.

spectroscopy. Observation of the wave length and intensity of light, or other electromagnetic waves, absorbed or emitted by various materials. When excited by an arc or spark each element emits light of certain well defined wave lengths. Even in very

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

minute quantities, the presence of any element may often be determined spectroscopically. These spectra may be used to obtain information on the structure of the atom. In the visible and infra-red regions, absorption spectra and Raman spectra, while more complex, serve as analytical tools for substances not otherwise readily determined. Theoretical interpretation of spectra in these regions leads to a knowledge of molecular structure. X-ray spectroscopy first established the atomic numbers of the elements. A more recent technique is nuclear magnetic resonance spectroscopy (q.v.).

specular iron ore. A variety of hematite with brilliant black color and metallic luster.

"Speedenamel." ⁴⁴⁸ Trade name for alkyl gloss general purpose enamels for interior or exterior, brush, dip or spray.

spelfer. Term applied loosely to relatively pure zinc as encountered in industrial operations such as galvanizing. Lead and/or iron are common impurities.

spent acid. Mixed acid (q.v.) which has given up part of its nitric acid.
Fire hazard: Dangerous.
Shipping regulations: Corrosive liquid.
White label.*

spent oxide. The residue resulting from passage of impure coal gas over iron oxide, as one of the final steps in purification of the gas before storage or domestic and industrial use. Contains unchanged ferric oxide, ferrous sulfide, sulfur as well as nitrogen compounds and other impurities from the gas. The sulfur comes from hydrogen sulfide which must be removed from the gas. Sometimes referred to as gashouse tankage.

Use: As fertilizer for its nitrogen content.
Shipping regulations: Flammable solid.
Yellow label. Not accepted by express.*

"Spergon." ²⁴⁸ Trademark for a series of fungicides and seed protectants based on tetrachloro-para-benzoquinone. Seed protectants are in powder form, with or without DDT for dust or slurry treatment of various field, flower and vegetable seeds before planting or storage; fungicidal formulations are available for spray or dust applications on cabbage downy mildew, flowering bulbs, lawns, seed beds, and plant beds.

See chloranil.

"Sperm 42." ⁴⁰³ Trade name for a self-emulsifiable 45 NW sperm oil.

Properties: Amber liquid; 100% active. Contains no water, added emulsifiers, ethylene oxide, or added non-ionic compounds. It is made up largely of fatty alcohol esters of fatty acids in the C₁₄ to C₂₀ range, plus a small percentage of a chemically reacted nitrogen compound which acts as an emulsifier.

Typical specifications: Cloud point 55°F; pour point 49°F; saponification number

105-125; iodine no. 70-80; flash point 420-440°F; ; unsaponifiable matter 30-40%.

Soluble in mineral spirits, kerosene, petroleum oils and most organic solvents; insoluble in alcohol and water.

Containers: Steel drums or tank cars.

Uses: Cutting oils; wire drawing compounds, lubricants, wetting agents; corrosion inhibitor; gear oils; rubber processing aid; leather oils; metal working compounds; oil and grease additive.

spermaceti (cetaceum).

Properties: Pearly-white, unctuous, semi-transparent, concrete, fatty substance; almost odorless and tasteless; becomes rancid on exposure. Soluble in ether, chloroform, carbon disulfide and hot alcohol; insoluble in water and cold alcohol. Sp.gr. 0.945; m.p. 42-50°C; refractive index about 1.4330; saponification no. 120-136; iodine no. 3-4.4.

Chief constituents: Cetyl palmitate, cetyl alcohol, esters of lauric, myristic and stearic acids.

Derivation: Found in the head of the sperm-whale or floating in the ocean; is filtered under pressure to remove stearin, boiled with water and a small amount of caustic soda, followed by repeated washing with water.

Grades: Technical; U.S.P. XVI; as blocks or cakes.

Containers: 50-, 60-lb cases.

Uses: Base for ointments, cerates and emulsions; manufacture of candles, soaps, cosmetics, laundry wax; finishing and lustering linens.

Shipping regulations: None.*

"Spermafoll." ²²¹ Trademark for a hydrogenated sperm oil derivative with applications in cosmetics, hand soaps, wax compounds, leather and textile chemicals, lubricants, drawing compounds, water-proof packing, buffing and polishing compounds.

sperm oil (sperm whale oil).

Properties: Light yellow liquid; sp.gr. 0.8781-0.8835; saponification number 123-147; iodine number 79.5-84; acid number 13.2. Soluble in chloroform, ether, and benzene.

Grades: Bleached winter; natural winter.

Containers: Drums, tank cars.

Use: High-grade lubricating oil for light machinery such as watches, clocks and scientific instruments; heat treating; rust proofing.

sperm whale oil. See sperm oil.

sperryllite PtAs₂.

Properties: Tin-white mineral, black streak, metallic luster. Of very rare occurrence but of interest as the only native compound of platinum. Contains 52.57% Pt., 43.5% As, with some replacement of platinum by rhodium and palladium.

Constants: Sp.gr. 10.60; hardness 6-7.

Occurrence: United States (Wyoming, North Carolina, Nevada); Canada.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Sperry process. An electrolytic process for the manufacture of lead carbonate, basic (white lead) from desilverized lead containing some bismuth. The impure lead forms the anode. A diaphragm separates anode and cathode compartments, and carbon dioxide is passed into the solution. Impurities, including bismuth, remain on the anode as a slime blanket.

sp. gr. Abbreviation for specific gravity (q.v.).

sphagnum (peat moss; bog moss). The moss found in marshes and wet places, which when it decays and dies forms peat. It is a paler green in color than the true mosses and forms taller growths. Its stems and leaves possess colorless cells, which are connected by small perforations that have the property of sucking up, and the capacity to retain, large quantities of liquid. Shipping regulations: None.*

sphalerite (blende; zinc blende, black jack) ZnS . Natural zinc sulfide, usually containing some cadmium, iron, and manganese.

Properties: Color yellow, brown, black, or red; luster resinous; hardness 3.5-4; sp. gr. 3.9-4.1; good cleavage; soluble in hydrochloric acid.

Occurrence: Missouri, Kansas, Oklahoma, Colorado, Montana, Wisconsin, Idaho; Australia; Canada; Mexico.

Use: Most important ore of zinc; also a source of cadmium; phosphor; source of sulfur dioxide for production of sulfuric acid and other sulfur compounds.

sphene. See titanite.

"Spheron." ²⁷⁵ Trade name for a series of channel carbon blacks for rubber. *

Available as:

"Spheron 9." Easy processing channel black (EPC).

"Spheron 6." Medium processing channel black (MPC).

spherosiderite. See siderite.

sphingomyelin. Diaminophosphatides occurring primarily in nervous tissue and containing a fatty acid, phosphoric acid, choline, and sphingosine. They are soluble in hot absolute alcohol, and insoluble in ether, acetone, and water.

"Spiceal." ³⁴² Trademark for water-miscible flavor concentrates from essential oils and oleoresin bases.

spice berry. See aralia.

spiegel. See spiegeleisen.

spiegeleisen (spiegel; spiegel iron). An alloy of manganese (15% to 30%) and iron containing approximately 5% carbon and small amounts of silicon, sulfur and phosphorus. In Bessemer practice molten spiegel is added to steel after the blow and an after-blow applied. The manganese serves to reduce oxides of iron and to furnish manganese to the steel. At the same time the carbon content is adjusted.

spiegel iron. See spiegeleisen.

spigella (pinkroot; Indian pink; Maryland pink; wormgrass).

Derivation: Dried rhizome and roots of *Spigelia marilandica*.

Occurrence: North America.

Grades: Technical.

Containers: Bags; bales.

Use: Medicine.

Shipping regulations: None.*

spignet. See aralia.

spike lavender oil. See lavender-spike oil.

spikenard. See aralia.

spike oil. See lavender-spike oil.

spin. An important concept in nuclear physics, which includes both the total angular momentum of a system, which may be a nucleus or a nuclear reaction, and the intrinsic angular momentum of the nucleons which make up the nucleus. Since a single nucleon may spin in only one of two directions, the intrinsic angular momentum may have only one of two possible values, but it will be coupled to the orbital angular momentum, and the manner in which the spin and orbital angular momenta are coupled together to produce the net value is important in an understanding of nuclear processes.

spinacane. See squalane.

spinacene. See squalene.

spindle oil. Low viscosity lubricating oil for lubrication of relatively high speed machinery.

spindle tree. See euonymus.

spinel $MgAl_2O_4$. A natural oxide of magnesium and aluminum, with replacement of magnesium by iron, zinc and manganese, and of aluminum by iron and chromium. There are also synthetic spinels, as magnesia-alumina or magnesia-chromia.

Properties: Color, various shades of red, grading to green, brown, and black; luster vitreous; hardness 8. There are many varieties.

Occurrence: New York, New Jersey, Massachusetts, Virginia, North Carolina; Ceylon; Burma; Thailand; Madagascar.

Uses: Gem stone (for example, balas ruby); synthetic spinel is used as a refractory.

"Spinesso." ⁵¹ Trademark for lubricating oils for textile spindles and other high-speed shafts. Viscosity grades cover the entire range now in use, and all grades contain oxidation inhibitor, oiliness agent and a corrosion preventive.

Spinning Lubricant L. ²⁸

Properties: A pale yellow liquid.

Use: As a textile spinning lubricant, with antistatic properties for yarns and fibers.

"Spiralloy." ²⁶⁶ Trademark for continuous filament-wound, resin-bonded glass fiber structures. Used in rocket and missile

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cases and commercial applications. Possesses best strength-to-weight property of any yet-known structural material. Non-conductive to electricity and resistant to corrosion.

spirit, potato. See fusel oil.

spirits. In medicine, alcoholic solutions of volatile principles, procured either by distillation or by simple dilution. Spirits as a rule are prepared by solution of the active substance in alcohol, and are employed as therapeutic agents or merely as flavoring agents. See tincture.

spirits, cologne. See ethyl alcohol.

spirits of wine. See ethyl alcohol.

spirit soluble dyes. Those that are soluble in oils and organic solvents as contrasted with solubility in water. Azo and triaryl methane dyes are most frequently used for this purpose.

spirit varnish. See varnish.

spirocycpane. See spiropentane.

spiropentane (spirocycpane; cyclopropane-spirocyclopropane) $\text{H}_2\text{CH}_2\text{CCCH}_2\text{CH}_2$.

Properties: Colorless liquid, refractive index (n 20/D) 1.41220; density 0.7551 (20/4°C), freezing point -107.05°C; b.p. 39.03°C (760 mm).

Derivation: Heating pentaerythrityl tetrabromide in ethanol with zinc dust.

spiro system. A structural formula consisting of two rings having one atom in common. Most bicyclic compounds, such as naphthalene, have two atoms in common. See, for example, spiropentane.

"Spl-Ash." ²⁴⁴ Trade name for soda ash (Na_2CO_3).

Properties: Solid, pillow-shaped block; bulk density 60-65 lb/cu ft; specific gravity 2.4, dust free, slowly soluble in water. Minimum Na_2O content 58%.

Containers: 100-lb multiwall bags; bulk shipments.

Uses: Water treatment; alkalinity control in swimming pools.

"Splic-It." ⁶⁵ Trademark for a material comprising natural latex, stabilizers, antioxidants, for use by textile and carpet manufacturers.

splint coal. A variety of bituminous or sub-bituminous coal, commonly having a dull luster and grayish-black color, of compact structure, often containing a few thin irregular bands with vitreous luster. When struck, it is resonant. It is hard and tough and breaks with an irregular, rough, sometimes splintery fracture. It is free burning and does not swell on heating. (ASTM definition, ASTM D493-39).

Splint coal consists principally of the drain structure.

split nut. See physostigma.

spodumene $\text{LiAl}(\text{SiO}_3)_2$.

Properties: White, pale green, emerald green, pink or purple mineral; white streak; vitreous luster. Contains 8.4% lithium oxide with some replacement by sodium. Insoluble in acids. Hiddenite and kufzite are gem varieties.

Constants: Sp. gr. 3.13-3.20; hardness 6.5-7.

Occurrence: United States (North Carolina, California, Massachusetts, South Dakota); Brazil; Madagascar.

Uses: Source of lithium; gemstone; in ceramics and glass as a source of lithia and alumina.

sponge iron. See iron sponge.

sponge, platinum. See platinum black.

"Spotleak." ²⁰⁴ Trademark for mercaptan type, fuel gas odorants.

"Spotrete." ⁴⁹ Trade name for a 75% thiuram fungicide used as a seed disinfectant and turf fungicide.

spotted cowbane. See conium.

spotted hemlock. See conium.

"Spraycop" 340. ⁵⁰ Trademark for a neutral copper fungicide which contains 34% metallic copper and a built-in spreader adhesive.

"Spray Flo." ²⁰⁴ Trademark for a 100% active cleaner with high active alkali content. For in-place lines and spray cleaning of tanks. Effective over wide temperature range, low foaming, easy rinsing. Packed in 25-, 125-, and 350-lb drums.

spreader-sticker. A substance which will reduce surface tension and increase spray adherence to surfaces, especially for agricultural and herbicidal use.

spruce oil (hemlock oil, hemlock needle oil).

Properties: Colorless to light yellow oil, characteristic agreeable odor, sp. gr. (15°C) 0.907-0.920, optical rotation -18° to -25°; refractive index (n 20/D) 1.4675-1.4700; usually clearly soluble in 0.5 and more volumes of 90% alcohol, benzyl benzoate, ether, chloroform, carbon disulfide, fixed oils, mineral oil; slightly soluble in propylene glycol, insoluble in glycerol.

Chief known constituents: Bornyl acetate, cadinene and pinene.

Derivation: Direct steam distillation of needles and branches of *Tsuga canadensis*, *Picea alba*, *Picea nigra*.

Method of purification: Rectification.

Containers: Cans, drums.

Uses: Medicine; veterinary liniments; for odor value in soaps and cosmetic preparations.

spruce sulfite extract. A by-product of the paper industry used in tanning, as a core binder in foundries; and as a road binder.

spunk. See agaric.

"S. Q." ¹²³ Trademark for sulfaquinoxaline preparation for the treatment of coccidiosis in poultry.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"SQ" Phosphate. ⁵⁸ Trademark for a glassy polyphosphate with high calcium sequestering properties.

Typical analysis: P_2O_5 63.0%; Na_2O 36.0%; pH (1% soln) 7.9.

Use: Formulating industrial cleaning compounds such as dishwashing and dairy cleaners.

Containers: 100-lb net paper bags or triotex bags.

squalane (perhydrosqualene; 2, 6, 10, 15, 19, 23-hexamethyltetracosane; spinacene) $C_{30}H_{62}$. See also "Robane."

Properties: Colorless, odorless, tasteless liquid, miscible with vegetable and mineral oils, organic solvents and lipophilic substances. Is nonrancid, nondrying, nonoxidizing, noncongealing. Sp. gr. 0.805-0.812 (20°C); b. p. approx. 350°C; f. p. approx. -38°C; refractive index 1.4520-1.4525 (n_D 20/D).

Derivation: Hydrogenation of squalene; may occur naturally in sebum.

Containers: Bottles; drums.

Uses: High grade lubricating oil; vehicle for externally applied pharmaceuticals and cosmetics.

squalene (spinacene, 2, 6, 10, 15, 19, 23-hexamethyl-2, 6, 10, 14, 18, 22-tetracosahexene) $C_{30}H_{50}$. A natural raw material found in human sebum (5%), as well as in other fatty and waxy deposits. An unsaturated aliphatic hydrocarbon with six unconjugated double bonds.

Properties: Oil with faint agreeable odor, sp. gr. 0.858-0.860 (20°C), b. p. c. 225°C; f. p. -60°C; refractive index 1.49-1.50, iodine no. 360-380, saponification value 0-5. Insoluble in water; slightly soluble in alcohol, soluble in lipids and organic solvents.

Grade: 90% min.

Containers: 100-lb metal drums, 5-gal metal pails; 1-gal metal tins; 1-lb bottles.

Uses: Biochemical and pharmaceutical research, a precursor of cholesterol in biosynthesis; possible fungicide.

squaw bush. See *viburnum opulus*.

Squeegee Mediums. ²⁸ (Squeegee Oils).

Specially compounded organic vehicles for paste colors applied by stencil screen.

Containers: 55-gal drums.

Uses: As vehicles for paste colors for stencil application on glassware, tumblers, bottles, porcelain enamel, pottery.

Squeegee Oils. ²⁸ See Squeegee Mediums.

squill (scilla; sea onion; squill white; Mediterranean squill; Indian squill).

Derivation: Bulb of *Urginea maritima* or *Urginea indica*, deprived of its dry, membranous, outer scales, cut into thin slices and carefully dried.

Occurrence: Mediterranean basin near the sea (Spain, France, Italy, Morocco and Algeria).

Grades: Crude; powdered.

Containers: Bags; barrels.

Uses: Medicine; rat poison.

Shipping regulations: None.*

squill, red. Similar to white squill and may be derived from the same sources.

Derivation: Also obtained from *Urginea burkei*. Sun dried or oven dried.

Use: Relatively nontoxic to humans, fowls, or domestic animals. Used as rat poison.

squill white. See squill.

Sr. Symbol for strontium.

"SR-406." ⁵¹ Trade name for captan.

SRF black. Abbreviation for semi-reinforcing furnace black. See furnace black.

"SRHS." ²⁸⁸ Trademark for chemical compounds and compositions in dry form for use in chromium plating baths and also in the form of aqueous solutions.

SS acid. See 8-amino-1-naphthol-5,7-disulfonic acid.

"S-1 Surfactant." ¹⁰⁸

"S-2 Surfactant." ¹⁰⁸ Water-soluble setting agents.

Containers: 40-lb cans; 425-lb drums.

Uses: Emulsifiers; lower surface tension, increase "injectivity" in oilfield waterflood surfaces.

"ST-115." ²⁵⁶ Trade name for denaturant.

Containers: 55-gal non-returnable steel drums; tank cars.

Shipping regulations: Flammable liquid. Red label.*

"Stab-a-dry." ¹²³ Trademark for vitamin supplements for animal and poultry feeds.

"Stabilide." ³²⁹ Trademark for potassium iodide stabilized with calcium stearate.

"Stabilite." ⁹⁴ Trademark for N,N-diphenylethylenediamine (q.v.).

"Stabilite Alba." ⁹⁴ Trademark for N,N-di-ortho-tolylethylenediamine, a rubber antioxidant.

"Stabilite L." ⁹⁴ Trademark for N,N-diphenylpropylenediamine (q.v.), a rubber antioxidant.

"Stabilite White." ⁹⁴ Trademark for a polyalkyl substituted monohydric phenol; used as a rubber antioxidant.

"Stabilizer D-22." ²¹⁴

$(CH_3CH_2CH_2CH_2)_2Sn[OCO(CH_2)_{10}CH_3]_2$.

Properties: Sp. gr. 1.0525 (20/20°C); f. p. 8°C; insoluble in water; viscosity 45.2 cps (20°C); wt/gal 8.9 lbs (20°C); flash point 440°F.

Uses: Outstanding heat and light stabilizer for vinyl chloride resins.

stabilizers. In general, any substance which makes a solution, mixture, suspension, or state, etc. more stable. Specifically, there are stabilizers which may retard a reaction rate or preserve a chemical equilibrium, act as antioxidants, keep pigments and other components in emulsion

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

form in an emulsion paint, or prevent the particles in a colloidal suspension from precipitating.

"Sta-fast." ⁵⁰ Trademark for a naphthalene-acetic acid product (q.v.). Used for thinning apples and reducing pre-harvest drop of apples and pears.

"Sta-fresh." ⁵⁰ Trademark for a sodium bisulfite powder for keeping grass silage fresh, green and sweet-smelling.

stagbush. See *viburnum prunifolium*.

"Stamere." ⁴⁰⁶ Trade name for a series of edible hydrocolloids extracted from Irish Moss. Several members of the series are:

Stamere Type DG: A highly refined extract of Irish Moss, commonly known as carrageenan, which is standardized for use as a suspending agent for cocoa.

Stamere Type CB: A blend of carrageenan and other vegetable gums, used for thickening such things as soups, toothpastes, and ice cream.

"Stanco." ¹¹⁰ Brand name for ordinary grade channel black for use in inks, plastics and some types of paints.

"Standard" Lead Zinc Oxide. ²⁶⁸ Brand name for a low consistency zinc oxide containing 3 to 5.5% lead, calculated as $PbSO_4$. Shipped in 50-lb bags.

Use: Extensively used in exterior paints and primers.

standard wood spirits. A purified methanol (q.v.).

"Standard" Zinc Dust. ²⁶⁸ Trademark for a finely divided gray metallic zinc powder. Contains a minimum of 96% metallic zinc, the remainder being mainly zinc oxide. Shipped in 100-lb sealed containers.

Use: Metal primers and metal protective paints because of its rust-preventive and adhesion properties.

"Standfast Metal." ⁶⁰ Trade mark for a bismuth, lead, tin, and cadmium alloy. M.p. 158°F.

Use: As liquid heat and pressure transfer medium.

stand oil. This is a drying oil which has been subjected to a heat-treatment process under conditions of minimum oxidation. It may be prepared by this means from any drying oil, such as linseed, tung, perilla, soya.

stannic acid. See stannic oxide.

stannic anhydride. See stannic oxide.

stannic bromide (tin bromide; tin tetrabromide) $SnBr_4$.

Properties: White, crystalline mass. Fumes when exposed to air. Soluble in water, alcohol, and carbon tetrachloride. Sp.gr. 3.3; b.p. 203°C; m.p. 31°C.

Containers: Glass bottles.

Use: Mineral separations.

Shipping regulations: None.*

stannic chloride (tin chloride; tin tetrachloride; sometimes erroneously called tin bichloride; butter of tin) $SnCl_4$. Often sold in the form of the double salt with sodium chloride, $Na_2SnCl_6 \cdot H_2O$.

Properties: Colorless, fuming, caustic liquid, which water converts into the crystalline butter of tin, $SnCl_4 \cdot 5H_2O$. Keep well stoppered! Sp.gr. 2.2788; m.p. -33°C; b.p. 114°C. Soluble in cold water, alcohol, carbon disulfide and oil of turpentine; decomposed by hot water.

Derivation: Treatment of tin or stannous chloride with chlorine.

Grades: Technical; C.P.

Containers: Various bottles; 560-, 1000-lb drums.

Uses: Electroconductive and electroluminescent coatings; textiles (mordant, weighting silk, brightening colors on wool, addition to sizing compounds for cotton warps to retard decomposition of the constituents of the size); perfume stabilization; manufacture of fuchsin; color lakes; ceramics; bleaching agent in the sugar industry; drug; stabilizer for certain resins; manufacture of blue print and other sensitized papers; other tin salts.

Shipping regulations: Corrosive liquid.

White label. Legal label name, tin tetrachloride.*

stannic chloride pentahydrate $SnCl_4 \cdot 5H_2O$.

Properties: White solid, m.p. 56°C; soluble in water or alcohol.

Uses: An easily handled solid used in place of stannic chloride anhydrous where the presence of water is not objectionable.

stannic chromate (tin chromate) $Sn(CrO_4)_2$.

Properties: Brownish-yellow, crystalline powder. Partially soluble in water.

Derivation: By the action of chromic acid on stannic hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Decorating porcelain and china in rose and violet colors.

Shipping regulations: None.*

stannic iodide (tin iodide; tin tetraiodide) SnI_4 .

Properties: Yellow to reddish crystals; sp.gr. 4.46; b.p. 341°C; m.p. 143.5°C. Soluble in alcohol, benzene, carbon disulfide, chloroform, and ether; soluble in water. Sublimes at 180°. Decomposed by hot water.

stannic oxide (stannic anhydride; tin peroxide; tin dioxide; stannic acid; flowers of tin; tin ash; tin anhydride) SnO_2 , or $SnO_2 \cdot nH_2O$.

Properties: White powder, anhydrous or containing variable amounts of water; sp.gr. 6.6-6.9; m.p. 1127°C. Soluble in concentrated sulfuric acid, hydrochloric acid and alkalis; insoluble in water.

Derivation: (a) Found in nature as the mineral cassiterite (q.v.). (b) Tin is melted and heated in air. (c) Tin ash, resulting from the oxidation of the baths of molten tin used in making tin plate, is refined. (d) Precipitated from stannic

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloride solution by ammonium hydroxide.
(e) Acidifying a solution of an alkali stannate.

Grades: White, pure; white; gray; C.P.

Containers: 1-, 5-lb bottles; drums.

Uses: Tin salts; catalyst; ceramics (glazes); production of ceramic colors; putty; perfume preparations and cosmetics; textiles (mordant, weighting); polishing powder for steel, glass, etc; manufacture of milk-glass, alabaster glass, enamel and opaque glass.

Shipping regulations: None.*

stannic phosphide (tin phosphide) Sn_2P_2 .

Properties: Silver-white, hard mass or lumps. Soluble in acids. Sp.gr. 6.56; m.p., forms Sn_4P_3 at 415°C .

Derivation: By heating tin and phosphorus.

stannic sulfide (artificial gold; mosaic gold;

tin bisulfide; tin bronze; tin disulfide) SnS_2 .

Properties: Yellow to brown powder. Soluble in concentrated hydrochloric acid and alkaline sulfides, insoluble in water. Sp.gr. 4.42-4.60; m.p., decomposes at red-heat.

Derivation: (a) By the action of sulfide on a solution of stannic chloride. (b) By heating tin amalgam with sulfur and ammonium chloride, distilling off the mercury sulfide and ammonium chloride.

Grades: Technical; reagent.

Containers: Glass bottles; boxes; 100-lb drums.

Uses: Imitation gilding; pigment.

Shipping regulations: None.*

"Stannine," ²⁰⁶ Brand name for a proprietary line of restrainers for use in the acid pickling of iron, steel and ferrous alloys. Recommended especially to be used with hot sulfuric acid.

stannite (tin pyrites) $\text{Cu}_2\text{S} \cdot \text{FeS} \cdot \text{SnS}_2$ or $\text{Cu}_2\text{FeSnS}_4$.

Properties: Steel-gray to nearly black mineral, metallic luster; often intermixed with chalcopyrite (q.v.). Soluble in nitric acid; sp.gr. 4.3-4.52; hardness 4.

Occurrence: United States (South Dakota); England; Germany; Bolivia.

"Stannochlor," ²⁸⁸ Trademark for anhydrous stannous chloride. Soluble in a number of non-aqueous solvents.

Uses: In the plating industry; as a catalyst in a variety of organic reactions; as a bleaching agent in white soaps; fuel additive; lubricant additive, as a stabilizer in frozen pineapple juice to prevent off-flavors during frozen storage.

stannous bromide (tin bromide, tin dibromide) SnBr_2 .

Properties: Yellow powder. Soluble in hydrochloric acid (dilute); soluble in water, alcohol, ether, and acetone. Oxidizes and turns brown in air. Sp.gr. 5.1; b.p. 619°C ; m.p. 215°C .

stannous chloride (tin crystals; tin salt; tin dichloride; tin protochloride) (a) SnCl_2 (b) $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline mass, which

absorbs oxygen from the air, being converted into the insoluble oxychloride. Soluble in water, alkalies, tartaric acid, and alcohol.

Constants: (a) M.p. 246.8°C ; b.p. $603-628^\circ\text{C}$. (b) Sp.gr. 2.71; m.p. 37.7°C ; b.p., decomposes.

Derivation: By dissolving tin in hydrochloric acid.

Grades: Technical; C.P.; reagent; anhydrous; hydrated.

Containers: 1-, 5-lb bottles; drums.

Uses: Reducing agent in manufacture of chemicals, intermediates, dyes, etc., manufacture of lakes; textiles (reducing agent in dyeing, mordant in cochineal dyeing; discharge in printing); tin galvanizing; reagent in analytical chemistry; medicine; removing ink stains; bleaching sugar; silvering mirrors; revivification of yeast sown in must (accelerator); antisludging agent for lubricating oils; chemical preservative, stabilizer for perfume in soaps.

Shipping regulations: None.*

stannous chromate (tin chromate) SnCrO_4 .

Properties: Brown powder. Almost insoluble in water.

Derivation: By the interaction of stannous chloride and sodium chromate.

Use: Decorating porcelain.

stannous 2-ethylhexoate (stannous octoate) $\text{Sn}(\text{C}_8\text{H}_{15}\text{O}_2)_2$.

Properties: Light yellow liquid; insoluble in water, methanol; soluble in benzene, toluene, petroleum ether; hydrolyzed by acids and bases. Sp.gr. 1.25; Gardner color, 3 (max).

Uses: Polymerization catalyst for urethane foams; lubricant; addition agent.

stannous fluoride (tin difluoride; tin fluoride) SnF_2 .

Properties: White, lustrous, crystalline powder. Slightly soluble in water.

Use: In toothpastes as fluoride source.

stannous octoate. See stannous 2-ethylhexoate.

stannous oleate $\text{Sn}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Light yellow liquid; insoluble in water and methanol, soluble in benzene, toluene, petroleum ether, hydrolyzed by acids and bases.

Uses: Polymerization catalyst; inhibitor.

stannous oxalate (tin oxalate) SnC_2O_4 .

Properties: Heavy, white, crystalline powder; sp.gr. 3.56; soluble in acids; insoluble in water.

Derivation: By the action of oxalic acid on stannous oxide.

Grades: Technical; C.P.; reagent.

Containers: 1-lb bottles; wooden kegs.

Uses: Dyeing and printing textiles.

Shipping regulations: None.*

stannous oxide (tin oxide; tin protoxide) SnO .

Properties: Brownish-black powder, unstable in air. Soluble in acids and strong bases; insoluble in water. Sp.gr. 6.3; m.p., decomposes with combustion.

Derivation: By heating stannous hydroxide in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- a current of carbon dioxide.
 Grades: Technical; C.P.
 Containers: 1-, 5-lb bottles; wooden kegs.
 Uses: Reducing agent; intermediate in preparation of stannous salts as used in plating and glass industries; pharmaceuticals.
 Shipping regulations: None.*
- stannous pyrophosphate** $\text{Sn}_2\text{P}_2\text{O}_7$.
 Properties: White, free-flowing crystals insoluble in water.
 Uses: Toothpaste additive.
- stannous sulfate** (tin sulfate) SnSO_4 .
 Properties: Heavy, white or yellowish, crystals; soluble in water and sulfuric acid. Water solution decomposes rapidly. M.p. loses sulfur dioxide at 360°C .
 Derivation: By the action of sulfuric acid on stannous oxide.
 Method of purification: Crystallization.
 Grades: Technical; pure.
 Containers: Fiber drums.
 Uses: Dyeing; tin-plating; particularly for plating automobile pistons and steel wire.
 Shipping regulations: None.*
- stannous sulfide** (tin monosulfide, tin protosulfide; tin sulfide) SnS .
 Properties: Dark-gray or black crystalline powder; sp.gr. 5.080; b.p. 1230°C ; m.p. 880°C . Soluble in concentrated hydrochloric acid (decomposes); insoluble in dilute acids and water.
 Containers: 100-, 400-lb wooden barrels and kegs.
 Uses: Making bearing material; as catalyst in polymerization of hydrocarbons; chemical reagent.
- stannous tartrate** (tin tartrate) $\text{SnC}_4\text{H}_4\text{O}_6$.
 Properties: Heavy, white, crystalline powder; soluble in water, dilute HCl.
 Derivation: By the action of tartaric acid on stannous oxide.
 Grades: Technical.
 Containers: Wooden kegs.
 Uses: Dyeing and printing fabrics.
 Shipping regulations: None.*
- St. Ann's bark.** See cinchona bark, succirubra.
- stannum.** The Latin name for tin, hence the symbol Sn in chemical nomenclature.
- "Star." ²⁰¹ Trade name for sodium silicate, 42° Bé. Liquid, $\text{SiO}_2/\text{Na}_2\text{O} = 2.50$. Used with peroxide in textile bleaching.
- starch** (amylum) $(\text{C}_6\text{H}_{10}\text{O}_5)_x$.
 Properties: White, amorphous, tasteless powder; irregular lumps, or fine powder. Insoluble in cold water, alcohol and ether; forms a jelly with hot water. See also soluble starch. Sp.gr. 1.499-1.513; m.p., does not melt; b.p. decomposes (burns) when heated.
 Derivation: From corn (maize), arrow-root, potatoes and the like; the material is rasped or ground with water; the resulting pulp is ground in various types of mills; the milky liquid is strained through sieves, allowed to stand a short time to permit sand and the like to settle. The milk is

- then removed to another tank and the starch allowed to settle, the supernatant liquid removed and the starch washed a number of times and then dried.
 Grades: Commercial; powdered; pearl; laundry; technical; reagent; edible; U.S.P. XVI (corn starch).
 Varieties: Corn, wheat, rice, potato, tapioca, cassava or arrow-root, alant or inulin.
 Containers: 140-, 200-, 280-lb bags; barrels of various sizes; cardboard cartons.
 Uses: Manufacture of adhesives; sizing and finishing textiles; foods (e.g., cocoas, chocolates, confectionery, ice cream, sausages, etc.); sizing paper; explosives; dextrin; reagent in analytical chemistry, indicator in iodometric analysis; medicine; face powders, cosmetics, etc.; bookbinding; distilled liquors; glucose; malt sugar; caramel; colloidal preparations; cattle foods.
 Shipping regulations: None.*
- starch, chlorinated.** Derivatives of starch produced by the treatment with alkaline hypochlorites. A variety of products are obtained depending upon the exact procedure. Chlorinated starches are water-soluble and the sols are highly fluid and are important in the proper sizing of paper and textiles.
- starch gum.** See dextrin.
- starch, liquid.** A water suspension of starch usually containing a small proportion of stabilizing agent so that the mixture remains homogeneous.
- starch nitrate.** See nitrostarch.
- starch, oxidized.** See starch, chlorinated.
- starch, permanent.** Term frequently applied to materials that are not starch, but instead consist of a water emulsion of a synthetic resin or plastic. These may be applied to a fabric and upon ironing produce stiffness similar to starch but of a relatively more permanent character.
- starch phosphate.** An ester made from the reaction of a mixture of orthophosphate salts (sodium dihydrogen phosphate and disodium hydrogen phosphate) with starch.
 Properties: Soluble in cold water (unlike regular starch), and has high thickening power. Can be frozen and thawed repeatedly without change in physical properties.
 Suggested uses: Thickener for frozen foods; taconite ore binder; in adhesives, drugs, cosmetics; low-cost substitute for arabic gum, locust bean gum, and carboxymethyl cellulose.
- starch, potato.** Starch manufactured from potato flour. Used as a substitute for grain starches. Important commercially in continental Europe. See starch.
- starch syrup.** See glucose.
- "Starwax." ¹²⁸ Trade name for a microcrystalline wax available in brown or amber colors; m.p. 180°F .
 Containers: 10-lb slabs, 8/carton or 168/pallet; 350-lb drums; tank cars.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Electrical insulation; paper coatings; wax compounds; precision casting, etc.

starwort. See helonias.

"Sta-set." ⁵⁰ Trademark for a trichlorophenoxypropionic acid product for use on apples to reduce pre-harvest drop.

"Statex." ¹³³ Trademark for furnace carbon blacks used in rubber, printing inks and protective coatings. Available in 25- and 50-lb bats and hopper cars as:

"Statex B." A fine furnace black (FF). High reinforcing carbon, producing rubber compounds with low heat development, good tear resistance, high tensile and high resilience. Usage: Tire carcass, under-tread and sidewall, wire and cable jacket compounds, and tank blocks. Neoprene stocks particularly.

"Statex B-12 & B-12A." Medium color furnace blacks used in printing inks and protective coatings. B-12 uncompressed, B-12A densed.

"Statex F-12." High color furnace black, for printing inks.

"Statex G." General purpose furnace black (GPF).

"Statex M." Fast extruding furnace black (FEF). A high structure carbon, producing high modulus, high hardness, dimensional stability and smooth extrusion. Used in inner tubes, molded and extruded goods; in blends in tire treads, sidewalls, carcass and camel backs. Excellent uncured stock retention of dimension.

"Statex R." High abrasion furnace black (HAF) for tires, conveyor belts, and miscellaneous molded and extruded items.

"Statex 93." High modulus furnace black (HMF). Intermediate reinforcement with a minimum heat build-up. Used in tire carcasses and sidewall, footwear, inner tubes, molded and extruded goods and V-belts. Also available non-staining.

"Statex 125." Intermediate super abrasion furnace black (ISAF). Used in rubber goods for high tensile, tear and abrasion resistance, also for products with electrical conductivity, including plastics, paints, etc.

"Statex 160." Super abrasion furnace black (SAF). Used for high tensile tear and abrasion resistance, also for products developing electrical conductivity.

"Statex 930." High modulus furnace black (HMF) which has been treated with 20% oil. Used where freedom from dust is desirable. Primary use in reclaiming.

"Staybelite." ²⁶⁶ Trademark for pale, medium hard, thermoplastic resin made from hydrogenated wood rosin; acid number 162; softening point 76°C, density 1.045 at 20°C. Characterized by resistance to oxidation and discoloration as compared to rosin. Used for adhesives and protective coatings.

"Staybelite Esters." ²⁶⁶ Trademark for a series of synthetic resins that are esters of hydrogenated rosin, including:

"Staybelite Ester 1": Pale, soft resin; ethylene glycol ester of hydrogenated rosin;

acid number 12 max; softening point 55-65°C; sp. gr. 1.07 (25/25°C).

"Staybelite Ester 2": Pale, soft resin; diethylene glycol ester of hydrogenated rosin; acid number 10 max; sp. gr. 1.05 (25/25°C).

"Staybelite Ester 3": Medium pale, viscous resin; triethylene glycol ester of hydrogenated rosin; acid number 10 max; sp. gr. 1.08 (25/25°C).

"Staybelite Ester 5": Pale, hard resin; glycerol ester of hydrogenated rosin; acid number 6 max; softening point 78-86°C; sp. gr. 1.06 (25/25°C).

"Staybelite Ester 10": Pale, hard resin; glycerol ester of hydrogenated rosin; acid number 10 max; softening point 80-88°C; sp. gr. 1.07 (25/25°C).

"Staybelite Ester 10-75X": "Staybelite Ester 10"; 75% solids in xylene; acid number 8; sp. gr. 1.01 (25/25°C).

"Staybelite Ester 2043-66": Medium pale, hard resin; mixed ester of hydrogenated rosin; acid number 5 max; softening point 93-101°C; sp. gr. 1.07 (25/25°C).

Uses: Adhesives; protective coatings; printing inks; chewing gum.

"Stayrite." ¹⁰⁴ Trademark for stabilizers used to provide increased heat and light stability during processing of vinyl resins. Available in range of products, both liquid and solid, including non-toxic products.

steapsin. A lipase in the pancreatic juice. See enzymes.

stearamide $\text{CH}_3(\text{CH}_2)_{16}\text{CONH}_2$. Octadecanamide. Properties: Colorless leaflets; m.p. 109°C; b.p. 251°C (12 mm); insoluble in water; slightly soluble in alcohol and ether.

Use: Corrosion inhibitor in oil wells.

stearato chromic chloride. A polynuclear complex in the form of a six-membered ring. The two chromium atoms are bridged on one side by a hydroxyl group, and on the other side by the carboxyl oxygens of the stearic acid. The water-soluble complex results from the neutralization of stearic acid with basic chromic chloride. It acts as a water repellent and non-adhesive.

stearic acid (n-octadecanoic acid)

$\text{CH}_3(\text{CH}_2)_{16}\text{CO}_2\text{H}$. The most common fatty acid occurring in natural animal and vegetable fats. Most commercial stearic acid is about 45% palmitic acid, 50% stearic acid, and 5% oleic acid.

Properties: Colorless, odorless, wax-like material. Odor and taste slight suggesting tallow. Soluble in alcohol, ether, chloroform, carbon disulfide, carbon tetrachloride; sparingly soluble in water. Sp. gr. 0.8390 (80/4°C); m.p. 69.6°C; b.p. 361.1°C (760 mm), 160°C (1 mm); refractive index 1.4299 (80°C).

Derivation: From high-grade tallow and yellow grease stearin by washing, saponification with the Twitchell or similar reagent, sometimes under pressure, boiling, distilling, cooling and pressing; or from oleic acid by hydrogenation.

Method of purification: Crystallization with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pressing; solvent crystallization, hydrogenation, and distilling.

Grades: Saponified; distilled; single-pressed; double-pressed; triple-pressed; U.S.P. XVI; 90% stearic with low oleic; grade free from chick edema factor; 99.8% pure.

Containers: 1-, 5-lb cans; 1-lb cartons; barrels; bags; tank cars and trucks.

Uses: Chemicals, especially stearates and stearate driers; lubricants; soaps; candles; pharmaceuticals and cosmetics; rubber compounding; shoe and metal polishes; coatings; food packaging.

Shipping regulations: None.*

stearin (tristearin; glyceryl tristearate)

Properties: Colorless crystals or powder; odorless; tasteless; m.p. 71.6°C; sp.gr. 0.943 (65°C); insoluble in water; soluble in alcohol, chloroform, carbon disulfide; insoluble in ligroin and ether.

Derivation: Constituent of most fats.

Grades: Technical, also graded as to source.

Containers: Barrels.

Use: Soap; candles; candies; adhesive pastes; artificial ivory; metal polishes; waterproofing paper; artificial stone; textile sizes; leather stuffing.

Shipping regulations: None.*

stearin and fatty acid pitches. A series of pitches obtained as by-product residue from the following operations: (a) Soap stock and candle stock manufacture. (b) Refining of vegetable oils. (c) Refining of refuse greases. (d) Refining of wool grease.

Properties: Dark brown to black; properties analogous to complex hydrocarbons; contains fixed carbon (5% to 35%). Soluble 80-100% in 88° naphtha; 95-100% in carbon disulfide; sp.gr. 0.90-1.10 (77°F).

Derivation: These pitches are named by the source from which derived, e.g., stearin; candle-tar, candle, fat; bone-fat; cottonseed-oil; cotton-stearin; cottonseed-foots, corn-oil; corn-oil-foots; packing-house; garbage; sewage; wool, wool-fat; cholesterol.

Uses: Manufacture of black paints and varnishes; tarred papers; printers' rolls; rubber filling agent; impregnating agent; ingredient of electrical insulations; marine caulking; waterproofing.

Shipping regulations: None.*

stearin pitch. See stearin and fatty acid pitches.

"Stearite." ¹⁰⁴ Trademark for stearic acid produced by selective hydrogenation process. Used in rubber vulcanization and other processing where a purer stearic acid is desired.

stearoyl chloride (n-octadecanoyl chloride)

Properties: M.p. 23°C; b.p. 174-178°C

(2 mm); soluble in hydrocarbons and ethers.

Containers: Bottles, carboys, steel drums.

Uses: Suggested for preparation of substituted amines and amides, acid anhydrides,

for esterification of alcohols, synthesis of other organic compounds.

stearyl alcohol (1-octadecanol; octadecyl alcohol) $\text{CH}_3(\text{CH}_2)_{16}\text{CH}_2\text{OH}$

Properties: Occurs as unctuous white, flakes or granules with faint characteristic odor and bland taste; sp.gr. 0.8124 (59/4°C); b.p. 210.5°C (15 mm); m.p. 59°C. Soluble in alcohol, acetone, and ether; insoluble in water.

Typical specifications: M.p. 57.5-59°C; b.p. 191-194°C (7 mm).

Derivation: Reduction of stearic acid.

Grades: Commercial; technical; U.S.P. XVI.

Containers: 50-lb bags; 200-lb fiber drums; steam-coiled tank cars.

Uses: Perfumery; cosmetics; intermediate; surface active agents; detergents; lubricants; plastics and resins.

stearyl mercaptan $\text{CH}_3(\text{CH}_2)_{17}\text{SH}$. Octadecyl mercaptan.

Properties: M.p. 25°C; b.p. 205-209°C (11 mm); sp.gr. 0.8420 (25°C/4); refractive index (n_D²⁰) 1.4591.

Grades: 95% (min) purity.

Use: Organic intermediate; synthetic rubber processing.

stearyl methacrylate. In this case, a group name for $\text{CH}_2\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_n\text{CH}_3$ (n = 13 to 17).

Containers: Drums.

Uses: Polymerizable monomers for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, paper finishing.

steatite. See talc.

"Steclin." ⁴¹² Trademark for tetracycline hydrochloride (q.v.).

"Sted." ⁴²⁸ Trademark for low sudsing, synthetic detergent. Contains non-ionic synthetic detergents, silicates, carbonates, complex phosphates, carboxymethylcellulose and optical bleach.

"Stedbac." ⁴³⁰ Trade name for stearyl dimethyl benzyl ammonium chloride, a hair conditioner used primarily in after-shampoo hair rinses.

steel. An alloy of iron and 0.1-1.5% carbon, which is produced from pig iron (q.v.) by oxidizing out the excess carbon and other impurities (phosphorus, sulfur, silicon) with air and hematite (q.v.). In the open-hearth process the hot air blows through a furnace over a mixture of molten pig iron, scrap iron, and hematite. In the Bessemer process the air blows directly through the mixture, contained in a large pot or "converter." The open-hearth process, although more time consuming and expensive, permits accurate addition of desired metal constituents such as manganese, nickel, and chromium (see ferro-alloys). Over 90% of the steel in the United States comes from open-hearth mills. Recent modifications include the use of an oxygen-air mixture to

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hasten the combustion of impurities; and the "vacuum degassing" of the molten steel in a vacuum chamber to remove excess oxygen. About 90% of the steel produced in the U.S. is plain carbon steel with the remainder divided into various alloy steels.

steel, alloy: Steels containing certain varying proportions of special elements which provide specific properties in the steels. Alloy steels are made by adding one or more of the following alloying metals: manganese, nickel, copper, chromium, molybdenum, vanadium, tungsten and cobalt.

steel, acid: Steel melted in a furnace the inner bottom and lining of which is composed of materials that have an acid reaction in the melting process and under a slag that is dominantly silicates.

steel, basic: Steel melted in a furnace that has a basic (crushed, burned dolomite, magnesite, magnesite bricks or basic slag) bottom and lining, and under a slag that is dominantly basic.

steel, high-carbon: Steel containing more than 0.85% carbon.

steel, killed: Steel deoxidized with a strong deoxidizing agent such as silicon or aluminum in order to reduce the oxygen content to a minimum so that no reaction occurs between carbon and oxygen during solidification.

steel, medium carbon: Steel having more than 0.3% carbon, but less than 0.85%.

steel, low carbon: Steel containing from 0.03 to 0.3% carbon.

steel, stainless: A group of steels, of three different classes (see below), which have in common the fact that they resist corrosion and oxidation much more strongly than ordinary steels and most alloy steels. All steels of the stainless group have high percentages of chromium, ranging from 10% up to as high as 25%. For typical commercial products, see "Enduro."

Austenitic stainless steels contain both chromium and nickel with a minimum chromium content of 16% and minimum nickel 7%.

AISI Types 302, 303, 304 and 316 are the most extensively used alloys in this group, which is often known by the name 18:8, referring to the percentages of principal alloying materials. Austenitic stainless steels work harden readily; are shock resistant and unless they contain sulfur or selenium are difficult to machine. They are readily hot worked, welded, and surpass other stainless steels in strength and resistance to scaling at high temperatures, as well as having better corrosion resistance. Austenitic stainless steels, unless stabilized, are subject to intercrystalline corrosion at the temperature range of 800 to 1600°F. These steels are used for a wide range of parts under most temperature and corrosive conditions.

ferritic stainless steels: Steels in this group contain chromium and are characterized as not being hardenable through heat treatment. They can be hot or cold worked, and often show excessive grain growth upon

extended exposure to high temperatures. Likewise, these ferro-magnetic steels are likely to become brittle after welding by most commonly used methods. Resistance to scaling at high temperatures is better than for martensitic stainless steels, although strength is somewhat lower. Although machinability is rated as good, it can be improved if sulfur or selenium is included in the composition. Most steels in this group are easily formed.

martensitic stainless steels: Stainless steels which can be hardened by heat treatment and are straight chromium grades fall in the martensitic group. Martensitic stainless steels are ferro-magnetic, can be cold worked; resist the effects of water, weather and some chemicals; machine readily; are tough, but easily forged and hot worked. Hardening usually increases corrosion resistance in these steels, which tend to harden when air cooled from above 1500°F. The martensitic stainless steels are used for many mechanical and stressed parts.

SAE steels: A number system devised to indicate principal ingredients of alloy steels: The first figure indicates the general class of the steel; the second figure the amount of the alloy and the last figures carbon content in hundredths of 1%. 1 stands for carbon; 2, nickel; 3, nickel-chromium; 4, molybdenum; 5, chromium; 6, chromium-vanadium; 9, silicon-manganese. Thus, SAE 2515 is a 5% nickel steel of 0.15% carbon. self-hardening steel (air-hardening steel).

Alloy steel which may be hardened by cooling in air from above the critical temperature, without special quenching. High speed tool steels are commonly of this type.

steel, high speed. Steel which does not soften at elevated temperatures, and is therefore used to make cutting tools which will retain their cutting edges at very high temperatures, even to a red heat, and hence can be operated at much higher speeds than ordinary tool steels.

The majority of machine tools are now made of high speed steel. There are at least 15 major types based on varying compositions of molybdenum, vanadium, tungsten, and cobalt. Special heat treatments, hardening, annealing and tempering are applied to develop desired characteristics in these steels. Surface treatments may also be used. The steels can all be forged. The four major types are: molybdenum steels; molybdenum-cobalt steels; tungsten steels; tungsten-cobalt steels.

Steffens molasses. See molasses.

Steffens process, for sugar. A process used in beet sugar manufacture to separate residual sugar from molasses. Based on the formation of insoluble tricalcium saccharate and its subsequent decomposition to sugar in the presence of a weak acid such as carbonic acid.

Steinbuhl yellow. See calcium chromate; also barium chromate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Stellite." ²¹⁴ Trademark for a series of cobalt-chromium-tungsten alloys for metal-cutting tools.

Forms: Rods; castings.

Uses: For hard-facing wearing surfaces; for applications requiring high resistance to abrasion and corrosion, such as centerless grinder rests, wear strips, valves for homogenizing equipment and refrigeration, reflectors, bushings, burnishing rollers, rubber-cutting knives, and dies.

Stengel process. Process for making ammonium nitrate fertilizer from anhydrous ammonia and nitric acid. The fertilizer particles can be made in different sizes according to the use.

"Stepan." ⁴⁵¹ Trade name for a series of methyl esters of C_6 to C_{18} saturated fatty acids.

C25 (caprylate, caprate) 55% C_8 , 40% C_{10} ; m.p. $-30^{\circ}C$.

C40 (laurate) 96% C_{12} ; m.p. $5^{\circ}C$.

C41 (laurate) 90% C_{12} ; m.p. $1^{\circ}C$.

C42 (laurate) 74% C_{12} ; 24% C_{14} .

C43 (laurate) 69% C_{12} , 29% C_{14} .

C49 (whole coco esters) 9.7% C_8 , 7.4% C_{10} , 48.7% C_{12} , 17.9% C_{14} , 7.9% C_{16} , 7.6% C_{18} .

C50 (myristate) 93% C_{14} ; m.p. $15^{\circ}C$.

C60 (palmitate) 80% C_{16} ; m.p. $28^{\circ}C$.

C65 (palmitate-oleate) 50%-50%; m.p. $14^{\circ}C$; iodine no. 45.

C66 (stearate) 50% palmitate, 50% stearate; m.p. $30^{\circ}C$; iodine no. 0.5.

C68 (oleate) 16% palmitate, 82% oleate-stearate; m.p. $16^{\circ}C$; iodine no. 75.

stephanite (brittle silver ore) Ag_3SbS_4 or $5Ag_2S \cdot Sb_2S_3$.

Properties: Soft, but brittle, iron-black mineral; streak same color; metallic luster. A natural silver sulfantimonite. Contains 68.5% silver, 15.2% antimony, 16.3% sulfur. Found with argentite, pyrrargyrite and polybasite (q.v.).

Constants: Sp.gr. 6.2-6.3; hardness 2-2.5.

Use: Extraction of silver.

"Sterane." ²⁹⁹ Trademark for prednisolone.

sterculia gum. See karaya gum.

stereoblock polymer. A polymer whose molecule is made of comparatively long sections of identical stereospecific structure, these sections being separated from one another by segments of different structure, as, for example, blocks of an isotactic polymer interspersed with blocks of the same polymer with a syndiotactic structure. See polymer, stereospecific.

stereochemistry. The chemistry of stereoisomers.

stereoisomers. Compounds whose molecules contain the same number and kind of atoms arranged in the molecule in an identical manner except for their relative positions in space. Stereoisomers are three-dimensional. See geometric isomerism; optical isomerism.

stereoregular polymers. Isotactic and syndiotactic polymers. See polymer, stereospecific.

stereospecific catalysts. Catalysts that cause formation of stereospecific polymers. Widely used examples are Ziegler and Natta catalysts derived from a transition metal halide and a metal alkyl, or similar substances. There are many patented catalysts of this general type, most of them developed in connection with the production of polypropylene or other polyolefins.

stereospecific polymer. See polymer, stereospecific.

steric hindrance. A characteristic of molecular structure in which the molecules have a spatial arrangement of their atoms such that a given reaction with another molecule is prevented or retarded in rate.

"Sterimine." ²⁸² Trade name for trichloromelamine (TCM) compounded with salt, wetting agent, and acid phosphate buffer. Available chlorine: 50%.

Properties: White, free-flowing powder; slight chlorine odor.

Containers: 10-, 25-, 100-lb fiber containers.

Uses: Sterilization of ion exchange beds, and of surfaces of equipment and utensils.

"Sterling." ²⁷⁵ Trade name for a series of furnace and thermal carbon blacks for rubber, inks, paints, plastics and paper. Available as:

"Sterling FT." Fine thermal black (FT).

"Sterling L and LL." High modulus furnace blacks (HMF).

"Sterling MT." Medium thermal black (MT).

"Sterling R and S." Semi-reinforcing furnace black (SRF).

"Sterling SO." Fast extruding furnace black (FEF).

"Sterling 10." Furnace carbon black.

"Sterling 99." Fine furnace black (FF).

See furnace black and thermal black.

"Sterofat." ²²⁸ A fatty acid ester of sterols and higher alcohols found in tall oil.

Properties are similar to degreas.

Uses: In leather; non-drying film applications; rust preventatives; and similar uses common to degreas.

steroids. A group of compounds including many important hormones, precursors of certain vitamins, bile acids, alcohols (sterols), and certain natural drugs and poisons (such as the digitalis compounds). Steroids have as a common "nucleus" a fused reduced 17-carbon-atom ring system, cyclopentanoperhydrophenanthrene. Most steroids also have two methyl groups and an aliphatic side-chain attached to the "nucleus." The length of the side-chain varies and generally contains 8, 9 or 10 carbon atoms in the sterols, 5 carbon atoms in the bile acids, 2 in the adrenal cortical steroids, and none in the estrogens and androgens. Steroids are classed as lipids because of their

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solubility in organic solvents and insolubility in water.

Most of the naturally-occurring steroids have been synthesized and many new steroids, unknown in nature have been synthesized for use in medicine, such as the fluorosteroids like dexamethasone.

sterols. The steroid alcohols. They contain the common steroid "nucleus", plus an 8 to 10 carbon-atom side-chain and an alcoholic group. Sterols are widely distributed in plants and animals, both in the free form and esterified to fatty acids. Cholesterol is the most important animal sterol, ergosterol is an important plant sterol, or phytosterol.

"Sterox." ⁵⁸ Trademark for a line of nonionic surface-active liquids, including:

"Sterox" AJ and AJ-100: Tridecanoethylene oxide condensates (polyoxyethylene ether); used for powdered detergent formulations, emulsifier; textile, paper and leather processing.

"Sterox" AP and AP-100: Tridecanoethylene oxide condensates (polyoxyethylene ether); used in liquid detergents.

"Sterox" CD: Polyoxyethylene ester; used in insecticide and herbicide formulations; detergent compositions; rewetting agent for paper towels; dispersing agent for powdered materials.

"Sterox" DF: Dodecyl phenol-ethylene oxide condensate (alkyl aryl polyoxyethylene ether); used as an intermediate for sulfation; emulsifier.

"Sterox" DJ: Dodecyl phenol-ethylene oxide condensate (alkyl aryl polyoxyethylene ether); used in powdered and liquid detergent formulation.

"Sterox" NJ: Nonyl phenol-ethylene oxide condensate (alkyl aryl polyoxyethylene ether), used in powdered and liquid detergents; textile, leather and paper processing; metal cleaning; toxicant formulations; deduster.

"Sterox" NL: Nonyl phenol-ethylene oxide condensate (alkyl aryl polyoxyethylene ether); used in liquid detergents.

"Sterox" SK: Polyoxyethylene thioether; used as a wetting agent and penetrant for insecticidal and herbicidal formulations.

"Sterox" No. 6: Polyoxyethylene thioether; used for textile scouring operations; rewetting agent for textiles.

Containers: 450- and 470-lb drums; tank cars and tank trucks.

"Sterozol." ¹⁷³ Trademark for a non-coloring, non-interfering germicide and preservative of low relative toxicity used to inhibit bacterial and mold development on hides, skins and leathers in tannery wet work operations. Also used to preserve leather finish preparations.

STH. See somatotrophic hormone.

stibamine glucoside $C_{35}H_{49}N_3NaO_{22}Sb_3$. A nitrogen glucoside of sodium para-aminobenzenestibonate. Incompletely defined structure.

Properties: Odorless, pale cream to light buff, amorphous powder. Unstable if warmed or exposed to air. Soluble in water. pH (6% solution) 8.5-9.0.

Derivation: Condensation of para-aminobenzenestibonic acid and glucose in slightly basic solution followed by precipitation with absolute alcohol and final drying.

Grade: N.N.D.

Use: Medicine.

stibenyl. See sodium-para-acetylaminophenylantimonate.

stibic anhydride. See antimony pentoxide.

stibium. The Latin name for the elementary metal antimony, hence the symbol Sb in chemical nomenclature.

stibnite (gray antimony; antimony glance; antimonite) Sb_2S_3 , sometimes contains silver or gold.

Properties: Lead-gray mineral inclining to steel-gray; subject to blackish tarnish; metallic luster. Differs from galenite and other sulfides by ease of fusion. Contains 71.8% antimony, 28.2% sulfur. Soluble in concentrated boiling hydrochloric acid with evolution of H_2S . Sp. gr. 4.52-4.62; hardness 2.

Occurrence: United States (Arkansas, Alaska, California, Nevada); Germany; Hungary; France; Japan; China; Mexico; Chile.

Use: The most important ore of antimony.

stibophen $C_{12}H_4Na_2O_{16}S_4Sb \cdot 7H_2O$. Sodium antimony III bis-catechol-2,4-disulfonate heptahydrate.

Properties: White, crystalline, odorless powder. Affected by light. Freely soluble in water; nearly insoluble in alcohol, ether, and chloroform.

Derivation: Reaction of sodium pyrocatechol-3,5-disulfonate with antimony trioxide and precipitating with alcohol.

Use: Medicine.

stick lac. See shellac.

stigmasterol $C_{29}H_{48}O \cdot H_2O$. A plant sterol. **Properties:** Anhydrous form has m.p. of $170^\circ C$. Insoluble in water; soluble in usual organic solvents.

Derivation: From soy or calabar beans.

Uses: In the preparation of progesterone and other important steroids.

stilbamidine isethionate

$H_2NC(NH)C_6H_4CH:CHC_6H_4C(NH)NH_2 \cdot 2HOCH_2CH_2SO_3H$. 4,4'-Stilbenedicarbox-

amidine di-(beta-hydroxyethanesulfonate).

Properties: White, odorless, crystalline powder. Darkens with heating above $250^\circ C$. M.p. $325-335^\circ C$ (dec); stable in air; decomposed by light. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in ether. pH (1% solution) 5.0-7.0.

Use: Medicine.

stilbene (toluylene; trans form of alpha, beta-diphenylethylene) $C_6H_5CH:CHC_6H_5$.

Properties: Colorless or slightly yellow crystals; sp. gr. 0.9707; m.p. $124-125^\circ C$;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

b.p. 306-307°C. Soluble in benzene and ether; slightly soluble in alcohol; insoluble in water.

Derivation: By passing toluene over hot lead oxide.

Method of purification: Crystallization; zone melting used for very pure crystals.

Grades: Technical; pure.

Containers: Wooden casks; fiber drums.

Uses: Manufacture of dyes and optical bleaches; crystals are used as phosphors and scintillators.

Note: The cis form of alpha, beta-diphenyl-ethylene (isostilbene), is a yellow oil; b.p. 145°C (13 mm); m.p. 1°C.

Shipping regulations: None.*

stilbene dyes. Dyes whose molecules contain both the $-N=N-$ and the $>C=C<$ chromophore groups in their structure and whose color index ranges from 620 to 635. A common example is Direct Yellow R, color index 620. These are direct cotton dyes.

stilbestrol. See diethylstilbestrol.

"Stilbetin." ⁴¹² Trademark for diethylstilbestrol (q.v.).

stilbite ($CaNa_2Al_2Si_7O_{18} \cdot 7H_2O$). A mineral, one of the zeolites (q.v.).

Properties: Color white, yellow; luster vitreous to pearly; hardness 3.5-4; sp.gr. 2.1-2.2.

Occurrence: New Jersey, Michigan, Colorado; Europe.

stillage. The grain residue from alcohol production, used in feeds and feed supplements.

stilingia (queen's root; yaw root; silver leaf).

Derivation: Root of *Stillingia sylvatica*.

Occurrence: Southeastern United States.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

stilingia oil (tallow-seed oil).

Properties: Pale yellow, limpid, drying oil; peculiar odor like linseed oil; mustard-like taste. Slightly soluble in alcohol. Sp.gr. 0.9432-0.9458, iodine number 160; saponification number 210.

Derivation: From the seeds of the tallow tree, *Stillingia sebifera*, by pressing.

Grades: Technical, regular; acidless.

Containers: 375-lb barrels; 8000-gal tank cars.

Uses: Candles; soap, dressing textiles, manufacturing lubricating compositions.

Shipping regulations: None.*

"Stimplants." ²⁹⁹ Trademark for diethylstilbestrol ear implants. Used in agriculture.

stinkweed. See stramonium.

St. John's bread. See carob seed.

Stoddard solvent. A widely used dry-cleaning solvent. See also naphtha, cleaners'.

Specifications of the U.S. Bureau of Standards for this product are as follows:

Material: A petroleum distillate conforming to the requirements given herein.

Appearance: Clear and free from suspended matter and undissolved water.

Color: Water-white or not darker than 2I by Saybolt chromometer.

Odor: Sweet.

Flash point: Not lower than 100°F (Tag closed cup).

Corrosion test: A clean copper strip shall show not more than extremely slight discoloration when submerged in the solvent for 3 hours at 212°F.

Distillation range: Not less than 50% shall be recovered in the receiver when the thermometer reads 350°F. The dry or end point shall be not higher than 410°F. No tolerance shall be allowed above 410°F.

Acidity: The residue remaining in the flask after the distillation is completed shall not show an acid reaction.

Doctor test: Negative.

Sulfuric acid absorption test: Not more than 5% of the solvent shall be absorbed by concentrated "c.p." sulfuric acid (sp.gr. 1.835) (approximately 93.2%).

Containers: 1-, 5- and 10-gal cans; 55-gal steel drums; tank cars; tank trucks.

Fire hazard: Caution. MCA warning label.

Shipping regulations: None.*

"Stod-Sol." ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white; initial boiling point 308-316°F, 95% distills between 363-373°F; sp.gr. 0.780 (60°F); flash point (TCC) 103°F; mild, nonresidual odor.

Use: In professional dry cleaning.

stoichiometry. The branch of chemistry and chemical engineering that deals with the quantities of chemical substances that enter into and are produced by chemical reactions. Thus when the hydrocarbon gas methane undergoes union with oxygen in complete combustion, sixteen grams of methane will require 64 grams of oxygen. At the same time 44 grams of carbon dioxide and 36 grams of water will be produced. Every other chemical reaction has its own characteristic proportions, and stoichiometry deals with the methods of obtaining these from chemical formulas, equations, atomic weights and molecular weights, and with the practical use of this information to determine quickly and easily what and how much is used and produced in chemical processes.

stone flax. See asbestos.

stone red. A fine red pigment consisting essentially of red iron oxide. See also iron oxide reds and hematite, red.

stoneware clay. Although an inferior material may sometimes be used, these clays usually range from semi-refractory up to the refractoriness of firebrick. In the latter case they differ from fire-brick in burning to a very dense body at a low temperature. Desirable characteristics of a good stoneware clay are: (a) tensile strength of 125 lbs per sq. in. or over; (b) low fire-shrinkage; (c) sufficient plasticity and toughness to permit its being turned on the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

potter's wheel; (d) absence of concretionary minerals such as lime or iron; (e) low coarse sand content.

Average of ten analyses of stoneware clays used in Ohio potteries: Clay base, 56.65%; sandy matter, 37.45%; fluxing matter, 4.44%; moisture, 1.57%. Total silica, 65.09%.

Occurrence: United States (Ohio, New York, New Jersey, Missouri, Texas, Minnesota, Illinois, Indiana).

"Stonex." ³¹⁸ Trademark for a white powder, free from nitric and chromic acids, used to remove beerstone; develops no gases.

"Stonite." ¹⁹⁴ Trademark applied to a series of protective and decorative coatings for a wide range of surfaces and range of service conditions.

storage battery (storage cell). An electrolytic cell (q. v.) which can be recharged after the electrode materials are partly consumed during generation of electricity. Recharging is achieved by forcing a current to flow into the cell in the opposite direction to the flow during the generating period. This reverse current flow regenerates the electrode materials. In practice several cells are usually connected in series, the result being a battery. Automobile batteries are a common example, the electrolyte being sulfuric acid in distilled water (see battery acid), with one electrode of lead and the other of lead dioxide, both of these being converted into lead sulfate when current is generated.

storage cell. See storage battery.

storax. The U.S.P. XVI name for styrax (q. v.).

storax oil. See styrax oil.

"Storcavite." ²⁹⁹ Trademark for a preparation containing vitamins and minerals; used in medicine.

storksbill. See geranium.

STPP. Abbreviation for sodium tripolyphosphate.

stramonium (Jamestown weed; jimson weed; thorn apple; stinkweed; devil's apple; apple of peru).

Derivation: Dried leaves and flowering tops of *Datura stramonium* or its variety *tutula*. Constituents: Atropine, scopolamine, proteins, albumin.

Occurrence: Europe; Asia; America.

Grades: Technical; N.F. XI.

Containers: 200-lb bales, bags of various sizes.

Uses: Medicine; source of its alkaloids.

Shipping regulations: None.*

strange particle. A kind of nuclear particle, not well understood, differing in subtle ways from similar more common nuclear particles.

strawberry aldehyde. See ethyl methylphenylglycidate.

strawberry tree. See euonymus.

"Stren." ²⁸ Trademark for a high strength, limp and low elongation monofilament for use in spin fishing.

"Strep-Combiotic." ²⁹⁹ Trademark for a combination drug containing penicillin and streptomycin.

"Strep-Dust." ²⁹⁹ Trademark for an agricultural product containing streptomycin sulfate. Used in veterinary medicine.

streptogenin. A peptide constituent of many pure proteins shown to be essential to the growth of several microorganisms, mice, and rats. Contains glutamic acid and glycine residues, but pure streptogenin has not been prepared. In insulin or trypsinogen, richest known sources of streptogenin, some of the free amino groups apparently constitute the amino groups of streptogenin.

streptidine $C_8H_{18}N_6O_4$. 1, 3-Diguanidino-2, 4, 5, 6-tetrahydrocyclohexane. A substituted cyclohexane found in the antibiotic, streptomycin.

Properties: Optically inactive, diacidic base. Isolated as dipicrate dihydrate ($C_{26}H_{24}N_{10}O_{18} \cdot 2H_2O$), which crystallizes in yellow needles from water and decomposes at 283-284°C.

Derivation: From streptomycin by acid hydrolysis.

streptobiosamine $C_{13}H_{23}NO_9$. A disaccharide, composed of streptose and N-methyl-L-glucosamine.

Derivation: From streptomycin by acid hydrolysis.

streptodornase. An enzyme, a deoxyribonuclease, obtained from hemolytic streptococci. It helps to split up the deoxyribonucleoproteins and nucleic acids of purulent exudates.

Grade: N.N.D. (as streptokinase-streptodornase).

streptoduocin. White powder consisting of a mixture of approximately equal parts of dihydrostreptomycin sulfate and streptomycin sulfate.

Grade: U.S.P. XVI.

Use: Medicine.

streptokinase. An enzyme, or specifically, an extracellular enzyme activator, obtained from hemolytic streptococci, which helps to dissolve blood clots and fibrinous exudates.

Grade: N.N.D. (as streptokinase-streptodornase).

streptolin.

Properties: An antibiotic, isolated as the hydrochloride. Gummy mass; soluble in water; most stable at pH 3.0-3.5.

Derivation: Produced by *Streptomyces* no. 11.

Use: Antibiotic; possible rodenticide.

streptomycin $C_{21}H_{39}N_7O_{12}$. The name of a specific antibiotic, but the word is also used loosely to designate several chemically related antibiotics produced by

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

actinomycetes belonging to the genus *Streptomyces* or related genera.

Streptomycin is produced by *Streptomyces griseus* and consists of streptidine attached in glycosidic linkage to the disaccharide, streptobiosamine. It is active against gram-negative bacteria and the tubercle bacillus. It is now used mainly in the treatment of tuberculosis.

Properties: A base which readily forms salts with anions. Quite stable but must be kept from moisture as it is very hygroscopic.

Units: One unit equals one microgram of pure crystalline streptomycin base.

Derivation: From *Streptomyces griseus* by submerged culture. The streptomycin is then concentrated by adsorption on activated carbon and purified.

Use: Medicine (usually as sulfate salt).

See also streptomycin sulfate and dihydrostreptomycin.

streptomycin sulfate $(C_{21}H_{39}N_7O_{12})_2 \cdot 3H_2SO_4$.

Properties: White or practically white powder. Odorless or very faint odor; slightly bitter taste; hygroscopic, stable toward air or light. Solutions are acid or nearly neutral to litmus, and are levorotatory. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform.

Grade: U.S.P. XVI.

Use: Medicine.

streptonigrin $C_{24}H_{20}O_8N_4$. Derived from *Streptomyces flocculus*. Dark brown rectangular crystals. Suggested as an anti-tumor antibiotic.

L-streptose $C_6H_{10}O_5$ or $CH_3CHOHC(OH)(CHO)CHOHCHO$. A peculiar sugar which is found as the disaccharide, streptobiosamine, in streptomycin. It is an unstable compound and has not been isolated.

streptothricin. An antibiotic that combats gram-negative bacteria. Its use is restricted by toxic effects.

striped alder. See hamamelis.

"Strip-Gard." ¹⁹⁴ Trade name used to identify a series of strippable vinyl films intended to protect metal surfaces from marring during fabrication, handling, and assembly.

"Stripkolex." ²⁸ Trademark for a dynamite for coal stripping operations.

"Stripolite." ¹⁵⁹ Trade name for sodium formaldehyde sulfoxylate used as a reducing agent (stripper) for textiles.

stripping.

1. Removal of relatively volatile components from a gasoline or other liquid mixture by distillation, evaporation, or by passage of steam, air or other gas through the liquid mixture.
2. Rapid removal of color from a dyed fabric or fiber by chemical action, as is sometimes required in the course of dyeing operations. See also stripping agents.

stripping agents. Compounds used to remove dyes from improperly dyed fabric so it can be redyed. When used in vat dyeing or in discharge printing the products are termed "discharge agents." Such compounds should possess good penetration, should strip evenly, rinse freely, and should not attack the fiber. Substances commonly used as strippers are sodium hydrosulfite, titanous sulfate, sodium and zinc sulfoxylate formaldehydes (q.v.).

"Strobane." ¹³⁸ Trademark for a versatile pesticide. Active ingredients are terpene polychlorinates (camphene, pinene and related terpene polychlorinates) with 65% chlorine value.

strontia. See strontium oxide.

strontianite $SrCO_3$. Natural strontium carbonate.

Properties: Color white, gray, yellow, green; luster vitreous; hardness 3.5-4; sp.gr. 3.7.

Occurrence: California, New York, Washington; Germany; Mexico.

Use: Source of strontium chemicals.

strontium Sr. A metallic element, of atomic number 38, classed in group II on the periodic chart.

Properties: Pale yellow, soft metal, similar to sodium. Must be kept immersed in naphtha. Soluble in alcohol and acids; decomposes water on contact. Occurs in nature in the minerals, strontianite (carbonate), and celestite (sulfate).

Constants: Sp.gr. 2.54; m.p. $770 \pm 10^\circ C$; b.p. $1380^\circ C$; burns when heated in air above m.p.

Derivation: By electrolysis of molten strontium chloride in a graphite crucible with cooling of the upper, cathodic space; by the thermal reduction of the oxide with metallic aluminum (strontium aluminum alloy formed).

Grades: Technical.

Containers: Glass bottles containing sufficient naphtha to cover the rods or lumps of metals.

Uses: Alloys; "getter" in electronic tubes.

Fire Hazard: Dangerous.

strontium 90. Radioactive strontium of mass number 90.

Properties: Half-life, 25 years; radiation, beta; radiotoxicity, very hazardous.

Derivation: From the fission products of nuclear reactor fuels.

Forms available: A mixture containing strontium 90, yttrium 90, and strontium 89 chlorides in hydrochloric acid solution.

Uses: The radiation source in thickness gauges for measuring sheet paper, steel, flooring, rubber, etc. Strontium 90 is also used for the elimination of static charge; for the treatment of eye diseases; in radioautography to determine the uniformity of material distribution; in electronics for studying strontium oxide in vacuum tubes; for the activation of phosphors; as a source of ionizing radiation in luminous paint; for cigarette density control; for measuring

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

silt density; in atomic batteries, etc.
In fallout: This isotope, a member of the mass 90 fission product chain which is produced in high yield from fission, is the longest lived member of that chain and consequently is itself produced in high yield. Because of its half-life, which is comparable to times of importance in meteorological and biological processes, this isotope is one of the principal radioactive species, in terms of activity, in fission products that are a few months to a few years old. In addition the element is classed as a "bone seeker", is metabolized in much the same manner as calcium, and is thus generally considered the most hazardous component of fall-out and the source of much of the concern for the fall-out problem. It is also the one generally isolated and measured when fall-out measurements are made.

Shipping regulations: Class D poison. Radioactive material. Blue label.*

strontium acetate $\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \frac{1}{2} \text{H}_2\text{O}$.

Properties: White, crystalline powder, soluble in water.

Derivation: Interaction of strontium hydroxide and acetic acid; followed by crystallization.

Grades: C. P.

Containers: 1-lb bottles.

Use: Medicine.*

Shipping regulations: None.*

strontium arsenite $\text{Sr}(\text{AsO}_2)_2 \cdot 4\text{H}_2\text{O}$ (approx.)

Properties: White powder; slightly soluble in water. Odorless; soluble in dilute acids.

Use: Medicine.

Shipping regulations: Class B poison. Poison label.*

strontium bromate $\text{Sr}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless or yellowish, crystalline, lustrous powder. Hygroscopic.

Caution! Keep well stoppered! Soluble in water. Sp.gr. 3.8.

strontium bromide $\text{SrBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, hygroscopic crystals or powder. Keep well stoppered. Soluble in water, alcohol, and amyl alcohol. Insoluble in ether. Sp.gr. 2.358. Loses all its water by 180°C ; m.p. anhydrous salt 643°C .

Derivation: A strontium carbonate is treated with bromine or hydrobromic acid in presence of a reducing agent.

Method of purification: Recrystallization.

Grades: Anhydrous powder; crystal; technical; C. P.

Containers: 1-, 5-lb bottles, 150-lb drums.

Use: Medicine.

Shipping regulations: None.*

strontium carbonate SrCO_3 .

Properties: White, impalpable powder.

Soluble in acids, carbonated water and solutions of ammonium salts; very slightly soluble in water.

Constants: Sp.gr. 3.62; m.p. decomposes at about 1100°C .

Derivation: Celestine is boiled with a solution of ammonium carbonate or is fused with sodium carbonate.

Method of purification: Ignition to pale red heat.

Grades: Pure; precipitated; technical; C. P.; natural.

Containers: 50-lb bags; drums.

Uses: Pyrotechnics; manufacture of iridescent glass; strontium salts; medicine.

Shipping regulations: None.*

strontium chlorate (a) $\text{Sr}(\text{ClO}_3)_2$; (b) $\text{Sr}(\text{ClO}_3)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, crystalline powder.

Must not be triturated with organic materials, liable to cause explosions. Soluble in water; slightly soluble in alcohol. (a)

Sp.gr. 3.152; m.p. decomposes at 120°C .

Derivation: Strontium hydroxide solution is warmed and chlorine passed in, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Manufacture of red-fire and other pyrotechnics.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label (applies to both wet and dry salt).*

strontium chloride (a) SrCl_2 ; (b) $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, crystalline needles; odorless; sharp, bitter taste; soluble in water and alcohol.

Constants: (a) Sp.gr. 3.054; m.p. 872°C .

(b) Sp.gr. 1.964; m.p. loses $6\text{H}_2\text{O}$ at 112°C .

Derivation: Strontium carbonate is fused with calcium chloride, the melt extracted with water, the solution concentrated and crystallized.

Method of purification: Recrystallization.

Grades: Reagent; technical; anhydrous.

Containers: 1-, 5-lb bottles, wooden kegs; fiber drums.

Uses: Strontium salts; pyrotechnics, medicine.

Shipping regulations: None.*

strontium chromate SrCrO_4 .

Properties: Clean, light yellow shade pigment; sp.gr. 3.84, with rust inhibiting and corrosion resistant properties. Has good heat and light resistance and low reactivity in high acid vehicles.

Containers: Fiber drums.

Uses: In metal protective coatings to prevent corrosion; in polyvinyl chloride resins to produce pastel primrose yellows.

strontium dioxide. See strontium peroxide.

strontium fluoride SrF_2 .

Properties: White powder; soluble in hydrochloric acid and hydrofluoric acid. Insoluble in water. Sp.gr. 2.4; m.p. 1190°C .

Uses: Medicine; substitute for other fluorides.

strontium hydrate. See strontium hydroxide.

strontium hydroxide (strontium hydrate)

(a) $\text{Sr}(\text{OH})_2$; (b) $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: Colorless, deliquescent crystals.

Soluble in acids and hot water; slightly soluble in cold water. Absorbs carbon

dioxide from air. Sp.gr. (a) 3.625;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(b) 1.396; m.p. (a) 375°C.

Derivation: Heating the carbonate in steam.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles; wooden kegs.

Use: Sugar industry; lubricants from soap; stabilizer for plastics.

Shipping regulations: None.*

strontium hyposulfite. See strontium thiosulfate.

strontium iodide (a) SrI_2 (b) $\text{SrI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: (a) White, crystalline plates; decomposes in moist air. Keep well stoppered! Becomes yellow on exposure to air or light. (b) White crystals; soluble in water and alcohol.

Constants: (a) Sp.gr. 4.549; m.p. 515°C; b.p., decomposes. (b) Sp.gr. 2.76.

Derivation: By treating strontium carbonate with hydriodic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-, 5-lb bottles; 25-lb jars.

Use: Medicine.

Shipping regulations: None.*

strontium lactate $\text{Sr}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals or granular powder. Soluble in water, alcohol, ether.

Odorless.

Containers: 1-lb bottles.

Use: Medicine.

Shipping regulations: None.*

strontium monosulfide. See strontium sulfide.

strontium nitrate (a) $\text{Sr}(\text{NO}_3)_2$

(b) $\text{Sr}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White powder. Soluble in water; very slightly soluble in absolute alcohol.

Sp.gr. (a) 2.98, (b) 2.249; m.p. (a) 570°C.

Derivation: A concentrated solution of strontium chloride is precipitated by means of sodium nitrate.

Method of purification: Recrystallization.

Grades: Technical; reagent.

Containers: 200-lb bags.

Uses: Pyrotechnics; marine signals, railroad flares; matches, medicine.

Shipping regulations: Oxidizing material.

Yellow label.*

strontium nitrite (strontium nitrite, anhydrous) $\text{Sr}(\text{NO}_2)_2$.

Properties: White or yellowish powder, or hygroscopic needles. Soluble in water; insoluble in alcohol. Sp.gr. 2.8.

strontium nitrite, anhydrous. See strontium nitrite.

strontium oxide (strontia) SrO .

Properties: Grayish-white powder; sp.gr. 4.7; m.p. 2430°C; converted to hydroxide by water.

Derivation: Decomposition of strontium carbonate or hydroxide.

Uses: Manufacture of strontium salts; pyrotechnics; pigments, medicine.

strontium peroxide (strontium dioxide) (a) SrO_2 (b) $\text{SrO}_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder; odorless and tasteless; sp.gr. (a) 4.56; m.p. (a)

decomposes, (b) loses $8\text{H}_2\text{O}$ at 100°C and decomposes when heated to a higher temperature. Soluble in ammonium chloride solution; decomposes in hot water. Very slightly soluble in cold water. Soluble in alcohol.

Derivation: (a) By passing oxygen over heated strontium oxide. (b) Reaction of strontium hydroxide and hydrogen peroxide.

Containers: 100-, 500-lb drums.

Uses: Bleaching; medicinal; fireworks.

Caution: Fire hazard: dangerous; oxidizing material, does not burn or explode by itself but mixtures of strontium peroxide and combustible substances are explosive and ignite easily.

Shipping regulations: Oxidizing material.

Yellow label.*

strontium phosphate $\text{Sr}_3(\text{PO}_4)_2$.

Properties: White tasteless powder. Insoluble in water; soluble in acids.

Grades: C.P.

Containers: 1-lb bottles.

Use: Medicine.

Shipping regulations: None.*

strontium-potassium chlorate (potassium-strontium chlorate) $\text{Sr}(\text{ClO}_3)_2 \cdot 2\text{KClO}_3$.

Properties: White, crystalline powder; explosive on contact with reducing materials. Soluble in water.

Grades: Technical.

Use: Pyrotechnics.

Shipping regulations: Oxidizing material.

Yellow label.*

strontium salicylate $\text{Sr}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals or powder; odorless with sweet saline taste. Soluble in water and alcohol; decomposes when heated. Protect from light.

Derivation: By the interaction of strontium carbonate and salicylic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 5-, 25-lb cartons; drums.

Uses: Medicine; pharmaceutical and fine chemical manufacture.

Shipping regulations: None.*

strontium stearate $\text{Sr}(\text{OOC}_{17}\text{H}_{35})_2$.

Properties: White powder; m.p. 130-140°C. Insoluble in alcohol; soluble (forms gel)

in aliphatic and aromatic hydrocarbons.

Uses: In grease and wax compounding.

strontium sulfate SrSO_4 .

Properties: White precipitate or crystals of the mineral celestite. Odorless. Slightly soluble in concentrated acids; very slightly soluble in water; insoluble in alcohol and dilute sulfuric acid. Sp.gr. 3.71-3.97; m.p. 1605°C.

Derivation: (a) Celestite is ground. (b) Precipitation of any soluble strontium salt by means of sodium sulfate.

Method of purification: Washing with water.

Impurities: Sodium sulfate.

Grades: Reagent; technical; air floated, 90%, 325 mesh; free from sodium salts; C.P.

Containers: 1-, 5-lb bottles; bags; fiber drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Pyrotechnics; ceramics; paper manufacture.

Shipping regulations: None.*

strontium sulfide (strontium monosulfide) SrS .

Properties: Gray powder. Has hydrogen sulfide odor when in presence of moist air. Soluble in acids (decomposes); slightly soluble in water. Sp.gr. 3.7.

Grades: Technical.

Containers: Glass bottles.

Uses: Depilatory; luminous paints.

strontium thiosulfate (strontium hyposulfite)

$\text{SrS}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

Properties: Fine needles. Soluble in water; insoluble in alcohol; sp.gr. 2.17; m.p. loses $4\text{H}_2\text{O}$ at 100°C .

strophanthin. A glycoside or a mixture of glycosides obtained from *Strophanthus kombé*. This is K-strophanthin; for G-strophanthin see ouabain.

Properties: White or yellowish powder containing varying proportions of water, which it does not lose entirely without decomposition. Stable in air but affected by light. Solutions are neutral to litmus. Soluble in water and diluted alcohol, less soluble in dehydrated alcohol; nearly insoluble in chloroform, ether and benzene.

Containers: Bottles.

Use: Medicine.

Caution: Extremely poisonous!

strophanthin thoms. See ouabain.

strophanthus. Poisonous.

Derivation: Ripe seeds of *Strophanthus kombé* or *hispidus*.

Occurrence: Central Africa, Asia, Philippines.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

structural formula. See formula, chemical.

strychnidine $\text{C}_{21}\text{H}_{22}\text{ON}_2$.

Properties: Colorless crystals; m.p. 256°C .

Use: Reagent for nitrate determination.

strychnine $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2$. An alkaloid.

Properties: Hard, white, crystals or powder; very bitter taste; very poisonous!

M.p. $268\text{--}290^\circ\text{C}$; b.p. 270°C (5 mm).

Soluble in chloroform; slightly soluble in alcohol and benzene; very slightly soluble in water and ether.

Derivation: By extraction of the seeds of *Nux vomica* with acetic acid, filtration, precipitation by alkali and filtration.

Method of purification: Recrystallization.

Grades: Crystal; powder; technical.

Containers: Vials; tins.

Uses: In medicine as such, or as the hydrochloride, disulfate, lactate, nitrate, sulfate or other salt, which are more soluble in water; for destroying rodents and predatory animals and for trapping fur animals. See also strychnine salts.

Danger: Poisonous if swallowed. MCA warning label.

Shipping regulations: Class B poison. Poison label.*

strychnine salts. Under this heading the following salts with their corresponding formulas are described:

strychnine acetate: $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{HC}_2\text{H}_3\text{O}_2$.

strychnine arsenate: $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{H}_3\text{AsO}_4 \cdot 2\text{H}_2\text{O}$.

strychnine hydrochloride:

$\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{HCl} \cdot 2\text{H}_2\text{O}$.

strychnine hypophosphite:

$\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{H}_3\text{PO}_2 \cdot 2\text{H}_2\text{O}$.

strychnine nitrate: $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{HNO}_3$.

strychnine phosphate:

$\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 \cdot \text{H}_3\text{PO}_4 \cdot 2\text{H}_2\text{O}$. (N.F. XI.)

strychnine sulfate:

$(\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2)_2 \cdot \text{H}_2\text{SO}_4 \cdot 5\text{H}_2\text{O}$. (N.F. XI.)

Properties: All above salts are fine white crystalline powders; odorless; stable in air. In general, the salts are slightly to moderately soluble in water.

Containers: Cans.

Uses: In medicine. In industry as a poison for animals and rodents.

Danger: Poisonous if swallowed.

Shipping regulations: Class B poison. Poison label.*

stuff. Term used by paper makers to refer to mixtures containing the constituents of paper as supplied to the papermaking machine.

"**Stymer**." ⁵⁸ Trademark for vinyl and styrene resins used for sizes for acetate, rayon, and other synthetic fibers.

S-type synthetic elastomer. See styrene-butadiene rubber.

"**Styphen**." ²³³ Trademark for a mixture of styrenated phenols.

Properties: Light amber liquid; pour point 13°C ; b.p. (reflux) 353°C ; sp.gr. 1.080 ($25/25^\circ\text{C}$); flash point 450°F . Insoluble in water; soluble in methanol and ether.

Use: Antioxidant.

styphnic acid (2, 4, 6-trinitroresorcinol)

$\text{C}_6\text{H}(\text{OH})_2(\text{NO}_2)_3$.

Properties: Yellow crystals from ethyl acetate; astringent taste; m.p. $179\text{--}180^\circ\text{C}$;

explodes on rapid heating; forms additive* compounds with many hydrocarbons. Soluble in ethyl alcohol and ether; slightly soluble in water.

Derivation: Nitration of resorcinol.

Use: A constituent of priming agents in the explosive industry.

Shipping regulations: Explosive, class A. High explosive label.*

styracin. See cinnamyl cinnamate.

styrallyl acetate (methyl phenyl carbinyl acetate; "Gardenol"; phenyl methyl carbinyl acetate; sec-phenylethyl acetate)

$\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)\text{OOCCH}_3$.

Properties: Colorless liquid with very strong odor suggesting gardenia. Soluble in 70% alcohol. Sp.gr. 1.023–1.026; refractive index 1.493–1.496.

Containers: Bottles.

Uses: Perfumery.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

styrallyl alcohol (methyl phenyl carbinol; phenyl methyl carbinol; alpha-methylbenzyl alcohol; sec-phenethyl alcohol) $C_6H_5CH(CH_3)OH$.

Properties: Colorless liquid with a "green" floral odor. Soluble in 18 parts 30% alcohol; slightly soluble in water; sp. gr. 1.008-1.015; m. p. 21.4°C.

Use: Perfumery; dyes.

styramate $C_6H_5CHOHCH_2OOCNH_2$. 2-Phenyl-2-hydroxyethyl carbamate. Used in medicine.

styrax (storax; oriental sweet gum; liquid amber orientalis).

Properties: (a) American. Amber-colored droplets or powder. (b) Levant. Thick, tough, gray, semi-liquid mass. Characteristic odor and taste. Soluble in ether, acetone, carbon disulfide, and warm alcohol, some residue usually remaining; insoluble in water.

Constituents: Storesin; cinnamic acid and esters; small amounts of styrene.

Constants: (a) Sp. gr. 0.890-1.100; b. p. 150-300°C; optical rotation -3° to -38°.

Derivation: A balsam obtained from the inner bark of *Liquidambar orientalis* or *L. styraciflua*.

Occurrence: (a) Honduras; (b) Asia Minor. Method of purification: Solution in ether and treatment with fused calcium chloride.

Grades: Technical; U.S.P. XVI.

Containers: 1-, 5-, 10-lb bottles, 90-lb cases.

Uses: Medicine; microscopy; fumigating powders and tablets; perfumery.

Shipping regulations: None.*

styrax oil (storax oil).

Properties: Pale yellow, liquid, volatile oil. Chief known constituents: Styrol; cinnamic acid esters.

Constants: Sp. gr. 0.890-0.900; b. p. 150-300°C, with decomposition; optical rotation -15°.

Derivation: By distillation from styrax.

Grades: Technical.

Containers: Glass bottles.

Use: Perfumery.

Shipping regulations: None.*

styrenated oils. Drying oils whose drying and hardening characteristics have been modified by incorporation with styrene or a similar easily polymerized monomer.

styrene (styrene monomer; vinylbenzene; phenylethylene; cinnamene; cinnamol) $C_6H_5CH=CH_2$.

Properties: Highly refractive; colorless liquid; aromatic odor. F. p. -30.63°C; b. p. 145.2°C; sp. gr. (25/25°C) 0.9045; wt./gal (20°C) 7.55 lbs; flash point (Tag open cup) 100°F. Insoluble in water; soluble in alcohol and ether. Readily undergoes polymerization when heated or exposed to light or a peroxide catalyst, becoming increasingly viscous until a clear solid is produced. The polymerization releases heat and may become explosive. Inhibitors, such as hydroquinone or para-tert-butylcatechol, must be added to prevent

polymerization during storage or shipping. Derivation: (a) From ethylene and benzene in the presence of aluminum chloride to yield ethylbenzene, which is catalytically dehydrogenated at about 630°C to form styrene; (b) from ethylbenzene, which is oxidized to acetophenone, hydrogenated to form methyl phenyl carbinol, and finally dehydrated to styrene. Large amounts of ethylbenzene are obtained by superfractionation of petroleum streams.

Purification: Vacuum and azeotropic distillation.

Grades: Technical 99.2%; polymer 99.6%.

Containers: Glass bottles; carboys; steel drums; in bulk in tank cars and tank trucks.

Uses: Polystyrene plastics; SBR and ABS resins; protective coatings (styrene-butadiene latex; alkyls); intermediate; impregnation of magnesium castings.

Caution: Vapor harmful. Use with adequate ventilation. Avoid prolonged or repeated contact with skin. MCA warning label.

Shipping regulations: Noae.*

styrene-butadiene rubber (SBR, GR-S, S-type synthetic elastomer). The most common type of synthetic rubber, amounting to over 80% of the total produced in recent years. Manufacture involves co-polymerization of about 3 parts butadiene with 1 part styrene. These materials are suspended in finely divided emulsion form in a large proportion of water, in the presence of some kind of a soap, or detergent. Also present in small amounts are an initiator or catalyst which is usually a peroxide, and a chain-modifying agent (usually a mercaptan such as dodecyl mercaptan).

A redox activator (ferrous sulfate, dextrose, and a complex phosphate) is also used for cold-rubber production. The latter differs from ordinary synthetic production only in that the activator causes the polymerizations to occur at about 40°F which in turn gives polymer molecules that have properties superior to those produced at higher temperatures. The earlier U.S. processes for SBR operated at about 120°F in the absence of the redox activator. Redox refers to the reactions between the reducing agents (dextrose, etc) and the oxidized form of the ferrous sulfate, which is instrumental in providing a controlled supply of free radicals at the 40°F temperature.

The polymerization process usually requires 5 to 15 hours, at the end of which the water contains suspended finely divided globules of synthetic rubber, i. e., a rubber latex. Usually only 60 to 80% of the butadiene and styrene are allowed to react because further reaction reduces quality and proceeds too slowly to be practical. The reaction is stopped at the desired time by adding an active reducing agent such as hydroquinone, referred to as a short stop.

The unreacted starting materials are vaporized to remove them from the latex and recover them for recycling. A rubber stabilizer (antioxidant), and other materials

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

are often added at this point, and the latex then coagulated by adding sodium chloride and various acidic materials. Crumbs of synthetic rubber form and are filtered, washed and dried to produce a product with physical appearance and properties similar to natural gum rubber. The material is white at first but quickly turns brown due to slight oxidation.

A great many special varieties of SBR are produced in addition to the regular and cold types. The most important special types are oil extended, cold oil black, and regular black masterbatch. The word oil signifies a rubber to which 20 to 35% of a petroleum oil has been added to improve properties and reduce cost. Regular black masterbatch is a synthetic rubber made at elevated temperature (120°F usually), and to which carbon black and other processing and compounding agents have been added prior to coagulation. Variations of many kinds are achieved for special purpose rubbers by changing the proportions of butadiene and styrene, by varying the percentage of completion of the reaction, by the nature and amounts of additives, etc. A considerable volume of the synthetic rubber latex is used as such.

SBR is used mainly for automobile and other tires, but molded and extruded industrial items (gaskets, shock absorbers, etc.) belts, hose, packing, footwear, flooring, heels and soles are also major uses.

styrene monomer. Same as styrene.

styrene nitrosite. A compound resulting from the reaction between styrene and nitrogen dioxide and used as a qualitative or quantitative specific test for monomeric styrene in mixtures with other hydrocarbons.*

styrene oxide $C_6H_5\overline{CHOCH_2}$.

Properties: Colorless to pale straw-colored liquid. Boiling range (5 to 95%) (760 mm) 194.2-195°C; f.p. -36.6°C, flash point 165°F, refractive index ($n_{25/D}$) 1.5328, sp. gr. (25/4°C) 1.0469; miscible in benzene, acetone, ether, and methanol.

Use: Highly reactive organic intermediate.

"Styresol." ³⁶ A group of styrenated alkyl resins with air-drying and baking properties and high resistance to gasoline, alkalies, acids, and water.

Physical properties: Non-volatile 44-51%, viscosity (Gardner-Holdt) Q-Z⁵, color (Gardner 1933) 2-9, acid number 3-15.

"Styrofoam." ²³³ Trademark for a brand of expanded, cellular polystyrene.

"Styron." ²³³ Trademark for polystyrene resin thermoplastic molding granules. Available in colors and a number of forms for compression or injection molding, extrusion, and transfer molding.

Properties: Colorless (unless pigmented); odorless; tasteless; resistant to weather, age, sunlight. Unaffected by water, strong and weak acids, strong and weak alkalies, and alcohols. Solvated by ketones, esters,

aromatic and aliphatic hydrocarbons, and some mineral, animal and vegetable oils.

Uses: Electrical insulators; high-frequency coaxial cables; decorative items; ornaments; refrigerator moldings; medical and chemical ware; combs; panels; optical parts; edge-lighted dials; reflector buttons; cosmetic containers; dishes; teaspoons.

styryl alcohol. See cinnamic alcohol.

styrylic alcohol. See cinnamic alcohol.

subbituminous coal. A rank of coal between lignite and bituminous coal. Usually has a glossy black color and pitchy luster. As mined, it may contain 12-40% moisture. The principal U.S. deposits are in Wyoming, Montana, New Mexico, and Washington.

subcritical. See chain reaction.

suberane. See cycloheptane.

suberic acid (octanedioic acid)

$HOOC(CH_2)_6COOH$.

Properties: Colorless crystals from water; m.p. 140°C, b.p. 279°C at 100 mm. Sparingly soluble in ether; soluble in alcohol; insoluble in chloroform.

Use: As intermediate for the synthesis of drugs, dyes and high polymers.

suberone. See cycloheptanone.

sublimation. The direct passage of a substance from the solid state to the gaseous state and back into the solid form without at any time appearing in the liquid state. Also applied to the conversion of solid to vapor without the later return to solid state, and to a conversion directly from the vapor phase to the solid state.

sublimed blue lead. See lead sulfate, blue basic.

sublimed white lead. See lead sulfate, basic.

subnuclear particle. Particles either found in the nucleus or observed coming from the nucleus as the result of nuclear reaction or rearrangement, i.e., neutrons, mesons, etc. See fundamental particle.

substantive dyes. Direct dyes.

substitution. Any chemical reaction in which one element replaces another in a compound. Chlorination of benzene to produce chlorobenzene is a typical example, in this case chlorine replaces hydrogen in the benzene molecule.

substrate. A substance upon which an enzyme or ferment acts.

subtilin. An antibiotic produced by the metabolic processes of a strain of *Bacillus subtilis*. It is a cyclic polypeptide similar to bacitracin in chemical structure and antibiotic activity, but not as important clinically. Subtilin is active against many gram-positive bacteria, some gram-negative cocci, and some species of fungi. It is a surface tension depressant, and its antibiotic action is increased by use of wetting agents.

Properties: Soluble in water in pH range 2.0-6.0; soluble in methanol and ethanol (up to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

80%); insoluble in dry ethanol or other common organic solvents. Relatively stable in acid solutions. Inactivated by pepsin and trypsin, and destroyed by light.

Uses: Medicine; seed disinfectant.

"Sucaryl."³ Trademark for sodium, potassium, and calcium salts of cyclohexylsulfamic acid. These are referred to as "Sucaryl" sodium, "Sucaryl" calcium, etc. Also known as cyclamates (q.v.).

succinaldehyde (butanedial) $\text{OHCCH}_2\text{CH}_2\text{CHO}$.
Properties: Liquid; sp.gr. 1.064 (20/4°C); b.p. 169-170°C. Refractive index 1.4254. Soluble in water, alcohol, and ether.

The name succinaldehyde is also often incorrectly used in commerce as a synonym for succinic anhydride.

succinic acid (butanedioic acid, ethylenedicarboxylic acid) $\text{CO}_2\text{H}(\text{CH}_2)_2\text{CO}_2\text{H}$.

Properties: Colorless crystals; soluble in water; sparingly soluble in alcohol and ether; odorless, acid taste. Sp.gr. 1.552; m.p. 185°C; b.p. 235°C.

Derivation: By the fermentation of ammonium tartrate.

Method of purification: Crystallization.

Grades: Technical, C.P.

Containers: 1-lb bottles, wooden barrels; kegs, fiber drums.

Uses: Medicine, organic synthesis; manufacture of lacquers, dyes, esters for perfumes, succinates, photography.

Shipping regulations: None.*

succinic acid peroxide.

Shipping regulations: Oxidizing material. Yellow label.*

succinic anhydride (2,5-diketotetrahydrofuran, succinyl oxide; butanedioic anhydride) $\text{H}_2\text{C}(\text{O})\text{OC}(\text{O})\text{CH}_2$. Note: The term succinaldehyde is incorrectly used as a synonym for succinic anhydride, but more correctly is a name for a different compound.

Properties: Colorless or lightly colored needles or flakes; sp.gr. 1.104 (20/4°C); m.p. 120°C; b.p. 261°C. Soluble in water (with conversion into succinic acid), alcohol, and chloroform; very slightly soluble in ether. Sublimes at 115°C at 5 mm pressure.

Grade: Distilled.

Containers: 250-lb drums.

Use: Manufacture of chemicals, pharmaceuticals, esters, and resins.

succinimide (2,5-diketopyrrolidine)

$\text{H}_2\text{C}(\text{O})\text{NHC}(\text{O})\text{CH}_2$ or $\text{C}_4\text{H}_5\text{O}_2\text{N} \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals or thin light tan flakes; nearly odorless; sweet taste; m.p. 125-127°C; b.p. 287-288°C; sp.gr. 1.41. Very soluble in hot water, completely soluble in cold water or sodium hydroxide solution; slightly soluble in alcohol; insoluble in ether and chloroform.

Grades: Purified; technical.

Use: Certain derivatives are useful as growth stimulants for plants; also used in organic synthesis.

succinodimide. See N-iodosuccinimide.

succinite. See amber.

succinonitrile. See ethylene cyanide.

succinylcholine chloride (choline succinate dichloride dihydrate)

$[\text{Cl}(\text{CH}_3)_3\text{N}(\text{CH}_2)_2\text{OOCCH}_2]_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, odorless, slightly bitter, crystalline powder. Very soluble in water; slightly soluble in alcohol; very slightly soluble in benzene and chloroform; practically insoluble in ether. Aqueous solutions are unstable at room temperature. pH (2% solution) 3.0-4.5; m.p. 160-164°.

Grade: U.S.P. XVI.

Use: Medicine.

succinyl oxide. See succinic anhydride.

succinylsulfathiazole $\text{C}_{13}\text{H}_{13}\text{N}_3\text{O}_5\text{S}_2 \cdot \text{H}_2\text{O}$.

Properties: White or yellowish white, crystalline powder; odorless and stable in air, slowly darkening on exposure to light. Almost insoluble in water, soluble in solutions of alkali hydroxides and in solutions of sodium bicarbonate with evolution of carbon dioxide; sparingly soluble in alcohol and acetone; insoluble in chloroform and ether.

Derivation: From sulfathiazole and succinic anhydride.

Grade: N.F. XI.

Use: Medicine.

"Suconox."²¹² Trademark for a series of amides of para-aminophenol, having antioxidant properties.

Suconox-4: N-n butyryl-para-aminophenol.

Suconox-9: N-n pelargonyl-para-aminophenol.

Suconox-12: Essentially N-lauroyl-para-aminophenol.

Suconox-18: Essentially N-stearoyl-para-aminophenol.

Uses: In synthetic rubber and polyethylene.

"Sucostrin."⁴¹² Trademark for succinylcholine chloride (q.v.).

sucrase. See invertase.

sucroblanc. A mixture used to defecate and bleach sugar solution in one operation. Contains high-test calcium hypochlorite, calcium superphosphate, lime and Filtercel.

sucrol. See dulcin.

sucrose. Pure sugar. See sugar, cane and beet.

sucrose acetate isobutyrate (SAIB)

$(\text{CH}_3\text{COO})_2\text{C}_{12}\text{H}_{14}\text{O}_3[\text{OOCCH}(\text{CH}_3)_2]_6$. Clear sucrose derivative available either as a semi-solid (100%), or as a 90% solution in ethyl alcohol.

Properties: Sp.gr. 1.146 (25/25°C); molecular weight 847; color (APHA) max 100.

Containers: 55-gal drums.

Uses: As a modifier for lacquers and hot-melt coating formulations.

sucrose monostearate.

Properties: Odorless, tasteless white powder.

Derivation: By reaction of sugar and methyl stearate in a suitable solvent and with potassium carbonate catalyst.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Low-foam non-ionic detergent; surfactants.

sucrose octaacetate $C_{12}H_{14}O_3(OOCCH_3)_8$.

Properties: White, hygroscopic, crystalline material. Bitter taste. When once melted does not recrystallize on cooling but becomes a transparent film. Ultra-violet light increases transparency. Molten film is very adhesive but this property is lost when the film is cooled below its melting point. Rate of hydrolysis, practically nil. Gives no action with Fehling's solution. Soluble in acetic acid, acetone, benzene, ethylene dichloride, methyl acetate, toluene; slightly soluble in water.

Constants: Sp.gr. 1.28 (fused) (20/20°C); b.p. 260°C (0.1 mm); m.p. 79-84°C; refractive index 1.4660 (20°C); decomposes above 285°C; viscosity (100°C) 29.5 poises; specific rotation (CCl₄) +54.96°.

Typical specification: Sucrose octaacetate 99.0% min; free acidity (as acetic) 0.01-0.10%; m.p. 78-84°C; insolubles (in alcohol) 0.05% max; sp.gr. (fused) 1.28; color creamy white.

Grades: Technical; reagent; denaturing.

Containers: Bags; plywood drums; 200-lb slack barrels.

Uses: Plasticizer for cellulose esters and synthetic resins; adhesive compositions; coating compositions; insecticide; termite repellent; denaturant in rubbing alcohol formulas, paper, plastics; lacquers.

Shipping regulations: None.*

"**Sudafed.**" ³⁰¹ Trademark for pseudoephedrine hydrochloride (q.v.).

"**Sudan.**" ³⁰⁷ Trademark of a line of dyestuffs.

Properties: Soluble in hydrocarbons.

Use: For the coloring of fats, oils, waxes, etc.

"**Sudan III.**" ³⁰⁷ Trademark for aminoazobenzene-beta-naphthol (q.v.).

"**Sudan IV.**" ³⁰⁷ Trademark for scarlet red (q.v.).

"**Suganilla.**" ³⁴² Trademark for concentrated extractives of vanilla beans adsorbed on sugar for food flavoring purposes.

sugar, acorn. See quercitol.

sugar, beet. See sugar, cane and beet.

sugar, burnt. See caramel.

sugar, cane and beet (saccharose; saccharum, sucrose) $C_{12}H_{22}O_{11}$.

Properties: Hard, white, dry crystals, lumps or powder; sweet taste; odorless.

Soluble in water; very slightly soluble in alcohol. Solutions are neutral to litmus.

Constants: Sp.gr. 1.5877; decomposes 160-186°C.

Derivation: By crushing and extraction of sugar cane (*Saccharum officinarum*) with water or extraction of the sugar-beet (*Beta vulgaris*) with water, evaporating and purifying with lime, absorbent carbon and various liquids.

Grades: Reagent; U.S.P. XVI; technical;

refined.

Containers: Multiwall paper sacks and in bulk in box cars.

Uses: Food; sweetening; manufacture of syrups; confectionery; preserves and jams; demulcent and lenitive; soap; pharmaceutical products; caramel; as chemical intermediate for detergents; emulsifying agents and other sucrose derivatives, including plasticizers, resins, explosives, glues, insecticides.

Shipping regulations: None.*

sugar cane wax. A hard wax varying from dark green to tan and brown; produced by solvent extraction. M.p. 76-79°C.

Grades: Domestic refined, in slabs.

Containers: Cartons.

Uses: Polishes, pigment disperser, castings, lubricant for plastics in food wrappers.

sugar coloring. See caramel.

sugar, corn. See dextrose.

sugar, grape. See dextrose.

sugar, invert. See invert sugar.

sugar of lead. See lead acetate.

sugar of milk. See lactose.

sugar, reducing. Sugars that will reduce Fehling's solution or similar test liquids, with conversion of the blue soluble copper salt to a red, orange or yellow precipitate of cuprous oxide. Glucose and maltose are typical examples of reducing sugars, their molecules containing an aldehyde group that is the basis for this type of reaction.

Suida process. A process for the separation of acetic acid from pyroigneous acid vapor by absorption using a high-boiling wood-oil fraction as the absorption oil.

"**Sulamyd.**" ³²¹ Brand name for sulfacetamide.

sulfacetamide (*N*¹-acetylsulfanilamide)

$NH_2C_6H_4SO_2NHCOCCH_3$.

Properties: Odorless, white crystalline powder. Characteristic sour taste. M.p. 181-184°C; decomposes with evolution of gas at 190-195°C. Soluble in alcohol; slightly soluble in water, ether and chloroform; practically insoluble in benzene.

Grade: N.F. XI.

Containers: Fiber drums.

Use: Medicine.

sulfacetamide sodium (*N*¹-acetylsulfanilamide

sodium) $NH_2C_6H_4SO_2NNaCOCCH_3 \cdot H_2O$.

Properties: White, odorless, bitter, crystalline powder. Soluble in water; sparingly soluble in alcohol, and acetone; practically insoluble in benzene, chloroform and ether. pH (1 in 20 solution) 8.0-9.5. Aqueous solutions must be refrigerated and protected from light.

Grade: U.S.P. XVI.

Containers: Fiber drums.

Use: Medicine.

sulfadiazine (2-sulfanilamidopyrimidine)

$H_2NC_6H_4SO_2NHC_4H_3N_2$.

Properties: White or slightly yellow powder

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or crystals nearly odorless; stable in air, slowly darkening on exposure to light; m.p. 252-256°C. Very slightly soluble in water; sparingly soluble in alcohol, acetone, and chloroform. Freely soluble in dilute mineral acids and in solutions of potassium and sodium hydroxides.

Derivation: Made from sulfanilamide by the action of pyrimidine.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine.

sulfadiazine sodium (sulfadiazine, soluble)

$C_{10}H_9N_4O_2SNa$.

Properties: White powder. Protect from air and light! Soluble in water; slightly soluble in alcohol.

Grade: U.S.P. XVI.

Containers: Fiber drums.

Use: Medicine.

sulfadiazine, soluble. See sulfadiazine sodium.

sulfadimethoxine $H_2NC_6H_4SO_2NHC_4HN_2(OCH_3)_2$.
N¹-(2, 6-Dimethoxy-4-pyrimidinyl)sulfanilamide.

Properties: M.p. 197-202°C. Insoluble in water; slightly soluble in alcohol; very slightly soluble in ether and chloroform.

Use: Medicine.

"Sulfads." ⁶⁹ Trademark for proprietary preparation of dipentamethylene thiuram tetrasulfide $[(CH_2)_5NC(S)_2]_2$.

Properties: Light yellow to buff powder (also supplied in "rodform"); sp.gr. 1.50 ± 0.03 ; melting range 126-135°C; soluble in chloroform, benzene, acetone; slightly soluble in gasoline, carbon tetrachloride; insoluble in water, dilute caustic.

Uses: Accelerator in natural, nitrile and butyl rubbers and SBR.

sulfaethidole $H_2NC_6H_4SO_2NHC_2N_2S(C_2H_5)_2$.

N¹-(Ethyl-1, 3, 4-thiadiazole-2-yl)sulfanilamide. White crystalline powder.

Grade: N.N.D.

Use: Medicine.

sulfaguanidine (sulfanilylguanidine)

$H_2NC_6H_4SO_2NHC(NH_2)NH \cdot H_2O$.

Properties: White needle-like crystalline powder; m.p. 190-193°C; nearly odorless; stable in air, darkening on exposure to light. Soluble in dilute mineral acids; sparingly soluble in alcohol and acetone; insoluble in solutions of sodium hydroxide at room temperature; soluble in hot water.

Derivation: Condensation of guanidine with N-acetylsulfanilyl chloride.

Grade: N.F. XI.

Containers: Drums.

Use: Medicine.

"Sulfamate Nickel." ⁷² Proprietary nickel sulfamate process used to produce heavy, smooth, nickel deposits with good mechanical properties. Prepared from nickel sulfamate, nickel chloride, boric acid and organic addition agents. The addition agents function to control the stress of the deposit.

Uses: Electroforming and electrotyping.

sulfamerazine $H_2NC_6H_4SO_2NHC_4H_2N_2CH_3$. N-(4-Methyl-2-pyrimidyl)sulfanilamide.

Properties: White or faintly yellowish-white crystals or powder; m.p. 234-238°C; slightly bitter taste; odorless or nearly so; stable in air but slowly darkens on exposure to light. Readily soluble in dilute mineral acids and in solutions of potassium, ammonium and sodium hydroxides; practically insoluble in water; sparingly soluble in acetone; slightly soluble in alcohol.

Grade: U.S.P. XVI.

Use: Medicine.

sulfamerazine sodium (sulfamerazine, soluble)

$C_{11}H_{11}N_4O_2SNa$.

Properties: White, or faintly yellowish-white crystals, or a crystalline powder, which slowly darkens on exposure to light, odorless or nearly so with a bitter taste. Soluble in water; slightly soluble in alcohol; insoluble in ether and chloroform.

Containers: Drums.

Use: Medicine.

sulfamethazine $NH_2C_6H_4SO_2NHC_4N_2H(CH_3)_2$.

N-(4, 6-Dimethyl-2-pyrimidyl)sulfanilamide.

Properties: White to yellow-white powder. Almost odorless; slightly bitter taste. Affected by light. M.p. 197-200°C. Soluble in acetone; slightly soluble in alcohol; very slightly soluble in water and ether.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine.

sulfamethizole $H_2NC_6H_4SO_2NHC_2N_2S(CH_3)_2$.

N¹-(5-Methyl-1, 3, 4-thiadiazol-2-yl)sulfanilamide.

Properties: White crystals or powder; slightly bitter taste; almost odorless. Very slightly soluble in water, soluble in solutions of alkalis; soluble in dilute mineral acids; sparingly soluble in alcohol. Melting range 207°-211°.

Grade: N.F. XI.

Use: Medicine.

sulfamethoxypyridazine $C_{11}H_{12}N_4O_3S$. N¹-(6-methoxy-3-pyridazinyl)sulfanilamide.

Properties: White or yellowish white, crystalline powder. Odorless or nearly so; bitter aftertaste. Stable in air, but slowly darkens on exposure to light; m.p. 180-183°C. Very slightly soluble in water. Sparingly soluble in alcohol and acetone. Freely soluble in dilute mineral acids and in solutions of alkali hydroxides.

Derivation: Prepared from 6-chloro-3-sulfanilamidopyridazine.

Grade: U.S.P. XVI.

Use: Medicine.

Also available as the hydrochloride.

sulfamic acid HSO_2NH_2 .

Properties: White crystalline solid; non-volatile; non-hygroscopic; sp.gr. 2.1; m.p. 205°C (decomposes). Moderately soluble in water; slightly soluble in organic solvents. Odorless. Aqueous solutions are highly ionized, giving pH values lower than solutions of formic, citric, tartaric, phosphoric, and oxalic acids. All of the common salts

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(including calcium, barium, and lead salts) are extremely soluble in water.

Grades: Reagent; crystalline; granular. Containers: 50- and 100-lb fiber drums.

Uses: Metal and ceramic cleaning; metal pickling; nitrite removal in azo dye operations; gas liberating compositions; electroplating and refining of metals; organic synthesis; analytical acidimetric standard; preparation of odorless formaldehyde; preparation of amine sulfamates used as plasticizers, softening agents, and fire retardants for paper and other cellulosic materials.

Shipping regulations: None.*

sulfamidyl. See sulfanilamide.

"Sulfamylon" Hydrochloride. ¹⁶² Trademark for maphenide hydrochloride.

sulfanilamide (p-aminobenzenesulfonamide; sulfamidyl) $\text{H}_2\text{NC}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: White; odorless crystals, or a crystalline powder; m.p. 164.5-166.5°C. Soluble in acetone, glycerin, hydrochloric acid, alcohol, and boiling water; slightly soluble in cold water, insoluble in chloroform, ether and benzene.

Derivation: Condensation of acetyl sulfanilyl chloride with ammonia and subsequent hydrolysis.

Method of purification: Recrystallization.

Grades: N.F. XI.

Containers: Ampoules, glass vials and bottles; fiber drums.

Uses: Medicine, chemotherapeutics.

Shipping regulations: None.*

2-sulfanilamidopyridine. See sulfapyridine.

2-sulfanilamidopyrimidine. See sulfadiazine.

sulfanilic acid (para-aminobenzenesulfonic acid; para-anilinesulfonic acid)

$\text{H}_2\text{NC}_6\text{H}_4\text{SO}_3\text{H} \cdot \text{H}_2\text{O}$.

Properties: Grayish-white, flat crystals. Soluble in fuming hydrochloric acid; slightly soluble in water, very slightly soluble in alcohol and ether.

Constants: M.p., chars at 280-300°C

Derivation: By heating aniline with weak fuming sulfuric acid and pouring the reaction product into water.

Method of purification: By boiling a solution of the sodium salt with animal charcoal.

Grades: Technical; pure, reagent.

Containers: 1-, 5-lb bottles; drums.

Uses: Dyestuffs; organic synthesis; medicine.

Shipping regulations: None.*

meta-sulfanilic acid. See metanilic acid.

sulfanilylbutylurea. See 1-butyl-3-sulfamylurea.

sulfanilylguanidine. See sulfaguanidine.

"Sulfanole." ⁴² Proprietary products. Various types.

Properties: Amber solutions and gels, pastes and powders. Disperse readily in water at temperatures of 60°C. Containers: 55-gal steel and fiber drums.

Uses: Detergents in all types of textile fabric preparation for scouring and dyeing.

"Sulfanole" NO-9. ⁴² Proprietary product. Non-ionic surfactant.

Properties: Colorless thick syrup at 25°C.

Disperses readily in water at 20°C.

Containers: 55-gal steel drums.

Use: Penetrating agent and detergent for all types of textile fabrics during preparation in scouring, dyeing and in resin application for finishing.

"Sulfanthrene." ²⁸ Trademark for a line of thioindigoid vat dyes characterized by good fastness properties.

Use: Principally for the dyeing and printing of cotton, rayon and silk.

sulfapyridine (2-sulfanilamidopyridine)

$\text{H}_2\text{NC}_6\text{H}_4\text{SO}_2\text{NHC}_5\text{H}_4\text{N}$.

Properties: White, or faintly yellowish-white crystals or crystalline powder. Soluble in dilute mineral acids and aqueous solutions of potassium or sodium hydroxide; slightly soluble in water and alcohol. M.p. 190-193°C.

Derivation: Condensation of acetyl sulfanilyl chloride with 2-aminopyridine and subsequent hydrolysis.

Method of purification: Crystallization.

Grades: U.S.P. XVI.

Containers: Ampoules, glass vials and bottles; tins.

Uses: Medicine, chemotherapeutics.

Shipping regulations: None.*

Also available as the sodium monohydrate salt.

sulfaquinoxaline [N-(2-quinoxaliny)sulfanilamide] $\text{H}_2\text{NC}_6\text{H}_4\text{SO}_2\text{NHC}_8\text{H}_5\text{N}_2$.

Properties: Crystals; m.p. 247°C, almost insoluble in water; soluble in alkaline solutions.

Containers: Drums.

Use: Veterinary medicine.

sulfarsphenamine (3,3'-disodium-4,4'-diaminodihydroxyarsenobenzene-N-dimethylenesulfonate) $\text{NaOSO}_2\text{CH}_2\text{NHOHC}_6\text{H}_3\text{As:AsC}_6\text{H}_3\text{OHNHCH}_2\text{OSO}_2\text{Na}$.

Properties: Orange-yellow powder; almost odorless. Must not contain less than 19% of arsenic. Readily soluble in water yielding a yellow solution which is acid to litmus paper; slightly soluble in alcohol; insoluble in ether.

Derivation: Synthetic.

Containers: Ampoules.

Use: Medicine.

Shipping regulations: None.*

"Sulfasan" R. ⁵⁸ Trade name for 4,4'-dithiodimorpholine.

Properties: Coarse, gray powder; m.p.

122°C min; flash point 250°F; sp.gr. 1.29.

Containers: 150-lb fiber drums.

Uses: Rubber compounding.

sulfate pulp. See wood pulp.

sulfate resisting cement. See cement, chemical-resisting.

sulfathiazole $\text{C}_9\text{H}_7\text{N}_3\text{O}_2\text{S}_2$.

Properties: White, or faintly yellowish-white

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

crystals or powder; odorless or nearly so; stable in air; slowly darkens on exposure to light. Soluble in acetone, dilute mineral acids, or aqueous solutions of potassium and sodium hydroxide; slightly soluble in water and alcohol. M.p. 200-204°C.

Derivation: Condensation of 2-aminothiazole with acetylsulfanilyl chloride and a subsequent hydrolysis.

Method of purification: Crystallization.

Grades: N.F. XI; technical.

Containers: Ampoules; glass vials and bottles; drums.

Uses: Medicine; chemotherapeutics.

Fire hazard: None.

Shipping regulations: None.*

sulfathiazole sodium (sulfathiazole, soluble; sodium 2-sulfanilamidothiazole)
 $C_9H_8N_4O_2S_2Na \cdot 1\frac{1}{2}H_2O$.

Properties: White to faintly yellowish-white powder or granules, affected by light. Soluble in water and alcohol. Absorbs CO_2 on prolonged exposure to humid air, becoming incompletely soluble in water.

Grades: N.F. XI.

Containers: Drums.

Use: Medicine.

sulfathiazole, soluble. See sulfathiazole, sodium.

ortho-sulphydrylbenzoic acid. See thiosalicylic acid.

"Sulfidal." ¹³⁸ Trademark for a dried colloidal sulfur powder.

Properties: A pale yellow powder, containing about 80% sulfur, which disperses readily in water up to about 10% to give a milky fluid.

Use: Medicine (external).

sulfide dyes (sulfur dyes). A group of dyes produced by heating various organic compounds with sulfur. The characteristic chromophore groupings are $\equiv C-S-C\equiv$ and $\equiv C-S-S-C\equiv$. Color index ranges from 933-1012. Application is usually to cotton from a sodium sulfide bath. Sulfur black (Color Index 978) is an important example.

"Suffindone." ²⁴³ Trademark of sulfur dyes for cotton.

sulfinpyrazone (C_6H_5)₂C₃N₂H(O)₂C₂H₄S(O)C₆H₅.
 1,2-Diphenyl-4-(2'-phenylsulfinylethyl)-3,5-pyrazolidinedione. Used in medicine.

sulfisomidine $H_2NC_6H_4SO_2NHC_4N_2H(CH_3)_2$.
 N¹-(2,6-Dimethyl-4-pyrimidinyl)sulfanilamide.

Grade: N.N.D.

Use: Medicine.

sulfisoxazole (N-3,4-dimethyl-5-isoxazolyl-sulfanilamide) $H_2NC_6H_4SO_2NHC_4NO(CH_3)_2$.
 Properties: White to slightly yellowish, odorless, slightly bitter, crystalline powder. M.p. 192-195°C. Freely soluble in dilute hydrochloric acid; soluble in boiling alcohol; almost insoluble in water.

Grade: U.S.P. XVI.

Use: Medicine.

sulfisoxazole diethanolamine

$C_{11}H_{13}N_3O_3S \cdot HN(CH_2CH_2OH)_2$.

Properties: Slightly yellowish, crystalline powder. Very soluble in water; soluble in alcohol; very slightly soluble in chloroform; practically insoluble in ether. M.p. 120-123°C.

Grade: U.S.P. XVI.

Use: Medicine.

sulfite acid liquor. An aqueous solution of calcium bisulfite or calcium and magnesium bisulfites containing a large amount of free sulfur dioxide. It is prepared from sulfur dioxide and limestone or dolomite or lime by passing sulfur dioxide gas up towers, packed with limestone, down which water flows.

Use: In the manufacture of sulfite pulp in the paper industry.

sulfite pulp. See wood pulp.

sulfite waste liquor. A waste liquor produced in the sulfite process of making paper. Sold in three forms, (a) Dilute, (b) Concentrated, (c) Solid.

Properties: (a) Light brown liquid. (b) Dark brown viscous liquid. (c) Brown granular solid.

Constants: (a) 10% total solids. (b) 50-52% solids; gr. 30-35° Bé.

Derivation: (a) Neutralized with lime or soda.

(b) Neutralized and evaporated to 30° Bé.

(c) Neutralized and evaporated to dryness.

Containers: (a) Drums; carboys. (b) Drums; barrels. (c) Bags; barrels.

Uses: Foam producer; emulsifier; adhesive; tanning agent; binder for briquets, cores, unpaved roads; source of torula yeast.

Shipping regulations: None.*

See also lignin sulfonates.

sulfobenzeneazodimethylaniline. See dimethylaminoazobenzene sulfonate.

meta-sulfobenzoic acid $HO_2SC_6H_4COOH \cdot 2H_2O$.

Properties: Grayish-white solid; stable but hygroscopic in air; m.p. 98°C, anhydrous form melts at 141°C. Soluble in water, alcohol; very soluble in ether; insoluble in benzene, carbon tetrachloride, petroleum ether.

Derivation: Direct sulfonation of benzoic acid with sulfur trioxide.

Typical specifications: Ground powder or $\frac{1}{2}$ -1 in. lumps. Less than 0.2% insoluble in water; neutralization equivalent 99-101; m.p. range 130-141°C; para isomer, small amount.

Uses: Derivative for surface active agents.

Shipping regulations: None.*

ortho-sulfobenzoic acid $HO_2SC_6H_4COOH$.

Properties: White needles. Soluble in water and alcohol; insoluble in ether.

Constants: M.p. 68-69°C (with 3H₂O of crystallization); m.p. 134°C (dry).

Derivation: (a) From saccharin and concentrated hydrochloric acid; (b) by the oxidation of thiosalicylic acid, with potassium permanganate in alkaline solution.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Method of purification: Crystallization from water.

Containers: Glass bottles.

Uses: Manufacture of sulfonaphthalein indicators; dyes.

Shipping regulations: None.*

sulfobromophthalein sodium $C_{20}H_8Br_4O_{10}S_2Na_2$.

Properties: White, crystalline powder; odorless with a bitter taste; hygroscopic. Soluble in water; insoluble in alcohol and acetone.

Derivation: From phenol and tetrabromophthalic acid or anhydride.

Grades: U.S.P. XVI; technical.

Use: Medicine (diagnostic aid).

sulfocarbanilide. See thiocarbanilide.

sulfocarbolic acid. See phenolsulfonic acid.

1-(4-sulfo-2,3-dichlorophenyl)-3-methylpyrazolone $(Cl_2C_6H_3SO_3H)NNC(CH_3)CH_2CO$.

Properties: White or yellowish powder or crystals. Very soluble in water; soluble in alkalis.

Derivation: By condensation of dichlorophenylhydrazine sulfonic acid with ethylacetate.

Method of purification: Crystallization.

Grades: Technical; C.P.

Use: Intermediate for dyes.

Shipping regulations: None.*

"Sulfogene." ²⁸ Trademark for a line of sulfur colors; dyed from a solution of sodium sulfide.

Use: Used extensively on cotton work-clothing and similar fabrics and to a limited extent on rayon and other materials.

"Sulfole." ³⁰³ Trademark for tert-dodecyl mercaptan.

Properties: Boiling range (5 mm) 85-106°C, sp. gr. (60/60°F) 0.862; refractive index (20/D) 1.464; flash point 99°C.

Containers: Drums; tank cars.

Uses: Polymer modification and manufacturing of detergents.

Hazards: Flammable liquid.

Shipping regulations: Red label not required.*

"Sulfo-Merthiolate." ¹⁰⁰ Trademark for the sodium salt of para-ethylmercurithiobenzene sulfonate (q.v.).

"Sul-fon-ate." ⁹³ Trade name for a line of derivatives of organic sulfonic acids produced by a special manufacturing process and intended for use generally in applications utilizing the surface active properties of these derivatives.

"Sul-fon-ate AA-9." ⁹³ Trade name for a 90-92% active, flake dodecylbenzene sulfonate, sodium salt.

Uses: Used as a wetting agent and detergent.

"Sul-fon-ate AA-10." ⁹³ Trade name for a 96% plus active, flake dodecylbenzene sulfonate, sodium salt.

Uses: Used as emulsification aid, wetting agent, detergent.

"Sul-fon-ate AA-T." ⁹³ Trade name for an amber liquid dodecylbenzene sulfonate, triethanolamine salt.

Uses: Similar to "Sul-fon-ate AA-9."

sulfonated castor oil. See Turkey red oil.

sulfonated oils. Vegetable or animal oils which have been treated with sulfuric acid and the excess of acid washed out and the oil neutralized with a small amount of caustic soda or ammonia. Sometimes paraffin oil is also included in the formula. Chemically this trade term, sulfonated, is incorrect since the oils are sulfated (contain the $-OSO_2OH$ group and not the $-SO_2OH$ group). These oils are soluble (emulsifiable) in water and are claimed to be capable of: (1) supplying lubrication for various purposes; (2) emulsifying (dispersing) in water various other materials; (3) plasticizing; (4) defoaming; (5) dispersing; (6) penetrating; (7) scouring; (8) wetting out; and (9) softening. For some of the foregoing operations specially formulated oils may be necessary.

Properties:

Solubility in water: From coarse emulsions to actual solutions, according to the degree of sulfation.

Color: Vary from pale yellow to dark brown.

Viscosity: Mobile liquids to semi-solids.

Emulsification: Emulsify mineral oils, solvents, fatty oils, fats, and waxes.

Penetration: Proportionate to sulfation.

Lubrication: In proportion to unchanged oil present.

Containers: Glass bottles; carboys; 1-, 5-, and 10-lb tins; steel drums.

Uses: They are very widely used in industrial processing, e.g., textiles, leather, paper, glue, cosmetics, metal working, cleansing, inks, disinfectants, petroleum products, ceramic clays, agricultural sprays, cutting oils, laundering, and many others.

Shipping regulations: None.*

See also soluble oils.

"Sul-fon-ate OA-5." ⁹³ Trade name for a sulfonate of oleic acid, sodium salt.

Properties: An amber liquid, which is a true sulfonate containing the $-SO_2ONa$ group, i.e., with a carbon-to-sulfur rather than carbon-to-oxygen linkage as in sulfated oils.

Uses: Used as wetting agent, defoamer, particularly effective in acid media.

sulfonation. The formation of a sulfonic acid, i.e., a compound containing the $-SO_2OH$ group in its molecular structure. Thus the conversion of benzene (C_6H_6) into benzene sulfonic acid ($C_6H_5HSO_3$) is an example. Common sulfonating agents are: concentrated sulfuric acid, fuming sulfuric acid (oleum), sulfur trioxide, alkali disulfates, pyrosulfates, chlorosulfonic acid and a mixture of manganese dioxide and sulfurous acid.

para-sulfondichloraminobenzoic acid. See halazone.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sulfonethylmethane (methylsulfonyl; diethyl-sulfonmethylethylmethane)
 $\text{CH}_3(\text{C}_2\text{H}_5)_2\text{C}(\text{SO}_2\text{C}_2\text{H}_5)_2$.

Properties: Colorless, lustrous, crystals or powder; odorless; characteristic, slightly bitter taste; m. p. 76°C ; decomposes on heating with evolution of sulfur dioxide. Soluble in hot water, alcohol, and ether; moderately soluble in cold water.

Derivation: By passing dry hydrochloric acid gas into a mixture of anhydrous ethyl mercaptan and methyl ethyl ketone and oxidizing the product with potassium permanganate.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-lb bottles; 5-, 25-lb boxes; 50-lb kegs.

Use: Medicine.

Shipping regulations: None.*

sulfonmethane (diethylsulfondimethylmethane)
 $(\text{CH}_3)_2\text{C}(\text{SO}_2\text{C}_2\text{H}_5)_2$.

Properties: Colorless, crystalline powder; odorless; nearly tasteless; m. p. $125-126^\circ\text{C}$; b. p. decomposes at 300°C . Soluble in alcohol, ether, chloroform, benzene; slightly soluble in water.

Derivation: Anhydrous acetone and anhydrous ethylmercaptan are combined by means of a stream of anhydrous hydrochloric acid, and oxidized with potassium permanganate.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles; 1-lb cartons.

Use: Medicine.

Shipping regulations: None.*

sulfonyl chloride. See sulfuryl chloride.

sulfonyldianiline (DDS; 4,4'-diaminodiphenyl sulfone) $(\text{C}_6\text{H}_4\text{NH}_2)_2\text{SO}_2$. Bis(4-amino-phenyl)sulfone.

Properties: Colorless crystals. M. p. $175-176^\circ\text{C}$. Insoluble in water; soluble in alcohol.

Use: Medicine, curing agent for epoxy resins.

sulfonyl diphenol. See dihydroxy diphenyl sulfone.

para-1-sulfonyl-3-methyl-5-pyrazolone
 $(\text{C}_4\text{H}_4\text{SO}_3\text{H})\text{NNC}(\text{CH}_3)\text{CH}_2\text{CO}$.

Properties: White or yellowish powder. Only very slightly soluble in water; soluble in alkalis.

Derivation: By condensation of phenylhydrazine sulfonic acid with ethylacetoacetate.

4-sulfophthalic anhydride $\text{HO}_2\text{SC}_6\text{H}_3(\text{CO})_2\text{O}$.

Properties: Reddish-brown nonflammable syrup; crystallizes partially on long standing; hygroscopic; fluorescent in solution under ultraviolet radiation; sp. gr. 1.62 (25°C), 1.56 (90°C); density 97.5 lbs/cu ft. Very soluble in water, alcohol; insoluble in ether, benzene.

Grades: Technical.

Uses: Esters of 4-sulfophthalic acid used in wetting, cleansing, emulsifying, softening and equalizing agents with textiles. Derivatives suggest application as surface active agents.

Shipping regulations: None.*

"Sulforon." ²⁸ Trademark for very finely divided sulfur; readily dispersible in water; not less than 97% sulfur; contains a wetting agent.

Containers: 6- and 50-lb bags.

Use: As a fruit fungicide for control of scab, brown rot, etc.

"Sulforon" X. ²⁸ Trademark for extremely finely divided wettable sulfur of 5 microns average particle size.

Containers: 5- and 50-lb bags.

Use: For control of brown rot, scab and certain other fungus diseases of fruits.

5-sulfosalicylic acid $\text{C}_6\text{H}_3\text{O}_2(\text{SO}_3\text{OH})\text{COOH} \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; colored pink by traces of iron. Very soluble in water. M. p. 120°C ; decomposes at higher temperatures.

Derivation: Action of sulfuric acid on salicylic acid.

Method of purification: Recrystallization.

Grades: C. P.; analytical; reagent.

Containers: Glass bottles.

Uses: Reagent for albumin; colorimetric reagent for ferric iron.

Shipping regulations: None.*

sulfotepp. See tetraethyldithiophosphate.

sulfovinic acid. See ethylsulfuric acid.

sulfovinous acid. See ethylsulfurous acid.

"Sulfoxide." ³⁴² Trademark for N-octyl sulfoxide of isosafrole.

sulfoxone sodium. See sodium sulfoxone.

"Sulframins." ⁴⁴⁹ Trademark for a series of alkyl aryl sulfonates, surface active agents used for general industrial applications and for household and toilet use, including dishwashing, cleaning of walls, woodwork, linoleum, rubber, tile. Used as detergent, wetting and dispersing agent for textile fabrics.

"Sulfricin." ²⁰² Trademark for a modified castor oil of increased hydroxyl content used for sulfonation.

sulfur (brimstone; flowers of sulfur; sulfur flour; sulfur flowers) S. Nonmetallic element with atomic number 16, group VI of periodic system.

Properties: Sulfur exists in two stable crystalline forms and at least two amorphous and two liquid forms.

(a) Alpha-sulfur, rhombic, octahedral yellow crystals stable at room temperature. Sp. gr. 2.06; transition to beta form 94.5°C ; m. p. (rapid heating) 112.8°C ; refractive index 1.957.

(b) Beta-sulfur, monoclinic, prismatic pale yellow crystals slowly changing to alpha form below 94.5°C . Sp. gr. 1.96; m. p. 119.3°C ; b. p. 444.6°C ; index of refraction 2.038. Both forms are insoluble in water; slightly soluble in alcohol and ether; soluble in carbon disulfide, carbon tetrachloride, and benzene.

Occurrence: Texas, Louisiana; Sicily.

Derivation: Mined as such or by Frasch.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

process (q. v.) in which it is melted underground by superheated water, pumped up and allowed to solidify in bins from which it is shipped; recovered from waste hydrogen sulfide and from natural gas, by oxidation.

Method of purification: Filtration of liquid or sublimation.

Grades: Technical (lumps, roll, flour); rubber makers; N.F. XI (sublimed); crude; refined; Mexican; high purity (impurities less than 10 ppm).

Containers: Bags; barrels, bulk in carloads and vessels, including molten sulfur.

Uses (in approximate order of volume): Sulfuric acid; pulp and paper; agricultural fungicide; carbon disulfide; other chemicals and dyes; rubber vulcanization; medicine.

Shipping regulations: None.*

sulfur 35. Radioactive sulfur of mass number 35.

Properties: Half-life, 87.1 days; radiation, beta; radiotoxicity, moderately hazardous. Derivation: By pile irradiation of elemental sulfur or of various chlorides.

Forms available: Solid elemental sulfur; sulfate in weak hydrochloric acid; barium sulfide in barium hydroxide solution; elemental sulfur in benzene solution; in tagged compounds such as carbon disulfide, chlorosulfonic acid, thiourea, sulfanilamide, thiamine, heparin, insulin, "Sucaryl," etc.

Uses: A research tool in studying the mechanism of rubber vulcanization, the mechanism of the polymerization of synthetic rubber; the role of sulfur in the coking process and in steel, the effect of sulfur on engine wear; sulfur removal in the viscose process for the manufacture of rayon; the behavior of detergents during washing; sulfur deposition in diesel engines, the action of sulfur in silver plating solutions; protein metabolism; surface active agents and surface phenomena; drug actions; etc.

Shipping regulations: Class D poison, radioactive material. Blue label.*

sulfurated lime. See lime, sulfurated.

sulfurated potash. See potash, sulfurated.

sulfur bichloride. See sulfur dichloride.

sulfur bromide (sulfur monobromide) S_2Br_2 .

Properties: Yellow liquid. Becomes red when exposed to air. Decomposed by water. Soluble in carbon disulfide. Sp.gr. 2.6 (15°C); b.p. 54°C.

sulfur cement Cement used for iron vessels and consisting of equal parts of sulfur and pitch. Acid resisting.

sulfur chloride (sulfur subchloride; sulfur monochloride) S_2Cl_2 .

Properties: Amber to yellowish-red, oily, fuming liquid; penetrating odor; irritating effect on the eyes, lungs and mucous membranes. Keep well stoppered. Reacts violently with water when contained in a closed vessel. Soluble in alcohol, ether, benzene, carbon disulfide and amyl acetate;

decomposes on contact with water. Sp.gr. 1.690 (15.5°C); m.p. -80°C; b.p. 138°C; flash point 266°F.

Derivation: By passing chlorine over molten sulfur.

Method of purification: Distillation.

Grades: Technical.

Containers: 25-, 50-, 75-lb jugs; 150-lb carboys; 700-lb drums; tank cars.

Uses: Chemicals (sulfur solvent, acetic anhydride, thionyl chloride, carbon tetrachloride from carbon disulfide, various chlorohydrins from glycerol, glycol, etc.); analytical reagent; rubber industry for vulcanizing; manufacturing vulcanized oils; rubber substitutes and cements; purifying sugar juices; manufacture of military poison gas; insecticide; hardening soft woods (by treatment with sulfur chloride dissolved in carbon disulfide); pharmaceuticals; textile finishing and dyeing; extraction of gold from its ores.

Warning: Causes burns. Vapor irritating. M.C.A. warning label.

Shipping regulations: Corrosive liquid. White label.*

sulfur dichloride (sulfur bichloride) SCl_2 .

Properties: Reddish-brown fuming liquid with pungent chlorine odor. Sp.gr. 1.638 (15.5°C); m.p. -78°C; b.p. decomposes above 40°C; on rapid heating, boils near 60°C, decomposes in water, and alcohol; refractive index 1.567 (n_D 20°); flash point, none; fire point, none. Very corrosive.

Derivation: Chlorine is passed into sulfur monochloride to saturation, at 6° to 10°C, followed by carbon dioxide to drive off the excess of chlorine.

Grades: Technical.

Containers: Drums; tank cars.

Uses: In general, as a chlorine carrier or chlorinating agent; rubber industry for vulcanizing; manufacturing vulcanized oils; rubber substitutes and cements; purifying sugar juices; sulfur solvent; as chloridizing agent in metallurgy, in manufacture of organic chemicals and insecticides.

Warning: Causes burns. Vapor irritating. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

sulfur dioxide (sulfurous acid anhydride) SO_2 .

Properties: Colorless gas or liquid. Caution: extremely irritating gas and liquid. Soluble in water, alcohol, and ether. Forms sulfurous acid H_2SO_3 . Sp.gr. 1.4337, liquid at 0°; m.p. -76.1°C; b.p. -10°C; vapor pressure 3.2 atmospheres at 68°F; refractive index (liquid) 1.410 (n_D 24°). An outstanding oxidizing and reducing agent.

Derivation: (a) By roasting pyrites in special furnaces. The gas is readily liquefied by cooling it with ice and salt, or at a pressure of three atmospheres. (b) By purifying and compressing sulfur dioxide gas from smelting operations, and (c) by burning sulfur.

Grades: Commercial; U.S.P. XVI; technical; refrigeration; anhydrous 99.98% min.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Containers: 2- to 300-lb cylinders; ton drums on multi-unit cars; 40,000-lbs tank cars.

Uses: Chemicals (sulfuric acid, salt cake, sulfites, hydrosulfites of potassium and sodium, thiosulfates, alum from shale, recovery of volatile substances); intermediates; solvent extraction of lubricating oils; general bleaching agent of oils, foods; preservative for beer, wine, and meats; restoring the yellow color of the new grain to old barley and oats; cellulose and paper industries; artificial ice industry; refrigeration; disinfecting and fumigating; tanning; field mouse destruction; agricultural fumigant; extraction of bituminous matters in lignite coal; sulfite pulp manufacture; annealing of glass.

Shipping regulations: Nonflammable gas. Green gas label.*

sulfur dyes. See sulfide dyes.

sulfuret of antimony. See antimony trisulfide.

sulfuretted hydrogen. See hydrogen sulfide.

sulfur flour. See sulfur.

sulfur flowers. See sulfur.

sulfur hexafluoride SF₆.

Properties: Colorless gas; boiling point -63.8°C (sublimes), m.p. -56°C; density of gas 6.5 grams per liter, of liquid 1.91; specific volume 2.5 cu ft/lb (70°F); slightly soluble in water; soluble in alcohol and ether.

Derivation: Sulfur and fluorine.

Grade: 98% pure.

Containers: 60-lb cylinders.

Use: Dielectric (gaseous insulator for electrical equipment).

Shipping regulations: Nonflammable gas. Green label.*

sulfuric acid (hydrogen sulfate; oil of vitriol; battery acid, dipping acid) H₂SO₄. See also sulfuric acid, fuming.

Properties: Strongly corrosive, dense, oily liquid; colorless to dark brown depending on purity. Miscible with water in all proportions but great caution is necessary in mixing due to evolution of much heat that can cause explosive spattering. Very reactive, dissolves most metals; concentrated acid oxidizes, dehydrates, or sulfonates most organic compounds, often causes charring. Sp.gr. of pure material 1.84, m.p. 10.4°C; b.p. varies over range 315-338°C due to loss of sulfur trioxide during heating to 300°C or higher.

Derivation: From sulfur, pyrites, sulfide smelter gases, hydrogen sulfide recovery processes, by the contact and chamber processes, q.v.

Grades: Technical; 50° Baumé (sp.gr. 1.53, 62.2% H₂SO₄); 60° Baumé (sp.gr. 1.71, 77.7% H₂SO₄); 66° Baumé (sp.gr. 1.84, 93.2% H₂SO₄); 98% (sp.gr. 1.84); 99%; 100%; reagent A.C.S.; battery acid (q.v.); C.P.

Containers: Bottles; 5-, 13-gal carboys; 55-, 110-gal drums; tank trucks; tank cars.

Uses (in approximate order of volume; includes fuming sulfuric acid): Fertilizer; chemicals; petroleum refining; paints and pigments; iron and steel; rayon and cellulose film; industrial explosives; nonferrous metallurgy; textile finishing. Generally considered the most important industrial chemical.

Danger: Causes severe burns. MCA warning label.*

Shipping regulations: Corrosive liquid. White label.*

sulfuric acid, aromatic (elixir of vitriol).

Properties: Clear, reddish-brown liquid; peculiar, aromatic odor; pleasant acid taste when diluted. Soluble in water.

Derivation: A mixture of sulfuric acid with alcohol, tincture of ginger, and oil of cinnamon.

Containers: Glass bottles.

Use: Medicine.

sulfuric acid, fuming (oleum; pyrosulfuric acid; disulfuric acid). A solution of sulfur trioxide in sulfuric acid as H₂S₂O₇.

Properties: A heavy, oily liquid. Colorless to dark brown depending on purity. Fumes strongly in moist air. Extremely corrosive and hygroscopic.

Derivation: Sulfur trioxide produced by the contact process (q.v.) is absorbed in concentrated sulfuric acid.

Grades: Technical (20-, 40-, 60-, 66% SO₃); C.P.

Containers: Bottles; 5-, 13-gal carboys; 55-, 110-gal drums; tank cars.

Uses: Sulfating and sulfonating agent; dehydrating agent in nitrations; dyes; explosives; petroleum refining.

Danger! Causes severe burns. MCA warning label. Reacts violently with water.

Shipping regulations: Corrosive liquid. White label.*

sulfuric anhydride. See sulfur trioxide.

sulfuric chloride. See sulfuryl chloride.

sulfuric ether. See ether.

sulfuric oxychloride. See sulfuryl chloride.

sulfur iodide. See sulfur iodine.

sulfur iodine (sulfur iodide, iodine disulfide; iodine bisulfide) I₂S₂.

Properties: Brittle masses, grayish-black; iodine odor; metallic luster. Soluble in carbon disulfide; slightly soluble in glycerol; insoluble in water.

Derivation: Heating iodine mixed with sulfur to fusion in a closed vessel.

Containers: 1-lb bottles.

Use: Medicine.

Shipping regulations: None.*

sulfurized asphalts (Dubb's asphalt). Products obtained by heating residual oil or residual asphalt with sulfur at high temperatures.

Shipping regulations: None.*

sulfur, lac (milk of sulfur; precipitated sulfur). Powdered sulfur itself.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: A fine, light-colored, amorphous powder, without taste or odor. For other properties, see sulfur.

Derivation: Obtained by the action of hydrochloric acid upon a solution prepared by boiling together sulfur and lime in water.

Grade: U.S.P. XVI (as precipitated sulfur).
Use: Medicine.

Shipping regulations: None.*

sulfur lotum (washed sulfur). Fine yellow crystalline powder without odor or taste. Sublimed sulfur which has been treated for 3 days with dilute ammonia water, then thoroughly washed with water.

Use: Medicine.

sulfur monobromide. See sulfur bromide.

sulfur monochloride. See sulfur chloride.

sulfur olive oil. See olive oil (grades).

sulfurous acid. A solution of sulfur dioxide in water. The formula H_2SO_3 is used, but the acid is known only through its salts.

Properties: Colorless liquid; suffocating sulfur odor. Sp.gr. about 1.03; unstable. Soluble in water.

Derivation: Absorption of sulfur dioxide in water.

Grades: Technical; C.P.

Containers: Carboys; drums.

Uses: Organic synthesis; bleaching straw hats, wickerware, textiles, etc.; paper manufacture; wine manufacture; brewing, metallurgy; ore flotation; medicine; reagent in analytical chemistry; sulfites; as preservative for fruits, nuts, foods, wines; disinfecting ships; refining crude oils and paraffins.

Shipping regulations: None.*

sulfurous acid, anhydride. See sulfur dioxide.

sulfurous oxychloride. See thionyl chloride.

sulfur oxychloride. See thionyl chloride.

sulfur, precipitated. See sulfur, lac.

sulfur subchloride. See sulfur chloride.

sulfur tetrafluoride SF_4 . Sold in cylinders as a selective fluorinating agent.

sulfur trioxide (sulfuric anhydride) SO_3 ; $(SO_3)_n$.

Properties: Exists in three solid modifications; alpha, m.p. $62^\circ C$; beta, m.p. $32.5^\circ C$; gamma, m.p. $16.8^\circ C$. The alpha form appears to be the stable form but the solid transitions are commonly slow; a given sample may be a mixture of the various forms, and its m.p. not constant. The solids sublime easily. The gamma form boils at $45^\circ C$. An explosive increase in vapor pressure occurs when the alpha form melts. The anhydride combines with water, forming sulfuric acid and evolving a large amount of heat. It is strongly corrosive and an active oxidizing agent. Will produce severe burns.

Containers: (Stabilized, liquid) 750-lb drums; tank cars.

Uses: Sulfonation of organic compounds.

Shipping regulations: Corrosive liquid.

White label.* It is usually generated in the plant where it is to be used.

sulfuryl chloride (chlorosulfuric acid; sulfonyl chloride; sulfuric chloride; sulfuric oxychloride) SO_2Cl_2 .

Properties: Colorless liquid. Pungent odor. Rapidly decomposed by alkalis and by hot water. Soluble in glacial acetic acid.

Constants: Sp.gr. 1.667 at $20^\circ C$; b.p. $69.2^\circ C$; m.p. $-64.1^\circ C$; vapor density 4.6.

Derivation: (a) By heating chlorosulfonic acid in the presence of catalysts. (b) From sulfur dioxide and chlorine in the presence of either activated carbon or camphor.

Grades: Technical.

Containers: 5-gal carboys; 55-gal drums; 725-lb drums.

Uses: Organic synthesis (chlorinating agent, dehydrating agent; acylating agent); making pharmaceuticals; dyestuffs; rubber-base plastics; rayon; military poison gas mixtures and making certain poison gases; as a solvent; as a catalyst.

Warning: Causes burns. Vapor irritating. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

"Sulmet." Trademark for sulfamethazine.

"Sulphon." ³⁰⁷ Trademark of acid dyestuffs used on wool and silk. Characterized by fairly good fastness to light, good fastness to washing, etc. Can be used on leather and paper.

sultam acid. See 1,8-naphthosultam-2,4-disulfonic acid.

sumac wax. See Japan wax.

sumbul (musk root).

Derivation: Dried rhizome and root of *Ferula* sumbul, or closely related species possessing the characteristic musklike odor.

Occurrence: Central Asia, East Indies.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

sumbul oil.

Properties: Dark-colored viscous essential oil; musk-like odor. Soluble in 1 vol or less of 90% alcohol.

Constants: Sp.gr. 0.941-0.964; optical rotation, $-6^\circ 20'$; acid value, 7.0; saponification value, 24-92.

Derivation: Distilled from the root of *Ferula* sumbul.

Shipping regulations: None.*

"Sumstar." ²¹² Trademark for a dialdehyde starch made by a periodate oxidant (electrolytic technique) from starch.

Properties: Fine powder, nonvolatile, odorless. Its acute toxicity is claimed to be only a small fraction of that of other commercially available aldehydes. Available as: Sumstar-S: Over 90% oxidized; Sumstar-R: 75-80% oxidized; Sumstar-J: 50% oxidized. Used in adhesives, leather, tobacco, plastics, paper.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Sumycin." ⁴¹² Trademark for tetracycline phosphate complex (q.v.).

sunflower cake. The cakes formed in the press when the seeds are subjected to hydraulic pressure in order to express the sunflower oil.

Constants: Contains various useful constituents, such as unexpressed oil, carbohydrates, proteins and salts. Typical analysis: proteins 21.0%; fats 8.5%; fiber 48.9%; water 10.2%; ash 11.4%.

Containers: Bags; bulk.

Uses: Cattle food; fertilizer ingredient.

Shipping regulations: None.*

sunflower meal. The mealy form assumed by sunflower seeds after the crushing and heating operations, preparatory to the expression of the oil in either hydraulic presses or expeller. If the oil cake is ground the product again is in this mealy form. Uses are similar to those of sunflower cake (q.v.).

sunflower oil.

Properties: Pale yellow liquid; mild taste; pleasant odor. Soluble in alcohol, ether, chloroform and carbon disulfide.

Constants: Sp. gr. 0.924-0.926; iodine value 125; refractive index 1.4611.

Derivation: By expression from the seeds of *Helianthus annuus*.

Method of purification: Filtration.

Grades: Crude; refined.

Containers: Wooden barrels; steel drums; tank cars.

Uses: Varnishes; soap; illuminant; edible oil, particularly in Russia.

Shipping regulations: None.*

"Sunny South" Rosin Oils. ²⁹⁶ Trademark for a line of rosin oils obtained from processing and blending of oils of terpenic origin. Available in three standard grades which differ in viscosity and acid number. Special grades produced to specifications.

"Sunolite." ¹⁰⁴ Trademark for anti-sun-checking wax used to prevent disintegration of rubber stocks which are constantly exposed to sunlight.

"Sunolith." ²⁹⁶ Brand name for a proprietary product consisting of various types of lithopone.

"Sunolox." ²⁰⁴ Trademark for a proprietary formulation designed to promote the stability of hydrogen peroxide bleach solutions.

Properties: White, free-flowing powder; bulk density, 56.6 lbs/cu ft; solubility, 48.1 g/100 ml of water at 25°C; insoluble in organic solvents. pH (0.1% sol), 7.5.

Use: Bleaching of textiles near the neutral point; softness of fabric is improved by low silicate content.

"Sunproofs." ²⁴⁸ Trademark for a series of protective waxes to prevent static atmospheric cracking in all types of synthetic and natural rubbers. There are five types, namely, "Sunproof 713", "Sunproof

Improved," "Sunproof Junior," "Sunproof Regular" and "Sunproof Super."

"Super Ad-It." ⁷⁴ Trademark for di-phenyl-mercuric dodecenylosuccinate (10% mercury as metal). For mildew resistance in pigmented and clear coatings. Easily handled. Does not affect film hardness, drying, color, or gloss.

superalloys (wrought heat-resisting alloys). Steels with oxidative resistance and tensile strength at temperatures up to about 2500°F. All heat-resisting steels contain chromium to combat oxidation; while nickel, manganese, nitrogen, molybdenum, or tungsten make the metal "austenitic" (provides strength). The addition of cobalt and sometimes titanium, aluminum, or silicon will produce a "superstrength wrought heat-resisting alloy." Uses include high pressure equipment, jet-engines, missiles, etc.

"Super-amides: L-9; GR; GC." ³²⁸ Alkanol-amides claimed to contain up to 50% more amide than the alkanolamide fatty acid condensates of highest concentration hitherto available. Used in textile applications based on their synergistic action with conventional textile processing assistants, to reinforce detergency, foam building, and foam stability. They provide versatility in combining wetting, penetrating, foaming, and dispersing properties.

"Superba." ¹³³ Trademark for a medium high-color carbon black for automotive finishes, locomotive paints, high grade industrial work. Available in two types:

"Standard Superba." Standard loose uncompresssed black. Packed in 12½-lb bags.

"Superba Beads." Dustless form. Especially suited for ball mills. Low viscosity mill pastes are produced. Packed in 25-lb bags.

"Super-Beckacite." ³⁶ Oil-soluble, oil-reactive, heat-hardening pure phenolic synthetic resins. Available in both foaming and nonfoaming types.

Physical properties: Color grades range from X to D (U.S. Department of Agriculture rosin standards), acid number various types range from 2-105; melting range 158°F to the theoretical equivalent of 650°F. capillary tube method.

Chemical properties: Imparts fast drying, quick hardening and strong resistance to wear, water, weather and other reagents to varnishes and oleoresinous vehicles.

Uses: Varnishes and enamels of the spar and marine type.

"Super-Beckosol." ³⁶ A group of isophthalic acid alkyd resins for fast drying, flexibility, and high exterior durability when used in the manufacture of paints and printing inks.

Physical properties: Non-volatile 49-100%; viscosity (Gardner-Holdt) L-Z¹; color (Gardner 1933) 5-8; acid number 4-11.

See also "Beckosol."

"Supercarbovar." ²⁷⁵ Trade name for channel carbon black for paints and plastics.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Super-CE."** ⁸⁸ Trademark for a cerium polish, consisting of cerium oxide and other ingredients.
- "Super-Cel."** See "Celite" Filter Aids.
- "Superchrome."** ²⁴³ Trademark of acid mordant dyes for wool and synthetics.
- "Superclear."** ⁷⁸ Trademark for a chemical preparation used for thickening solutions of coloring matters, and mordants used in textile printing and for finishing textiles in order to bind, strengthen, stiffen, or otherwise desirably affect the handle of the treated textile materials.
- superconductivity.** The property which causes certain metals, alloys, and compounds near absolute zero to lose both electrical resistance and magnetic permeability. For instance, an "isolated" wire loop at superconductive temperatures has been known to maintain a constant current for 18 months. Depending upon the substance, the maximum temperature (transition temperature) for the behavior is 0.5-18°K. Superconductivity is absent in alkali metals, noble metals, ferro- and antiferromagnetic metals. The property often occurs, however, in elements having 3, 5, or 7 valence electrons per atom; and is associated with high room-temperature resistivity.
- "Super Cordura."** ²⁸ Trademark for high tenacity viscose process yarns having special properties of fatigue and heat resistance, and durability. Available denier sizes from 1100-4400.
Containers: Cones and beams.
Uses: In pneumatic tires and other industrial and mechanical goods uses.
- supercritical.** See chain reaction.
- "Super Dylan."** ¹¹ Trademark for polyethylene for use where strength and rigidity are required. Heat resistant to 250°F, solvent resistant, has low temperature strength, electrical insulation properties. Developed by the low pressure Ziegler process.
- "Super Exsize."** ¹¹⁴ See "Exsize."
- "Superfloc 16."** ⁵⁷ Trademark for a flocculant.
- "Super Floss."** See "Celite" Mineral Fillers.
- "Superglo."** ¹⁰⁸ Trademark for a completely neutral, liquid synthetic detergent. Combination of highly active wetting agents and foam stabilizers. Soluble in hot and cold water.
Containers: 5-gal cans, 15-gal drums.
- "Super Glo Gloss Oils."** ²⁹⁶ Trade name for limed rosin in petroleum solvent processed in three standard grades differing only in color.
Use: Primarily in paint and varnish industry.
- "Supergum."** ⁷⁸ Trademark for compositions used as thickeners and dyestuff carriers in textile printing.
- "Superior Red."** ¹⁴¹ Trade name for azo red pigments.
- Properties: Bright, yellow-red pigments with excellent stability in moisture set inks.
Produce inks having excellent flow and body.
Grades: Resinated and non-resinated.
Uses: In all types of inks; especially recommended for moisture set inks.
- "Superkel."** ²⁴⁴ Trademark for a bottle washing product. Highly alkaline composition with scale and foam control agents.
Uses: Bottle washing, dairies, breweries and soft drink plants.
Hazards: Same as those for sodium hydroxide.
- "Superlan."** ²³² Brand name for a series of level-dyeing acid dyestuffs of good fastness properties.
- "Superlith."** ²²³ Trade name for imported zinc sulfide pigments.
Grades: Available as pure zinc sulfide, 60% zinc sulfide.
- "Superloid."** ³²² Trademark for ammonium alginate.
Properties: A tan colored, refined, granular product passing essentially through 20-mesh and having a moisture content of about 13%; dissolves in hot or cold water to give a high viscosity solution (1% by weight about 1200 cps) of slightly acid pH.
Grades: Technical.
Uses: As a hydrophilic colloid for suspending, thickening, emulsifying and stabilizing agent in creaming and bodying of natural and synthetic rubber latex products; protective colloid in resin emulsion paints; adhesives; fire-retarding compositions; ceramics, etc.
Shipping regulations: None.*
- "Superlume."** ⁷² Trade name for a bright nickel plating process. Prepared from nickel sulfate, nickel chloride, boric acid and organic addition agents. Used for high speed reproduction where leveling and brightness are desired. Applications include plating steel stampings, forgings, die castings, brass, copper and aluminum parts.
- "Super-Multifex."** ²⁴⁴ Brand name for an ultra fine calcium carbonate—surface coated.
Properties: Weight per solid gal 22.07 lbs; color, white; particle size 0.03 microns.
Derivation: Precipitated calcium carbonate.
Containers: Multi-wall paper bags, 50-lb net.
Uses: Rubber and plastics.
- "Supernilla."** ³⁴² Trademark for natural vanilla concentrate in liquid form.
- "Superoxol."** ¹²³ Trademark for hydrogen peroxide (q.v.).
- "Superpax."** ³³⁷ Trade name for 92 to 94.5% zircon with bulk density 68 lbs/cu ft; average particle size 5 microns max. "Superpax A" has average particle size 4 microns max. Used as opacifiers and for texture control in ceramic products. See "Zircopax."
- superphosphate** (acid phosphate). The most important phosphorus fertilizer. It is made by the action of sulfuric acid on insoluble phosphate rock (essentially calcium

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

phosphate, tribasic) to form a mixture of gypsum and calcium phosphate, monobasic. A typical composition is $\text{CaH}_4(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$ 30%; CaHPO_4 10%; CaSO_4 45%; iron oxide, alumina, silica 10%; water 5%. This mixture is the superphosphate marketed by the fertilizer industry.

Typical analysis: Moisture 10-15%; available phosphoric acid (as P_2O_5) 18-21%; insoluble phosphoric acid 0.3-2%; total phosphoric acid (as P_2O_5) 19-23%.

Grades: Based on available P_2O_5 .

Containers: Bags; bulk; multi-wall paper sacks; carloads.

Use: Fertilizer.

Shipping regulations: None.*

See also triple superphosphate and nitrophosphate.

superphosphoric acid. See phospholeum.

"Super Prime." ⁸⁴ Brand name for a specially constructed explosive primer for detonating non-cap sensitive blasting agents and ammonium nitrate-fuel oil mixtures.

Containers: 1-lb and 2-lb units in 50-lb shipping cans.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

"Superset." ⁵⁷ Trademark for a resin finish which renders cotton wrinkle-resistant with little loss in tensile strength. Also gives shrinkage control, remains durable after washing and dry cleaning, makes starching unnecessary. Based on "Aerotex Resin M-3" and "Aerotex Resin 133."

"Supersil." ⁴³⁶ Trade name for powdered silica, 99.9% pure.

Grades: Available in a complete range of grades from 80 mesh to material finer than 325 mesh.

Containers: 100-lb multi-wall paper bags and bulk carloads.

Uses: Manufacture of ceramics, porcelain enamel, scouring powders and buffing compounds, fiber glass, autoclave concrete products, chemicals, asbestos products and for cementing deep oil wells.

"Supersilicate." ²⁴⁴ Trademark for a compound consisting essentially of the formula, $1.5 \text{Na}_2\text{O} \cdot \text{SiO}_2 \cdot 5.5 \text{H}_2\text{O}$.

Properties: Dustless, white, granular product containing water of crystallization, soluble in water; m.p. 80-85°C; total Na_2O content 36.6%; loose bulk density 60 lb/cu ft.

Containers: 100-lb multi-wall bags; 125-lb fiber drums; 350-lb fiber drums.

Uses: Laundry and metal cleaning; paint remover; concrete floor cleaner; base for cleaning compounds.

"Super-sol." ²⁵ Brand name for an odorless petroleum naphtha; a rapid-drying highly purified solvent.

Properties: Flash point 130°F, distillation range 330-430°F, water-white color, 98% unsulfonatable residue.

Uses: As a carrier for insecticides and

mothicide, in the preparation of odorless paints, and in cleaning compositions.

"Super Spectra." ¹³³ Trademark for high color impingement carbon black used for jet black enamel and lacquers requiring satin finish. Containers 6 1/4-lb bags.

"Super Stod-Sol." ²⁰⁰ Trade name for a petroleum solvent.

Properties: Water-white color; boiling range 310-353°F; sp.gr. 0.779 (60°F); wt/gal 6.49 lbs (60°F); flash point 102°F.

Containers: Drums, tank wagon, tank cars.

Uses: Dry cleaning solvent.

"Super X." ⁸⁴ Trademark applied to each of a series of permissible ammonia gelatin type dynamites developed for use in underground coal mining operations.

Containers: Packaged in cartridges 1" to 2 1/2" in diameter in 50-lb shipping cases.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

"Suplex." ²⁴⁴ Trademark for a formulation for detergent aid. Mildly alkaline water conditioner, detergent, and foam control agent. Uniform, rapidly soluble granules.

Uses: Bottle washing.

"Supracet." ²³² Brand name for a series of disperse dyestuffs for acetate rayon and synthetic fibers.

"Suprak." ⁵⁷ Trade name for a line of tanning agents classified as synthetic phenolic resins. Used in the leather industry as a tanning agent.

"Supralan." ³⁰⁷ Metallized acid colors of good fastness and level dyeing properties.

"Suprawine" XA. ³⁰⁷ Trademark for a leather chemical.

Composition: Solubilized sulfur phenol condensate; 75% active.

Properties: Fine tan powder; soluble in water. Density 0.90-1.00.

Uses: Penetrating, leveling and toning agent in the application of acid, direct and chrome dyestuffs to leather.

"Supranol." ³⁰⁷ Trademark. Acid dyestuffs used on wool and silk. Characterized by good fastness to light, washing, and sea water. Can also be used on leather.

"Suprarenin." ¹⁶² Trademark for synthetic epinephrine.

"Suprexcel." ²³² Brand name for a series of light fast direct cotton dyestuffs.

"Suprex" Clay. ²⁸⁵ Proprietary brand name for a group of hydrous aluminum silicates (sedimentary kaolins) from South Carolina.

Properties: Sp.gr. 2.60; bulk density, aerated 18-20 lbs/cu ft., packed 35-40 lbs/cu ft; creamy white; pH 4.5-5.5; air-floated; particle size 90% minus 2 microns.

Containers: 50-lb multiwall bags or bulk.

Uses: As a "hard" clay in rubber compounding to produce high modulus and tensile, good abrasion resistance and a stiff uncured

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

compound; as a carrier in pesticides where its fine particle size, plate-like shape and good wetting provide high adsorption in concentrates and excellent suspension behavior in wettable powders. See "Paragon" Clay for a "soft" rubber clay.

"Supronyx." ³²⁸ Modified sodium lauryl sulfate, synergistically blended for superior wetting, foaming, emulsifying, and detergency properties. It is claimed to be an excellent scouring compound and dye assistant for wool, synthetics, and silk, and with alkaline builders, outstanding on cotton. Although neutral and mild in character it is said to possess outstanding soil-carrying properties.

suramin. See sodium suramin.

"Surett." ⁵¹ Trademark for tacky, adhesive lubricants which afford protection for open gears and wire ropes. They resist water and prevent rusting.

"Surfacaine." ¹⁰⁰ Trade name for cyclo-methycaine.

surface active agent. Any compound that affects (usually reduces) surface tension when dissolved in water or water solutions, or which similarly affects interfacial tension between two liquids. Soap is such a material, but the term is most frequently applied to organic derivatives such as sodium salts of high molecular weight alkyl sulfates, or sulfonates.

Uses: As detergents; wetting agents; penetrants; spreaders; dispersing agents; and foaming agents.

See detergents, synthetic.

surface combustion. Combustion of fuel-air mixtures at incandescent surfaces that catalyze the process to give rapid, flameless and complete combustion.

surfactant. Abbreviated term for surface active agent.

"Surfactol." ²⁰² Trademark for a series of castor oil-derived non-ionic surfactants including:

"Surfactol" 13: A water dispersible grade of glyceryl monoricinoleate.

Uses: Emulsifier; foam inhibitor; deflocculant for colored pigments in water-based pigment dispersions and latex emulsion paints.

"Surfactol" 318, 340, 365, 380: Alkoxy adducts of castor oil listed in the order of their increasing tolerance for water (from moderately self-emulsifiable to completely water soluble).

Uses: Emulsifiers; defoamers; plasticizers; solubilizers for oils, dyes; lubricants; in emulsion paints, pigment dispersions, cosmetics and polishes.

"Surfaseptic." ²³³ Trademark for synthetic molding resins containing germicides.

"Surfex." ²⁴⁴ Brand name for a high purity precipitated calcium carbonate (surface coated).

Properties: Oil absorption, 18-20; density as shipped, 50-55 lbs/cu ft; wt/solid gal, 22.07 lbs; color, white; particle size, 1-5 microns.

Derivation: Precipitated calcium carbonate. **Containers:** Multiwall paper bags, 50 lbs net. **Uses:** Paint, plastics, rubber, inks.

"Surfex MM." ²⁴⁴ Brand name for a high purity precipitated calcium carbonate (surface coated, micro milled).

Properties: Oil absorption, 18-20; density as shipped, 50-55 lbs/cu ft; wt/solid gal, 22.07 lbs; color, white; particle size, 1-5 microns.

Derivation: Precipitated calcium carbonate. **Containers:** Multiwall paper bags, 50 lbs net. **Uses:** Paints, plastics, rubber, inks.

"Surfonic." ¹³⁷ Trademark for a group of nonionic surface active agents, each with 100% active ingredient.

"Surfonic" N-10 (ethylene oxide nonyl phenol). **Properties:** Color 500 Pt-Co max; completely soluble in acetone, methanol, xylene, carbon tetrachloride, and mineral oils; insoluble in water; flash point, 355°F; sp.gr. 0.980 (20/20°C), refractive index 1.5090 (20°C).

Uses: Emulsifier; anti-foaming agent; detergent; penetrant; solubilizing agent; dispersant.

"Surfonic" N-40 (polyoxyethylene nonylphenol, 4 to 1 mole ratio).

Properties: Clear liquid; color, 200 Pt-Co max.; soluble in Stoddard solvent, acetone, methanol, xylene, carbon tetrachloride; gel in water, not dispersible; sp.gr. 1.026 at 20/20°C; refractive index 1.4979 (20°C); flash point 435°F.

Uses: Metal cleaning; degreasing; high-foaming liquid detergents; oil soluble emulsifier; dispersant; penetrant; solubilizing agent.

"Surfonic" N-60 (polyoxyethylene nonylphenol, 6 to 1 mole ratio).

Properties: Color, 200 Pt-Co max.; clear liquid; sp.gr. 1.041 (20/20°C); refractive index 1.4938 (20°C); flash point 475°F; f.p. less than 0°C. Soluble in Stoddard solvent, acetone, methanol, xylene, carbon tetrachloride; gel in water, dispersible.

Uses: Agricultural chemical concentrates; metal cleaning; degreasing; dry cleaning; emulsifier for styrene-butadiene latices; dispersant.

"Surfonic" N-95 (polyoxyethylene nonylphenol, 9.5 to 1 mole ratio).

Properties: Color, 100 Pt-Co max.; clear liquid; completely soluble in water, acetone, methanol, xylene, carbon tetrachloride; sp.gr. 1.061 (20/20°C); refractive index 1.4893 (20°C); freezing point 5°C; flash point 500°F.

Uses: Agricultural chemical concentrates; household and industrial cleaning compounds; textile processing; removal of wall-paper; fire fighting compounds; fruit and vegetable washing; caking prevention.

"Surfonic" N-120 (polyoxyethylene nonylphenol, 12 to 1 mole ratio).

Properties: Color, 200 Pt-Co max; viscous

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

clear liquid; completely soluble in water, acetone, methanol, xylene, carbon tetrachloride; insoluble in kerosine and Stoddard solvent; sp. gr. 1.070 (20/20°C); refractive index 1.4869 (20°C); freezing point 14°C; flash point 525°F.

Uses: Agricultural chemical concentrates; textile processing; wetting agent; degreasing; wool scouring; emulsification; removal of wallpaper; dispersant.

"Surfonic" N-150 (polyoxyethylene nonylphenol, 15 to 1 mole ratio).

Properties: Color, 200 Pt-Co max.; white semi-solid; completely soluble in water, acetone, methanol, xylene, carbon tetrachloride; sp. gr. 1.065 (30/4°C); refractive index, 1.4815 (30°C); f. p. 23°C; flash point 500°F.

Uses: High temperature emulsification; dispersion; high foaming detergents; wetting agents; penetrants.

"Surfonic" N-200 (polyoxyethylene nonylphenol, 20 to 1 mole ratio)

Properties: Color, 200 Pt-Co max; white waxy solid; completely soluble in water, acetone, methanol, xylene, carbon tetrachloride; insoluble in kerosine and Stoddard solvent; refractive index 1.4720 (50°C); f. p. 34°C; flash point 550°F.

Uses: High temperature emulsification; dispersion; high foaming detergents; wetting agents; penetrants.

"Surfonic" N-300 (polyoxyethylene nonylphenol, 30 to 1 mole ratio).

Properties: Color, 200 Pt-Co max; white waxy solid; completely soluble in water, acetone, methanol, xylene, carbon tetrachloride; insoluble in kerosine and Stoddard solvent; refractive index 1.4690 (50°C); f. p. 44°C.

Uses: High temperature emulsification; dispersion; wetting agent; very high foaming detergents; penetrants.

All the above "Surfonic" products available in 55-gal steel drums and in tank cars.

"Surfynol," ¹⁴⁴ Trade name for ditertiary acetylenic glycols, $R_1R_2C(OH)C:CC(OH)R_1R_2$. Properties: White solids, non-foaming, nonionic surface active agents, soluble in a wide variety of organic solvents, available in the following types:

"Surfynol" 82, m. p. 49°C; b. p. 222°C.

"Surfynol" 102, m. p. 61°C; b. p. 253°C.

"Surfynol" 104, m. p. 37°C; b. p. 260°C.

Uses: Pigment dispersion and defoaming in emulsion paints; rinsing agents; viscosity reductions; foam suppression agents; wetting agents; components of descaling compounds.

"Surital" Sodium. ³³⁰ Trademark for thiamylal sodium.

S. U. S. Abbreviation for Saybolt Universal Seconds, a method of expressing viscosity.

suspension. A liquid medium having small solid particles more or less uniformly dispersed through it. If the particles are small enough to pass through ordinary filters and do not settle out on standing, the

suspension is called a colloidal suspension or colloid. See also sol.

"Suspenso." ²⁴⁴ Brand name for a high purity precipitated calcium carbonate.

Properties: Oil absorption, 20-22; density as shipped, 50-55 lbs/cu ft; wt/solid gal 22.07 lbs; color, white; particle size, 1-5 microns.

Derivation: Precipitated calcium carbonate. Containers: Multiwall paper bags, 50 lbs net. Uses: Paint, plastics, rubber.

"Suspensoil." ²⁴⁴ Trademark for a rapidly soluble alkaline powder laundry detergent.

Uses: Complete detergent and builder for commercial laundry applications.

"Sustane." ⁴¹⁶ Trademark for a group of non-toxic antioxidant formulations based on UOP butylated hydroxyanisole; variations may include other approved antioxidants.

Properties: "Sustane BHA" is in the form of white tablets and "Sustane 1-F" in the form of solid white flakes; m. p. 135°F; b. p. 516°F (745 mm Hg), 270°F (5 mm Hg); viscosity (kinematic) 3.3 cSt at 100°F; soluble to slightly soluble in wide variety of oils, fats, various organic solvents.

Other variations: "Sustane 3-F" and "Sustane 5-F" are flake form mixtures. "Sustane 3, 6 and 8" are liquid formulations.

Uses: Antioxidants for food products, especially for processors of animal fats and vegetable oils; in cooked food products such as potato chips, baked goods, nuts, etc; stabilizer for petroleum wax coatings for food packaging; antioxidants for petroleum products.

sweet basil oil. See basil oils.

sweet bay. See laurus.

sweet bay oil. See laurel oil, volatile.

sweet cane. See calamus.

sweet fennel. See fennel.

sweet flag. See calamus.

sweet gas. See sour gas.

sweet grass. See calamus.

sweet gum, oriental. See styrax.

sweet oil.

1. See olive oil.

2. A petroleum oil, free of sulfur compounds.

sweet orange. See orange peel, sweet.

sweet spirits of niter.

Properties: Clear mobile liquid of pale yellow or greenish-yellow tint; sp. gr. not above 0.823 (25°C). Unstable in light and air.

Derivation: Alcoholic solution of about 4% ethyl nitrite.

Containers: Well-stoppered amber bottles, kept in cool, dark place.

Use: Medicine.

Fire hazard: Dangerous; keep tightly closed, remote from fire.

Shipping regulations: Flammable liquid. Red label.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sweet viburnum. See *viburnum prunifolium*.

sweet water. The glycerin and water mixture obtained when fats are split (or hydrolyzed) with water to give fatty acid and glycerin. Also, the washings from char used in sugar retining.

sweet wood bark. See *cascarilla*.

"Sylfat." ²⁹⁶ Trade name for high-purity tall oil fatty acids used in protective coatings, soaps, detergents, disinfectants, chemical intermediates, and flotation chemicals.

"Sylflex." ¹⁴⁹ Trademark for compositions used in the preparation of leather to impart permanent water repellence to the leather.

"Sylkyd." ¹⁴⁹ Trademark for organosiloxo compositions for use as intermediates in the production of resins and formulating varnishes, paints, and enamels of general utility.

"Sylmer." ¹⁴⁹ Trademark for silicone compositions used in the finishing of knitted, netted and textile fabrics, and also used in the preparation and treatment of leather to impart permanent water repellence to the leather.

"Syloid." ²⁴¹ Brand name for a line of finely divided silica gels.

Properties: White powder, transparent in vehicles; refractive index 1.46; oil adsorption 0.9-3.0 g oil/g; liquid bulking value 0.06 solid gal/lb; bulk density 4-30 lb/cu ft.

Typical analysis: Untreated grades, SiO₂, 99.7% ignited basis; volatile portion (6%) is water. Several grades surface-treated with organic and inorganic compounds. Containers: 50-, 100-lb drums; 15-, 30- and 50-lb bags.

Grades and Uses:

"Syloids" 308, 978: Flatting agents for lacquers.

"Syloids" 161, 162: Flatting agents for heat set finishes.

"Syloid" 404: For air dry varnishes producing matte surfaces.

"Syloid" 72: Anti-blocking agent plastic film, specialty paper coatings.

"Syloid" 73: Anti-blocking agent for plastic film and surfaces.

"Syloid" 75: Reinforcement of adhesives.

"Syloid" AL-1: Cassing preventative in metallic paints.

"Syloid" 244: Anti-caking agent, thickening organic liquids, bodying agent for paste inks.

"Sylox." ²⁴¹ Brand name for an antiseptic body dusting powder. Principal component is silica gel.

sylvanite (Au,Ag)Te₂.

Properties: One of the gold telluride group of minerals. Corresponds to the same general formula as calaverite (q.v.) and krennerite (q.v.). Steel-gray to silver-white color. Brilliant metallic luster becoming dull on exposure. Contains 24.2% Au, 13.3% Ag.

Constants: Sp.gr. 7.9-8.3; hardness 1.5-2.

Occurrence: United States (California, Colorado); Australia.

Use: Source of gold.

"Sylvanol." ³⁴² Trademark for ketonic aromatic having an intense heavy woody note for use in perfumery.

"Sylvaros." ²⁹⁶ Trade name for high-purity tall oil rosins used in sizing of paper and manufacture of resins for use in protective coatings and food containers.

"Sylvatal." ²⁹⁶ Trade name for refined tall oil.

sylvic acid. See abietic acid.

sylvine. See sylvite.

sylvinite. Granular masses of sylvite (q.v.) found naturally intermixed with rock salt and kieserite (q.v.). Used as a fertilizer.

"Sylviola." ³⁴² Trademark for woody cedarlike ketonic concentrate for perfumery.

sylvite (sylvine) KCl. A natural potassium chloride. Contains about 43% potassium chloride, 57% sodium chloride, sometimes with up to 0.26% bromine.

Properties: Colorless or white, bluish or reddish in color; streak, white; vitreous luster. Resembles rock salt in appearance but is easily identified by difference in sp.gr.

Constants: Sp.gr. 1.97-1.99; hardness 2. Occurrence: Italy; Germany; West Texas; New Mexico.

Use: Major source of potassium compounds in the United States, used for fertilizers.

sym-. Abbreviation for symmetrical. A prefix denoting the structure of organic compounds in which substituents are disposed symmetrically with respect to the carbon skeleton or to a functional group, such as a double bond. For example, sym-dichloroethane is ClH₂CCH₂Cl. In this dictionary, it is disregarded in alphabetizing. Uns- and as- are used for unsymmetrical or asymmetrical.

"Sympatol" Tartrate. ¹⁶² Trademark for paramethylaminoethanol-phenol tartrate. (HOC₆H₄CHOHCH₂NHCH₃)₂C₄H₂O₆.

Properties: White crystals; freely soluble in water and alcohol; m.p. 182-185°C.

Use: Medicine.

Note: These properties have been incorrectly ascribed in this book to phenylephrine tartrate, which is the meta-isomer.

synaptase. See emulsin.

"Synasol." ²¹⁴ Trademark for proprietary solvent. Composed of 100 gal of S.D. 1 ethanol denatured with 1 gal of methyl isobutyl ketone, 1 gal of ethyl acetate (87%), and 1 gal of aviation gasoline.

Properties of anhydrous grade: Sp.gr. 0.7900-0.7940 at 20/20°C; b.p. (760mm) 74.5°-79.5°C; flash point 55°F.

Grades: Anhydrous and 190 proof.

Containers: 1-gal can; 5- and 55-gal drums; tank cars up to 10,000 gal.

Uses: Shellac thinner and aniline ink solvent;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

coupler or latent solvent in nitro-cellulose lacquers; recommended for general industrial use wherever an alcohol-type solvent is required, except for anti-freeze manufacture where its use is prohibited by the Bureau of Internal Revenue.

Shipping regulations: Flammable liquid.
Red label.*

synchrocyclotron. See cyclotron.

synchrotron. See cyclotron.

"Syncurine." ³⁰¹ Trademark for decamethonium bromide, used in anesthesia.

syndets. Abbreviated form for "synthetic detergents." See detergents, synthetic.

syndiotactic (syndyotactic). A type of polymer molecule in which groups of atoms that are not part of the backbone structure are located in some symmetrical and recurring fashion above and below the atoms in the backbone chain, when the latter are arranged so as to be in a single plane. See polymer, stereospecific.

syndyotactic. See syndiotactic.

"Synektan." ⁷⁸ Trademark for a line of synthetic tanning materials.

syneresis. The contraction of a gel on standing, with exudation of liquid. The separation of serum from a blood clot, or of the whey in milk souring or cheese making are examples.

synergist. A material which enhances the remedial efficiency of a therapeutically active agent, or the effectiveness of an insecticide, fungicide, or similar biological agent.

"Synkamin." ³³⁰ Trademark for 4-amino-2-methyl-1-naphthol.

"Synkayvite" Sodium Diphosphate. ¹⁹⁰ Trademark for a brand of menadiol sodium diphosphate (q.v.).

"Synoca." ¹⁰⁸ Trademark for a granular, alkaline hexametaphosphate compound containing a wetting agent.

Containers: 100- and 300-lb drums.

Uses: Washing paper machine felts; washing motor vehicles.

"Synpex." ³³³ Trade name for metal enamels composed of a combination of synthetic resin and cellulose bases.

syntans. Synthetic organic tanning materials made from phenolsulfonic acids and formaldehyde. Used in making chrome and vegetable tanned leathers.

"Syntergent." ³⁰⁹ Trademark for a series of liquid, nonionic detergents especially useful in the textile industry.

"Syntharol." ³²⁵ Brand name for blends of lubricants and binders used as warp size additions.

"Synthe-Copal." ³⁶ Pure rosin ester gum. Physical properties: Color WG to N (U.S.

Department of Agriculture rosin standards); acid number 6-8; melting range 149-162°F, capillary tube method.

Chemical properties: Soluble in acetates, coal tar solvents, turpentine and drying oils. Imparts fair resistance to water, weather, abrasion, and many reagents.

Use: General application in the formulation of varnishes and oleoresinous vehicles.

"Synthenol." ⁶⁴ Trademark for a series of dehydrated castor oils with fast, controllable rate of bodying, excellent color retention, and water resistance.

Uses: Varnishes, enamels, house paints.

synthesis gas. Any mixture of carbon monoxide and hydrogen, usually intended to be used for catalytic conversion to hydrocarbons, alcohols or other organic compounds. The hydrogen and carbon monoxide may be in various proportions, and production may be by high temperature action of steam on carbon or natural gas, by partial oxidation of natural gas, or by other processes. See water gas, and Oxo process.

synthetic indigo blue. See indigo.

synthetic muguet. See hydroxycitronellal.

synthetic oil of bitter almonds. See benzaldehyde.

Synthine process. A name sometimes applied to the more highly developed forms of the Fischer-Tropsch process.

Synthol. A name originally used for a catalytic process developed by Fischer and Tropsch for obtaining mixtures of alcohols and other oxygenated organic compounds from carbon monoxide and hydrogen. The name has also been applied to more recent varieties of such processes and to the products of such processes. See Fischer-Tropsch process.

"Synthrapols." ³²⁵ Series of ethylene oxide condensation products. Used as nonionic all-purpose surface-active agents.

"Synthracon." ³²⁵ Brand name for a series of non-substantive softeners used as textile napping assistants, lubricants, and resin finishing plasticizers.

syntonin (para-peptone; muscle fibrin).

Properties: Yellow powder. Soluble in dilute hydrochloric acid and alkaline carbonates.

Derivation: By conversion of albumose by means of dilute hydrochloric acid.

"Syntropan" Phosphate. ¹⁹⁰ Trademark for amprotropine phosphate (q.v.).

Syrian asphalt. A glance pitch (q.v.) found in Syria, containing mineral matter up to 5% and having a fusing point (B & R) of 275°F. Shipping regulations: None.*

Syrian gum. See carmania gum.

syrosingopine. An analog of reserpine, prepared from it by hydrolysis and reesterification.

Grade: N.N.D.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

syrup. Trade name for solution of cane or beet sugar sold in tank car lots to manufacturers of candy, soft drinks, soda-fountain goods, etc.

syrup, U. S. P. XVI. Aqueous solution of cane sugar (85 g/100 ml). A viscous liquid with sp. gr. about 1.313.

systemics. Pesticides which are absorbed without harm by the host but which are toxic to parasites which feed upon it.

"Systox." ¹⁸¹ Trademark for O, O-diethyl O - (and S)-2-(ethylthio)ethyl phosphorothioates (q. v.).

"Syton." ⁵⁸ Trademark for colloidal silicas, dispersed in water; available in various grades:

"Syton" AS-200 is used as an anti-soilant for pile fabrics.

"Syton" C-30 and 200 are used as anti-blocking agents in water finishes; gloss control agents in water finishes; increase bond strength of rubber latex adhesives; increase modulus of latex film and thread; surface harden water-base laminating resins; suspending agents for pigments in water systems; mold lubricant; binders for precision casting molds; flame retarding agents for water-based paints.

"Syton" DS and DS-200 are used in spinning, wet processing and finishing of textiles.

"Syton" P and P-200 are used on paper containers to make slip-resistant coatings.

"Syton" W-200 is used as an anti-slip agent in wax emulsion polishing compounds.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

T

T. Symbol for tritium (q. v.).

2,4,5-T. Abbreviation for 2,4,5-trichlorophenoxyacetic acid.

2,4,6-T. Abbreviation for 2,4,6-trichlorophenol.

Ta. Symbol for tantalum.

tabbyite. A mineral hydrocarbon found in Utah and elsewhere.

Uses: As a filler in rubber and roofing materials.

table salt. See sodium chloride.

tabun (dimethylphosphoramidocyanidic acid, ethyl ester) $(CH_3)_2NP(O)(C_2H_5O)(CN)$.

Properties: Liquid, m.p. $-50^\circ C$; b.p. 240° (760 mm); sp. gr. 1.4250 ($20/4^\circ C$); readily soluble in organic solvents; miscible with water but readily hydrolyzed. Destroyed by bleaching powder, which, however, generates cyanogen chloride.

Use: Proposed as military nerve gas and experimental cholinesterase inhibitor. Toxic symptoms similar to parathion.

tachysterol $C_{28}H_{44}O$. A sterol.

Properties: Oil; levorotatory; insoluble in water, soluble in most organic solvents. Protect from air.

Use: Medicine, as the dihydrotachysterol.

tack. See tackiness.

tackiness (tack). Property of being sticky or adhesive.

taconite. A low grade iron ore consisting essentially of a mixture of hematite and chert (q. v.). It contains about 25% iron. Found in the Lake Superior district.

tactic. Refers to definite regularity or symmetry of some kind in the molecular arrangement or structure of a polymer molecule. Contrasts with random positioning of substituent groups along the polymer backbone, or random position with respect to one another of successive atoms in the backbone chain of the polymer molecule.

See polymer, stereospecific.

"Tag." ²¹³ Brand name for a type of fungicide containing phenyl mercuric acetate.

"Tagathen." ³¹⁵ Trademark for chlorothen citrate (q. v.).

tagged compound. A compound whose molecules or formula units contain one or more radioactive atoms. See tracer.

tailed pepper. See cubeba.

tailings. In flour-milling, the product left after grinding and bolting middlings (q. v.); impurities remaining after the extraction of useful minerals from an ore. In general, any residue from a mechanical refining or separation process.

"Takalab TLM." ²¹² Trademark for a product containing diastatic and proteolytic enzymes. **Properties:** Dry, fine, white powder, fully water-soluble, nonhazardous, non-flammable; optimum pH for diastatic reaction 6.5-7.0; for proteolytic reaction 7.0-8.4; optimum temperature $45^\circ C$.

Containers: 1-lb packages, each containing two $\frac{1}{2}$ -lb sifter-top bottles.

Use: For the digestion of albumen and starch-containing stains in commercial dry-cleaning plants.

Fire hazard: None.

"Take-Hold." ¹⁷² Brand name for a proprietary product.

Properties: Completely water-soluble mixture of ammonium and potassium phosphates giving a substantially neutral solution.

Containers: 50-lb paper bags.

Use: An agricultural starter solution mix for transplanting set-outs.

"Takimerse." ²¹² Trademark for a product containing diastatic and proteolytic enzymes. **Properties:** Dry, fine white powder, water-soluble, nonhazardous, nonflammable. Optimum pH 7.0-8.0; optimum temperature $40-45^\circ C$.

Grade: Technical.

Containers: 2- and 4-lb cans.

Uses: For the digestion of albumen and starch-containing stains by immersion, in commercial dry-cleaning plants.

"Talase." ²¹² Trademark for product containing diastatic and proteolytic enzymes. **Properties:** Dry, fine white powder, water-soluble, nonhazardous, nonflammable. Optimum pH for diastatic reaction 7.0-7.2, for proteolytic reaction 7.5-8.0; optimum temperature $45^\circ C$.

Grade: Technical.

Containers: 50-, 100-, and 300-lb drums.

Uses: Desizing of textile fabrics preparatory to dyeing, bleaching, mercerizing, printing and finishing.

talbutal (5-allyl-5-sec-butylbarbituric acid) $C_{11}H_{18}N_2O_3$.

Properties: White crystals; m.p. $103.4-106.4^\circ C$.

Use: Medicine.

talc (talcum; mineral graphite; steatite)

$Mg_3Si_4O_{10}(OH)_2$. A natural hydrous

*See 'I. C. C. Shipping Regulations,' page xiii.

Reference numbers refer to name of manufacturer. See 'List of Manufacturers,' page v.

magnesium silicate, usually occurring as a natural alteration of magnesium silicate rocks or in metamorphosed dolomites. Compact massive varieties may be called steatite in distinction to the foliated varieties which are called talc. Soapstone is an impure variety of steatite.

Properties: Color white, apple green, gray; luster pearly or greasy, feel greasy; can be cut with a knife; hardness 1-1.5 (may be harder when impure). High resistance to acids, alkalies and heat. Sp.gr. 2.7-2.8.

Occurrence: New York, North Carolina, California, Vermont, Georgia, Maryland, Virginia, Nevada, Montana, Texas, Washington.

Grades: Crude; washed; air floated; U.S.P. XVI; fibrous (99.5%, 99.95%).

Containers: Railroad cars; 50-lb paper bags; 200-lb burlap bags.

Uses: In paint as an extender and as a pigment; in ceramics; in tar paper, asphalt shingles, and roll roofing; in cosmetics and pharmaceuticals; as a filler in rubber, insecticides, soap, putty, plaster, linoleum, oilcloth, rope, fabrics; as a dusting agent for linoleum, oilcloth, leather; as a lubricant; in paper; in slate pencils and crayons, in gas burner tips and electrical insulation. See also magnesium silicate.

talcum. See talc.

"Tallene." ²²⁸ Trademark for tall oil pitch, the residue obtained from distillation and fractionation of whole tall oil.

Properties: 35-50% fatty acids, 24-32% rosin acids, and 22-32% sterols, higher alcohols, etc. It is dark brown in color and a semi-solid at room temperature.

Uses: Protective coatings, adhesives, linoleum, asphalt tile, plasticizers, and rust preventatives. "Tallene" will undergo reactions common to fatty and rosin acids such as esterification, saponification, and liming.

tall oil (tallol; liquid rosin). The oily mixture of rosin acids, fatty acids, and other materials obtained by acid treatment of the alkaline liquors from the digesting (pulping) of pine wood.

Derivation: The spent black liquor from the pulping process is concentrated until the sodium salts (soaps) of the various acids separate out and are skimmed off. These are acidified by sulfuric acid to obtain the crude tall oil.

Constituents: Rosin acids, including abietic and its isomers; unsaturated fatty acids, including oleic, linoleic and linolenic; and phytosterols and higher alcohols and hydrocarbons, many still unidentified. The composition and properties of tall oil vary widely. The crude fatty acid derivatives, especially metal compounds, are known as tallates.

Grades: Crude; refined.

Containers: Drums; tank cars; tank trucks.

Uses: Drying oils; alkyd resins; linoleum; soaps, cutting oils and emulsifiers; driers; flotation agents; oil well drilling muds; core

oils, lubricants and greases; asphalt derivatives; rubber; synthesis of cortisone and sex hormones.

tallol. See tall oil.

tallow.

Derivation: The fat extracted from the solid fat or "suet" of cattle, sheep or horses.

The quality varies depending on the season, the food and age of the animal.

Chief constituents: Stearin, palmitin and olein.

Properties: The solidifying points of the different tallows are as follows: from 20-45°C for horse fat; 27-38°C for beef tallow; 54-56°C for stearin and oleo; 32-41°C for mutton tallow.

Grades: Edible; inedible; beef tallow; mutton tallow, horse fats, acidless; edible, extra.

Containers: 50-lb tierces; 375-lb wooden barrels; tank trucks; tank cars.

Uses: Soap stock; leather dressing; candles; food; railway axle grease; manufacture of stearin and oleo oil.

Shipping regulations: None.*

tallow-seed oil. See stillingia oil.

tallow shrub. See myrica.

talmi gold. See Abyssinian gold.

"Tamarax." ³⁴² Trademark for extract of tamarind rind for flavoring.

"Tamax." ⁴⁰⁸ Trade name for a premium grade mullite refractory made from the best grade of calcined Indian kyanite to which a mineralizer is added. The mineralizer increases the mullite content of the bond. Al₂O₃ 68.0%, PCE Cone 38-39. Available in bonded brick and special shapes.

Uses: Recommended for use under extreme conditions of temperature, load, spalling and attack by most slags, specific uses are glass melting superstructure and feeder parts, ferrous and non-ferrous melting refractories, crowns and linings for all types of furnaces and kilns, car top blocks, muffles and piers.

TAM Color "A." ³³⁷ Trademark for aluminum iron silicate containing Al₂O₃ 47%, SiO₂ 32%, Fe₂O₃ 13.5%; available as granular +50 mesh 6.6%, +70 mesh 32.1%, +100 mesh 45.0%, +140 mesh 12.0% and milled +200 mesh 3.8%. Granular is used as a speckle ingredient for glazes; milled is used as a colorant for ceramic glazes and bodies. **Containers:** 100-lb drums or bags; 50,000-lb carloads.

"Tamol." ²³ Trademark for anionic, polymer-type dispersing agents. Supplied as light-colored powders or aqueous solutions. Effective dispersant for aqueous suspensions of insoluble dyestuffs, polymers, clays, tanning agents and pigments.

Use: Manufacture of dyestuff pastes; textile printing and dyeing; pigment dispersion in textile backings, latex paints and paper coatings; retanning and bleaching of leather; dye resist in leather dyeing; dispersion of pitch in paper manufacture; pre-floc

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

prevention in the manufacture of synthetic rubber.

"Tamul." ⁴⁰⁸ Trade name for a refractory made of sintered synthetic mullite grain; Al_2O_3 68.21%, PCE Cone 39. Available in bonded brick and special shapes; also refractory heat setting cements, air setting cements, hydraulic setting cements and ramming mixes.

Uses: Refractories for glass melting superstructure, ferrous and non-ferrous metal melting, construction of high temperature furnaces and kilns using all types of fuel.

"TAM" Zircon. ³³⁷ See Zircon Granular "TAM" and Zircon Milled "TAM."

"Tanak." ⁵⁷ Brand name for a group of highly concentrated synthetic tanning agents in liquid and dry form.

Uses: In leather manufacture for bleaching dye leveling, for penetration of vegetable tans, for tanning. Used for pitch control in paper manufacture.

"Tanak" MRX. ⁵⁷ Trademark for melamine-formaldehyde resin tanning agent used to make pure white leather and for bleaching and filling chrome leather.

"Tanamer." ⁵⁷ Trademark for sodium polyacrylate adhesive for use during the drying of leather.

"Tanarc." ²⁵⁰ Trademark for a closely controlled rutile substitute specifically processed for welding electrode coatings. The product is essentially titanium dioxide plus iron oxides with minor impurities of silica and alumina.

Grades: Granular (80 mesh) and airfloated (325 mesh).

"Tanasol." ⁷⁸ Trademark for a series of synthetic, organic sulfonic acid condensation products used in tanning of hides and skins.

tangerine oil. See mandarin oil.

"Tanigan" DLNA. ³⁰⁷ Trademark for a leather chemical.

Composition: Sulfonated condensation product of a dihydroxy diaryl sulfone and diphenylol • propane; 19% tannin content.

Properties: Dark brown, opaque liquid, sp. gr. 1.22; soluble in water.

Uses: In the leather industry as a replacement for vegetable extracts in combination tanned grain leather; bleaching agent for chrome tanned leather; leveling agent for pastel shades; mordant for basic dyestuffs.

"Tanninol" BMN. ²⁰⁶ Brand name for a mordant for basic dyestuffs on cotton and viscose.

"Tanninol" WR. ²⁰⁶ Brand name for a wool resist.

tankage (animal tankage). The product obtained in abattoir by-product plants from meat scraps and bones. These are boiled under pressure and allowed to settle. The grease is removed from the top and the liquor drawn off. The scrap is then pressed, dried and sold for fertilizer.

Grades: Based on per cent of ammonia and bone phosphate. A medium grade has 10% ammonia and 20% bone phosphate. Concentrated tankage has had the boiled down tank liquor and press water added to it before drying, and runs about 15-17% ammonia.

Shipping regulations: Flammable solid. Yellow label. Not accepted by freight.*

tankage, garbage. Garbage treated with steam under pressure, the water and some of the grease removed by pressing and further grease removed by solvent extraction. Contains from 3-4% ammonia, 2-5% phosphoric acid and 0.50-1.00% potash.

Use: Fertilizer.

Shipping regulations: Less than 8% moisture; flammable solid. Yellow label. Not accepted by express.*

tankage, gashouse. A misnomer for spent oxide (q.v.).

"Tannex." ²³⁶ Brand name for a full substitute for quebracho in the thinning of drilling muds. Used in mud thinning when exposed to the high bottom-hole temperatures of deep wells. May be added directly to the mud system, but gives better results when dissolved in caustic soda solution before adding to the mud system.

tannic acid (gallotannic acid; tannin; digallic acid) $C_{14}H_{10}O_9$. Naturally occurring substance widely found, probably as a glucoside, in nutgalls, tree barks such as sumac, oak, and hemlock, and in other plant parts. The molecular formula is only an approximation, although the tannins are known to be gallic acid derivatives. They have been known in the crude form for centuries for their ability to tan skins. A solution of tannic acid will precipitate albumen.

Properties: Lustrous, faintly yellowish, amorphous powder, glistening scales or spongy mass, odorless; strong astringent taste; m.p., decomposes at 210°C; soluble in water, alcohol, and acetone; almost insoluble in benzene, chloroform, ether, and petroleum ether.

Derivation: Extraction of powdered nutgalls with water and alcohol.

Grades: Technical; C.P.; N.F. XI; fluffy.

Containers: Barrels; drums.

Uses: Chemicals (tannates, gallic acid, pyrogalllic acid, hydrosols of the noble metals); alcohol denaturant; tanning; textiles (mordant and fixative); electroplating; galvanoplastics (gelatin precipitant); clarification agent in wine manufacture and brewing; inks; pharmaceuticals; deodorization of crude oil; rubber substitutes; photography; paper (sizing, mordant for colored papers); stove polishing compounds; medicine.

Shipping regulations: None.*

tannin. See tannic acid.

tannin albuminate. See albumin tannate.

tannin-formaldehyde. See tannoform.

tanning extracts. These are now prepared from nearly all of the tannin substances

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

by extraction with water in specially designed extracting equipment and then evaporating the tannin solution to a thick syrup or even to dryness, generally by aid of vacuum.

tanning grease. See *degras*.

tannoform (methylene ditannin; tannin-formaldehyde) $\text{CH}_2(\text{C}_{14}\text{H}_9\text{O}_9)_2$.

Properties: Reddish, odorless, tasteless, bulky powder. Soluble in alcohol, dilute ammonia, sodium hydroxide, potassium hydroxide; insoluble in organic solvents and water.

Constants: Decomposes at 230°C .

Derivation: Reaction of tannin and formaldehyde in hot aqueous solution and precipitating with concentrated hydrochloric acid.

Use: Medicine.

Shipping regulations: None.*

tannyl acetate. See *acetyltannic acid*.

"Tanolin." ²⁴⁴ Trademark for basic chromium sulfate, specifically adjusted to varying basicities.

Properties: Green crystalline powder, soluble in water.

Derivation: From sodium bichromate.

Grades: Available in 6 basicities, ranging from 34-60%; available in solid or liquid.

Brands: "R"; "T"; "KXD"; "225"; "W2XD"; "S".

Containers: Multiwall paper bags, 80-lb net; fiber drums, 200-lb net. Liquid shipped in tank cars or tank trucks.

Uses: Chrome tanning of leather; colors; compounding.

"Tanoyl." ³⁰⁹ Trademark for sulfonated oils with or without raw oils blended therewith, for use in the fat-liquoring, oiling-off and stuffing of leather.

tansy oil.

Properties: Yellowish liquid; strong odor; becomes brown on exposure to air and light; poisonous! Soluble in alcohol, ether, carbon disulfide and chloroform; almost insoluble in water.

Chief known constituents: Thujone; camphor; borneol.

Constants: Sp. gr. 0.925-0.955.

Derivation: Distilled from the herb, *Tanacetum vulgare*.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-, 5-lb bottles; 20-lb tins; drums.

Use: Medicine.

Shipping regulations: None.*

tannic acid anhydride. See *tantalum oxide*.

tantal chloride. See *tantalum chloride*.

tantalite. See *columbite*.

tantalum Ta. Element of atomic number 73 in group V of the periodic system.

Properties: (a) Black powder. (b) Steel-blue-colored metal when unpolished; nearly a platinum-white color when polished.

Soluble in fused alkalis; insoluble in acids

except hydrofluoric and fuming sulfuric acids.

Constants: Sp. gr. (a) 14.491; (b) 16.6 (worked metal); m. p. $2996 \pm 50^\circ\text{C}$. Tensile strength of drawn wire may be as high as 130,000 lbs/sq in. Linear coefficient of expansion is only slightly less than platinum and more than molybdenum or tungsten. Electrical resistance about 8 times that of copper and 3 times that of tungsten. With 10% tungsten it has great strength at very high temperatures.

Source: Columbite.

Derivation: From tantalum-potassium fluoride, by heating in an electric furnace, by sodium reduction, or by electrolysis. The powdered metal is converted to the massive metal by sintering in a vacuum. Foot-long crystals can be grown by an arc-fusion process.

Corrosion resistance: 99.5% pure tantalum is resistant to all concentrations of hot and cold sulfuric (except concentrated boiling), hydrochloric, nitric and acetic acids, hot and cold dilute sodium hydroxide, all dilutions of hot and cold ammonium hydroxide, mine and sea waters, moist sulfurous atmospheres, aqueous solutions of chlorine. Forms and grades available: Powder; sheet; rods; wire; ultrapure; single crystals.

Uses: Dental instruments; surgical tools; container material in nuclear reactors; pen points; filament wire, plates, and support wire for incandescent lamps of thermionic tubes; hypodermic needles; cathodes for use in electrochemical analysis; analytical weights; laboratory ware; parts of scientific instruments, acidproof pumps and parts of chemical equipment; electrical devices; radio; sutures; capacitors; alloys with tungsten used in missiles.

tantalum carbide TaC. A very hard, heavy, high-melting, brown crystalline solid; m. p. 3700°C ; b. p. 5500°C ; sp. gr. 14.5; hardness 1800 kg/sq mm; resistivity 30 micro-ohm cm (room temp); extremely resistant to chemical action except at elevated temperatures.

Derivation: Tantalum oxide and carbon heated at high temperatures.

Use: In cutting tools and dies although alloy does not have "seizing" effect of pure Ta; in cemented carbide tools.

tantalum chloride (tantalum chloride; tantalum pentachloride) TaCl₅.

Properties: Pale yellow, crystalline powder. Decomposed by moist air. Caution! Keep well stoppered! Sp. gr. 3.7; b. p. 242°C ; m. p. 221°C . Soluble in alcohol and potassium hydroxide.

Grades: Technical.

Uses: Chlorination of organic substances; medicine; production of pure metal.

tantalum nitride TaN.

Properties: Hexagonal brown, bronze or black crystals; sp. gr. 16.3; m. p. 3090°C ; insoluble in water; slightly soluble in aqua regia, nitric acid, hydrofluoric acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Grade: Technical, powder.
Shipping regulations: None.*
- tantalum ore.** See columbite.
- tantalum oxide** (tantic acid anhydride; tantalum pentoxide) Ta_2O_5 .
Properties: Rhombic, crystalline prisms; sp. gr. 7.6; m.p. infusible; insoluble in water and acids except hydrofluoric.
Derivation: From tantalite, by removal of other metals.
Grades: Technical.
Containers: Wooden kegs.
Uses: Production of tantalum; "rare-element" optical glass; intermediate in preparation of tantalum carbide; electronics.
Shipping regulations: None.*
- tantalum pentachloride.** See tantalum chloride.
- tantalum pentoxide.** See tantalum oxide.
- tantalum potassium fluoride** (potassium tantalum fluoride, potassium fluotantalate) K_2TaF_7 .
Properties: White, silky needles. Slightly soluble in cold water, quite soluble in hot water.
Use: Intermediate in preparation of pure tantalum.
- tantiron.** A ferrous alloy containing 84.87% iron, 13.5% silicon, 1% carbon, 0.4% manganese, 0.18% phosphorus, 0.05% sulfur. It is resistant to acids, used for chemical equipment. Very brittle.
- "Tanz."** ⁴⁸ Trademark for an ammonium lignin sulfonate used as an extender for vegetable tannin extracts.
- "Tao."** ²⁹⁹ Trademark for triacetyloleandomycin.
- "Tao-AC."** ²⁹⁹ Trademark for combination drug containing triacetyloleandomycin, phenacetin, caffeine, salicylamide, and buclizine hydrochloride. Used in medicine.
- "Taomid."** ²⁹⁹ Trademark for a combination drug containing triacetyloleandomycin, sulfadiazine, sulfamerazine, and sulfamethazole.
- "Tapazole."** ¹⁰⁰ Trademark for methimazole, U.S.P.
- tiapioca.** See cassava starch.
- tiapioca dextrin.** See dextrin.
- tar.** A dark-colored, bituminous substance, liquid or semi-liquid at room temperature, obtained by the destructive distillation of coal, wood, peat, or other carbonaceous or vegetable materials. If often possesses a characteristic "tarry" odor; usually insoluble in water, but miscible with carbon disulfide, benzene, etc. On further distillation, oxidation, etc., forms a pitch. Its composition and origin are variable.
Shipping regulations: May be classed as flammable liquid. Red label.*
- tar acid oil.** Same as tar acids or a blend of same with neutral oils.
- tar acids.** Mixtures of phenols present in tars or tar distillates and extractable by caustic soda solutions. The term is generally recognized as applying particularly to tar acids from coal tar; when applied to the products from other tars it should be qualified by the appropriate prefix, e.g., wood-tar acids, lignite-tar acids, etc.
Properties: Soluble in alcohol and coal-tar hydrocarbons.
Grades: 15-18%, 25-28% and 50-53% phenol.
Containers: Drums; tank cars.
Uses: Wood preservative; as an insecticide for cattle and sheep dipping, called dip oils or sheep dip; and in the manufacture of disinfectants.
Danger: Rapidly absorbed through skin.
Causes severe burns. MCA warning label.
- taraxacum** (dandelion; lion's tooth).
Properties: Blackish-brown roots; odorless; bitter taste.
Derivation: The dried rhizome and root of the dandelion, *Taraxacum officinale* or of *Taraxacum levigatum*.
Components: Taraxasterol, choline, levulin, inulin.
Occurrence: North America and Europe.
Grades: Technical; N.F. XI.
Containers: Bags; barrels.
Use: Medicine.
Shipping regulations: None.*
- tar bases.** Basic nitrogen compounds from coal tar, such as pyridine, picoline, lutidine, and quinoline.
- tar camphor.** See naphthalene.
- tar camphor, chlorinated.** See chloronaphthalenes.
- tar, dehydrated** (tar, refined).
Properties: Dark brown, thick, viscid liquid; poisonous!
Derivation: Tar from which the water has been driven off.
Grades: Technical.
Containers: Barrels; tank cars.
Uses: Water-proofing compounds; roads; medicine.
Shipping regulations: None.*
- tar, hardwood.** See tar, wood.
- "106 Tarmastic."** ³²³ Trademark for a series of tar base protective coatings.
- tar oil.** See creosote, coal tar.
- tar oil, rectified.** The volatile oil from pine tar rectified by steam distillation.
Properties: Thin liquid with dark reddish-brown color and strong, burning odor and taste. Alcohol solution is acid to moistened blue litmus. Miscible with alcohol. Sp. gr. 0.960-0.990.
Use: Medicine.
- tar oil, wood** (pine-tar oil).
Properties: Almost colorless liquid when freshly distilled; turns dark reddish-brown; strong tarry odor and taste; poisonous!
Sp. gr. 0.862-0.872. Soluble in ether, chloroform, alcohol and carbon disulfide.
Chief constituents: Phenols.
Derivation: Obtained by the destructive

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

distillation of the wood of *Pinus palustris*.
Method of purification: Rectification.

Grades: Technical; rectified; refined.

Containers: Iron drums; glass bottles; tank cars.

Uses: Renders paper proof against moisture and insects. Used in paints and stains. A heatquenching oil for steel and iron castings and as an insecticide in cattle dips. Used in the manufacture of reclaimed rubber due to its softening action and its mild antioxidant property. Used by the mining industry as a reagent in ore flotation; by the paint industry in roofing compounds; as the vehicle in insulating varnishes; as a wood stain; and as a solvent for various compounds and in emulsions. Used as a spreader for nicotine; as a medicine.

tar, pine.

Properties: Very viscous, dark brown to black liquid or semi-solid with strong characteristic odor and sharp taste. Translucent in thin layers; hardens with aging. Sp. gr. 1.03-1.07; boiling range 240-400°C. Soluble in alcohol, ether, chloroform, acetone, glacial acetic acid, fixed and volatile oils and in sodium hydroxide solution; insoluble in water. Chief constituents are complex phenols; also present are turpentine, rosin, toluene, xylene and other hydrocarbons.

Derivation: By destructive distillation of pine wood, especially *Pinus palustris*.

Grades: Kiln burnt, retort; N.F. XI.

Containers: Tanks, drums, and barrels.

Uses: Medicine, ore flotation; roofing compositions, paints and varnishes, plastics; tar soaps; linoleum; asphaltic compositions, general preservative; marine preservative.

Shipping regulations: None.*

tarragon oil. See estragon oil.

tarras cement. See pozzolana cement.

tar, refined. See tar, dehydrated.

"Tarset." ³²³ Trademark for a coal tar-epoxy coating.

tartar, chalybeated. See iron-potassium tartrate.

tartar, cream of. See potassium bitartrate.

tartar, crude. See argols.

tartar emetic. See antimony-potassium tartrate.

tartaric acid (dihydroxysuccinic acid)
 $\text{HOOC}(\text{CHOH})_2\text{COOH}$.

Properties: Colorless, transparent crystals, or white, fine to granular, crystalline powder; odorless, has acid taste, stable in air. Soluble in water, alcohol, and ether.

Constants: Sp. gr. 1.7598; m.p. 170°C.

Derivation: (a) Wine-lees containing cream of tartar and calcium tartrate are treated with sufficient milk of lime to convert the cream of tartar into calcium tartrate. The calcium tartrate is treated with sulfuric acid, the solution filtered and the tartaric

acid obtained by crystallization. (b) From maleic anhydride and hydrogen peroxide.

Method of purification: Recrystallization.
Grades: Technical; C.P.; crystalline; powder; granular; N.F. XI.

Containers: Bags; drums.

Uses: Chemicals (tartrates, e.g., cream of tartar, tartar emetic, acetaldehyde); as a sequestrant; tanning; effervescent beverages; baking powder preparations; fruit esters; ceramics; galvano-plastics; effervescent medicinal preparations; photography (printing and developing, light-sensitive iron salts); textile industry; silvering glass mirrors, coloring metals.

Shipping regulations: None.*

tartaric acid, inactive. See racemic acid.

para-tartaric acid. See racemic acid.

tartar, salt of. See potassium carbonate.

tartrated antimony. See antimony-potassium tartrate.

tartrated iron. See iron-potassium tartrate.

tar, water-gas.

Properties: Dark brown, thick, viscid liquid; poisonous! Sp. gr. 1.005-1.15.

Derivation: A by-product from the manufacture of illuminating gas (carburetted water gas).

Grades: Technical.

Containers: Iron drums; tank cars.

Uses: Distillation for benzene, phenol, etc.; in flame projectors.

Shipping regulations: None.*

tar weed. See grindelia.

tar, wood (tar, hardwood).

Properties: Black, syrup-like, viscous fluid.

Derivation: A by-product of the destructive distillation of wood.

Grades: Technical.

Containers: Tank cars.

Use: Hardwood pitch; wood creosote; heavy, high boiling wood oils; wood preserving oils, paint thinners; medicine.

Shipping regulations: None.*

"Tasil." ⁴⁰⁸ Trade name for a mullite super refractory made from the best grade of calcined Indian kyanite, selected for low content of impurities including iron, titania and alkalis. Al_2O_3 59.0%, PCE Cone 37-38. Available in bonded brick and special shapes; also refractory heat, air setting and hydraulic setting cements, and ramming mixes.

Uses: Refractories for glass melting superstructure and feeder parts, ferrous and non-ferrous metal melting and heat treating, linings and crowns for high temperature furnaces and kilns firing all kinds of fuel, kiln furniture, car top blocks, muffles and piers.

taurine (2-aminoethanesulfonic acid)

$\text{NH}_2\text{CH}_2\text{CH}_2\text{SO}_3\text{H}$. A crystallizable amino acid found in combination with bile acids; its combination with cholic acid is called

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

taurocholic acid.

Properties: Rods; decompose 300°C; soluble in water; insoluble in alcohol.

Derivation: Isolated from ox bile; organic synthesis.

Use: Biochemical research; pharmaceuticals; organic synthesis; wetting agents.

taurocholic acid (cholaic acid; cholytaurine) $C_{26}H_{45}NO_7S$. Occurs as sodium salt in bile. It is formed by the combination of the sulfur-containing amino acid, taurine, and cholic acid (q.v.) as the sodium salt. It aids in digestion and absorption of fats.

Properties: Crystals; stable to air. M.p. 125°C (dec). Freely soluble in water; soluble in alcohol; almost insoluble in ether and ethyl acetate.

Derivation: Isolation from bile.

Use: Biochemical research; medicine. The acid and its salts are emulsifying agents.

"Taycor." ⁴⁰⁸ Trade name for a corundum base super-refractory made of sintered high purity alumina. Al_2O_3 88.0-90.0%, PCE Cone 41. Available in bonded brick and shapes and also heat, air setting and hydraulic setting cements, patches and ramming mixes. Outstanding resistance to abrasion, load and iron oxide slag attack at high temperatures.

Uses: Rails in billet heating furnaces and other service where iron oxide slag is a problem; lining for ferrous melting in electric furnaces, direct arc, indirect arc and induction types; high temperature furnaces of all types including crowns, linings, kiln furniture, muffles and piers.

"Taylor Zircon." ⁴⁰⁸ Trade name for a refractory made of selected grades of refined zirconium silicate. PCE above Cone 42. Available in bonded bricks and special shapes, also high temperature cements and ramming mixes of all types.

Uses: Paving superstructure and feeder parts for glass melting furnaces; linings for aluminum melting and holding furnaces, gas, oil and electrically fired; refractories for melting ferrous alloys in induction and arc electric furnaces, refractories for phosphate, sodium silicate and frit melting, kiln furniture for firing of certain porcelain and other ceramic bodies.

Tb. Symbol for terbium.

TBH. Abbreviation for technical benzene hexachloride. See 1, 2, 3, 4, 5, 6-hexachlorocyclohexane. Used as an insecticide.

TBT. Abbreviation for tetrabutyl titanate.

"TBTO." ²⁸⁸ Trademark for bis(tributyltin) oxide.

Properties: Colorless to slightly yellow liquid; b.p. 180°C/2 mm; f.p. lower than -45°C; sp.gr. 1.17 (25°C); flash point above 212°F (Tag closed cup); viscosity 4.8 centistokes at 25°C; practically insoluble in water.

Containers: 6-gal steel pails; 55-gal steel drums.

Uses: Potential application as a fungicide in

the fields of textile, wood, leather, paper and plastic preservation.

Tc. Symbol for technetium.

TCA. Abbreviation for trichloroacetic acid or its sodium salt, a herbicide.

TCA cycle (tricarboxylic acid cycle; Krebs cycle; citric acid cycle) A special mechanism in the normal metabolism of living cells for the final degradation of 2-, 3-, or possibly 4-carbon fragments of metabolites by a combination of decarboxylation and dehydrogenation.

TCB. Abbreviation for tetracarboxybutane (q.v.).

T.C.C. Abbreviation for Tag (actually Tagliabue) closed cup, a type of flash point test.

TCP. Abbreviation for tricresyl phosphate.

TDE (2, 2-bis(para-chlorophenyl)-1, 1-dichloroethane; dichlorodiphenyldichloroethane; DDD) $(ClC_6H_4)_2CHCHCl_2$. Insecticide similar to DDT but considered less toxic to mammals. Name accepted as generic by Ent. Soc. TDE is the abbreviation for tetrachlorodiphenylethane.

Properties: Colorless crystals; m.p. 109-110°C; soluble in organic solvents; insoluble in water, not compatible with alkalies.

Derivation: Chlorination of ethanol and condensation with chlorobenzene.

Grades: Technical.

Containers: Fiber drums.

Caution! Harmful if swallowed. Absorbed through skin when in solution. MCA warning label.

Uses: Similar to DDT, as dusts, emulsions and wettable powders for contact control of leaf rollers and other insects not readily controlled by DDT.

TDI. Abbreviation for toluene diisocyanate.

TDQP. Abbreviation for trimethyldihydroquinoline polymer.

Te. Symbol for tellurium.

TEA. Abbreviation for triethanolamine.

teaberry. See gaultheria.

TEAC. Abbreviation for tetraethylammonium chloride.

TEA chloride. Another abbreviation for tetraethylammonium chloride.

teal oil. See sesame oil.

"TEC-Anti-Freeze." ²⁵⁶ Trade name for methyl alcohol solution.

Use: Freezing point depressant.

technetium Tc. Element with atomic number 43 of group VII of the periodic system. Technetium was first obtained by the deuteron bombardment of molybdenum but since has been found in the fission products of uranium and plutonium. Apparently all the known isotopic forms of technetium are radio-active. Several isotopes have been prepared ranging in mass numbers

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

from 93 to 99. Technetium 99 is the most important because of its long half-life, 9.4×10^5 years.

The chemistry of technetium has been studied by tracer techniques and is similar to that of rhenium and manganese. The free metal is obtained from reactor fission products by solvent extraction followed by crystallization as an ammonium salt of technetium, which is reduced with hydrogen. The metal is silver gray in appearance, and melts at 2200°C (4000°F). The specific gravity is approximately the same as that of silver. It is slightly magnetic. Compounds of the types TcO_2 , Tc_2O_7 , NH_4TcO_4 , etc., have been prepared. The principal chemical interest in technetium derives from the remarkably strong corrosion-inhibiting properties of pertechnetate compounds.

"Technoscents." ¹⁸⁸ Trademark for odor modifiers designed to cover a disagreeable odor associated with products of a technical nature: solvents, cutting oils, paints, lubricating oils, detergents, scrub soaps and powders, fuel oils.

"Tecnangam." ²⁵⁶ Trade name for free flowing granular solid containing 70% manganese sulfate.

Containers: 5-ply paper bags (50-lb net); bulk.

Use: Source of manganese in fertilizers and animal feeds.

"Tecquiol." ²⁵⁶ Trade name for technical hydroquinone (98.5% min).

Properties: White to cream colored crystals; melting point 169°C min.

Containers: 100- and 110-lb net fiber drums.

Use: As a polymerization inhibitor for many monomers; as an arrester for peroxide-catalyzed polymerizations; and as a raw material for organic synthesis.

"Tecsol." ²⁵⁶ Trade name for proprietary solvents consisting of denatured anhydrous and denatured 95% ethyl alcohol.

Properties: Anhydrous grade: Sp.gr. (15.6°/15.6°C) 0.794-0.798; boiling range $74^\circ\text{--}80^\circ\text{C}$; miscible without turbidity with 19 vols 60° A.P.I. gasoline at 20°C ; flash point (Tag open cup) 51°F .

Properties: 95% grade: Sp.gr. (15.6°/15.6°C) 0.813-0.817; boiling range $74^\circ\text{--}80^\circ\text{C}$; miscible without turbidity with 19 vols 60° A.P.I. gasoline at 20°C ; flash point (Tag open cup) 54°F .

Containers: 55-gal non-returnable steel drums; 4000-, 6000-, 8000-, and 10,000-gal tank cars.

Use: A basic raw material and solvent interchangeable with most denatured ethyl alcohol formulations.

Shipping regulations: Flammable liquid. Red label.*

"Tedion." Trademark for 2,4,4',5'-tetrachlorodiphenylsulfone, $\text{Cl}_2\text{C}_6\text{H}_2\text{SO}_2\text{C}_6\text{H}_4\text{Cl}$. White crystalline powder, m.p. 147°C . Used as a miticide, especially for fruit trees, including citrus fruit trees.

"Tedlar." ²⁸ Trademark for polyvinylfluoride film.

teel oil. See sesame oil.

teeming. Metallurgical term for the process of pouring molten metal (steel or iron) from a ladle into molds.

"Teepol" 610. ¹²⁵ Trademark for a detergent and wetting agent in liquid form based on the sodium salt of secondary alkyl sulfates, of the type $\text{R}_1\text{R}_2\text{CHOSO}_2\text{ONa}$, where R_1 is a large alkyl group and R_2 is a relatively small alkyl group.

Properties: A clear amber liquid, pH 8.5-9.0; sp.gr. 1.08 (60/60°F); soluble even in hard water; gives clear solutions. The calcium and magnesium salts are extremely soluble in water and are surface-active also. The surface-active properties of "Teepol" are apparent even in low concentrations.

Containers: Specially lined drums.

Shipping regulations: None.*

"Teflon." ²⁸ Trademark for tetrafluoroethylene (TFE) fluorocarbon resins available as molding powder, extrusion powder, aqueous dispersion and fiber. The trademark also applies to fluorinated ethylene-propylene resins designated as 100 FEP. See polytetrafluoroethylene.

TEG. Abbreviation for tetraethylene glycol, or triethylene glycol.

"Tego." ²³ Trademark for thin tissue impregnated with heat-convertible phenol-formaldehyde resin, supplied in rolls. Produces waterproof bond with plywood veneers.

Use: Hot press bonding of furniture veneers, premium wall panelling.

Teichmann's crystals. See hemin.

TEL. Abbreviation for tetraethyl lead.

"Telar." ²⁸ Trademark for an anti-freeze and summer coolant. Concentrated ethylene glycol with rust inhibitors that protect cooling system metals, including aluminum, against rust and corrosion in winter and summer. Can be mixed with any potable water and never needs to be drained from a properly operating cooling system. The color of "Telar," bright red, changes to yellow when serious cooling system failure occurs and the coolant turns corrosive.

"Teldrin." ⁷¹ Trademark for chloropropenpyridamine maleate, an antihistamine drug.

"Telepaque." ¹⁶² Trademark for iopanoic acid.

"Telloy." ⁶⁹ Trademark for a proprietary product. Finely ground tellurium. A secondary vulcanizing agent for rubber products.

"Tellurac." ⁶⁹ Trademark for proprietary product, tellurium diethyldithiocarbamate $[(\text{C}_2\text{H}_5)_2\text{NC}(\text{S})\text{S}]_4\text{Te}$.

Properties: Orange-yellow powder (also supplied in "rodform"); sp.gr. $1.44 \pm .03$; melting range $108\text{--}118^\circ\text{C}$; soluble in benzene, carbon disulfide, chloroform; slightly soluble in alcohol, gasoline; insoluble in water. Uses: Primary or secondary (with thiazoles)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

accelerator in natural, nitrile and butyl rubber and SBR; for curing bags, inner tubes, hose, molded and extruded goods.

telluric acid (trihydrated telluric oxide; hydrogen tellurate) H_2TeO_4 .

Properties: White heavy crystals. Soluble in hot water and alkalies; slightly soluble in cold water.

Constants: Sp. gr. 3.07; m.p., decomposes at 160°C.

Derivation: By the action of sulfuric acid on barium tellurate.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Chemical reagent.

Shipping regulations: None.*

telluric bismuth. See tetradymite.

telluric bromide. See tellurium tetrabromide.

tellurium Te. Element having atomic number 52; in Group VI of the periodic system.

Properties: Silvery white, lustrous solid with metal characteristics. Density 6.24 g/cc (30°C); Mohs hardness 2.3; m.p. 450°C \pm 10°C; b.p. 990°C. Soluble in sulfuric acid, nitric acid, potassium hydroxide and potassium cyanide solution; insoluble in water. Imparts garlic-like odor to breath of workers; can be depilatory.

Source: From anode slime produced in the electrolytic refining of copper and lead.

Derivation: By the reduction of telluric oxide with sulfur dioxide; by dissolving the oxide in a caustic soda solution and plating out the metal.

Grades: Powder, sticks, slabs and tablets, 99.5% pure; crystals, 99.99% and 99.999% pure.

Uses: Alloys (tellurium lead, stainless steel, etc.); secondary vulcanizing agent in the rubber industry, in manufacture of iron and stainless steel castings; coloring agent in glass and ceramics, thermoelectric devices.

Shipping regulations: None.*

tellurium bromide. See tellurium dibromide and tellurium tetrabromide.

tellurium chloride. See tellurium dichloride.

tellurium dibromide (tellurium bromide; tellurous bromide) TeBr_2 .

Properties: Blackish-green, crystalline mass, or gray to black needles. Very hygroscopic. Decomposed by water. Violet vapor.

Constants: B.p. 340°C; m.p. 280°C.

tellurium dichloride (tellurium chloride; tellurous chloride) TeCl_2 .

Properties: Amorphous, black mass. Greenish yellow when powdered. Decomposed by water.

Constants: Sp. gr. 6.9; b.p. 327-377°C; m.p. 175°C.

Grades: Technical.

tellurium dioxide (tellurous acid anhydride) TeO_2 .

Properties: Heavy, white, crystalline powder, odorless. Soluble in acids (conc.).

alkalies; slightly soluble in acids (dilute), water.

Constants: Sp. gr. 5.89; m.p. 700°C.

Grades: Technical; C.P.

Uses: Antiseptic; detecting bacteria in vaccines.

tellurium disulfide (tellurium sulfide) TeS_2 .

Properties: Red powder. Turns in time to a dark brown, amorphous powder. Fuses to gray, lustrous mass. Soluble in alkali sulfides; insoluble in acids, water.

tellurium lead. See lead, tellurium.

tellurium sulfide. See tellurium disulfide.

tellurium tetrabromide (telluric bromide; tellurium bromide) TeBr_4 .

Properties: Red crystals when hot, orange when cold. Soluble in a little water (decomposes in excess water).

Constants: Sp. gr. 4.3; m.p. 380°C; b.p. approx 420°C, with decomposition into bromine and dibromide.

tellurous acid H_2TeO_3 .

Properties: White, crystalline powder. Soluble in acids (dilute), alkalies; slightly soluble in water, alcohol.

Constants: Sp. gr. 3.053; m.p. 40°C (decomposes).

Grades: Technical.

tellurous acid anhydride. See tellurium dioxide.

tellurous bromide. See tellurium dibromide.

tellurous chloride. See tellurium dichloride.

"Tel-Tale." ²⁴¹ Trademark for 6-16 mesh silica gel which is impregnated with cobalt chloride and turns from blue to pink as the relative humidity increases.

"Telura." ⁵¹ Trademark for pale, filtered lubricating oils for textile mills. Compounded grades are supplied for knitting machines and shear oil requirements. Low viscosity grades are suitable for process use where white mineral oil quality is not required.

"Telvar." ²⁸ Trademark for a monuron weed killer on sites where bare ground is desired; and for selective control of weed seedlings in certain crops.

TEM. Abbreviation for triethylene melamine.

"Temasept." ⁴³⁰ Trade name for polybrominated salicylanilide, an active germicidal agent.

"Temex." ³⁰⁴ Trademark for a series of organic vinyl stabilizers. Available as:

"Temex 3." Barium-zinc organic compound.

Properties: Fine white powder, sp. gr. 1.15. Containers: 30- and 175-lb fiberboard drums. Uses: Heat and light stabilizer for asbestos-filled vinyl flooring with outstanding resistance to moisture and curling, and freedom from sulfide staining.

"Temex 3A." Barium-zinc organic compound.

Properties: Fine white powder, sp. gr. 1.37. Containers: 30- and 125-lb fiberboard drums. Uses: Stabilizer for vinyl asbestos-filled

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

flooring compounds. Provides heat stability and color retention properties in these systems.

"Temex 4." Barium-zinc organic compound. Properties: Fine white powder, sp.gr. 1.17. Containers: 15- and 75-lb fiberboard drums. Uses: Stabilizer for all types of vinyl flooring. Imparts heat and light stability, and excellent retention of color shades.

"Temex 5." Metal salt-organic complex. Properties: Fine white powder, sp.gr. 1.5. Containers: 200-lb fiberboard drums. Uses: Stabilizer for utility grade vinyl asbestos flooring. Imparts good heat and light stability and resistance to sulfide stain.

temperature. The thermal state of a body considered with reference to its ability to communicate heat to other bodies (J. C. Maxwell). There is a distinction between temperature and heat, as is evidenced by Helmholtz' definition of heat as "energy that is transferred from one body to another by a thermal process," where, by a thermal process, is meant radiation, conduction, and/or convection.

Temperature is measured by such instruments as thermometers, pyrometers, thermocouples, etc.; and by scales such as Centigrade, Fahrenheit, Réaumur, and absolute (Kelvin). See also absolute temperature.

"Tenamene 1." ²⁵⁶ Trade name for a tan to red liquid composed of N-butylated-p-amino-phenol in isopropanol.

Properties: Sp.gr. (60/60°F) 0.91, flash point (Tag closed cup) 52°F, soluble in dilute acid and 10% sodium hydroxide; miscible with benzene.

Containers: 30-, 55-gal non-returnable steel drums.

Use: An antioxidant and gum inhibitor for gasoline.

Shipping regulations: Flammable liquid. Red label.*

"Tenamene 2." ²⁵⁶ Trade name for a tan to red liquid consisting of N,N'-di-sec-butyl-p-phenylenediamine.

Properties: Sp.gr. (60/60°F) 0.94; viscosity at 100°F (Saybolt Universal) 63 secs; flash point (Cleveland open cup) 285°F; soluble in dilute acid; insoluble in water and 10% sodium hydroxide; miscible with benzene.

Containers: 30-, 55-gal non-returnable steel drums; 6000-gal tank cars.

Use: A gum inhibitor and sweetening agent for motor fuels and aviation gasolines.

Shipping regulations: Poison label.*

"Tenamene 3." ²⁵⁶ Trade name for a white to light yellow solid consisting of 2,6-di-tert-butyl p-cresol, or a pale yellow liquid composed of this compound in toluene ($\frac{1}{3}$ solids, $\frac{2}{3}$ solvent).

Properties: Sp.gr. of liquid (60/60°F) 0.89; viscosity at 100°F (Saybolt Universal) 28 secs; flash point (Tag closed cup) 44°F; insoluble in water, dilute acid or 10% sodium

hydroxide; soluble in benzene.

Containers: Solid, 100-lb fiber drums; liquid, 55-gal non-returnable steel drums, 6000- and 8000-gal tank cars.

Use: An antioxidant and gum inhibitor for gasoline, transformer, turbine and lubricating oils. Also as a stabilizer for paraffin wax, polyethylene and other plastic resins.

Shipping regulations: Liquid: flammable liquid. Red label.*

"Tenamene 30." ²⁵⁶ Trademark for a dioctyl derivative of para-phenylenediamine.

Properties: Dark reddish brown liquid; sp.gr. 0.896 (80°F); flash point (C.O.C.) 420°F; soluble in dilute acid; insoluble in 10% sodium hydroxide; miscible with benzene.

Containers: 55-gal drums and 5-gal cans.

Uses: Sweetening agent and antioxidant for gasoline and related products.

"Tenamene 31." ²⁵⁶ Trademark for a dioctyl derivative of para-phenylenediamine.

Properties: Dark reddish-brown liquid; sp.gr. 0.903 (80°F); flash point (C.O.C.) 410°F. Soluble in dilute acid; insoluble in 10% sodium hydroxide; miscible with benzene.

Containers: 55-gal drums; 5-gal cans.

Uses: Sweetening agent and antioxidant for gasoline and related products.

"Tenamene 60." ²⁵⁶ Trade name for a reddish-brown liquid composed of disalicyl propylenedi-imine, 80%, in toluene.

Properties: Sp.gr. (60/60°F) 1.07, viscosity at 100°F (Saybolt Universal) 80 secs, flash point (Tag closed cup) 20°F; decomposes in dilute acid, soluble in 10% sodium hydroxide, miscible with benzene.

Containers: 30-gal non-returnable steel drums and 5-gal steel cans.

Use: A copper deactivator for gasoline.

Shipping regulations: Flammable liquid. Red label.*

"Tenamene MD 50." ²⁵⁶ Trademark for a reddish-brown liquid composed of disalicyl propylenedi-imine, 50% in mixed xylene.

Properties: Sp.gr. 1.014 (60/60°F); flash point, Tag open cup, 106°F. Decomposes in dilute acid; miscible with benzene.

Containers: 30-gal lined drums.

Use: A copper deactivator for gasoline.

"Tenex." ⁷⁹ Trademark of an extremely pale, "all purpose" wood rosin claimed to show excellent solubility and freedom from crystallization.

Constants: M.p. (capillary tube) 53°C; m.p. (ball and ring) 72°C; acid number 148; unsaponifiable matter 17.0%, color "X."

Containers: Non-returnable, light-weight galvanized drums of about 500 lbs gross wt. Tare 14-16 lbs.

Uses: Adhesive tape; artificial Burgundy pitch; core oil; cosmetics; disinfectants; electric insulating compounds; emulsions; ester gum; printing ink; rubber cement; shellac diluent; solder; spirit varnishes; synthetic resins; varnishes; Venice turpentine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Tenite." ²⁵⁶ Trademark. "Tenite" Acetate—cellulose acetate molding composition. "Tenite" Butyrate—cellulose acetate butyrate molding composition. "Tenite" Polyethylene—polyethylene molding composition. Thermoplastic.

"Tenite" Acetate and "Tenite" Butyrate:

Colors: The molded products are made in all shades of color and any degree of translucence, including clear transparent.

Forms: Granulation and pellets for injection molding and continuous extrusion.

Physical properties: Vary with formula as follows: sp.gr. (20/20°C) 1.13-1.34; elongation 3-94%; tensile strength at yield 900-8000 lbs/sq in; flexural strength at yield 1000-13,500 lbs/sq in; compressive strength at yield 650-9400 lbs/sq in; impact strength (Izod) 0.2-2.9 (-40°F) ft lbs/in of notch; 0.3-9.6 (77°F) ft lbs/in of notch; modulus of elasticity 0.49-8.14 x 10⁵ lbs/sq in; water absorption (24-hr immersion) wt gained 1.1-5.7%, soluble matter lost 0.1-2.8%; refractive index 1.46-1.50; Rockwell hardness 32-120 (R scale); softening temperature 140-250°F; max recommended service temperature 160°F.

Chemical properties: All cellulose ester compositions are somewhat hygroscopic, absorbing moisture to some extent, depending upon the relative humidity and temperature as well as the formula used.

"Tenite" Butyrate absorbs on immersion about the same amount of water as cellulose nitrate plastic, or about half as much as cellulose acetate plastic. Articles molded or extruded of "Tenite" cellulosic plastics should not be subjected to concentrated acids or alkalis. Alcohol or some essential oils of an aromatic type will spot the surface of a molded piece. "Tenite" cellulosic plastics are not damaged by contact with most vegetable and mineral oils but are soluble in ketones and certain esters.

Uses: Miscellaneous articles, wherever appearance and strength in resistance to impact is desired without exposure to excessive heat. Continuously extruded in the form of film, sheets, strips, rods, tubing, pipe, and various profile sections.

• **"Tenite" Polyethylene:**

Properties: White, translucent waxy solid; tasteless, odorless, and non-toxic in natural formulation; it is waterproof, has low rate of water-vapor permeability; excellent electrical insulation properties; insoluble in all ordinary solvents at room temperature; slightly soluble in vegetable oils at 200°F and above; highly resistant to chemicals including concentrated sulfuric, nitric, hydrochloric and acetic acids at room temperature; fairly resistant to strong oxidizing agents such as chromic acid or acid permanganate solutions.

Grades: It is available in melt index ranges from 0.3-200, ranging in molecular weights from 10,000-38,000, and in mechanical properties from tough, flexible plastics to wax-like materials.

Uses: Housewares, containers, closures,

packaging materials, flexible pipe, sheathing for wire and cable, coatings for paper and metal foil to give heat-sealing packaging materials.

"Tenlo." ³⁰⁹ Trademark for polyhydroxy alcohol fatty acid esters sold to the paint making trade as an oil soluble, non-ionic surface active agent adapted for use as an aid in grinding and mixing pigments.

tennantite (Cu, Fe)₁₂As₄S₁₃. A natural sulfarsenide of copper and iron, found in metallic veins. A variety of fahlore (q.v.).

Properties: Color flint gray to iron black; luster metallic; streak black to brown; hardness 3.5-4.5; sp.gr. 4.6.

Occurrence: Colorado, Idaho, Utah, Montana; Canada; Europe.

Use: Minor ore of copper.

tenorite (melanconite) CuO. For the synthetic material, see copper oxide, black.

Properties: Copper mineral occurring as dull black earthy masses, black powder, or shining black scales; streak, black; luster, metallic in scales, dull in masses.

Constants: Sp.gr. 5.82-6.25; hardness 3. Occurrence: United States (Utah, Arizona, Wyoming, Oregon, Tennessee), Italy.

"Tenox." ²⁵⁶ Trade name for a line of food-grade antioxidants containing one or more of the following ingredients: butylated hydroxyanisole; butylated hydroxytoluene and/or propyl gallate with or without citric acid. Some formulas are supplied in solvents such as propylene glycol.

Containers: Solids: 1-lb bottle, 5-, 10- and 100-lb fiber drums (net); liquids: 1-lb bottle, 1-gal bottle, 15- and 30-gal non-returnable steel drums.

Use: Antioxidants for edible fats and oils.

"Tenox BHT." ²⁵⁶ Trademark for a form of butylated hydroxytoluene especially prepared for feed use.

Properties: White free flowing, nondusting powder; melting range 69-70°C; molecular weight 220.

Grade: Agricultural.

Containers: 50-, 100-lb fiber drums.

Uses: Stabilizer for fish meals and scraps, and antioxidant for poultry and animal feeds.

"Tensilon" Chloride. ¹⁹⁰ Trademark for a brand of edrophonium chloride (q.v.).

"Tensol." ⁸³ Trade name for a dispersing agent, emulsifier, and colloidal film breaker used in the textile, leather, and rubber industries, and for mineral flotation.

"Ten-Ten." ²³³ Trademark for 2,4-D compositions.

"Tentone." ³¹⁵ Trademark for methoxypromazine maleate (q.v.).

"Teox 120." ⁸⁴ Trademark for a nonionic surface active agent composed of polyethenoxy tallate.

Properties: Light straw-colored liquid; bland odor; sp.gr. 1.065-1.070 (77°F);

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

refractive index 1.4762 (77°F); viscosity 190 cps (77°F); heat stable to 644°F; very slightly hygroscopic; pH (0.2% soln) 7.2; soluble in water, acetone, benzene, ethyl ether, carbon tetrachloride, ethanol, methanol, and xylene.

Containers: 450-lb drums; tank trucks; tank cars.

Uses: Detergents; surface cleaners; textile cleaning and dyeing; emulsion formulations.

"Teox" Compounds. ²⁴ Detergent products consisting of "Teox 120" compounded with alkaline builders to form an all-purpose controlled sudsing nonionic detergent, "Teox Compound 3," or formulated with soda ash and sodium tripolyphosphate to form an anti-dusting additive for alkaline detergents, "Teox Compound DD."

TEPA. Abbreviation for triethylene phosphoramide. See also nitrogen mustards.

tephroite. See olivine.

"Tepidone." ²⁵ Trademark for 47% water solution of sodium dibutyldithiocarbamate. Properties: Clear, amber liquid. Containers: Drums (125 lb, net). Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

TEPP. Abbreviation for tetraethylpyrophosphate.

tera-. Prefix meaning 10^{12} units, i.e. 1 Tg = 1 teragram = 10^{12} grams.

terbia. See terbium oxide.

terbium Tb. Atomic number 65; Group III of the periodic table; one of the rare-earth elements of the yttrium sub-group. See also rare earth metals.

Properties: Metallic luster. Reacts slowly with water, and is soluble in dilute acids. Sp.gr. 8.332; m.p. 1360°C; b.p. 2500°C (approx); salts colorless.

Source: See rare-earth minerals.

Derivation: Reduction of fluoride with calcium.

Grades: Regular, high purity (ingots, lumps).

Uses: Phosphor activator.

terbium chloride TbCl₃·6H₂O.

Properties: Transparent, colorless, prismatic crystals; readily soluble in water or alcohol; density 4.35; m.p. (anhydrous) 588°C; very hygroscopic.

Derivation: By treatment of carbonate or oxide with hydrochloric acid in an atmosphere of dry hydrogen chloride.

terbium fluoride TbF₃·2H₂O.

Grades: Up to 99.9% terbium salts. Available as 77% Tb₂O₃.

Containers: Glass bottles.

Use: To make the element.

terbium nitrate Tb(NO₃)₃·6H₂O.

Properties: Colorless monoclinic needles or white powder, soluble in water; m.p. 89.3°C.

Derivation: By treatment of oxide, carbonate or hydroxide with nitric acid.

Containers: Glass bottles.

Shipping regulations: Oxidizing material. Yellow label.*

terbium oxide (terbia) Tb₂O₃.

Properties: Dark brown powder; soluble in dilute acids; slightly hygroscopic; absorbs carbon dioxide from air.

Derivation: By ignition of hydroxides or salts of oxyacids.

Grades: 98-99%.

Containers: Glass bottles.

See also rare earths.

terbium sulfate Tb₂(SO₄)₃·8H₂O.

Properties: Colorless crystals which lose 8H₂O at 360°C. Soluble in water.

Grades: Up to 99.9%.

Containers: Glass bottles.

terebene. A mixture of terpenes, chiefly dipentene and terpinene.

Properties: Colorless liquid; sp.gr. 0.862-0.866; optical rotation, inactive; b.p. 160-172°C. Soluble in alcohol; insoluble in water.

Derivation: Prepared from oil of turpentine.

Use: Medicine.

Shipping regulations: None.*

terebinthina canadensis. Canada turpentine.

See Canada balsam.

terephthalic acid (para-phthalic acid; benzene-para-dicarboxylic acid) C₆H₄(COOH)₂.

Properties: White crystals or powder; insoluble in water, chloroform, ether, acetic acid; slightly soluble in alcohol; soluble in alkalis.

Derivation: Oxidation of para-xylene or of mixed xylenes and other alkyl aromatics, with heavy metal salts and bromine as catalyst. Also by reacting benzene and potassium carbonate over a cadmium catalyst.

Uses: Production of synthetic resins, fibers and films by combination with glycols, e.g., "Dacron," "Mylar," "Terylene." Also used as a reagent for alkali in wool.

terephthaloyl chloride C₆H₄(COCl)₂. 1,4-Benzenedicarbonyl chloride.

Properties: Colorless needles; m.p. 78°C; b.p. 259°C; decomposes in water and alcohol; soluble in ether.

Uses: Dye manufacture; synthetic fibers, resins, films; ultraviolet adsorption; pharmaceuticals; rubber chemicals; cross-linking agent for polyurethanes and polysulfides.

"Teresso." ⁵¹ Trademark for high quality lubricants for purposes ranging from applications requiring light bearing oils through turbine oils and diesel engine oils to gear lubricants. Made from paraffin-base stocks by solvent refining methods to impart high viscosity index, low carbon content, high flash point, resistance to sludging, and rapid separation from moisture contamination.

"Tergitol." ²¹⁴ Trademark for a group of surface active agents including: Nonionic NPX (alkyl phenyl ether of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

polyethylene glycol).

Properties: Active ingredient 100% by wt; colorless liquid; solubility in water, complete at 20°C; cloud point (0.5% aqueous soln), 60-65°C; freezing point 5-7°C; sp. gr. 1.063; wt/gal 8.9 lb; viscosity, 373.8 cks at 20°C, 11.9 cks at 100°C; flash point 550°F.

Uses: Detergent, wetting agent, emulsifier in acid, alkaline, neutral or hard water systems.

Nonionic NP-14 (alkyl phenyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; colorless liquid; solubility in water, less than 0.01% by wt at 20°C; freezing point, sets to a glass below -40°C; sp. gr. 1.031 (20/20°C); wt/gal 8.6 lb at 20°C; viscosity, 240 cks at 20°C, 6.7 cks at 100°C; flash point, 480°F.

Uses: Oil-soluble emulsifier in acid, alkaline, neutral or hard water systems.

Nonionic NP-27 (alkyl phenyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; colorless liquid; solubility in water, 20% by wt at 20°C; cloud point (0.5% aqueous solution), 8°C; freezing point, -5 to -7°C; sp. gr. 1.055 at 20/20°C; wt/gal 8.8 lb at 20°C; viscosity, 224 cks at 20°C, 8.7 at 100°C; flash point 510°F.

Uses: Aromatic-soluble emulsifier in acid, alkaline, neutral or hard water systems.

Nonionic NP-35 (alkyl phenyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; white semi-solid; solubility in water, complete at 20°C; cloud point (0.5% aqueous solution) 95°C; freezing point, 25-27°C; sp. gr. 1.065 at 40/20°C; wt/gal 8.8 lb at 40°C; viscosity, 39 cks at 65°C, 15.6 at 100°C; flash point, 490°F.

Uses: Detergent and wetting agent at elevated temperatures.

Nonionic NP-40 (alkyl phenyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; white solid; solubility in water, complete at 20°C; cloud point (0.5% aqueous solution), above 100°C; freezing point, 36-38°C; sp. gr. 1.077 at 40/20°C; wt/gal 8.9 lb at 40°C; viscosity, 55.1 cks at 65°C, 21.7 cks at 100°C; flash point, 505°F.

Uses: Detergent and wetting agent at elevated temperatures.

Nonionic 12P-6 (dodecyl phenol adduct with 6 mols of ethylene oxide).

Properties: Active ingredient 100% by wt.

Uses: General purpose nonionic; sulfation.

Nonionic 12P-12 (dodecyl phenol adduct with 12 mols of ethylene oxide).

Properties: Active ingredient 100% by wt; cloud point (0.5% aqueous solution) 60°C; sp. gr. 1.0555; f.p. 15.1°C.

Uses: General purpose nonionic.

Nonionic TMN-3 (trimethyl nonyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; sp. gr. 0.9355; f.p. sets to glass at -40°C.

Uses: Aromatic-soluble nonionic surfactant.

Nonionic TMN-10 (trimethyl nonyl ether of polyethylene glycol).

Properties: Active ingredient 90% by wt; solubility in water, complete at 20°C; cloud point (0.5% aqueous solution), 36°C; freezing point, 15-17°C; sp. gr. 1.024 at 20/20°C; wt/gal 8.5 lb at 20°C; viscosity 118 cks at 20°C, 6.5 cks at 100°C; no flash point.

Uses: Wetting, leveling and spreading agent in dilute solutions of acids, bases, salts, and hard water.

Nonionic TP-9 (alkyl phenyl ether of polyethylene glycol).

Properties: Active ingredient 100% by wt; colorless liquid; soluble in water; cloud point (0.5% aqueous solution) 51-56°C; f.p. 5°C; sp. gr. 1.057 (20/20°C); 8.8 lbs/gal; flash point 550°F.

Uses: Detergent; wetting agent; emulsifier in acid, alkaline, neutral or hard water systems.

Nonionic XD (polyalkylene glycol ether).

Properties: Active ingredient 100% by wt; white, soft-solid; solubility in water, complete at 20°C; cloud point (0.5% aqueous solution), 62°C; f.p. 28-38°C; sp. gr. 1.053 at 40/20°C; wt/gal 8.7 lb at 40°C; viscosity 177 cks at 55°C, 54.4 cks at 100°C; flash point, 480°F.

Uses: Detergent and emulsifier in acid, alkaline, neutral or hard water systems.

Nonionic XH (polyalkylene glycol ether).

Properties: Active ingredient 100% by wt; white semi-solid; solubility in water, complete at 20°C; cloud point (0.5% aqueous solution), 85-95°C; f.p. 35-40°C; viscosity 258.8 cks at 55°C, 58.1 cks at 100°C.

Uses: Detergents and emulsifier at elevated temperatures.

Anionic 7

$C_4H_9CH(C_2H_5)C_2H_4CH(SO_3Na)C_2H_4CH(C_2H_5)_2$.

Properties: Active ingredient 25-27% by wt; colorless liquid; solubility in water, complete at 20°C; pH (0.1% aqueous solution), 5.3, sp. gr. 1.046 at 20/20°C; wt/gal 8.7 lb at 20°C.

Uses: Wetting agent in aqueous solutions containing less than 1% dissolved solids.

Anionic P-28 $[C_4H_9CH(C_2H_5)CH_2]_2NaPO_4$.

Properties: Active ingredient 24-26% by wt; amber liquid; solubility in water, complete at 20°C; pH (0.1% aqueous solution) 6.7; sp. gr. 1.034 at 20/20°C; wt/gal 8.6 lb at 20°C.

Uses: Wetting agent and penetrant in aqueous solutions containing 1-2% dissolved alkali or 2-5% dissolved salts.

Anionic 4

$C_4H_9CH(C_2H_5)C_2H_4CH(SO_3Na)CH_2CH(CH_3)_2$.

Properties: Active ingredient 26-28% by wt; colorless liquid; solubility in water, complete at 20°C; pH (0.1% aqueous solution), 8.5; sp. gr. 1.056 at 20/20°C; wt/gal 8.8 lb at 20°C.

Uses: Wetting agent and penetrant in aqueous solutions containing 1-10% dissolved acid, 2-5% dissolved alkali or 1-10% dissolved salts.

Anionic 08 $C_4H_9CH(C_2H_5)CH_2SO_3Na$.

Properties: Active ingredient 38-40% by wt;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

colorless liquid; solubility in water, complete at 20°C; pH (0.1% aqueous solution), 7.3; sp.gr. 1.144 at 20/20°C; wt/gal 9.5 lb at 20°C.

Uses: • Wetting agent and penetrant in aqueous solutions containing 15-30% dissolved acid, 10-20% dissolved alkali, or 10-25% dissolved salts.

"Teridax." ³²¹ Brand name for iophenoxic acid.

terneplate. Terneplate is a product made by coating steel sheet with an alloy of lead and tin.

"Terola." ⁵¹ Trademark for naphthenic lubricating oils especially recommended for small, two-stroke cycle, crankcase scavenging engines in marine service.

1,4(8)-terpadiene. See terpinolene.

1,8(9)-terpadiene. See dipentene.

terpene alcohol. An alcohol directly related to or derived from a terpene hydrocarbon; the following are common examples: terpineol (tertiary cyclic), borneol (secondary cyclic), geraniol (primary, acyclic), linalool (tertiary, acyclic).

terpene (hydrocarbon). An unsaturated organic compound having the empirical chemical formula $C_{10}H_{16}$, occurring in most essential oils and oleo-resins of plants. The terpenes may be considered as polymers of isoprene, C_5H_8 , and may be either open-chain or cyclic with one or more benzenoid groups. They are classified as monocyclic (dipentene), dicyclic (pinene), or acyclic (myrcene), according to the molecular structure.

terpene hydrochloride. See bornyl chloride.

terphenyl (1,4-diphenylbenzene) $(C_6H_5)_2C_6H_4$.
Properties: Solid; sp.gr. 1.234 (0°C), m.p. 213°C; sublimes at 427°C.

Derivation: From para-dibromobenzene, or bromobenzene and sodium.

Method of purification: Zone-melting.

Grades: Technical; scintillation.

Containers: Glass bottles; fiber drums.

Uses: Polymerized with styrene to make a plastic phosphor. Single crystals used as scintillation counters.

terpilenol. See terpineol.

terpineol (alpha-terpineol, beta-terpineol; gamma-terpineol; terpileneol) $C_{10}H_{17}OH$.
Properties: Colorless liquid or low melting transparent crystals; lilac odor, sp.gr. (alpha) 0.933-0.936, (beta) 0.923-0.924, (gamma) 0.936; m.p. (alpha) 35°C, (beta) 32°C, (gamma) 69-70°C; b.p. (alpha) 218°C, (beta) 210°C, (gamma) 218°C.

Usually sold commercially as a mixture of the three isomers.

Typical specifications: Sp.gr. (15°C) 0.936-0.941; optical rotation between -0° 10' and +0° 10'; boiling range between 214 and 224°C, 90% within 5°C; refractive index (n_D 20) 1.4825-1.4850; soluble in 2 vols 70%, 4 vols 60% alcohol, 8 vols of 50%

alcohol; soluble in diethyl phthalate, benzyl benzoate, mineral oil; slightly soluble in water, glycerin.

Derivation: By heating terpin hydrate with phosphoric acid and distilling, or with dilute sulfuric, using an azeotropic separation; fractional distillation of pine oil.

Occurs naturally in several essential oils.

Method of purification: Distillation.

Grades: Technical; perfumery; extra; prime.

Containers: 1-, 5-, 10-lb bottles; 50-lb tins; 1000-lb drums.

Uses: Solvent for resins, gums, waxes, oils, other products; mutual solvent for resins and cellulose esters and ethers; perfumes; soap; disinfectant; antioxidant; medicine.

Shipping regulations: None.*

alpha-terpineol. See terpineol.

beta-terpineol. See terpineol.

gamma-terpineol. See terpineol.

"Terpineol 318." ²⁶⁶ Trade name for a highly refined mixture of alpha- and beta-terpineols; 96.5% tertiary terpene alcohols; colorless liquid, freezing point less than -10°C; sp.gr. 0.9374 at 15.6/15.6°C; ASTM distillation range, 10-95%, 217-220°C.

terpin hydrate (dipentene glycol) A cyclohexane derivative. $CH_3(OH)C_6H_5C(CH_3)_2OH \cdot H_2O$.
Properties: Colorless, lustrous, rhombic crystalline prisms, or white powder; slight characteristic odor, slightly bitter taste; efflorescent; m.p. 115-117°C; anhydrous, m.p. 102-105°C, b.p. 258°C, soluble in alcohol and ether; slightly soluble in water.
Derivation: Action of nitric acid and dilute sulfuric acid, or dilute sulfuric alone, on pine oil boiling between 200-220°C.

Grades: Technical; N.F. XI.

Containers: 1-lb cans and cartons; 100-lb net fiber drums.

Uses: Pharmaceuticals; raw material for terpineol.

Shipping regulations: None.*

terpinolene (1,4(8)-terpadiene) $C_{10}H_{16}$.
Properties: Water-white to pale amber liquid. Insoluble in water; soluble in alcohol, ether, glycol.

Constants: Sp.gr. (15.5/15.5°C) 0.864; b.p. (760 mm) 183-185°C; flash point (closed cup) 38°C; wt/gal 7.2 lbs (15.5°C).

Typical specifications: Sp.gr. at 15.5/15.5°C 0.864-0.868; boiling range 180-200°C; acidity none; color water-white; moisture trace.

Derivation: By fractionation from crude wood turpentine.

Grades: Technical.

Containers: 55-gal non-returnable galvanized drums.

Uses: Solvent for resins; essential oils; manufacture of synthetic resins, chemical derivatives.

Fire hazard: Flammable.

Shipping regulations: None.*

terpinyl acetate $C_{10}H_{17}OOCCH_3$.

Properties: Colorless liquid; characteristic odor suggestive of bergamot and lavender;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sp.gr. 0.958-0.968 (15°C); refractive index (n_D²⁰) 1.4640-1.4660; optical rotation -0° 30' and +0° 30'; m.p. -50°C; b.p. 220°C. Soluble in 5 or more vols of 70% alcohol; slightly soluble in water and glycerol.

Derivation: By heating terpeneol with acetic acid or anhydride in the presence of sulfuric acid, and subsequent distillation.

Method of purification: Rectification.

Grades: Technical; prime; extra.

Containers: Cans; drums.

Use: Perfumes.

Shipping regulations: None.*

terpinyl propionate C₁₀H₁₇OOCC₂H₅.

Containers: Drums.

Use: In perfumes.

"Terposol 8." ²⁶⁶ Trademark for a technical grade of terpinyl ethyleneglycol ether.

Properties: Colorless to pale yellow liquid;

sp.gr. 0.9813 (15.6/15.6°C), distillation range 248-284°C.

Uses: Powerful solvent for resins, waxes, natural oils, fats, polymerized oils, and rubber; in enamels, printing inks and perfume; special grade used in insecticides.

terra alba CaSO₄·2H₂O. Finely pulverized powder made from gypsum and used in the manufacture of paper, paints, artificial marble, and composition plastics. See also kaolin.

"Terraclor." ⁸⁴ Trade name for pentachloronitrobenzene (q.v.). Available as technical grade and formulations of 75% wettable powder, 2 lb concentrate, 20% dust, and 10% granular. Useful as soil fungicide. Caution: Avoid skin exposure, and inhaling dust or mist.

"Terra-Cortril." ²⁹⁹ Trademark for a combination drug containing oxytetracycline and hydrocortisone.

terra-cotta clay. Terra-cotta clays differ quite widely, but semi-fire clays or a mixture of these with a more impure clay or shale are mostly used. Buff-burning clays are preferred because of the hard body produced on burning. Desirable qualities in the terra-cotta clay: (a) dense burning character and strong bonding, (b) low shrinkage and freedom from warping, (c) absence of soluble salts.

Occurrence: United States (New Jersey, Pennsylvania, Indiana, Missouri).

terra di sienna. A raw sienna (q.v.) found in Cyprus and various parts of Italy. See also iron oxide reds.

Use: Pigment.

"Terramix ABD-25." ²⁹⁹ Trade name for vitamin-fortified antibiotic mix for agricultural feeds.

"Terramycin." ²⁹⁹ Trademark for oxytetracycline hydrochloride.

"Terran A, B and E." ³⁴⁹ Trademark for a high temperature epoxy cement used in the rocket and missile industry.

"Terran S." ³⁴⁹ Trademark for a phenolic varnish with special high heat resistant properties for use as an impregnant for various reinforcing materials, as fabric or rovings, nylon, asbestos, glass, or graphite.*

terra ponderosa. See barium sulfate.

terra rosa. A variety of hematite, red (q.v.) used as a pigment.

terre verte. See earths, green.

"Tersan" 75. ²⁸ Trademark for a turf fungicide containing tetramethylthiuramdisulfide (thiram). It is used to control brown patch and dollar spot; for control of stem rot of sweet potatoes and basal rot and decay of gladiolus bulbs.

Containers: 8-oz cans and 3-lb bags.

"Tersan" OM. ²⁸ Trademark for turf fungicide containing thiram and hydroxymercurichlorophenol.

Containers: 3-lb cans.

Use: For the prevention and control of large brown patch, dollar spot, copper spot, and certain other diseases on golf greens, grass tennis courts, lawns and other fine turf.

tert-. Abbreviation for tertiary. See primary. May also mean a trisubstituted methyl radical, R₁R₂R₃C-, in which the central carbon is attached to three other carbons.

tertiary calcium phosphate. See calcium phosphate, tribasic.

tertiary sodium phosphate. See sodium phosphate, tribasic.

"Tervan." ⁵¹ Trademark for a group of petroleum wax specialties. The 2800 grade is a blend of "Vistanex"-polybutene and crystalline paraffin, applicable as a modifier for both crystalline and microcrystalline petroleum waxes. Tervan 2850, 2865, and 2875 are especially suitable for coating paperboard milk containers.

"Terylene." ^{56, 206} Trademark for a synthetic polyester textile fiber based on terephthalic acid.

"Tessalon." ³⁰⁵ Trademark for benzonatate N.N.D.

Use: Medicine.

testosterone C₁₉H₂₈O₂. An androgenic steroid; the male sex hormone produced by the testis. It has six times the androgenic activity of its metabolic product, androsterone.

Properties: White or slightly creamy-white crystals or as crystalline powder; odorless and stable in air; m.p. 153-157°C; dextro-rotatory in dioxane solution. Very soluble in chloroform; soluble in alcohol, dioxane and vegetable oils; slightly soluble in ether; insoluble in water.

Derivation: Isolation from extract of testis; synthesis from cholesterol or from the plant steroid diosgenin.

Grade: N.F. XI.

Containers: Bottles.

Use: Medicine; biochemical research.

See also methyltestosterone.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

testosterone cyclopentylpropionate

Properties: Off-white, odorless, tasteless, crystalline powder; m.p. 98-101°C. Freely soluble in alcohol, chloroform, and ether; soluble in vegetable oils; slightly soluble in water.

Grade: U.S.P. XVI.

Use: Medicine.

testosterone enanthate $C_{19}H_{27}O \cdot OOC C_6H_{13}$

Properties: White or creamy-white crystalline powder or a viscous, amber-colored liquid. Odorless or faint odor resembling enanthic acid; m.p. 34-39°C. Insoluble in water; soluble in ether and vegetable oils.

Grade: U.S.P. XVI.

Use: Medicine.

testosterone propionate $C_{19}H_{27}O \cdot OOC C_2H_5$

The propionate ester of testosterone; has androgenic activity.

Properties: White, or creamy white crystals or crystalline powder; odorless and stable in air; m.p. 118-123°C. Freely soluble in alcohol, dioxane, ether, and other organic solvents; soluble in vegetable oils; insoluble in water.

Derivation: By organic synthesis.

Grade: U.S.P. XVI.

Containers: Bottles.

Use: Medicine.

"Testryl." ⁴¹² Trademark for testosterone (q.v.).

TETD. Abbreviation for tetraethylthiuram disulfide.

"Tetmosol." ²⁰⁷ Trademark for tetraethylthiuram sulfide.

Uses: In human and animal medicine. 4

tetraamylbenzene $(C_5H_{11})_4C_6H_2$

Properties: Sp. gr. at 20°C 0.89, boiling range 320-350°C, color light straw; odor faintly aromatic; flash point 295°F.

Shipping regulations: None.*

tetra base. See tetramethyldiaminodiphenylmethane.

tetrabromobisphenol A. A flame retardant. See "Firemaster" BP4A.

sym-tetrabromoethane. See acetylene tetrabromide.

tetrabromoethylene C_2Br_4

Properties: Colorless crystals; m.p. 55-56°C, b.p. 227°C.

Derivation: Bromination of dibromoacetylene.

Use: Organic synthesis.

tetrabromofluorescein. See eosin.

tetrabromofluorescein, disodium salt. See eosin, yellowish.

tetrabutylthiuram disulfide $[(C_4H_9)_2NCS_2]_2$

Properties: Amber color, sp. gr. (20/20°C)

1.03-1.06°C, solidifies approx. -30°C;

slight sweet odor. Soluble in carbon disulfide, benzene, chloroform, and gasoline; insoluble in water and 10% caustic.

Uses: Vulcanizing and accelerating agents.

tetrabutyltin $(C_4H_9)_4Sn$

Properties: Colorless or slightly yellow oily liquid; b.p. 145°C (10 mm); decomposes at 265°C. Insoluble in water; soluble in most common organic solvents.

Derivation: Reaction of tin tetrachloride with butyl magnesium chloride.

Uses: Stabilizing and rust-inhibiting agent for silicones; lubricant and fuel additive; polymerization catalyst; hydrochloric acid scavenger.

tetrabutyl titanate (TBT; butyl titanate; titanium butylate) $Ti(OC_4H_9)_4$

Properties: Colorless to light yellow liquid. B.p. 310-314°C; forms a glass below -55°C; sp. gr. 0.996; refractive index 1.486; flash point 170°F; decomposes in water; soluble in most organic solvents except ketones.

Derivation: Reaction of titanium tetrachloride with butyl alcohol.

Uses: Ester exchange reactions; heat resistant paints (up to 500°C), improving adhesion of paints, rubber, and plastics to metal surfaces; cross-linking agent; condensation catalyst.

tetrabutyl urea $(C_4H_9)_2NCON(C_4H_9)_2$

Properties: Liquid, sp. gr. 0.880; refractive index 1.4535, vapor pressure less than 0.01 mm, b.p. 305°C; m.p. less than -60°C; flash point 146°C; insoluble in water.

Use: Plasticizer.

tetrabutyl zirconate $(C_4H_9O)_4Zr$. White solid from reaction of zirconium tetrachloride with butyl alcohol. Used as condensation catalyst and cross-linking agent.

tetracaine

2-Dimethylaminoethyl para-butylaminobenzoate.

Properties: White or light yellow, waxy solid. Very slightly soluble in water; soluble in alcohol, ether, benzene, chloroform. M.p. 41-46°C.

Grade: U.S.P. XVI.

Use: Medicine.

tetracaine hydrochloride $C_{15}H_{24}N_2O_2 \cdot HCl$

Properties: Fine, white crystalline, odorless powder with a bitter taste and a melting range of 147-150°C. Soluble in water and alcohol; insoluble in ether and benzene.

Derivation: By reaction of para-butylaminobenzoyl chloride with dimethylaminoethanol.

Grade: U.S.P. XVI.

Use: Medicine.

tetracalcium aluminoferrate. An ingredient of cement. See cement, Portland, and other cement articles.

1,2,3,4-tetracarboxybutane (TCB). A substance used for making alkyd resins; as an epoxy curing agent; and as a sequestrant.

tetracene. See naphthacene.

1,2,3,4-tetrachlorobenzene $C_6H_2Cl_4$

Properties: White crystals; m.p. 46.6°C; b.p. (760 mm) 254°C; flash point 161°C; insoluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Use: Component of dielectric fluids; synthesis.
- 1,2,4,5-tetrachlorobenzene** $C_6H_2Cl_4$.
Properties: White flakes; m.p. 137.5–140°C; distillation range 240–246°C.
Uses: Intermediate; insecticide; impregnant for fire and moisture resistance, for electrical insulation, for temporary protection in packing.
- tetrachloro-para-benzoquinone**. See chloranil.
- tetrachlorobisphenol A** $C_{15}H_{12}Cl_4O_2$. A monomer for flame-retardant epoxy, polyester and polycarbonate resins.
- sym-tetrachlorodifluoroethane** CCl_2FCCl_2F .
Properties: White solid or colorless liquid with slightly camphor-like odor when concentrated. B.p. 92.8°C; f.p. 26°C; critical temperature 278°C; sp.gr. (25°C) 1.6447; refractive index (25°C) 1.413; wt/gal 13.8 lbs.
Grades: Purified; solvent.
Use: Nonflammable, nonexplosive degreasing solvent.
- tetrachlorodiphenylethane**. See TDE.
- tetrachlorodiphenyl sulfone**. See "Tedion."
- sym-tetrachloroethane** (acetylene tetrachloride) $CHCl_2CHCl_2$.
Properties: Heavy, colorless, mobile, nonflammable, corrosive, toxic liquid. Chloroform-like odor, but more toxic than the latter. Soluble in alcohol and ether, insoluble in water.
Constants: Sp.gr. 1.593 (25/25°C); b.p. 146.5°C, f.p. -43°C; weight 13.25 lbs/gal (25°C); refractive index 1.4918 (25°C); flash point none; fire point none; heat of vaporization 55.1 cal/gm (b.p.); specific heat 0.27 cal/gm/°C; specific resistivity 4.2×10^7 ohms/cm, viscosity 1.59 centipoises at 25°C.
Typical specifications: Colorless.
Derivation: By the interaction of acetylene and chlorine, and subsequent distillation.
Method of purification: Rectification.
Grades: Technical.
Containers: 55-gal drums.
Uses: Solvent; cleansing and degreasing metals; paint removers, varnishes, lacquers, photographic film; resins and waxes; extraction of oils and fats; ethyl alcohol denaturant; organic synthesis; insecticides; as a weed killer; fumigant.
Danger! Vapor extremely hazardous; do not breathe vapor or get on skin or clothing. MCA warning label.
Shipping regulations: None.*
- tetrachloroethylene**. See perchloroethylene.
- tetrachloromethane**. See carbon tetrachloride.
- tetrachloronaphthalene**. See chloronaphthalenes.
- 2,3,4,6-tetrachlorophenol** C_6HCl_4OH .
Properties: Brown flakes or sublimed mass with a strong characteristic odor; m.p. 69–70°C; b.p. 164°C (23 mm); no flash or fire point; sp.gr. 25/4°C 1.839; soluble in acetone, benzene, ether, and alcohol.
Use: Fungicide.
Warning! Harmful dust. MCA warning label.
- 2,4,5,6-tetrachlorophenol** C_6HCl_4OH .
Properties: Brown solid; phenol odor. Sp.gr. 1.65 at 60/4°C; m.p. >50°C. Soluble in sodium hydroxide solutions and most organic solvents; insoluble in water.
Uses: Fungicide; wood preservative.
Warning! Harmful dust. MCA warning label.
- tetrachlorophthalic acid** $C_6Cl_4(CO_2H)_2$.
Properties: Colorless, crystalline plates. Soluble in hot water; sparingly soluble in cold water.
Derivation: By passing a stream of chlorine through a mixture of phthalic anhydride and antimony pentachloride.
Method of purification: Crystallization.
Grades: Technical.
Containers: Wooden kegs.
Uses: Dyes; intermediates.
Shipping regulations: None.*
- tetrachlorophthalic anhydride** $C_6Cl_4(CO)_2O$.
Properties: White, odorless, free-flowing, non-hygroscopic powder; slightly soluble in water; m.p. 254–255°C; b.p. 371°C.
Containers: 60-, 120-lb fiber drums; 400-lb barrels.
Uses: Intermediate in dyes, pharmaceuticals, plasticizers, and other organic materials.
- tetrachloroquinone**. See chloranil.
- tetrachlorothiophene** $CClCClCClCClS$.
Properties: M.p. 29–30°C; b.p. 104°C (10 mm). Soluble in benzene, hexane, alcohols, chlorocarbon.
Uses: Agricultural chemicals; lubricants.
- tetracopper calcium oxychloride**. A complex compound containing not less than 45% copper; finely divided bluish powder.
Containers: 6- and 50-lb bags.
Uses: Fungicide; manufacture of agricultural copper dust.
- tetracosane** $C_{24}H_{50}$ and $CH_3(CH_2)_{22}CH_3$.
Properties: Crystals; soluble in alcohol; insoluble in water. Sp.gr. 0.779 (51/4°C); b.p. 324.1°C; m.p. 51.5°C.
Grades: Technical.
Use: Organic synthesis.
- n-tetracosanoic acid**. See lignoceric acid.
- tetracyanoethylene** $(CN)_2C:C(CN)_2$. The first member of a new class of compounds called cyanocarbons.
Properties: Colorless crystals; sublimes above 120°C; m.p. 198–200°C, b.p. 223°C. Has high thermal stability; burns in oxygen with a hotter flame than acetylene.
Caution: Hydrolyzes with water or in moist air to give hydrogen cyanide.
Use: Organic synthesis; dyes; makes colored solutions with aromatics.
- tetracycline** $C_{22}H_{24}N_2O_8 \cdot 0$ to $6H_2O$. An antibiotic obtained from certain *Streptomyces* species. It can also be prepared by catalytic hydrogenation of chlortetracycline or oxytetracycline, which it resembles in its actions

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

and uses. Its chemical structure is that of a modified naphthacene molecule.

Properties: Yellow, odorless, crystalline powder. Stable in air; affected by strong sunlight. Potency affected in solutions with pH below 2 and destroyed in alkali hydroxide solutions. Practically insoluble in chloroform and ether; very slightly soluble in water; slightly soluble in alcohol; very soluble in dilute hydrochloric acid and alkali hydroxide solutions; pH (saturated solution) 3.0-7.0. Induces fluorescence in mitochondria of living cells in tissue culture or in fresh preparations from various organs.

Derivation: From para-chloro-meta-cresol in 24 steps.

Grade: U.S.P. XVI.

Use: Medicine.

tetracycline hydrochloride $C_{22}H_{24}N_2O_8 \cdot HCl$.

The hydrochloride salt of tetracycline.

Properties: Yellow, odorless, crystalline powder. Stable in dry air; affected by strong sunlight in moist air. Potency affected in solutions with pH below 2, and destroyed by alkali hydroxide solutions; pH (1% solution) 1.8-2.8. Slowly hydrolyzes in aqueous solution. Soluble in water; slightly soluble in alcohol; soluble in solutions of alkali hydroxides and carbonates; practically insoluble in chloroform and ether.

Grade: U.S.P. XVI.

Use: Medicine.

tetracycline phosphate complex.

Properties: Yellow, odorless, hydrated, fine crystalline powder. Insoluble in water.

Derivation: Prepared by adding a solution of sodium metaphosphate to a solution of tetracycline or tetracycline hydrochloride.

Grade: N.N.D.

Use: Medicine.

"Tetracyn." ²⁹⁹ Trademark for tetracycline hydrochloride.

n-tetradecane $C_{14}H_{30}$ and $CH_3(CH_2)_{12}CH_3$.

Properties: Colorless liquid; sp.gr. (20/4°C) 0.7653; m.p. 5.5°C, b.p. 253.5°C; refractive index (n 20/D) 1.4302; flash point 121°C. Soluble in alcohol; insoluble in water.

Grades: 95%, 99%.

Containers: Bottles, small drums.

Uses: Organic synthesis; solvent, standardized hydrocarbon.

tetradecanoic acid. See myristic acid.

tetradecanol. See myristyl alcohol; see also 7-ethyl-2-methyl-4-undecanol.

1-tetradecene (alpha-tetradecylene)

$CH_2=CH(CH_2)_{11}CH_3$.

Properties: Colorless liquid; density 0.775 g/ml (20/4°C); m.p. -12°C; b.p. 256°C (760 mm); insoluble in water; very slightly soluble in alcohol and ether.

Uses: Perfumes, flavors, medicines, dyes, oils, resins, plastics.

tetradecylamine $C_{14}H_{29}NH_2$.

Properties: A white solid with odor of

ammonia; m.p. 37°C; b.p. 291.2°C; insoluble in water; soluble in alcohol and ether.

Grade: 90% purity.

Containers: Drums; tank cars.

Uses: Intermediate for manufacture of cationic surface-active agents; germicides.

tetradecyl chloride (myristyl chloride)

$CH_3(CH_2)_{13}Cl$.

Properties: Water-white distilled liquid, mild odor. Sp.gr. 0.8590; f.p. -0.2°C; b.p. 154-155°C (15 mm); 15.2% chloride; subject to mild hydrolysis on standing.

Grade: 97% min.

alpha-tetradecylene. See 1-tetradecene.

tetradecyl mercaptan (myristyl mercaptan)

$CH_3(CH_2)_{13}SH$.

Properties: Liquid; m.p. 6.5°C; b.p. 176-180°C (22 mm); sp.gr. 0.8398 (25/4°C); refractive index 1.4612 (n 20/D).

Grade: 95% (min) purity.

Uses: Organic intermediate; synthetic rubber processing.

tert-tetradecyl mercaptan $C_{14}H_{29}SH$.

Properties: Flammable liquid; boiling range (5 mm) 104-129°C, sp.gr. (60/60°F) 0.865; refractive index (20/D) 1.467; flash point 113°C.

Containers: 1-, 5-, 54-gallon drums; tank cars.

Uses: Polymer modifications.

Shipping regulations: No label required.*

tetradymite (bismuth telluride; telluric bismuth; bismuth tritelluride) Bi_2Te_3 . A natural telluride of bismuth, frequently containing sulfur and selenium.

Properties: Color and streak pale steel gray; luster metallic; hardness 1.5-2; sp.gr. 7.3.

Occurrence: California, Colorado, Arizona, Montana, New Mexico, Virginia; Canada, Europe.

Use: Ore of bismuth.

tetraethanolammonium hydroxide

$(HOCH_2CH_2)_4NOH$.

Properties: A white, crystalline solid; m.p. 123°C, vapor pressure less than 0.01 mm (20°C), completely soluble in water. A strong base, approaching sodium hydroxide in alkalinity. Its aqueous solutions are stable at ordinary temperatures but decompose on heating to form weakly basic polyethanolamines.

Grades: Commercial grade is a 40% water solution.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: As an alkaline catalyst; solvent for certain types of dyes; in screen printing with "Rapdog" dyestuffs; in the application of rubber latices; in metal-plating solutions.

tetraethylammonium chloride (TEAC; TEA chloride) $(C_2H_5)_4NCl$.

Properties: Anhydrous: Colorless, odorless, hygroscopic crystals; sp.gr. 1.080; freely soluble in water, alcohol, chloroform, acetone; slightly soluble in benzene and ether.

Tetrahydrate: $(C_2H_5)_4NCl \cdot 4H_2O$, crystals;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m.p. 37.5°C; sp.gr. 1.084.

Grade: N.N.D.

Use: Medicine.

tetraethylammonium hexafluorophosphate. See fluophosphoric acids.

tetra-(2-ethylbutyl) silicate $[(C_2H_5)_4C_4H_9O]_4Si$.

Properties: Sp.gr. (20/20°C) 0.8920-0.9018; m.p. below -100°C; b.p. 238°C (50 mm); insoluble in water; slightly soluble in methanol; miscible with most organic solvents.

Uses: Heat transfer medium; hydraulic fluid; wide-temperature-range lubricant.

tetraethyl dithiopyrophosphate (ethylthiopyrophosphate; sulfotep) $(C_2H_5)_4P_2S_2O_5$.
Used as an insecticide.

Shipping regulations: Liquid or any mixture containing sulfotep: Poison, class B. Poison label. Compressed gas mixture: Poison, class A. Poison gas label. Not accepted by express.*

tetraethylene glycol (TEG) $HO(C_2H_4O)_3C_2H_4OH$.

Properties: Colorless liquid; hygroscopic. Soluble in water; insoluble in benzene, toluene, or gasoline.

Constants: Sp.gr. 1.1248 at 20/20°C; b.p. (760 mm) 327.3°C; vapor pressure < 0.001 mm (20°C); flash point 345°F; wt/gal 9.4 lbs (20°C).

Grades: Technical.

Containers: 1-gal cans; 5-gal (tin-lined) drums; 55-gal drums. Net content 9.0, 45, 510 lbs.

Uses: Solvent for nitrocellulose, plasticizer; lacquers, coating compositions; suggested as a resin intermediate, heat transfer medium.

tetraethylene glycol dimethacrylate

Properties: Water-white to pale straw liquid, b.p. (1 mm) 200°C; sp.gr. (20/20°C) 1.075; refractive index (20°C) 1.4620; viscosity 12 cps; insoluble in water, soluble in styrene, many esters and aromatics; limited solubility in aliphatic hydrocarbons.

Use: Plasticizers.

Caution: Avoid contact with skin or eyes!

tetraethylene glycol dimethyl ether. See dimethoxytetraglycol.

tetraethylene glycol distearate

$(C_{17}H_{35}COOCH_2CH_2OCH_2CH_2)_2O$.

Properties: M.p. 32-33°C, insoluble in water.

Use: Plasticizer.

tetraethylene glycol monostearate

$C_{17}H_{35}COO(CH_2CH_2O)_4H$.

Properties: Sp.gr. 0.971; m.p. 30-31°C; insoluble in water.

Use: Plasticizer.

tetraethylenepentamine

$NH_2(CH_2CH_2NH)_3CH_2CH_2NH_2$.

Properties: Somewhat viscous, hygroscopic liquid. Sp.gr. 0.9980 at 20/20°C; b.p. (760 mm) 333°C; vapor pressure < 0.01 mm (20°C); wt/gal 8.3 lbs (20°C). Coefficient of expansion 0.00076 (20°C); viscosity 0.962 poise (20°C).

Typical specifications: Sp.gr. 0.990-1.000 at 20/20°C; boiling range 280-360°C (760 mm). Soluble in most organic solvents and water.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Solvent for sulfur, acid gases, various resins and dyes; saponifying agent for acidic materials; manufacture of synthetic rubber.

Danger! Causes severe eye and skin burns.

MCA warning label.

tetra-(2-ethylhexyl) silicate

$[C_4H_9CH(C_2H_5)CH_2O]_4Si$.

Properties: Sp.gr. 0.8838; b.p. 350-370°C; f.p. -90°C; solubility in water < 0.01; pounds/gallon 7.4; flash point 390°F.

Shipping regulations: No label required.*

tetra-(2-ethylhexyl) titanate

$[C_4H_9CH(C_2H_5)CH_2O]_4Ti$. A light-yellow, viscous liquid from the transesterification of isopropyl titanate with 2-ethylhexanol. Used as cross-linking agent; condensation catalyst; adhesion promoter. Available in commercial quantities.

tetraethyllead (TEL) $Pb(C_2H_5)_4$.

Properties: Colorless, oily liquid; pleasant characteristic odor. Caution! Fairly strong poison. Absorbed by the skin. Soluble in all organic solvents. Insoluble in water and dilute acids or alkalis.

Constants: Sp.gr. 1.65; b.p. 198-202°C (at 760 mm, calculated), 75-85°C (13-14 mm); f.p. -136°C; decomposes slowly at room temperature, rapidly at 125-150°C.

Derivation: (a) By treating lead-sodium alloy with ethyl chloride; (b) by the Ziegler process based on the reaction of metallic lead and a triethylaluminum complex in an electrolytic cell. Raw materials are lead, ethylene and hydrogen.

Method of purification: Careful and repeated steam distillation and drying over $CaCl_2$; vacuum distillation.

Grades: One grade only—approximately 98% pure.

Containers: May be shipped in tight metal containers.

Uses: Used for preventing knocking in internal combustion engines; certain ethylation operations.

Shipping regulations: Class B poison. Poison label.*

O, O, O', O'-tetraethyl-S, S'-methylenediphosphorodithioate. Used in commercial form as insecticide and acaricide. See ethion.

tetraethyl orthosilicate. See ethyl silicate.

tetraethyl pyrophosphate (TEPP) $(C_2H_5)_4P_2O_7$.

Properties: Water-white to amber liquid depending on purity; hygroscopic; miscible in all proportions with water and all organic solvents except aliphatic hydrocarbons; hydrolyzed in water with formation of mono-, di- and triethyl ortho-phosphates; water solutions attack metals. Commercial material contains 40% TEPP; sp.gr. approx. 1.20; refractive index 1.420.

Derivation: From phosphorus oxychloride

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and ethanol or phosphorus oxychloride and triethyl phosphate.

Grades: 40%.

Containers: 5-gal cans; 50- and 55-gal drums.

Uses: To formulate insecticides for aphids and mites; as a rodenticide.

Danger: Poisonous by skin contact, inhalation or swallowing. Rapidly absorbed through skin. Repeated exposure may, without symptoms, be increasingly hazardous. MCA warning label.

Shipping regulations: Tetraethyl pyrophosphate and compressed gas mixture: Poison, class A. Poison gas label. Not accepted by express. Liquid or mixture, dry, or liquid: Poison, class B. Poison label.*

tetraethylthiuram disulfide [disulfiram; TTD; TETD; bis (diethylthiocarbamyl) disulfide] $[(C_2H_5)_2NCS]_2S_2$.

Properties: Cream color, sp.gr. (20/20°C) 1.17; freezing range 65-70°C; slight odor. Soluble in carbon disulfide, benzene and chloroform; insoluble in water.

Grades: N.N.D.; technical.

Containers: 5-, 50-, 100-, 150-lb drums.

Uses: May be used without sulfur as vulcanizing agents or with sulfur as ultra accelerators and as activators for thiazole-type accelerators. Also causes the vulcanizates to be nonstaining, non-discoloring and exceptionally resistant to heat aging; medicine; fungicide and insecticide.

tetraethylthiuram sulfide [bis-(diethylthiocarbamyl) sulfide] $[(C_2H_5)_2NCS]_2S$.

Properties: Dark brown; slight odor; sp.gr. (20/20°C) 1.12, boiling range 225-240°C (3 mm).

Uses: Pharmaceutical ointments, fungicide, insecticide.

tetraethyltin $Sn(C_2H_5)_4$.

Properties: Colorless liquid, sp.gr. (23°C) 1.187; b.p. 181°C, m.p. -112°C; insoluble in water; soluble in alcohol and ether.

tetrafluoroethylene. See tetrafluoroethylene.

tetrafluorodichloroethane. See dichlorotetrafluoroethane.

tetrafluoroethylene (perfluoroethylene, tetrafluoroethylene) $F_2C:CF_2$. Raw material for polytetrafluoroethylene polymers.

Properties: Colorless gas; m.p. -142.5°C, b.p. -78.4°C, insoluble in water.

Derivation: By passing chlorodifluoromethane through a hot tube.

Shipping regulations: Inhibited: Flammable gas. Red gas label.*

tetrafluorohydrazine F_2NNF_2 .

Properties: Colorless mobile liquid and colorless gas; b.p. (calc) -73°C; heat of vaporization 3170 cal/mole; critical temperature 36°C.

Use: Organic synthesis; oxidizer in fuels for rockets, missiles, etc.

tetrafluoromethane CF_4 .

Properties: A colorless gas; m.p. -184°C; b.p. -128°C, slightly soluble in water.

Density of liquid 1.96 g/ml at -184°C; sp. vol. (70°F) 4.4 cu ft/lb.

See "Freon 14."

tetrafluoro-1-propanol. See fluoroalcohols.

tetraglycine hydroperiodide. See "Globaline."

tetraglycol dichloride $(ClCH_2CH_2OCH_2CH_2)_2O$.

Properties: Colorless liquid. Slightly miscible with water. Sp.gr. 1.186; b.p. (2 mm) 114°C.

Grade: Technical.

Uses: High-boiling solvent and extractant for oils, fats, waxes and greases; chemical intermediate.

tetrahedrite $(CuFe)_{12}Sb_4S_{13}$. A natural sulfantimonide of copper and iron. Silver, zinc, lead and mercury may be present. A variety of fahlore (q.v.).

Properties: Color grayish black to black; luster metallic; streak black to brown; hardness 3-4; sp.gr. 4.6-5.1.

Occurrence: Colorado, Montana, Nevada, Arizona, Utah; Mexico; Europe; South America.

Use: Ore of silver and copper.

1,2,3,6-tetrahydrobenzaldehyde. See 3-cyclohexene-1-carboxaldehyde.

1,2,3,4-tetrahydrobenzene. See cyclohexene.

tetrahydrofuran (THF) C_4H_8O .

Properties: Water-white liquid with ethereal odor, sp.gr. (20°C) 0.888; refractive index (n_D 20/D) 1.4070; f.p. -65°C; b.p. 66°C; flash point (open cup) 5°F. Soluble in water and organic solvents.

Derivation: From furfural, as an intermediate in the production of adiponitrile.

Containers: 7-lb (1 gal) containers, 35- and 375-lb drums, 29,000-lb tank cars.

Uses: Solvent for natural and synthetic resins, particularly vinyls, in topcoating solutions, polymer coating cellophane, protective coatings, adhesives, printing inks, etc. Useful reaction solvent, e.g., in Grignard reactions, $LiAlH_4$ reductions, and polymerizations. Versatile chemical intermediate and monomer.

Shipping regulations: Flammable liquid. Red label.*

tetrahydrofurfuryl acetate $C_4H_7OCH_2OOCCH_3$.

Properties: Colorless liquid. Soluble in water, alcohol, ether, and chloroform. Sp.gr. 1.061 (20/0°C); b.p. 194-195°C/753 mm.

Derivation: By treatment of tetrahydrofurfuryl alcohol with acetic anhydride.

Grade: Refined.

Containers: Bottles.

Shipping regulations: None.*

tetrahydrofurfuryl alcohol (tetrahydrofuryl carbinol) $C_4H_7OCH_2OH$.

Properties: Water-white liquid with a mild odor; sp.gr. 1.0543 (20/20°C); b.p. 178°C (760 mm); refractive index 1.4520 (20/D); flash point (open cup) 183°F; viscosity 5.49 cps (25°C).

Derivation: Catalytic hydrogenation of furfural.

Grades: Commercial; industrial (about 80%).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers: 1-, 5-, 10-gal cans; 55-gal drums; tank cars; tank trucks.
 Uses: Solvent for resins, dyes, chlorinated rubber; preparation of esters.
 Shipping regulations: None.*
- tetrahydrofurfuryl benzoate** $C_4H_7OCH_2OOC C_6H_5$.
 Properties: Colorless liquid, insoluble in water; soluble in alcohol, ether, and chloroform. Sp. gr. 1.137 (20/0°C); b.p. 300-302°C/750 mm, 138-140°C/2 mm.
 Derivation: Tetrahydrofurfuryl alcohol and benzoic acid by usual esterification procedure.
 Grade: Refined.
 Containers: Bottles.
 Shipping regulations: None.*
- tetrahydrofurfuryl laurate** $C_{17}H_{32}O_3$.
 Properties: Sp. gr. (25°C) 0.930; m.p. -76 to -9°C; insoluble in water.
 Use: Plasticizer.
- tetrahydrofurfuryl levulinate**
 $CH_3CO(CH_2)_2COOCH_2C_4H_7O$.
 Properties: M.p. 59-61°C; soluble in water.
 Use: Plasticizer.
- tetrahydrofurfuryl oleate** $C_{17}H_{33}COOCH_2C_4H_7O$.
 Properties: Colorless liquid; sp. gr. (25°C) 0.923, b.p. (5 mm) 240°C, m.p. -30°C; insoluble in water.
 Containers: 1-, 5-, 55-gal drums.
 Uses: Plasticizer.
- tetrahydrofurfuryl phthalate**
 $C_6H_4(COOCH_2C_4H_7O)_2$.
 Properties: Sp. gr. (25°C) 1.194, m.p. less than 15°C; insoluble in water.
 Use: Plasticizer.
- tetrahydrofuryl carbinol**. See tetrahydrofurfuryl alcohol.
- tetrahydrolinalool** $C_{10}H_{20}OH$.
 Properties: A colorless liquid with a delicate floral odor. Sp. gr. 0.832-0.837; optically inactive.
 Use: Perfumery.
- tetrahydromethylnicotinic acid**. See arecaidine.
- tetrahydro-para-methyloxyquinoline**. See thalline.
- 1,2,3,4-tetrahydro-6-methylquinoline**. See "Tetraquinone."
- tetrahydronaphthalene** $C_{10}H_{12}$.
 Properties: Colorless liquid; pungent odor. Fairly stable but will, however, polymerize and oxidize giving rise to discoloration and resinous material. Miscible with most solvents, especially the resinous and petroleum thinners, and compatible with natural and synthetic vehicles; insoluble in water.
 Constants: Sp. gr. 0.981 at 13°C; b.p. 206°C; refractive index 1.540-1.547, flash point 78°C; freezing point -25°C; moisture content none; residue on evaporation none; acidity neutral, wt/gal approx. 8 lbs.
 Derivation: Hydrogenation of naphthalene in the presence of a catalyst at 150°C.
 Grade: Technical.
 Containers: 1-, 2-, 5-, 10-, 50-gal drums.
 Uses: Solvent for waxes, resins, rubber, gums; oils, resinsates, cellulose ethers, asphalt, linoloxyn, liquid driers, metallic soaps, greases, benzene, toluene, naphthalene, casinghead gasoline, other products; removing printing ink from paper; turpentine substitute; purifying coal gas; extracting sulfur from spent oxide in gas purification; paint and varnish; bituminous emulsions; water-proofings; solvent mixtures; motor fuels; paint and varnish removers; textile processing; agricultural sprays; shoe polishes, floor polishes, etc.; extracting casinghead gasoline from natural gas; other purposes.
- 2-tetrahydronaphthyl-2-imidazoline hydrochloride**. See tetrahydrozoline hydrochloride.
- tetrahydro-1,4-oxazine**. See morpholine.
- tetrahydrophenobarbital**. See cyclobarbital.
- tetrahydrophthalic anhydride** $C_6H_4(CO)_2O$.
 Properties: White crystalline powder, solidification point 99-101°C; sp. gr. (105°C) 1.20; slightly soluble in petroleum ether and ethyl ether; soluble in benzene.
 Derivation: Diels-Alder reaction of butadiene and maleic anhydride.
 Containers: Fiber drums.
 Uses: Chemical intermediate for manufacture of light colored alkyls, polyesters, plasticizers and adhesives; intermediate for pesticides.
- tetrahydropyran-2-methanol**
 $OCCH_2CH_2CH_2CH_2CH_2OH$.
 Properties: Liquid; sp. gr. (20°C) 1.0272; b.p. 187.2°C; f.p., sets to glass below -70°C, miscible with water.
 Use: Chemical intermediate.
- 1,2,5,6-tetrahydropyridine** C_5H_9N .
 Properties: Sp. gr. (20/4°C) 0.912-0.914; m.p. -44°C, b.p. 115.5-120.0°C
 Purity: 96% min.
 Use: Organic intermediate.
- tetrahydrothiophene** $CH_2CH_2CH_2CH_2S$.
 Properties: Water-white liquid, sp. gr. 1.00 (15.6/15.6°C); boiling range 115-124.4°C.
 Uses: Solvent; intermediate. Stable fuel gas odorant.
- tetrahydroxyadipic acid**. For two of fourteen possible isomers, see mucic acid, saccharic acid.
- tetrahydroxybutane**. See erythritol.
- tetrahydroxydiphenyl**. See diorescinol.
- tetrahydroxyethylethylenediamine** [N,N,N',N'-tetraakis(2-hydroxyethyl)ethylenediamine]
 $(HOCH_2CH_2)_2NCH_2CH_2N(CH_2CH_2OH)_2$.
 Properties: Clear, viscous liquid; good heat stability; low toxicity.
 Uses: Organic intermediate; cross-linking of rigid polyurethane foams; chelating agent; humectant; gas absorbent; resin formation; detergent processing.
- tetrahydroxyflavanol**. See quercetin.
- 2,3,4,5-tetrahydroxyhexanedioic acid**. See D-saccharic acid.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

tetrahydrozoline hydrochloride (2-(1,2,3,4-tetrahydro-1-naphthyl)-2-imidazoline hydrochloride) $C_{13}H_{16}N_2 \cdot HCl$.

Properties: White, odorless solid; soluble in water and alcohol; slightly soluble in chloroform; insoluble in ether; melting range 253-259°C.

Grade: N.F. XI.

Use: Medicine.

tetralodoethylene (diiodoform; ethylene periodide; ethylene tetraiodide, iodoethylene) $I_2C:Cl_2$.

Properties: Light-yellow, heavy, small odorless crystals; on exposure to light turns brown; m.p. 187°C; sp.gr. 2.98. Insoluble in water; soluble in most organic solvents.

Derivation: Action of iodine on diiodoacetylene obtained from calcium carbide and iodine.

Uses: Surgical dusting powder, antiseptic ointment; fungicide.

Warning: Protect from light.

tetralodofluorescein. See iodeosin.

tetralodophenolphthalein. See iodophthalein.

tetralodophenolphthalein, sodium salt. See iodophthalein sodium.

tetralodopyrrole. See iodole.

tetraisopropylthiuram disulfide $[(CH_3CH_2CH_2)_2NCS]_2S_2$.

Properties: Tan color; sp.gr. (20/20°C) 1.12; melting range 95-99°C; amine odor. Soluble in benzene, chloroform, gasoline; insoluble in water, 10% caustic, carbon disulfide.

Uses: Vulcanizing and accelerating agents.

tetraisopropyl titanate (TPT; titanium isopropylate, isopropyl titanate) $Ti[OCH(CH_3)_2]_4$.

Properties: Light yellow liquid which fumes in moist air. B.p. (10 mm) 102-104°C; m.p. 14.8°C, sp.gr. 0.954; index of refraction 1.46; apparent viscosity (25°C) 2.11 cps. Decomposes rapidly in water, soluble in most organic solvents.

Derivation: Reaction of titanium tetrachloride with isopropanol.

Uses: Ester exchange reactions, improving adhesion of paints, rubber, and plastics to metal surfaces; condensation catalyst.

tetraisopropyl zirconate $(C_3H_7O)_4Zr$.

Properties: White solid; decomposes before melting.

Derivation: By reaction of zirconium tetrachloride with isopropanol.

Uses: Condensation catalyst; cross-linking agent.

N, N, N', N' -tetrakis(2-hydroxyethyl)ethylene-diamine. See tetrahydroxyethylethylene-diamine.

tetrakis(hydroxymethyl)phosphonium chloride $(HOCH_2)_4PCl$. A crystalline compound made by the reaction of phosphine, formaldehyde and hydrochloric acid. Used to render cotton fabrics flame resistant. It is more effective when used with bromoform

allyl phosphate or with other resin-forming materials.

"Tetralin." ²⁸ Trademark for tetrahydronaphthalene ($C_{10}H_{12}$).

Use: As a solvent in the textile, soap, and manufactured gas industries; chemical intermediate.

tetralite. See tetryl.

tetramer. A molecule formed by union of four identical simpler molecules. Also applied to the substances composed of such quadruple molecules. Thus C_8H_8 is a tetramer of C_2H_2 . See polymer.

tetramethylammonium chloride $(CH_3)_4NCl$. A quaternary ammonium compound.

Properties: White crystalline solid; sp.gr. 1.1690 (20/4°C); m.p., decomposes. Soluble in water and alcohol; insoluble in ether.

tetramethylammonium chlorodibromide $(CH_3)_4NClBr_2$.

Properties: M.p. 118-126°C. Soluble in water and other polar solvents. Liberates elemental bromine on contact with water.

Uses: Dry brominating agent; ingredient in formulation of sanitizers.

1, 2, 3, 4-tetramethylbenzene. See prehnitene.

1, 2, 3, 5-tetramethylbenzene. See isodurene.

sym-tetramethylbenzene. See durene.

2, 2, 3, 3-tetramethylbutane. See hexamethylethane.

N, N, N', N' -tetramethyl-1, 3-butanediamine $CH_3CHN(CH_3)_2CH_2CH_2N(CH_3)_2$.

Properties: Colorless, stable liquid; f.p. below -100°C, b.p. 165.0°C (760 mm), sp.gr. 0.8020 (20/20°C); vapor pressure 1.64 mm (20°C), miscible in all proportions with water, viscosity 1.0 cps (20°C).

Uses: Amine catalyst for polyurethane foams, catalyst for epoxy resins, high energy fuels.

tetramethyldiamidophosphoric fluoride. See dimefox.

tetramethyldiaminobenzhydrol (tetramethyldiaminodiphenylcarbinol, Michler's hydrol; ϕ hydrol) $(CH_3)_2NC_6H_4CH(OH)C_6H_4N(CH_3)_2$.

Properties: Colorless prisms; forms a colorless solution in ether or benzene and a blue solution in alcohol or acetic acid. Soluble in alcohol, ether, benzene, and acetic acid. M.p. 96°C.

Derivation: By the reaction of tetramethyldiaminodiphenylmethane, hydrochloric acid and glacial acetic acid; oxidized with lead peroxide.

Grade: Technical.

Containers: Wooden kegs or fiber drums; tank trucks.

Uses: Dye intermediate; organic synthesis.

Shipping regulations: None.*

tetramethyldiaminobenzophenone (Michler's ketone) $CO[C_6H_4N(CH_3)_2]_2$. (4, 4'-bis(dimethylamino) benzophenone).

Properties: Crystalline leaflets; m.p. 172°C;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- b.p., decomposes at 360°C; soluble in alcohol, ether, and water.
 Derivation: From dimethylaniline by reaction with phosgene.
 Method of purification: Crystallization.
 Grade: Technical.
 Containers: Wooden barrels or fiber containers.
 Use: Synthesis of dyestuffs and auramine derivatives.
 Shipping regulations: None.*
- tetramethyldiaminodiphenylcarbinol.** See tetramethyldiaminobenzhydrol.
- tetramethyldiaminodiphenylmethane** (tetra base) $\text{H}_2\text{C}[\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2]_2$.
 Properties: Yellowish leaflets or glistening plates; m.p. 90-91°C; sublimes with decomposition; b.p. 390°C; insoluble in water; soluble in benzene, ether, carbon disulfide and acids.
 Derivation: By heating dimethylaniline with hydrochloric acid and formaldehyde.
 Method of purification: Crystallization.
 Grade: Technical.
 Containers: Wooden barrels.
 Use: Dye intermediate.
 Shipping regulations: None.*
- tetramethyldiaminodiphenylsulfone** $[(\text{CH}_3)_2\text{NC}_6\text{H}_4]_2\text{SO}_2$ (4,4'-bis(dimethylamino) diphenylsulfone).
 Constants: M.p. 259-260°C.
 Grades: Technical; reagent.
 Use: Intermediate in making dyestuffs and medicinal chemicals; analytical reagent for lead.
- tetramethylene.** See cyclobutane.
- tetramethylene bismethanesulfonate.** See busulfan.
- tetramethylenediamine** $\text{H}_2\text{N}(\text{CH}_2)_4\text{NH}_2$.
 Properties: Colorless crystals with strong odor; m.p. 27°C; b.p. 158-159°C. Soluble in water with strongly basic reaction.
 Use: As a chemical intermediate.
- tetramethylene dichloride.** See 1,4-dichlorobutane.
- tetramethylene glycol.** See 1,4-butylene glycol.
- 1,1,4,4-tetramethyl-6-ethyl-7-acetyl-1,2,3,4-tetrahydronaphthalene** $\text{C}_{18}\text{H}_{26}\text{O}$.
 Properties: Colorless crystals; m.p. 45°C, b.p. (2 mm) 130°C; insoluble in water.
 Uses: Perfumes; cosmetics; soaps.
- tetramethylethylenediamine** (TMEDA; N,N,N',N'-tetramethylethylenediamine) $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$.
 Properties: Colorless, anhydrous liquid with slight ammoniacal odor. Soluble in water and most organic solvents. B.p. 121-122°C; sp.gr. 0.7765 (20/4°C); refractive index (n_D²⁵) 1.4170; f.p. -55.1°C.
 Grade: Anhydrous.
 Containers: Up to 55-gal steel drums.
 Uses: Preparation of epoxy curing agents, and polyurethane formation; corrosion inhibitor; textile treating compounds; intermediate for quaternary ammonium compounds.
- tetramethylguanidine** $(\text{CH}_3)_2\text{NC}(\text{NH})\text{N}(\text{CH}_3)_2$.
 Properties: Liquid with slight ammoniacal odor; b.p. 159-160°C; soluble in both water and organic solvents.
 Containers: Drums.
 Use: A strong, all-organic base.
- tetramethyllead** (TML) $(\text{CH}_3)_4\text{Pb}$.
 Properties: Colorless liquid. Sp.gr. 1.995; m.p. -27.5°C; b.p. 110°C (10 mm). Insoluble in water; slightly soluble in benzene, petroleum ether, alcohol.
 Derivation: Lead-sodium alloy and methyl chloride.
 Use: Gasoline additive (antiknock compound).
- 1,2,6,6-tetramethyl-4-mandeloxypiperidine hydrochloride.** See eucatropine hydrochloride.
- tetramethylmethane.** See neopentane.
- 3,3'-tetramethylnonyl thiodipropionate.** See ditiidecyl thiodipropionate.
- N,2,3,3-tetramethyl-2-norcamphanamine hydrochloride.** See mecamlamine hydrochloride.
- 2,6,10,14-tetramethylpentadecane.** See "Pris-tane."
- tetramethylsilane** $(\text{CH}_3)_4\text{Si}$.
 Properties: Colorless volatile liquid. B.p. 26.5°C; sp.gr. 0.646 (20/4°C). Insoluble in water and cold, concentrated sulfuric acid; soluble in most organic solvents. Ignites in air.
 Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.
 Grades: Technical; purified.
 Containers: Bottles; 50-lb drums.
 Use: Liquid in high-speed aircraft.
 Shipping regulations: Flammable-liquid. Red label.*
- tetramethylthiuram disulfide** (thiram; thiuram; bis(dimethylthiocarbamyl) disulfide; TMTD) $[(\text{CH}_3)_2\text{NCS}]_2\text{S}_2$.
 Properties: White crystalline powder with a characteristic odor; soluble in alcohol, benzene, chloroform, carbon disulfide; insoluble in water, dilute alkali, gasoline; sp.gr. 1.29 (20°C); melting range 146-148°C.
 Grades: 75% wettable powder; 95% technical powder.
 Containers: 50-lb multiwall paper bags.
 Uses: As a rubber accelerator to impart heat-resistance; fungicide; insecticide; seed disinfectant; rat repellent in vinyl film; lube oil additive; bacteriostat.
 Caution! May cause irritation; harmful if inhaled or swallowed. MCA warning label.
- tetramethylthiuram monosulfide** (bis(dimethylthiocarbamyl) sulfide) $[(\text{CH}_3)_2\text{NCS}]_2\text{S}$. Yellow powder. A powerful accelerator of vulcanization for rubber. It is usually used in combination with some other accelerator. It has also been used as a fungicide and insecticide.
- tetraminoditolylmethane** $[\text{CH}_3\text{C}_6\text{H}_2(\text{NH}_2)_2]_2\text{CH}_2$.
 Properties: White crystalline powder. Insoluble in water. M.p. 195°C.
 Derivation: Condensation of meta-tolylene-diamine and formaldehyde.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"**Tetramix.**" ²⁸ Trademark for a liquid antiknock compound, the active component of which is a redistribution mixture of tetraethyl and tetramethyl lead; sp.gr. 1.591.

Use: In concentrations up to 2.52 cc active ingredient per gal as an antiknock agent for motor gasoline.

Containers: Liter cans, 10- and 55-gal drums; 3,000- and 6,000-gal tank cars.

tetranitroaniline (TNA) $C_6H(NO_2)_4NH_2$. A nitration product of aniline which melts at 170°C and explodes at 237°C.

Use: In the manufacture of detonators and primers.

Fire hazard: Dangerous.

Shipping regulations: Explosive, class A. High explosive label.*

tetranitrol. See erythrityl tetranitrate.

tetranitromethane $C(NO_2)_4$.

Properties: Colorless liquid. Very toxic; irritating to the eyes and respiratory passages. B.p. 125.7°C; m.p. 12.5°C; sp.gr. (13°C) 1.650. Miscible with alcohol and ether; insoluble in water. Decomposed by alcoholic solution of potassium hydroxide.

Derivation: By action of fuming nitric acid on benzene, acetic anhydride, or acetylene.

Uses: Rocket fuel, as an oxidant or monopropellant; qualitative test for unsaturated compounds.

Caution: Poison; fire hazard.

Shipping regulations: Oxidizing material. Yellow label.*

"**Tetranol.**" ³⁰⁰ Trademark for a highly sulfated fatty ester of the oleic type, with wetting and dye-leveling properties.

tetra(octylene glycol)titanate. See octylene glycol titanate.

1,1,4,4-tetraphenylbutadiene

$(C_6H_5)_2C:CHCH:C(C_6H_5)_2$.

Properties: White crystals; m.p. 205°C, insoluble in water; soluble in most organic solvents.

Grade: Purified.

Use: As primary fluor or as wave length shifter in solution scintillators.

tetraphenylsilane $(C_6H_5)_4Si$.

Properties: White solid, m.p. 237°C, b.p. 428°C. Very stable and inert.

Derivation: By Grignard reaction of silicon tetrachloride and phenylmagnesium chloride; or by chlorination of phenyltrichlorosilane.

Grade: Technical.

Use: Heat transfer medium, polymers.

tetraphenyltin $(C_6H_5)_4Sn$.

Properties: White powder. Sp.gr. 1.490, m.p. 225-228°C; b.p. above 420°C. Insoluble in water; soluble in hot benzene, toluene, xylene.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Uses: Stabilizer in chlorinated transformer oils; mothproofing agent; scavenger in dielectric fluids; intermediate.

tetraphosphorus hexasulfide. See phosphorus trisulfide.

tetraphosphorus trisulfide. See phosphorus sesquisulfide.

tetrapotassium EDTA. See ethylenediamine-tetraacetic acid salts.

tetrapotassium pyrophosphate (TKPP). See potassium pyrophosphate.

tetrapropenylsuccinic anhydride (TPSA)

$CH_2CH_2CH_2CH(CH_3)CH_2C(CH_3):CHC(CH_3)_2-$

$CHC_2O_3CH_2$. Molecule with both a hydrophobic and a hydrophilic end-section. Used as curing agent for epoxy resins; in drying oils and lacquers; in waterproofing resins and polyester resins; and as organic intermediate.

tetrapropylene (dodecene; propylene tetramer) $C_{12}H_{24}$. Mixture of C_{12} monoolefins.

Properties: Liquid; sp.gr. (20/20°C) 0.770; boiling range 183°-202°C; weight 6.44 lb/gal (60°F).

Derivation: Olefin fraction obtained from catalytic polymerization of propylene.

Containers: Barge or tank car.

Uses: Detergents (dodecylbenzene); lubricant additives, plasticizers.

tetrapropylthiuram disulfide $[(C_3H_7)_2NCS]_2S_2$.

Properties: Light cream color; sp.gr.

(20/20°C) 1.13; melting range 49-51.5°C;

musty odor. Soluble in carbon disulfide, benzene, chloroform and gasoline; insoluble in water and 10% caustic.

Uses: Vulcanizing and accelerating agents.

"**Tetraquinone.**" ²²⁷ Trademark for 1,2,3,4-tetrahydro-6-methylquinoline, $C_{10}H_{13}N$. (Civetall).

Properties: Yellowish crystals; characteristic civet odor, stable, may cause discoloration, congealing point, minimum 32.8°C; soluble in 2 parts of 80% alcohol.

Uses: A contributive note to the odor of civet, an effective fixative.

tetrasodium EDTA. See ethylenediaminetetraacetic acid salts.

tetrasodium 2-methyl-1,4-naphthalenediol diphosphate. See menadiol sodium diphosphate.

tetrasodium monopotassium tripolyphosphate

$Na_4KP_3O_{10}$.

Properties: White crystalline solid; m.p. 580-600°C; density, 2.55; solubility in water (26°C) 30 g/100 ml.

Use: Sequestrant.

tetrasodium pyrophosphate. See sodium pyrophosphate.

tetrastearyl titanate. A substance used as organic intermediate, adhesion promoter, pigment dispersant.

tetrazene (guanyl nitrosaminoguanyl tetrazene).

An initiating explosive.

Shipping regulations: Class A explosive. Not accepted by express.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tetrazolium chloride (tetrazolium salts; TTC; 2,3,5-triphenyltetrazolium chloride)
 $\text{CN}_4\text{Cl}(\text{C}_6\text{H}_5)_3$.

Properties: White to pale-yellow crystalline powder which darkens on exposure to light. Readily soluble in water. M.p. (with decomposition) 245°C.

Uses: In germination and viability tests.

Viable parts of seed are stained red by deposition of red insoluble triphenyl formazan. Also used in medicine.

tetrazolium salts. See tetrazolium chloride.

"Tetrine." ⁷³ Trademark for a series of organic chelating, sequestering, and complexing agents consisting of ethylene-diaminetetraacetic acid and its sodium salts.

tetrol. See furan.

"Tetron." ⁸⁸ Trademark for tetraethyl pyrophosphate (TEPP), technical, and in liquid formulations for insecticidal use.

"Tetrone" A. ²⁸ Trademark for dipentamethylenethiuramtetrasulfide rubber accelerator. Properties: Grayish-yellow powder. Containers: 50-lb bags.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

"Tetronic." ²⁰³ Trademark for a series of nonionic surface active agents prepared by the sequential addition of propylene and ethylene oxides to ethylenediamine. They are available in liquid, paste, and flake form and all are 100% active agents. Major uses are as low foaming detergents, lime soap and pigment dispersing agents, emulsifying and demulsifying agents, wetting agents, and as plasticizers for a variety of resins.

"Tetrosan 60%." ³²⁸ Trademark for an alkyl dimethyl 3,4-dichlorobenzyl ammonium chloride and alkenyl dimethyl ethyl ammonium bromide in the ratio of 5:1.

Properties: Clear, mobile liquid, light yellow to amber with mild characteristic odor and a bitter taste; miscible in any proportion with water, methanol, ethanol, isopropanol, and acetone. Insoluble in hydrocarbons, halides, vegetable, animal and mineral oils. Use dilutions are colorless and virtually without odor.

Containers: 5- and 13-gal returnable glass carboys; 15- and 55-gal lined drums.

Use: Disinfectant and antiseptic in the veterinary and pharmaceutical fields.

tetryl (tetralite; nitramine). Common commercial names for trinitrophenyl-methylnitramine.

Properties: Yellow crystals; m.p. 130-132°C. explodes at about 180-190°C. Insoluble in water; soluble in alcohol, ether, benzene, glacial acetic acid.

Use: As explosive used in detonators; also as a "priming" or intermediary detonating agent for less sensitive high explosives.

Fire hazard: Dangerous.

Shipping regulations: Explosive, class A.

High explosive label.*

tetterwort. See sanguinaria.

"Texavon." ⁵⁷ Trademark for textile penetrant or scouring agent.

"Texicote" Emulsions. ²⁶³ Proprietary product. Vinyl acetate polymer and copolymer emulsions, plasticized and unplasticized. Several grades: Solids content 35-63%; pH less than 5. Hard to very flexible films.

Uses: Emulsion paints; finishes for textiles, leather, and paper; adhesives; floor coatings.

"Texicryl" Emulsions. ²⁶³ Proprietary product. Acrylic polymer and copolymer emulsions. Several grades. Solids content 30-50%; pH less than 10. Hard to very flexible films.

Uses: Emulsion paints; textile, leather and paper finishes.

"Texigel" Thickening Agent. ²⁶³ Proprietary product. Water-soluble, anionic colloid; solids content less than 20%; viscosities 15,000-50,000 cps, or over 100,000 cps. (Ferranti).

Uses: Thickening agent for natural and synthetic latex; protective colloid for emulsions and dispersions; textile and leather finishes.

"Texilac" Solutions. ²⁶³ Proprietary product. Vinyl polymer and copolymer solutions in various solvents, plasticized and unplasticized. Solids content 30-65%.

Uses: Adhesives; impregnants and surface coatings; printing inks.

"Texiprint" Color Pastes. ²⁶³ Proprietary product. Synthetic resin pigment pastes and thickeners for screen and roller printing on textiles.

textile clays. China clays low in grit and silica, and used as fillers for textiles.

textile oils. This term includes the various specially compounded oils used to condition all types of raw fibers, yarns or fabric for manufacturing, bleaching, dyeing and finishing operations. While the primary purpose of these oils is to lubricate or soften the fibers, they also may add any or all of the following properties or conditions: (1) increase tenacity and tensile strength; (2) diminish static electricity; (3) prevent breakage and abrasion during spinning and twisting; (4) coat and bind the filaments together; (5) make the yarn less sensitive to atmospheric conditions, (6) serve as a carrier for any special agents; for example, tints applied to mixed rayon and silk yarns so each can be readily distinguished by its code color.

"Textolite." ²⁴⁵ Trademark for industrial laminated plastic sheets, tubes, and rods used as insulating materials. Includes laminations of various combinations of phenolic, melamine, silicone, and epoxy resins with such base materials as paper, asbestos, cotton, linen, and nylon. Also some of the above materials with copper foil cladding for printed circuit applications.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Textone." ⁸⁴ Brand name for a proprietary product. A sodium chlorite product that bleaches textile fabrics (cotton, linen, rayon, nylon) to high whiteness without degradation of the fibers.

textryl. A generic name for non-woven structures which may be manufactured by wet-processing from staple fibers and fibril binder.

"Texzyme." ¹¹⁴ Trademark for a liquid enzyme preparation, principally proteolytic enzyme, produced by growing pure cultures of micro-organisms on select media.

Uses: Removal of protein type sizes such as gelatine type coatings from photographic film.

Shipping regulations: None.*

TFE. Abbreviation for tetrafluoroethylene. See also polytetrafluoroethylene.

"TG-8." ⁵² Trade name for triethylene glycol dicaprylate (q.v.).

Uses: Low temperature plasticizer for synthetic resins and rubbers.

"T-Glo-8-210." ⁷⁹ Trade name for a tall oil gloss oil, i.e., solution of a limed special tall oil in mineral spirits.

Properties: Acid value (on solution) 28; concentration (total solids) 62%; viscosity (Gardner-Holdt) K; color (Hellige) 9, percent lime 8.

Containers: 55 gal drums; tank cars.

Uses: Paint and varnish; caulking compounds.

"T-Glo-8Y." ⁷⁹ Trademark for a tall oil gloss oil, i.e., solution of limed special tall oil in mineral spirits.

Properties: Acid value (on solution) 33; concentration (total solids) 65%; viscosity (Gardner-Holdt) Y; color (Hellige) 7-8, percent lime 9.

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish; caulking compounds.

"T-Glo-8Y-210." ⁷⁹ Trade name for a tall oil gloss oil, i.e., solution of a limed special tall oil in mineral spirits.

Properties: Acid value (on solution) 33, concentration (total solids) 65%; viscosity (Gardner-Holdt) Y, color (Hellige) 9-10, percent lime 9.

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish; caulking compounds.

Th. Symbol for thorium.

"Thalamyd." ³²¹ Brand name for phthalyl-sulfacetamide.

thallic oxide. See thallium peroxide.

thalline (tetrahydro-para-methyloxyquinoline) $C_9H_{10}N(OCH_3)$.

Properties: White crystalline powder, darkens on exposure to air and light; m.p. 42-43°C; b.p. 283-285°C; soluble in water, petroleum ether, alcohol, ether.

Derivation: Reaction of para-aminoanisole, para-nitroanisole, glycerol and sulfuric acid, to form para-quinanisole, followed by reduction with tin and hydrochloric acid.

Use: Medicine.

Shipping regulations: None.*

thallium Tl. Element of atomic number 81, group III of the periodic system.

Properties: Bluish-white, lead-like metal.

Soluble in nitric and sulfuric acids; insoluble in water. Its compounds are poisonous.

Constants: Sp.gr. 11.85; m.p. 302°C; b.p. 1650°C.

Source: Cadmium-bearing flue dust from zinc smelting.

Purification: By heating thallium iodide with metallic sodium.

Grades: Technical.

Containers: Glass bottles.

Use: Thallium salts; alloys.

Shipping regulations: None.*

thallium acetate (thallous acetate) $TlOOCCH_3$.

Properties: White, deliquescent crystals.

Poisonous! Soluble in water, alcohol.

Constants: M.p. 110°C; sp.gr. 3.68.

Derivation: Interaction of acetic acid and thallium carbonate.

Grades: Technical.

Containers: Bottles.

Uses: Medicine; high specific gravity solutions used to separate ore constituents by flotation.

Shipping regulations: Poison, class B.

Poison label.*

thallium bromide (thallous bromide) $TlBr$.

Properties: Yellowish-white, crystalline powder. Very poisonous! Soluble in alcohol, slightly soluble in water, insoluble in acetone.

Constants: Sp.gr. 7.557; b.p. 815°C, m.p. (approx) 460°C.

Uses: Mixed crystals with thallium iodide for infrared radiation transmitters.

Shipping regulations: Poison, class B.

Poison label.*

thallium carbonate (thallous carbonate) Tl_2CO_3 .

Properties: Heavy shiny, colorless or white crystals. Highly refractive. Melts to dark-gray mass. Slightly alkaline taste. Soluble in water, insoluble in alcohol. Poisonous!

Constants: Sp.gr. 7, m.p. 272°C.

Grades: Technical.

Uses: Analysis (testing for carbon disulfide), artificial diamonds.

Shipping regulations: Poison, class B.

Poison label.*

thallium chloride (thallous chloride) $TlCl$.

Properties: White, crystalline powder. Becomes violet on exposure to light. Slightly soluble in water; insoluble in alcohol, ammonium hydroxide. Very poisonous!

Constants: Sp.gr. 7; m.p. 430°C.

Containers: Bottles.

Uses: Catalyst (chlorination); medicine; tungsten lamps.

Shipping regulations: Poison, class B.

Poison label.*

thallium hydroxide (thallous hydroxide)

$TlOH \cdot H_2O$.

Properties: Yellow needles. Soluble in

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alcohol, water. Poisonous!

Constants: B.p. (dehydrated) 100°C (dec).

Grades: Technical.

Use: Analysis (testing for ozone; indicator).

Shipping regulations: Poison, class B.

Poison label.*

thallium iodide (thallous iodide) TlI .

Properties: Yellow powder. Insoluble in alcohol; slightly soluble in water; soluble in aqua regia.

Constants: Sp.gr. 7.09; b.p. 824°C; m.p. 440°C. Becomes red at 170°C.

Uses: Medicine; mixed crystals with thallium bromide for infrared radiation transmitters.

Shipping regulations: Poison, class B.

Poison label.*

thallium monoxide (thallium oxide; thallous oxide) Tl_2O .

Properties: Black powder. Oxidizes when exposed to air. Caution! Keep well stoppered! Soluble in alcohol, water (decomposes). Poisonous! M.p. 300°C.

Grades: Technical.

Uses: Analysis (testing for ozone), artificial gems, optical glass of high refractive index.

Shipping regulations: Poison, class B.

Poison label.*

thallium nitrate (thallous nitrate) $TlNO_3$.

Properties: Colorless crystals. Soluble in hot water, insoluble in alcohol.

Constants: Sp.gr. 5.5; m.p. 206°C (solidifies to a glass-like solid, decomposes at 450°C).

Grades: Technical.

Uses: Analysis; pyrotechnics, green fire.

Shipping regulations: Poison, class B.

Poison label.*

thallium oxide. See thallium monoxide; thallium peroxide.

thallium peroxide (thallous peroxide; thallium sesquioxide; thallium trioxide) Tl_2O_3 .

Properties: Brown or dark-red powder. Soluble in acids; insoluble in basic solutions, water.

Constants: Sp.gr. 9.6; m.p. 759°C.

Grades: Technical.

Use: Matches.

Shipping regulations: Poison, class B.

Poison label.*

thallium sesquichloride (thallo-thallic chloride) $TlCl_3 \cdot 3TlCl$ or Tl_2Cl_3 .

Properties: Yellow, crystalline powder. Slightly soluble in water.

Constants: Sp.gr. 5.9, m.p. 400-500°C.

Shipping regulations: Poison, class B.

Poison label.*

thallium sesquioxide. See thallium peroxide.

thallium sulfate (thallous sulfate) Tl_2SO_4 .

Properties: Colorless crystals. Soluble in water.

Constants: Sp.gr. 6.77; m.p. 632°C.

Grades: Technical, 99%.

Containers: Bottles.

Uses: Analysis (testing for iodine in the

presence of chlorine); medicine; ozonometry; rodent and insect poisons.

Danger! Cumulative poison. Absorbed through skin. MCA warning label.

Shipping regulations: Poison, class B.

Poison label.*

thallium sulfide (thallous sulfide) Tl_2S .

Properties: Blue-black, lustrous, microscopic crystals or amorphous powder.

Soluble in mineral acids; insoluble in water, alcohol or ether.

Constants: Sp.gr. 8.0; m.p. 448°C.

Uses: Infrared-sensitive photocells.

Shipping regulations: Poison, class B.

Poison label.*

thallium trioxide. See thallium peroxide.

thallo-thallic chloride. See thallium sesquichloride.

thallous acetate. See thallium acetate.

thallous bromide. See thallium bromide.

thallous carbonate. See thallium carbonate.

thallous chloride. See thallium chloride.

thallous hydroxide. See thallium hydroxide.

thallous iodide. See thallium iodide.

thallous nitrate. See thallium nitrate.

thallous oxide. See thallium monoxide.

thallous sulfate. See thallium sulfate.

thallous sulfide. See thallium sulfide.

THAM. See tris(hydroxymethyl)aminomethane.

"Thanite." ²⁶⁶ Trademark for a technical grade of isobornyl thiocanoacetate.

Properties: Amber liquid; sp.gr. 1.107 (15.6/15.6°C).

Uses: Insecticides.

thebaine (para-morphine) $C_{19}H_{21}NO_3$.

Properties: White, crystalline alkaloid; very poisonous! Slightly soluble in water; soluble in alcohol and ether. M.p. 193°C.

Derivation: From opium.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

thebaine hydrochloride $C_{19}H_{21}NO_3 \cdot HCl \cdot H_2O$.

Properties: Large rhombic prisms, white to slightly yellow. Soluble in water, alcohol and ether. Poisonous!

Derivation: By the action of hydrochloric acid on thebaine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Thedane Blue." ²⁴³ Trade name for biological staining solution useful for the rapid and precise identification of blood parasites.

theine. See caffeine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thenardite Na_2SO_4 (verde salt). A natural anhydrous sulfate of sodium. White to brownish in color.

Occurrence: United States (Arizona, California), Central Asia, Chile, Spain, Germany.

Thénard's blue. See cobalt blue.

"Thenfadi" Hydrochloride. ¹⁶² Trademark for thenyldiamine hydrochloride.

thenyl. The radical $\text{C}_6\text{H}_5\text{SCH}_2-$ or CHCHSCHCH_2- , based on methylthiophene. Thenyl alcohol is a synonym for thiophenemethanol.

thenyldiamine (2-[2-dimethylaminoethyl]-3-thenylamino]pyridine) $(\text{C}_6\text{H}_5\text{SCH}_2)\text{N}(\text{C}_2\text{H}_5)_2\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$. Thenyldiamine is a coined name, not a true chemical name.

Properties: Liquid, b.p. (1.0 mm) 169-172°C.

Derivation: Prepared by condensing N,N-dimethylaminoethyl-alpha-amino-pyridine with 3-thenyl bromide.

Use: Medicine (as base for various salts, especially the hydrochloride).

thenyldiamine hydrochloride (N,N-dimethyl-N'-(3-thenyl)-N'-(2-pyridyl)ethylenediamine hydrochloride).

Properties: White, practically odorless, crystalline powder; solutions neutral to litmus; soluble in water, alcohol, and chloroform; nearly insoluble in ether and benzene, m.p. 167-171°C.

Grade: N.F. XI.

Use: Medicine.

"Thenylene" Fumarate. ³ Trademark for methapyrilene fumarate (q.v.).

"Thenylene" Hydrochloride. ³ Trademark for methapyrilene hydrochloride (q.v.).

theobroma oil. See cacao butter.

theobromine (3,7-dimethylxanthine) $\text{C}_7\text{H}_8\text{N}_4\text{O}_2$. The alkaloid found in cocoa and chocolate products.

Properties: White crystalline powder; poisonous! Insoluble in water, alcohol and ether; sublimes at 260°C.

Derivation: By extraction from the seeds of the Theobroma cacao.

Method of purification: Crystallization.

Grades: Technical; N.F. XI.

Containers: 1-lb cans; 1-lb bottles; fiber drums.

Use: Medicine.

Shipping regulations: None.*

theobromine calcium salicylate (calcium theobromine salicylate). A complex or double salt of equimolecular proportions of theobromine calcium $(\text{C}_4\text{H}_4\text{CaN}_2\text{O}_4)$ and calcium salicylate $(\text{C}_7\text{H}_5\text{CaO}_4)$.

Properties: White, odorless powder with saline taste. Solutions are alkaline to litmus and phenolphthalein. Slightly soluble in water; insoluble in alcohol.

Grade: N.F. XI.

Use: Medicine.

theobromine-sodium acetate

$\text{C}_7\text{H}_7\text{O}_2\text{N}_4\text{Na} \cdot \text{NaC}_2\text{H}_3\text{O}_2$.

Properties: White crystalline powder; odorless, bitter taste. Contains not less than 55% theobromine. Incompatible with carbonated beverages, acids, saccharin, mucilaginous liquids, alkaloids. Soluble in cold water; slightly soluble in cold alcohol, more soluble in hot alcohol; hygroscopic; absorbs carbon dioxide from the air and liberates theobromine.

Grades: N.F. XI.

Containers: Fiber drums.

Use: Medicine.

Shipping regulations: None.*

theobromine sodium salicylate. A mixture of sodium theobromine and sodium salicylate in equimolecular proportions.

Properties: White powder; odorless, sweet, saline alkaline taste. Contains not less than 46.5% theobromine and 35% salicylic acid when dried to constant weight at 105°C. Slowly absorbs carbon dioxide from the air, liberating theobromine; develops characteristic odor. Soluble in water; slightly soluble in alcohol.

Grades: N.F. XI.

Containers: 1-lb bottles, 25-, 100-lb fiber drums.

Use: Medicine.

Shipping regulations: None.*

"Theocalcin." ⁹ Trademark for theobromine-calcium salicylate.

theophylline (1,3-dimethylxanthine)

$\text{C}_7\text{H}_8\text{N}_4\text{O}_2 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline alkaloid; poisonous! Odorless with a bitter taste; m.p. 270-274°C, slightly soluble in water and alcohol, more soluble in hot water, sparingly soluble in ether or chloroform.

Derivation: (a) By extraction from tea leaves; (b) synthetically from ethyl cyanacetate.

Method of purification: Crystallization.

Grades: Technical; N.F. XI.

Containers: Glass bottles; 1-, 5-lb tins; 25-, 100-lb drums.

Use: Medicine.

Shipping regulations: None.*

theophylline choline. See oxtriphylline.

theophylline ethylenediamine. See aminophylline.

theophylline-methylglucamine. An equimolecular mixture of theophylline $(\text{C}_7\text{H}_8\text{N}_4\text{O}_2 \cdot \text{H}_2\text{O})$ and N-methyl-L-glucosamine $(\text{C}_7\text{H}_{17}\text{NO}_5)$.

Use: Medicine.

theophylline sodium acetate. A hydrated mixture of theophylline sodium $(\text{C}_7\text{H}_7\text{N}_4\text{O}_2\text{Na})$ and sodium acetate $(\text{C}_2\text{H}_3\text{O}_2\text{Na})$ in approximately equimolecular proportions.

Properties: White, crystalline powder; odorless; bitter, salty taste; gradually absorbs CO_2 from the air liberating free theophylline. Soluble in water to give solution basic to phenolphthalein; insoluble in alcohol, ether, and chloroform.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: N.F. XI.

Use: Medicine.

theophylline sodium glycinate (sodium theophylline glycinate). A mixture containing theophylline sodium ($C_7H_7N_4NaO_2$) and glycine (NH_2CH_2COOH) in approximately equimolecular proportions buffered with an additional mole of glycine.

Properties: White crystalline powder with slight ammoniacal odor and a bitter taste. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform. pH (saturated solution) 8.5-9.5.

Grade: N.F. XI.

Use: Medicine.

"Thephorin" Tartrate.¹⁹⁰ Trademark for a brand of phenindamine tartrate (q.v.).

therm. A unit of heat equal to 100,000 Btu. It has also been used to mean 1 Btu or 1 small calorie, but these alternative uses have been abandoned in the U.S.

"Thermaflow."⁸⁹ Trademark for a series of reinforced polyester molding compounds.

thermal black. Carbon black made by the thermatomic process. It consists of coarser particles than channel black and is less suitable for rubber reinforcement but is used as a pigment.

Grades: Fine thermal black (FT), medium thermal black (MT).

thermal conductivity. The capacity for conducting heat, usually expressed as the number of calories which pass per second through a plate one square centimeter in area and one centimeter thick having its opposite faces differ in temperature by 1°C. In engineering applications thermal conductivity is expressed as Btu/hr/sq ft/°F/ft of thickness of the material under consideration.

thermal expansion coefficient. The change in volume per unit volume per degree change in temperature (cubical coefficient). For isotropic solids the expansion is equal in all directions, and the cubical coefficient is approximately three times the linear coefficient of expansion. These coefficients vary with temperature; but for gases at constant pressure the coefficient of volume expansion is nearly constant and equals 0.00367 for 1°C at any temperature.

thermal glass. A glass in which boron oxide replaces the calcium oxide in ordinary lime soda glass. Has low coefficient of expansion, can be heated and cooled rapidly without breakage. See "Pyrex."

thermal neutrons. See neutron.

"Therma-Tite."¹⁷⁰ Trademark for a specially formulated adhesive for high speed bottle label machines to withstand the dangers of thermoshock. Material will adhere to cold glass without crystallizing. Properties: Light tan liquid; pH 3.0-3.5. Humidity resistant and fast-setting.

thermatomic process. Methane is cracked over hot bricks at a temperature of 1600°F to form amorphous carbon (carbon black) and hydrogen.

"Thermax."⁶⁶ Trademark for thermatomic carbon; a medium thermal carbon black, available in powder and pellet form.

Use: In rubber and synthetic rubber compounds. See "P-33."

thermionics. Study of the process by which electrons are produced and caused to escape from a material by use of high temperatures. There are many applications, as in the vacuum tubes used in radio and other electronic devices. Recent studies relate to the use of this phenomenon as a means for direct conversion of heat to electricity.

"Thermit."²⁸⁸ Trademark for a mixture of iron oxide and finely divided aluminum used in welding iron and steel, and for incendiary bombs. It is said to develop a temperature of from 2000 to 5000°F.

thermodynamics. Originally defined as the study of the conversion of heat into work and vice versa. Now defined as the study of the laws of transformation of energy from any one form to another. The original kind of thermodynamics is now often called engineering thermodynamics to distinguish it from chemical thermodynamics, which is chiefly concerned with the relationship of heat and work and other forms of energy to equilibrium in chemical reactions and changes of state.

thermoelectric alloy. An alloy used as a junction element in a thermocouple or other thermoelectric device. New alloys of silver, antimony, and tellurium are expected to replace semiconductors such as lead telluride and bismuth telluride. See thermoelectricity.

thermoelectricity. Electricity produced directly by applying a temperature difference to different parts of electrically conducting or semiconducting materials. Usually two different materials are used and the points of contact are kept at different temperatures (Peltier effect). Many temperature measuring devices (thermocouples, thermopiles) work on this principle, since the voltage is proportional to the temperature difference. Metallic conductors are usually used for these "thermometers," which produce a rather small current. A newer use for the effect is as a source of electrical energy, i.e., a means of direct conversion of heat into electricity (or vice versa) without the use of a generator (or motor). The materials used for these new thermoelectric couples are semiconductors (i.e., zinc antimonide; lead, bismuth, germanium tellurides; samarium sulfide) or thermoelectric alloys (q.v.), either of which produce relatively large currents. Several of these "cells" are then hooked in series much like the cells of a battery.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Thermoflex" A. ²⁸ Trademark for a rubber antioxidant containing 25% di-para-methoxydiphenylamine ($\text{CH}_3\text{OC}_6\text{H}_4$)₂NH, 25% diphenyl-para-phenylenediamine $\text{C}_6\text{H}_4(\text{NHC}_6\text{H}_5)_2$, and 50% phenyl-beta-naphthylamine $\text{C}_{10}\text{H}_7\text{NHC}_6\text{H}_5$.

Properties: Dark gray pellets, sp.gr. 1.21; f.p. not lower than 67°C.

Containers: 250-lb drums.

Use: Promote outstanding heat aging and flex life of natural and synthetic rubbers.

Thermofor process. Catalytic cracking process in which petroleum vapor is passed up through a reactor and countercurrent to a flow of small beads of aluminum silicate catalyst.

"Thermoguard H." ²⁸⁸ Trade name for antimony oxide, Sb_2O_3 , of high tinctorial strength.

Properties: Very fine white powder, fineness 99.5% minimum through 325 wet sieving; refractive index 2.087; m.p. 656°C, sp.gr. 5.7 (25°C), insoluble in common organic solvents, very slightly soluble in water; soluble in aqueous hydrochloric acid, potassium hydroxide and tartaric acid.

Containers: 50-lb moisture-proof 3-ply paper bags.

Uses: Flame retardant pigment for vinyl chloride, polyesters and polyethylene compounds used in the manufacture of films, sheets, textiles, paper and paints. For special applications where high tinctorial strength is desired.

"Thermoguard L." ²⁸⁸ Trade name for antimony trioxide, Sb_2O_3 , of low tinctorial strength.

Properties: Very fine white powder, fineness of 99.5% minimum through 325 wet sieving, refractive index 2.087 (25°C), m.p. 656°C, sp.gr. 5.7 (25°C). Insoluble in common organic solvents, very slightly soluble in water, soluble in aqueous hydrochloric acid, potassium hydroxide and tartaric acid.

Containers: 50-lb moisture-proof 3-ply paper bags.

Uses: Flame retardant pigment for vinyl chloride, polyesters, and polyethylene compounds used in the manufacture of films, sheets, textiles, paper, paints, and special applications where low tinctorial strength is desired.

"Thermolite." ²⁸⁸ Trademark for a series of heat and light stabilizers for polyvinyl chloride resins and other chlorinated organic compounds.

"Thermolite 12" A high boiling, slightly yellow, oily liquid; b.p. above 400°F (10 mm); bulk density 8.75 lbs/gal; sp.gr. 1.05 (25°C); refractive index 1.470 (25°C); viscosity 43 cps (25°C); completely miscible in all commonly used PVC plasticizers; soluble in petroleum ether, octane, benzene, toluene, carbon tetrachloride, ethyl ether, esters; insoluble in water and methyl alcohol.

"Thermolite 13" A powerful organotin stabilizer; white powder; insoluble in water; soluble in benzene, ethyl alcohol and acetone.

"Thermolite 17" A complex organotin composition; light yellow liquid of faint odor; sp.gr. 1.15 (25°C); 9.6 lbs/gal; refractive index 1.48; pour point (ASTM) -17°C; viscosity 203 cps (25°C); completely miscible in all commonly used PVC plasticizers; soluble in petroleum ether, octane, benzene, toluene, carbon tetrachloride, ethyl ether, esters.

"Thermolite 20" A sulfur-containing organotin product; a pale amber liquid; f.p. -10°C; b.p., non-distillable at 10 mm; sp.gr. 0.995 (25°C); refractive index 1.496 (25°C); viscosity 19 centistokes (25°C); lbs/gal 8.3; insoluble in water; sparingly soluble in lower alcohols; soluble in higher alcohols and other organic solvents; miscible with most PVC plasticizers.

"Thermolite 25" A complex organotin composition; a light yellow liquid; sp.gr. 1.15 (25°C); decomposition temperature above 200°C; f.p. below 0°C.

"Thermolite 26" A complex organotin composition; slightly viscous, light yellow liquid; sp.gr. 1.035 (25°C); decomposition temperature above 200°C, f.p. below 0°C.

"Thermolite 31" A sulfur-containing organotin compound, clear liquid of slightly characteristic odor, f.p. below -35°F, sp.gr. 1.11 (25°C), viscosity 33.2 cps (25°C), refractive index 1.504 (25°C); miscible with all common PVC plasticizers; highly soluble in esters, ethers, ketones, alcohols, aliphatic and aromatic hydrocarbons, chlorinated hydrocarbons and other organic types; insoluble in water.

"Thermolite 35" A sulfur-containing organotin compound; white, free-flowing crystals; bulk density approx. 45 lbs/cu ft; slight characteristic odor; soluble in most organic solvents but insoluble in water; stable in air but should be kept in dry, tightly-closed containers.

"Thermolite 45" A complex organotin composition, pale amber liquid, freezing point -10°C, density 0.995 (25°C), refractive index 1.496 (25°C); viscosity 19 centistokes (25°C), insoluble in water, sparingly soluble in lower alcohols, soluble in higher alcohols and other organic solvents; miscible with most PVC plasticizers.

"Thermolite 112" A liquid barium-cadmium stabilizer completely free of any fatty acids such as octoates; an amber colored liquid; sp.gr. 1.05 (25°C); flash point 100°C; pour point below -20°C (ASTM).

"Thermolite 166" An organic zinc vinyl resin stabilizer, a light yellow liquid, sp.gr. 1.02 (25°C); flash point 275°F; Gardner color 9 max; pour point -36°C; viscosity 238-333 centistokes (25°C); soluble in ester plasticizers and the usual solvents employed in the vinyl industry such as ketones, aromatic hydrocarbons, esters, etc; insoluble in water.

"Thermolite 180" An organic vinyl stabilizer

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

containing no diluents, plasticizers or epoxy groups; a yellow liquid; sp.gr. 0.992 (25°C); flash point 175°C; pour point -7°C.

thermoluminescence. A term used to denote phosphorescence which occurs at a particular temperature, but not at other temperatures. This, however, does not imply luminescence excited by heat.

thermonuclear reactions. See nuclear fusion.

thermoplastic. Term applied particularly to synthetic resins that may be softened by heat, and then regain their original properties upon cooling. Polyvinyl, polystyrene, and acrylate resins are of this type. See thermosetting.

"Thermoscents." ¹⁸⁸ Trademark. Aromatic designed for use in plastics; available in various forms for incorporation into latex, milled plastics, and for use as a dressing. Unusual features of the "Thermoscents" are their stability and resistance to high temperatures.

thermosetting. Term applied to synthetic resins which solidify or set on heating and cannot be remelted. The thermosetting property is usually associated with a cross-linking reaction of the constituents to form a three-dimensional network of polymer molecules. Phenol-formaldehyde and urea-formaldehyde resins are of this type. Products made of thermosetting resins cannot be reshaped once they have been fully cured.

"THFA." ²⁴⁴ Trademark for tetrahydrofurfuryl alcohol (q.v.).

thiacetic acid. See thioacetic acid.

thiamine (vitamin B₁) C₁₂H₁₇ClN₄OS. 3-(4-Amino-2-methylpyrimidinyl-5-methyl)-4-methyl-5, beta-hydroxyethylthiazolium chloride. The antineuritic vitamin which is essential for growth and the prevention of beriberi. It functions in intermediate carbohydrate metabolism in coenzyme form in the decarboxylation of alpha-keto acids. Deficiency symptoms: emotional

- hypersensitivity, loss of appetite, susceptibility to fatigue, muscular weakness and polyneuritis.

Sources: Enriched and whole grain cereals, milk, legumes, meats, yeast. Most of the thiamine commercially available is synthetic.

Uses: Medicine; nutrition; enriched flours. Available as thiamine hydrochloride and thiamine mononitrate.

thiamine hydrochloride C₁₂H₁₇ClN₄OS·HCl.

Properties: Small white crystals or crystalline powder; hygroscopic; m.p. 248°C (dec); nut-like odor; bitter taste; soluble in water and glycerol; slightly soluble in alcohol; insoluble in ether and benzene; pH (1% solution) 2.7-3.4.

Units: One USP Unit or IU is the activity possessed by 3.0 micrograms.

Grades: U.S.P. XVI.

Containers: Fiber drums.

Uses: Medicine; nutrition.

thiamine mononitrate C₁₂H₁₇N₅O₄S.

Properties: White crystals or crystalline powder; nonhygroscopic; m.p. 196-200°C (dec.); slightly soluble in water, alcohol, and chloroform; more stable than the chloride; pH (2% solution) 6.0-7.5.

Units: One USP Unit or IU is the activity possessed by 2.92 micrograms.

Grades: U.S.P. XVI.

Containers: Fiber drums.

Uses: Medicine; nutrition.

thiamine pyrophosphate chloride. See cocarboxylase.

thiamylal sodium C₁₂H₁₇N₂NaO₂S. Sodium

5-allyl-5-(1-methyl butyl)-2-thiobarbiturate.

Properties: Pale yellow, hygroscopic liquid, with disagreeable odor. Solutions are alkaline to litmus. Soluble in water.

Grade: U.S.P. XVI (as an injection solution, buffered with anhydrous sodium carbonate).

Use: Medicine.

"Thiate A." ⁶⁹ Trademark for a proprietary thiohydropyrimidine.

Properties: White, crystalline powder; sp.gr. 1.12 ± .03; melts at 250°C min; moderately soluble in chloroform, ethyl alcohol; insoluble in water; soluble in caustic, carbon disulfide, gasoline, benzene).

Uses: Accelerator for neoprenes to be cured in open steam. Used alone or with thiurams or guanidines plus sulfur for neoprene Type W accelerator.

"Thiate B." ⁶⁹ Trademark for a proprietary trialkyl thiourea.

Properties: Reddish brown liquid; sp.gr. 1.05 ± .02; very soluble in benzene, carbon disulfide, chloroform, acetone, ethanol; soluble in water; insoluble in dilute caustic, gasoline.

Uses: Accelerator for press-cured neoprene, especially where low compression set is required.

1,4-thiazane CH₂SCH₂CH₂NHCH₂.

Properties: Colorless liquid. Pyridine-like odor. Fumes in air. Absorbs carbon dioxide from the air. Soluble in alcohol, benzene, ether, water. B.p. 169°C (758 mm).

Derivation: Interaction of alcoholic ammonia and dichlorodiethyl sulfide.

Grades: Technical.

Use: Organic synthesis.

thiazole SCH=NCH=CH.

Properties: Colorless or pale yellow liquid; sp.gr. 1.198; b.p. 116.8°C; soluble in alcohol and ether; slightly soluble in water; odor resembles that of pyridine.

Use: Organic synthesis of fungicides, dyes.

thiazole dyes. Dyes whose molecular structure contains the thiazole ring (see thiazole).

The chromophore groups are =C=N-, -S-C=, but the conjugated double bonds

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

are also of importance. The members of the class are mainly used as direct or developed dyes for cotton, though some find use as union dyes. One example is Direct Fast Yellow (Color Index 814).

thiazolsulfone $\text{NH}_2\text{C}_6\text{H}_4\text{SO}_2\text{C}_3\text{HNS}(\text{NH}_2)_2$.
2-Amino-5-sulfanylylthiazole.

Properties: White to off-white, odorless, crystalline powder; slightly soluble in alcohol and water.

Grade: N. N. D.

Use: Medicine.

2-thiazylamine. See 2-aminothiazole.

"Thibetolide." ²²⁷ Trademark for penta-decanolide; 15-hydroxypentadecanoic acid lactone. $(\text{CH}_2)_{14}\text{CO}_2$ (cyclic).

Properties: Colorless liquid, congealing to white crystals at cool room temperature; has an extremely strong odor of musk; stable; not known to cause discoloration; clearly soluble in 6 parts of 80% alcohol. Congealing point, minimum 36.0°C.

Occurrence: Found in angelica root oil.

Uses: Musky note, and fixative for perfumes.

thickened oils. See blown oils.

2-thienylalanine $\text{C}_9\text{H}_7\text{SCH}_2\text{CHNH}_2\text{COOH}$.

White, microcrystalline powder of characteristic sweetish taste, m.p. 243-245°C.

thimerosal (sodium ethylmercurithiosalicylate) $\text{NaOOC}_6\text{H}_4\text{SHgC}_2\text{H}_5$.

Properties: Light cream-colored crystalline powder with slight characteristic odor. pH (1% solution) about 6.7. Affected by light. Soluble in water and alcohol; almost insoluble in ether and benzene.

Derivation: Reaction between ethylmercuric chloride and thiosalicylic acid in alcoholic sodium hydroxide.

Grade: N. F. XI.

Use: Medicine; bacteriostat, fungistat.

"Thimet." ⁵⁷ Trademark for a systemic insecticide based on O,O-diethyl-S-(ethylthiomethyl)phosphorodithioate, $(\text{CH}_3\text{CH}_2\text{O})_2\text{SPSCH}_2\text{SCH}_2\text{CH}_3$. It can be applied to cottonseed to protect the young plants against insect attacks, by absorption through the root system. Also used on alfalfa, potatoes and sugar beets.

thin boiling starch. See soluble starch.

thioacetamide CH_3CSNH_2 .

Properties: Colorless leaflets; stable in solution, m.p. 109°C; soluble in water, alcohol, ether, benzene.

Use: To replace gaseous hydrogen sulfide in the qualitative analysis of Group II and III cations.

thioacetic acid (thiacetic acid; ethanethiolic acid) CH_3COSH .

Properties: Clear yellow liquid; pungent acetic and hydrogen sulfide odor; sp.gr. 1.05 (25°C); m.p. -17°C; b.p. 81.8°C (630 mm); soluble in water, alcohol and ether.

Derivation: By heating glacial acetic acid and phosphorus pentasulfide, with subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Use: Chemical reagent; lachrymator.

Shipping regulations: None.*

thioallyl ether. See allyl sulfide.

thiobenzoic acid (benzenecarbothioic acid) $\text{C}_6\text{H}_5\text{COSH}$.

Properties: Yellow oil or crystals. Sp.gr. (20/4°C) 1.1825-1.1835; m.p. 24°C; b.p. 77.5°C (5 mm), 122°C (30 mm); refractive index (n_D 20/D) 1.602-1.604. Insoluble in water; miscible in all proportions with organic solvents.

Grade: 95% min.

Uses: Organic intermediate; in zinc thiobenzoate.

thiocarbamide. See thiourea.

thiocarbanil. See phenyl mustard oil.

thiocarbanilide (N,N'-diphenylthiourea; sulfo-carbanilide) $\text{CS}(\text{NHC}_6\text{H}_5)_2$.

Properties: Gray powder, m.p. 146°C (min); sp.gr. 1.32. Soluble in alcohol and ether; insoluble in water.

Derivation: By the interaction of aniline and carbon disulfide and alcohol in the presence of sulfur.

Grades: Technical.

Containers: Bags, drums.

Uses: Intermediates; dyes (sulfur colors, indigo, methyl indigo); vulcanization accelerator; synthetic organic pharmaceuticals; flotation agent; acid inhibitor.

Shipping regulations: None.*

thiocarbonyl chloride. See thiophosgene.

para-thiocresol. See toluene-para-thiol.

thioctic acid. See dl-alpha-lipoic acid.

thiodiethylene glycol. See thiodiglycol.

thiodiglycol (thiodiethylene glycol, beta-bis-hydroxyethyl sulfide) $(\text{CH}_2\text{CH}_2\text{OH})_2\text{S}$.

Properties: Syrupy colorless liquid. Characteristic odor; nontoxic. Sp.gr. 1.1847 at 20°C; b.p. 282°C; freezing point -10°C; viscosity 0.652 poises (20°C); flash point 320°F; weight per gallon 9.86 lbs, refractive index (20/D) 1.5217. Soluble in acetone, alcohol, chloroform, water, slightly soluble in benzene, carbon tetrachloride, and ether.

Derivation: Hydrolysis of dichloroethyl sulfide, interaction of ethylene chlorhydrin and sodium sulfide.

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars.

Use: Organic synthesis; solvent for dyes in textile printing, antioxidant.

Caution: Do not use with hydrochloric acid.

thiodiglycolic acid $\text{HOOCCH}_2\text{SCH}_2\text{COOH}$.

Colorless crystals; m.p. 128°C. Soluble in water and alcohol. Used as an analytical reagent.

thiodiphenylamine. See phenothiazine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thiodipropionic acid $S(CH_2CH_2CO_2H)_2$. Used as a food preservative.

thiodipropionic acid, dilauryl ester. See dilauryl thiodipropionate.

thiodipropionic acid, dioctyl ester. See dioctyl thiodipropionate.

thiodipropionic acid, distearyl ester. See distearyl thiodipropionate.

thiodipropionic acid, ditridecyl ester. See ditridecyl thiodipropionate.

beta, beta-thiodipropionitrile $S(CH_2CH_2CN)_2$.
Properties: White crystals; sp.gr. (30°C) 1.1095; m.p. 28.65°C; slightly soluble in water and alcohol; soluble in acetone, chloroform and benzene.

Suggested uses: Preservative; selective solvent.

thioethanolamine. See cysteamine.

"Thiofast." ⁴³⁸ Trademark for a thio-indigo deep maroon pigment with a red-violet undertone. Used in paints, printing inks, and plastics.

"Thiofide." ⁵⁸ Trademark for 2-2'-dithiobis-(benzothiazole) (MBTS).

Properties: Cream powder, sp.gr. 1.50; m.p. 168°C min; petroleum ether extractable 1.5-3.0%. Available in seed form as "Thiofide S."

Use: Rubber accelerator.

Thioflavin T $CH_3C_6H_3N(HCl)SCC_6H_4N(CH_3)_2$.

Properties: A yellow basic dye of the thiazole class. Color Index No. 815. Fluoresces yellow to yellowish-green when excited by ultraviolet.

Derivation: By heating para-toluidine with sulfur in the presence of lead oxide.

Uses: Textile dyeing; fluorescent sign paints; in combination with green or blue pigments to produce brilliant greens; preparation of phosphotungstic pigments.

thiofuran. See thiophene.

1-thioglycerol $CH_2(OH)CH(OH)CH_2SH$.

Properties: Water white; b.p. 118°C at 5 mm; sp.gr. 1.295 (14.4°C). Soluble in water, alcohol and ether.

Uses: Reducing agent for cystine molecule in human hair and wool; for stabilization of acrylonitrile polymers; medicine.

thioglycolic acid (mercaptoacetic acid) $HSCH_2COOH$.

Properties: A colorless liquid or white crystals with a strong, unpleasant odor; sp.gr. 1.325; m.p. -16.5°C; b.p. 123°C (29 mm). Miscible with water, alcohol or ether.

Derivation: Heating chloroacetic acid with potassium hydrogen sulfide.

Containers: Carboys; drums.

Uses: Reagent for iron; manufacture of thioglycolates, permanent wave solutions and depilatories; making complex antimony derivatives and esters used as drugs.

2-thiohydantoin $C_3H_4N_2OS$.

Properties: Crystals. M.p. 230°C.

Slightly soluble in water; insoluble in alcohols and ethers.

Purity: 99% min.

Uses: Intermediate, pharmaceuticals, rubber accelerators, copper plating brighteners and dyestuffs.

2-thio-4-keto-thiazolidine. See rhodanine.

"Thiokol." ²⁷ Trademark for a line of products including the polymers produced by the chemical reaction between dichlorodiethylformal and an alkali polysulfide. These are distributed as liquid polymers, water-dispersed latices, and dry rubber (crude).

"Thiokol" Liquid Polymers: LP-2, LP-32, LP-3, LP-8. Liquids of varying viscosity capable of being converted to tough resilient rubbers at room temperature, without appreciable shrinkage, by the addition of curing agents.

Properties of cured polymers: Grease-, oil-, solvent-, and water-swell resistant; good electrical resistivity; superior aging characteristics; better than adequate flexibility at temperatures as low as -65°F; good plastic flow under stress; highly impermeable to gases and moisture; resistant to ozone and sunlight; strong adhesiveness to many materials.

Uses: As sealants for fuel cells; sealer adhesives for machine components; for potting and sealing electrical parts; for caulking ship decks and buildings; as the flexibilizing constituents of resin-based adhesives and potting compounds.

"Thiokol" Organic Polysulfide Rubbers: A, FA, ST. Synthetic rubbers made from dihalogenated organic compounds and inorganic polysulfides or combinations and modifications of these.

Properties: Low swell in oils and solvents; excellent resistance to deterioration in oils, greases, solvents; good resistance to ozone, sunlight, corona discharge, and natural aging; more resistant to aromatic blended fuels than natural or other synthetic rubbers; tensile strengths lower than those of natural rubbers, but good resilience, elongation, low-temperature flexibility, abrasion resistance, and resistance to cold flow.

Uses: Paint spray hose; oil suction and discharge hose; extruded and molded goods; printers' rolls; tank linings; cable covers; tubing; gaskets; putties; cements; and other permanent oil- and weather-resistant putties.

"Thiokol" Water Dispersions: MX, WD-6, WD-2. Aqueous dispersions of polysulfide polymers developed for special applications in the protective coating field.

Properties: Stability to chemical and physical action; excellent resistance to oils and solvents (except the chlorinated type) and to aromatic and aliphatic fuels; good resistance to water; strong adhesion to clean metal, wood and concrete surfaces; excellent flexibility at low temperatures; better than average resistance to aging, adequate resistance to dilute acids and alkalis.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thiomalic acid (mercaptosuccinic acid)
 $\text{HOOCCH}(\text{SH})\text{CH}_2\text{COOH}$.

Properties: White crystals or powder; sulfuric odor; m.p. 149–150°C; soluble in water, alcohol, acetone, and ether; slightly soluble in benzene.

Use: Biochemical research; intermediate; suggested as antidote to heavy metal poisoning; rust inhibitor aid; antidarkening agent for crepe rubber; tackifier for synthetic rubber.

"Thionex." ²⁸ Trademark for tetramethylthiuram monosulfide. $[(\text{CH}_3)_2\text{NCS}]_2\text{S}$.

Properties: Lemon yellow powder or grains, sp. gr. 1.39, m.p. not lower than 110°C. Containers: 50-lb boxes.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

"Thionone." ²³² Brand name for a series of sulfur dyestuffs.

thionyl chloride (sulfurous oxychloride; sulfur oxychloride) SOCl_2 .

Properties: Clear, pale yellow to red liquid; b.p. 78.8°C, sp. gr. 1.638; m.p. -105°C, decomposes in water.

Grades: 93%, 97.5%.

Containers: Glass carboys; drums.

Use: Organic synthesis; preparation of acid chlorides and anhydrides; catalyst.

Warning! Causes burns. Vapor irritating. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

2-thio-4-oxypyrimidine. See thiouracil.

thiopental sodium (thiopentone soluble)

$\text{C}_{11}\text{H}_{17}\text{N}_2\text{O}_2\text{SNa}$. Sodium 5-ethyl-5-(1-methylbutyl)-2-thiobarbiturate.

Properties: Yellowish-white, hygroscopic powder with a disagreeable odor. Soluble in water and alcohol; insoluble in absolute ether, benzene and ligroin. Solution decomposes on standing. Precipitation occurs on boiling of solution.

Grade: U.S.P. XVI.

Use: Medicine.

thiopentone soluble. See thiopental sodium.

thiophene (thiofuran) $\text{C}_4\text{H}_4\text{SCHS}$.

Properties: Colorless mobile liquid; refractive index (n_D²⁰) 1.5285, sp. gr. 1.0644 (20°/4°C), f.p. -38.5°C; b.p. 84°C. Soluble in alcohol and ether; insoluble in water.

Derivation: Found in coal tar (benzene fraction) and petroleum, synthetically from heating sodium succinate with phosphorus trisulfide.

Use: Organic synthesis

alpha-thiophenealdehyde $\text{C}_4\text{H}_3\text{SCHO}$. 2-Thiophenecarboxaldehyde.

Properties: Oily liquid with almond-like odor; b.p. 198°C (760 mm), 90°C (20 mm); sp. gr. 1.210–1.220; very soluble in alcohol, benzene, ether, slightly soluble in water.

Grades: 95%.

Containers: Drums.

Uses: For thiophene derivatives; for introducing thenyl group into organic compounds.

thiophenol $\text{C}_6\text{H}_5\text{SH}$.

Properties: Water white liquid, repulsive odor, b.p. (760 mm) 168.3°C; b.p. (15 mm) 71°C; refractive index 1.5891; sp. gr. (25/25°C) 1.075; insoluble in water; soluble in alcohol and ether.

Derivation: Reduction of benzenesulfonyl chloride with zinc dust in sulfuric acid.

Grades: 99%.

Uses: Pharmaceutical; synthesis.

"Thiophos." ⁵⁷ Trademark for parathion technical.

thiophosgene (thiocarbonyl chloride) CSCl_2 .

A reddish liquid; sp. gr. 1.5085 (15°C); b.p. 73.5°C. Decomposes in water and alcohol. Poisonous!

Use: Organic synthesis.

Shipping regulations: Poison, class B. Poison label.*

thiophosphoric anhydride. See phosphorus pentasulfide.

thiophosphorous anhydride. See phosphorus trisulfide.

thiophosphoryl chloride PSCl_3 .

Properties: Colorless liquid, sp. gr. 1.68, b.p. 126°C; m.p. -35°C; decomposed by water, soluble in carbon disulfide, carbon tetrachloride.

Shipping regulations: Corrosive liquid. White label.*

thiopropazate hydrochloride

$\text{C}_{23}\text{H}_{28}\text{ClN}_3\text{O}_2\text{S} \cdot 2\text{HCl}$. 2-Chloro-10-{3-[1-(2-acetoxyethyl)-4-piperazinyl] propyl}-phenothiazine dihydrochloride.

Properties: Crystals, m.p. 223° (decomposes). Soluble in water, slightly soluble in organic solvents.

Grades: N.N.D.

Use: Medicine.

thiopropionic acid, dioctyl ester. See 3,3'-(2-ethylhexyl) thiodipropionate.

thioridazine hydrochloride $\text{C}_{21}\text{H}_{26}\text{N}_2\text{S}_2$.

2-Methylthio-10-[2-(1-methyl-2-piperidyl)-ethyl]phenothiazine hydrochloride.

Properties: Colorless crystals; m.p. 158°C; soluble in water and alcohol.

Use: Medicine.

"Thiosafast." ⁴³⁸ Similar to "Thiofast."

Trademark for a thio-indigo deep maroon pigment with a red-violet undertone. Used in paints, printing inks, and plastics.

thiosalicylic acid (2-mercaptobenzoic acid; ortho-sulphydrylbenzoic acid)

$\text{HOOC}(\text{C}_6\text{H}_4)\text{SH}$.

Properties: Yellow solid; m.p. 164–165°C; sublimes; slightly soluble in hot water; soluble in alcohol, ether and acetic acid.

Grades: Reagent, technical, 80%.

Containers: Drums.

Uses: Dyes; reagent for iron determination.

thiosemicarbazide (aminothiurea)
 $\text{NH}_2\text{CSNHNH}_2$.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Melting point 180-184°C; white crystalline powder, no odor, soluble in water and alcohol.

Derivation: From potassium thiocyanate and hydrazine salts.

Grades: Technical and pure.

Containers: 1-, 5-lb bottles; 25-, 100-lb drums.

Uses: Reagent for ketones and certain metals; photographic; rodenticide relatively non-toxic to humans.

thiosemicarbazide hydrochloride

$\text{NH}_2\text{CSNHNH}_2 \cdot \text{HCl}$.

Properties: White crystalline powder; m.p. 184°C (min); no odor; soluble in water.

Grades: Pure.

Uses: See thiosemicarbazide.

thiosemicarbazone (para-acetylaminobenzaldehyde thiosemicarbazone)

$\text{CH}_3\text{CONHC}_6\text{H}_4\text{CH:NNHCSNH}_2$.

Properties: Yellow solid; decomposes at 230°C; m.p. 207°C; insoluble in water and organic solvents except glycols.

Use: Medicine.

thiosinamine. See allyl thiourea.

"Thiostop K." ²⁴⁸ Trade name for a 50% aqueous solution of potassium dimethyl dithiocarbamate.

Properties: Clear yellow to amber liquid. Sp.gr. 1.23, good storage stability. The salt will start to crystallize out at 20°F. Avoid long storage in partially filled containers.

Uses: Used as a shortstop in SBR latices to arrest the catalytic action which induces polymerization of monomer to polymer.

"Thiostop N." ²⁴⁸ Trade name for a 40% aqueous solution of sodium dimethyl dithiocarbamate.

Properties: Clear yellow to amber liquid; sp.gr. 1.18, good storage stability, salt will start to crystallize out at 32°F. Avoid long storage in partially filled containers.

Uses: Used as a shortstop in SBR polymerization to arrest the catalytic action which induces polymerization of monomer to polymer.

thiostrepton. An antibiotic.

Properties: White to off-white powder, m.p. 246-256°C. Insoluble in water and lower alcohols, soluble in chloroform, dioxane, glacial acetic acid and dimethylformamide.

Derivation: Produced by fermentation with *Streptomyces azureus*.

Use: Medicine.

"Thiotax." ⁵⁸ Trade name for 2-mercaptobenzothiazole.

Thio-TEPA. See triethylenethiophosphoramidate.

thiouracil (2-thio-4-oxypyrimidine; 2-mercapto-4-hydroxypyrimidine) OCNHC(S)NHCH_3 .

Properties: Bulky, white, odorless, crystalline powder of intense bitter taste; melts with decomposition at about 340°C; has a characteristic ultraviolet absorption spectrum $A_{260} = 11.0 \times 10^3$ at 260 millimicrons

(pH 7.0); slightly soluble in water, insoluble in alcohol.

Use: Experimental work in nutrition and physiology; medicine.

thiourea (thiocarbamide) $(\text{NH}_2)_2\text{CS}$.

Properties: White, lustrous crystals; bitter taste; sp.gr. 1.406; m.p. 180-182°C, b.p. sublimes in vacuo at 150-160°C; soluble in cold water, ammonium thiocyanate solution, and alcohol; nearly insoluble in ether.

Derivation: By heating dry ammonium thiocyanate, extraction with a concentrated solution of ammonium thiocyanate with subsequent crystallization.

Method of purification: Sublimation in vacuo.

Grades: Technical; reagent.

Containers: Bottles, bags.

Uses: Photography; organic synthesis (intermediates, dyes, drugs); rubber accelerator; analytical reagent, medicine (external).

thiourea resins. A type of amino resins (q.v.).

"Thiovanic Acid." ³¹² Trademark for thioglycolic acid (q.v.).

"Thiovanol." ³¹² Trademark for vacuum-distilled alpha-monothioglycerol. See 1-thioglycerol.

thiram. See tetramethylthiuram disulfide.

"Thiram-75W." ²⁴⁸ Trade name for a tetramethylthiuram disulfide formulation especially prepared for slurry seed treating to reduce seed decay and "damping-off" of beans, corn, peas, and certain other vegetable and field crops. Also available as "Thiram 50 Dust" for dry seed treatment and "Thiram Technical" for manufacturing. **Hazards:** May cause skin irritation. Do not inhale dust. Do not get in eyes or on skin. Wash thoroughly after handling.

thistle saffron. See carthamus.

"Thiurad." ⁵⁸ Trademark for tetramethylthiuram disulfide.

thiuram.

1. In general, the radical R_2NCS . The most important derivatives are the disulfides $[\text{R}_2\text{NCSS}]_2$ or $[\text{R}_2\text{NCS}]_2\text{S}_2$. Some of them are tetraethylthiuram disulfide, tetramethylthiuram disulfide, tetrabutylthiuram disulfide, tetraisopropylthiuram disulfide and tetrapropylthiuram disulfide (q.v.).

2. Specifically, the tetraethyl- and tetramethylthiuram disulfides, which are often referred to by the name thiuram alone.

Use: To accelerate and improve the vulcanization of synthetic and natural rubber compounds; as insecticides and fungicides.

Thiuram E. ²⁸ Trade name for tetraethylthiuram disulfide.

Thiuram M. ²⁸ Trade name for tetramethylthiuram disulfide.

"Thiexin." ²⁰² Trademark for a fine, white non-discoloring, non-toxic powder used as multipurpose thixotropic agent in paints, inks, calk compounds, plastisols, non-drip lubricants, greases and similar compositions.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thixotropic paint. See gel paint.

thixotropy. The property enabling certain colloidal gels to liquefy when agitated (as by shaking or ultrasonic sound) and then to return to the jelly-like form when at rest. This is often observed in paints or printing inks which flow freely only when force (brushing or rolling pressure) is applied.

Thomas & Gilchrist process for steel. A basic Bessemer process used to remove phosphorus from pig iron, involving the use of a basic liner of dolomite brick for the converter and the addition of lump lime during the process.

Thomas balsam. See tolu balsam.

Thomas metal. See basic slag.

Thomas phosphate. See basic slag.

Thomas slag. See basic slag.

thomsonite $\text{NaCa}_2\text{Al}_5(\text{SiO}_4)_5 \cdot 6\text{H}_2\text{O}$. A mineral, one of the zeolites (q.v.).
Properties: White, reddish or green; streak uncolored, vitreous luster; sp.gr. 2.3-2.4; hardness 5-5.5.
Occurrence: Europe, Iceland, United States, Nova Scotia.

thonzylamine hydrochloride $\text{C}_{16}\text{H}_{22}\text{N}_4\text{O} \cdot \text{HCl}$, 2-[(2-dimethylaminoethyl)(para-methoxybenzyl)amino]pyrimidine hydrochloride. $\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{N}(\text{C}_4\text{H}_3\text{N}_2)\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$.
Properties: White, crystalline powder with faint odor. M.p. 173-176°C. Very soluble in water; freely soluble in alcohol and chloroform; practically insoluble in ether and benzene, pH (2% solution) 5.0-6.0.
Grade: N.F. XI.
Containers: Bottles (syrup form); also tablet form.
Use: Medicine.

"Thor." ⁶⁵ Trademark for phenolic or urea resins in powder or liquid form.
Uses: Foundry sand for foundry applications, core binders, shell mold resins, core pastes, shell pastes and parting adhesives.

"Thorazine." ⁷¹ Trademark for a brand of chlorpromazine (q.v.).

thoria. See thorium dioxide.

thorin. See ortho-(2-hydroxy-3,6-disulfo-1-naphthylazo)-benzenearsonic acid.

"Thorite." ¹⁹⁵ Trade name for a nonshrink grouting compound used as a patching mortar to fill holes and blisters in masonry surfaces and to prevent further destruction of steel reinforcing.

thorite ThSiO_4 . A natural thorium silicate, usually impure, found in pegmatites.
Properties: Color black to orange; luster vitreous to resinous; hardness 4.5-5; sp.gr. 4.4-5.2; radioactive.
Occurrence: Norway, Ceylon.
Use: Source of thorium.

thorium Th. Metallic element having atomic number 90; classified as a member of the

actinide series.

Properties: Soft metal with bright silvery luster when freshly cut; similar to lead in hardness when pure. Sp.gr. about 11.7; m.p. about 1520°C; b.p. about 4500°C. Soluble in acids; insoluble in alkalis and water. Radioactive. Also encountered in the powdered form (see under derivation).

Source: Monazite, thorite.

Derivation: Reduction of thorium dioxide with calcium; fused salt electrolysis of the double fluoride $\text{ThF}_4 \cdot \text{KF}$. The product of either process is thorium powder. The powder is fabricated into the metal by powder-metal-lurgy techniques. Hot-surface decomposition of the iodide produces crystal-bar thorium.

Forms available: Powder, unsintered bars, sintered bars, sheets.

Uses: In special lamps such as sun lamps; in magnesium alloys. The radioactive 228 isotope can be used in dissipating static electricity. Thorium is a source of nuclear energy, the naturally occurring thorium 232 being converted to the nuclear fuel uranium 233 when bombarded by neutrons.

Shipping regulations: (For powdered thorium) Flammable solid. Yellow label.*

thorium acetate $\text{Th}(\text{OH})_2(\text{OOCCH}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: Soluble in formic acid, insoluble in water.

Grades: Technical.

thorium acetylacetonate $\text{Th}(\text{C}_5\text{H}_7\text{O}_2)_4$. Crystalline powder. Slightly soluble in water. Resistant to hydrolysis. A chelating, non-ionizing compound.

thorium anhydride. See thorium dioxide.

thorium chloride (thorium tetrachloride) ThCl_4 .

Properties: Colorless or white, lustrous needles (light-yellow color caused by iron trace). Hygroscopic. Partially volatile. Crystallizes with variable water of crystallization. Soluble in alcohol, water. Sp.gr. 4.59; b.p. 1100°C (dec), m.p. 820°C.

Grades: Technical; as 50% ThO_2 .

Containers: Glass bottles; fiber drums.

Use: Incandescent lighting.

thorium decay series. The series of radioactive elements produced as successive intermediate products when the element thorium undergoes its spontaneous natural radioactive disintegration into lead.

thorium dioxide (thorium anhydride, thorium oxide; thoria) ThO_2 .

Properties: Heavy, white powder; sp.gr. 9.7; m.p. about 3300°C; b.p. 4400°C; hardness 6.5 (Mohs). Very refractory. Soluble in sulfuric acid; insoluble in water.

Derivation: By the reduction of thorium nitrate.

Grades: Technical and purities to 99.8%

ThO_2 ; granular particles, crystals.

Containers: Lined drums.

Uses: Ceramics (high temperature); nuclear fuel; flame spraying; crucibles; medicine; non-silica optical glass; catalyst; thoriated tungsten; electronics.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thorium fluoride ThF_4 .

Properties: White powder having approximate formula $\text{ThF}_4 \cdot 1.4\text{H}_2\text{O}$. Dehydrated between 200 and 300°C; m.p. 1111°C. Above 500°C reacts with atmospheric moisture to form thorium oxyfluoride, ThOF_2 , and finally the oxide ThO_2 . Forms a series of compounds with other metallic fluorides such as NaF and KF.

Uses: For production of thorium metal and magnesium-thorium alloys; used in high temperature ceramics. ThOF_2 is used as a protective coating on reflective surfaces.

Grades: 79-80% ThO_2 .

Containers: Glass bottles; fiber drums.

thorium nitrate $\text{Th}(\text{NO}_3)_4 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline mass.

Soluble in water and alcohol.

Derivation: By extraction from monazite sand.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Glass bottles; fiber drums.

Uses: Medicine; reagent for determination of fluorine; thoriated tungsten.

Caution: Oxidizing material, in contact with organic or other readily oxidizable (combustible) substances it will cause violent combustion on ignition.

Shipping regulations: Oxidizing material. Yellow label.*

thorium ore. See monazite.**thorium oxalate** $\text{Th}(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White powder, insoluble in water and most acids. Soluble in solutions of alkali and of ammonium oxalates. Above 300-400°C decomposes to thorium oxide, ThO_2 .

Grades: Purities to 99.9%; as 59% ThO_2 .

Containers: Glass bottles; fiber drums.

Use: Ceramics.

thorium oxide. See thorium dioxide.**thorium sulfate** (thorium sulfate, normal) $\text{Th}(\text{SO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: White, crystalline powder; sp. gr. 2.8; m.p. loses water at 400°C.

- Slightly soluble in water; soluble in ice water.

Grades: As 43% ThO_2 .

Containers: Glass bottles; fiber drums.

thorium sulfate, normal. See thorium sulfate.**thorium tetrachloride.** See thorium chloride.**thorn apple.** See stramonium.

"**Thoroclear.**" ¹⁹⁵ Trade name for a clear, water-repellent silicone resin for porous brick, stone, concrete stucco, asbestos siding, plaster and for all masonry surfaces.

thorogummite. A natural hydrated silicate of uranium and thorium approximately $\text{UO}_3 \cdot \text{ThO}_2 \cdot 3\text{SiO}_2 \cdot 6\text{H}_2\text{O}$.

Occurrence: Texas.

thoron. An isotope of radon (q.v.).

"**Thoro seal.**" ¹⁹⁵ Trade name for a cementitious product used to fill and seal pores and voids in masonry surfaces.

"**Thoro set.**" ¹⁹⁵ Trade name for a metallic non-shrink grouting compound for hardening mortars, grouting and bedding, accelerates strength and set.

thortveitite. An ore containing 37-42% scandium oxide. A basic material in production of scandium.

"**THPC.**" ³⁰⁶ Trademark for tetrakis (hydroxymethyl) phosphonium chloride (q.v.).

"**Thram.**" ³⁴² Trademark for bird-repellent composition.

threonine (alpha-amino-beta-hydroxybutyric acid) $\text{CH}_3\text{CH}(\text{OH})\text{CH}(\text{NH}_2)\text{COOH}$. An essential amino acid.

Properties: Colorless crystals, soluble in water; optically active.

DL-threonine, m.p. 228-229°C with decomposition;

L(-)-threonine (natural occurring), m.p. 255-257°C with decomposition;

DL-allo-threonine, m.p. 250-252°C.

Derivation: Hydrolysis of protein (casein); organic synthesis.

Containers: Bottles; drums.

Uses: Nutrition and biochemical studies.

Commercially available as D-, DL-, L-, and DL-allo-threonine.

throwing oils. Oils applied to prepare raw silk and filament rayon for "throwing," the operation by which strands are twisted and wound into proper size threads. Applied by a bath, the oils improve the strength, elasticity and suppleness of the yarns, properly conditioning them for subsequent weaving or knitting operations. The oils are usually compounded to be self-emulsifying and may contain a sizing agent such as dextrin, gelatin, etc.

throwing power. A term denoting the effectiveness of an electrolytic cell for depositing metal at the cathode. The throwing power is the weight of deposition per unit distance between the electrodes.

thuja (arbor vitae; white cedar; tree of life).

Dried leafy twigs of *Thuja occidentalis*.

Occurrence: Northern and central United States.

Uses: Source of thuja oil; medicine.

thuja oil (arbor vitae oil). Sometimes called cedar leaf oil, but different from the cedar leaf oil listed in this book.

Properties: Pale yellow liquid; characteristic, rather agreeable odor; sp. gr. 0.910-0.920; refractive index (n_D²⁰) 1.459; optical rotation -10° to -13° in 100 mm tube. Soluble in alcohol, ether, chloroform and carbon disulfide.

Chief known constituents: Dextro-pinene; levo-fenchone; thujone; should contain not less than 60% ketones calculated as thujone ($\text{C}_{10}\text{H}_{16}\text{O}$).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Derivation: Distilled from the leaves of the white cedar, *Thuja occidentalis*.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine; perfumery.

Shipping regulations: None.*

thujone $C_{10}H_{16}O$. A terpene-type ketone contained in thuja oil and the oils of sage, tansy and wormwood.

Properties: Colorless liquid; sp. gr. 0.915-0.919 (20°/20°C); b. p. 203°C. Insoluble in water; soluble in alcohol.

thulia. See thulium oxide.

thulite. See zoisite.

thulium Tm. Atomic number 69; Group III of the periodic table; one of the rare-earth elements of the yttrium sub-group.

Properties: Metallic luster; reacts slowly with water; soluble in dilute acids; salts colored green; sp. gr. 9.346; m. p. 1550-1600°C, b. p. (approx) 2100°C.

Derivation: For source see rare-earth minerals. Isolated by reduction of the fluoride with calcium. See rare-earth metals.

Grades: Regular high purity (ingots, lumps).

thulium 170. Radioactive thulium of mass number 170. Thulium 170 is used as the x-ray source in portable x-ray units.

Shipping regulations: Poison, class D, radioactive material. Red or blue label.*

thulium oxalate $Tm_2(C_2O_4)_3 \cdot 6H_2O$.

Properties: Greenish-white precipitate.

Soluble in aqueous alkali oxalates.

Derivation: Precipitation from a solution containing a thulium salt and a mineral acid by addition of oxalic acid.

Uses: For analytical separation of thulium (and other rare-earth metals) from the common metals.

Shipping regulations: None.*

thulium oxide (thulia) Tm_2O_3 .

Properties: Dense white powder with greenish tinge; slightly hygroscopic; absorbs water and CO_2 from the air; sp. gr. 8.6. Exhibits a reddish incandescence on heating, changing to yellow and then white on prolonged heating. Slowly soluble in strong acids.

Derivation: By ignition of thulium oxalate, salt of other oxyacids or hydroxide.

Grades: 99-99.9%.

Containers: Glass bottles; fiber drums.

Shipping regulations: None.*

See also rare earths.

thulium salts. Other thulium salts are available in 99% or 99.9% purity; in glass bottles or fiber drums. They include:

thulium chloride, $TmCl_3 \cdot xH_2O$.

Available as 45% Tm_2O_3 .

thulium fluoride, $TmF_3 \cdot xH_2O$.

Available as 77% Tm_2O_3 .

thulium nitrate, $Tm(NO_3)_3 \cdot 6H_2O$.

Available as 42% Tm_2O_3 .

thulium sulfate, $Tm_2(SO_4)_3 \cdot 8H_2O$.

Available as 47% Tm_2O_3 .

"Thuricide." A microbial insecticide inducing disease in certain insects, but apparently harmless to plants, fish, and warmblooded animals. It is the first microbial insecticide to get full tolerance exemption from FDA. An example of a "biological" poison, "Thuricide" consists of the spores of *Bacillus thuringiensis* Berliner.

thus, American. See turpentine.

thus gum. See olibanum, or turpentine.

"Thylate." ²⁸ Trademark for a wettable off-white powder containing thiram (tetramethylthiuramdisulfide) used to control scab and other apple diseases.

Containers: 5- and 50-lb bags.

Thylox process. A process whereby hydrogen sulfide and organically combined sulfur are absorbed from gases by a solution of arsenious oxide and soda ash (or sodium thioarsenate) in water.

thyme.

Deviation: The dried leaves and flowering tops of *Thymus vulgaris*.

Constituents: Volatile oil, tannin, gum.

Occurrence: Southern Europe; cultivated in England and United States.

Grades: Technical; French; Spanish.

Containers: Bags; bales.

Uses: Source of thyme oil; flavoring; medicine.

Shipping regulations: None.*

thyme camphor. See thymol.

thyme oil. Essential oil distilled from flowering plant *Thymus vulgaris* or *Thymus zygis* and its variety *gracilis*.

Properties: A colorless to reddish brown liquid with a pleasant odor and sharp taste; sp. gr. 0.910-0.935 (25°/25°C); refractive index 1.4950-1.5050 (20°C), very slightly soluble in water; soluble in alcohol.

Chief constituents: Not less than 40% by volume of phenols, and including thymol, carvacrol, cymene, pinene, linolool, and bornyl acetate.

Grades: N.F. XI; red; white.

Containers: Cans; drums.

Use: Medicine, perfumery, cosmetics, toilet soaps, flavoring.

thyme oil, Cyprian. This is an origanum oil (q.v.).

thymic acid. See thymol.

thymidine (thymine-2-desoxyribose)

$C_{10}H_{14}N_2O_5$. The nucleoside (deoxyribose) of thymine. It is found in deoxyribonucleic acid.

Properties: Crystalline needles; m. p. 185°C; dextrorotatory in solution; soluble in water, methanol, hot alcohol, hot acetone and hot ethyl acetate; sparingly soluble in hot chloroform; soluble in pyridine and glacial acetic acid. $A_m = 9.65 \times 10^3$ at 267 millimicrons and pH 7.2.

Use: Biochemical research.

Also available as trityl thymidine, and as tritiated thymidine in a radioactive form.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

thymidylic acid. The nucleotide of thymine; i.e. the phosphate ester of thymidine.

thymine (5-methyluracil)
 $\text{CH}_3\text{CC}(\text{O})\text{NHC}(\text{O})\text{NHGH}$. 5-Methyl-2,4-dioxypyrimidine.

Properties: White crystalline powder; decomposes at 335-337°C; slightly soluble in hot water; insoluble in cold water, alcohol; sparingly soluble in ether; readily soluble in alkalis. $M = 7.89 \times 10^3$ at 264.5 millimicrons and pH 7.0.

Derivation: Hydrolysis of deoxyribonucleic acids; from methylcyanacetylurea by catalytic reduction.

Use: Biochemical research.

thymine-2-desoxyriboside. See thymidine.

thyminic acid (nucleotinphosphoric acid)
 $\text{C}_{30}\text{H}_{46}\text{N}_4\text{O}_{15} \cdot 2\text{P}_2\text{O}_5$.

Properties: Yellow amorphous powder. Soluble in water.

Use: Medicine.

Shipping regulations: None.*

thymol (isopropyl-meta-cresol, 5-methyl-2-isopropylphenol; 3-hydroxy-para-cymene; thyme camphor; thymic acid)
 $(\text{CH}_3)_2\text{CHC}_6\text{H}_3(\text{CH}_3)\text{OH}$.

Properties: White crystals with aromatic odor and taste. Soluble in alcohol, carbon disulfide, chloroform, glacial acetic acid, ether and fixed or volatile oils, slightly soluble in water and glycerol. Sp.gr. 0.979; m.p. 48-51°C, b.p. 233°C.

Derivation: From thyme oil or other oils; synthetically from meta-cresol and isopropyl chloride by the Friedel-Crafts method at -10°C.

Grades: Technical; N.F. XI, reagent.

Containers: Bottles; tins, 25-, 50-, 100-lb drums.

Uses: Medicine; perfumery; thymol compounds; microscopy; preservative; embalming; antioxidant.

Shipping regulations: None.*

thymol blue (thymolsulfonephthalein) $\text{C}_{27}\text{H}_{30}\text{O}_5$.

Properties: Brown green powder or crystals; insoluble in water, soluble in alcohol or dilute alkali.

• Use: Acid base indicator. See indicators.

thymol iodide. Principally the dithymoldi-iodide, $[\text{C}_6\text{H}_2(\text{CH}_3)(\text{OI})(\text{C}_3\text{H}_7)]_2$.

Properties: Red-brown powder or crystals, slight aromatic odor, affected by light. Soluble in ether, chloroform and fixed or volatile oils; slightly soluble in alcohol, insoluble in water.

Derivation: By the interaction of thymol and potassium iodide in alkaline solution.

Grades: Technical.

Containers: 1-lb bottles; 5-, 25-lb boxes; drums.

Use: Medicine; feed additive.

Shipping regulations: None.*

thymolphthalein $(\text{C}_{10}\text{H}_{13}\text{O})_2\text{CC}_6\text{H}_4\text{COO}$.

Properties: White powder; m.p. 245°C; insoluble in water, soluble in alcohol and acetone and in dilute alkali and acids.

Use: Used in medicine and as acid base

indicator in pH range 9.3 (colorless) to 10.5 (blue). See indicators.

thymolsulfonephthalein. See thymol blue.

para-thymoquinone (2-isopropyl-5-methylbenzoquinone) $\text{C}_{10}\text{H}_{12}\text{O}_2$.

Properties: Bright yellow crystals; penetrating odor. M.p. 45.5°C; b.p. 232°C. Slightly soluble in water; soluble in alcohol and ether.

Derivation: From diazonium salt of aminothymol and nitrous acid.

Use: Fungicide.

thymus nucleic acid. See deoxyribonucleic acid.

"Thyrite." ²⁴⁵ Trademark for composite dielectric or resistance material in molded form applied primarily to silicon carbide type resistance material having a negative resistance-voltage characteristic.

thyroid.

Properties: Yellow, amorphous powder with slight, characteristic odor, saline taste.

Derivation: Dried, cleaned, powdered thyroid gland obtained from domesticated animals.

Grade: U.S.P. XVI.

Use: Medicine.

thyroid-stimulating hormone. See thyrotropic hormone.

thyronine (desiodothyroxine)

$\text{HOC}_6\text{H}_4\text{OC}_6\text{H}_4\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. The para-hydroxyphenyl ether of tyrosine. Thyronine and its iodinated derivatives are used for physiological and biochemical research regarding the thyroid gland and its activity.

thyrotropic hormone (TSH; thyroid-stimulating hormone; thyrotropin). One of the hormones secreted by the anterior lobe of the pituitary gland. It increases the rate of the removal of iodine from the blood by the thyroid gland, of the synthesis of the thyroid hormone, and of the release of thyroid hormone into the bloodstream. The thyrotropic hormone has not been completely purified but is known to be a protein which has a low molecular weight (approximately 10,000) and which contains some carbohydrate.

thyrotropin. See thyrotropic hormone.

thyroxine $\text{C}_{15}\text{H}_{11}\text{I}_4\text{NO}_4$ or

$\text{HOC}_6\text{H}_2\text{I}_2\text{OC}_6\text{H}_2\text{I}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$.

3,5,3',5'-Tetraiodothyronine. The hormone produced by the thyroid gland. (See also triiodothyronine). It is an amino acid and a derivative of tyrosine. It increases the metabolic rate and oxygen consumption of animal tissues.

Properties: Optically active, the L-isomer is the natural and physiologically active form.

DL-thyroxine: Needles; decompose 231-233°C; insoluble in water, alcohol, and the common organic solvents; soluble in alcohol in the presence of mineral acids or alkalis.

L-thyroxine: Crystals; decompose 235-

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

236°C.

D-thyroxine: Crystals; decompose 237°C.

Derivation: Obtained from the thyroid glands of animals; organic synthesis.

Uses: Medicine; physiological research.

Ti. Symbol for titanium.

TIBAL. Abbreviation for triisobutylaluminum.

"Ti-Cal." ²⁸ Trademark for titanium-calcium pigment containing approximately 30% titanium dioxide (TiO₂) and 70% calcium sulfate (CaSO₄).

Properties: Fine, white powder; sp.gr. 3.25. Containers: 50-lb bags.

Uses: In flat paints, architectural finishes, gloss paints and enamels, fade-resistant tinted exterior finishes, paper, and rubber.

"Ticon." ³³⁷ Trade name for a line of metallic stannates, titanates and zirconates chiefly used as additives in ferroelectric and piezoelectric devices; also used for capacitors, and in some cases for electroluminescent devices. The group includes the following:

"Ticon B": Barium titanate, BaTiO₃. Insoluble in water and alkalies; soluble in acids; high dielectric constant; K approx. 1200-1600. Used in electronics industries; as electroluminescent devices.

"Ticon B": Bismuth titanate, Bi₂Ti₂O₇. Insoluble in water; dielectric K approx. 100-115, P.F. = 0.5%. Used as piezoelectric ceramics and capacitors.

"Ticon C": Calcium titanate, CaTiO₃. Insoluble in water and alkalies; soluble in acids; dielectric K approx. 150, P.F. = 0.05%.

"Ticon Ce": Cerium titanate, CeTiO₄. Insoluble in water; dielectric properties.

"Ticon Co": Cobalt titanate, CoTiO₃. Insoluble in water; dielectric K approx. 19-20, P.F. = 0.2%.

"Ticon Cu": Copper titanate, CuTiO₃. Insoluble in water; dielectric.

"Ticon M": Magnesium titanate, MgTiO₃. Insoluble in water and alkalies, soluble in acids; dielectric; K approx. 15, P.F. = 0.1%.

"Ticon N": Nickel titanate, NiTiO₃. Insoluble in water; dielectric K approx. 15, P.F. = 1.6%.

"Ticon P": Lead titanate, PbTiO₃. Insoluble in water; dielectric.

"Ticon S": Strontium titanate, SrTiO₃. Insoluble in water and alkalies, soluble in acids; dielectric K = 225-250, P.F. = 0.06%.

"Ticon T": Titanium oxide, TiO₂. Insoluble in water and alkalies; slightly soluble in dilute acids; soluble in hot concentrated H₂SO₄; dielectric. Used as capacitors and as a thread guide body.

"Ticon ZB": Zinc titanate, Zn₂TiO₄. Insoluble in water; dielectric.

"Ticon BT": Barium stannate, BaSnO₃. Insoluble in water and alkalies; soluble in dilute acids; dielectric.

"Ticon CT": Calcium stannate, CaSnO₃. Insoluble in water and alkalies; soluble in dilute acids; dielectric.

"Ticon CeT": Cerium stannate, CeSnO₄. Insoluble in water; dielectric.

"Ticon MT": Magnesium stannate, MgSnO₃. Insoluble in water and alkalies; soluble in dilute acids; dielectric.

"Ticon PT": Lead stannate, PbSnO₃. Insoluble in water; dielectric.

"Ticon ST": Strontium stannate, SrSnO₃. Insoluble in water and alkalies; soluble in dilute acids; dielectric.

"Ticon BZ": Barium zirconate, BaZrO₃. Insoluble in water and alkalies; slightly soluble in dilute acids and hot concentrated H₂SO₄; soluble in HF. Used as a filler in plastics and resins.

"Ticon BiZ": Bismuth zirconate, Bi₄Zr₃O₁₂. Insoluble in water; dielectric.

"Ticon CZ": Calcium zirconate, CaZrO₃. Insoluble in water and alkalies; slightly soluble in dilute acids and hot concentrated H₂SO₄; soluble in HF; dielectric.

"Ticon CdZ": Cadmium zirconate, CdZrO₃. Insoluble in water; dielectric.

"Ticon CeZ": Cerium zirconate, CeZrO₄. Insoluble in water; dielectric.

"Ticon MZ": Magnesium zirconate, MgZrO₃. Insoluble in water; dielectric.

"Ticon PZ": Lead zirconate, PbZrO₃. Insoluble in water.

"Ticon SZ": Strontium zirconate, SrZrO₃. Insoluble in water and alkalies; slightly soluble in dilute acids and hot concentrated H₂SO₄; soluble in HF; dielectric.

"Ticon ZZ": Zinc zirconate, ZnZrO₃. Insoluble in water; dielectric.

tiff. See barite.

"Tigan" Hydrochloride. ¹⁹⁰ Trademark for a brand of trimethobenzamide hydrochloride (q.v.).

tiger's eye. A pseudomorph of quartz (q.v.) or silicified crocidolite (q.v.).

Properties: Golden or tawny yellow; luster, silky.

Use: Ornamental stone.

tiglic acid (methylcrotonic acid; crotonolic acid; trans-2-methylbutenoic acid; alpha, beta-dimethylacrylic acid) CH₃CH:C(CH₃)COOH. The trans isomer of angelic acid.

Properties: Thick, syrupy liquid or colorless crystals, spicy odor; very poisonous! Soluble in alcohol and ether; slightly soluble in water. Sp.gr. 0.9641; m.p. 65°C; b.p. 198.5°C.

Derivation: Obtained from croton oil, which is extracted from seeds of Croton tiglium. Also occurs in Roman chamomile oil.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

tiglum (croton; purging croton; molucca grains; grana tilli).

Properties: Ovoid seed, reddish-brown when fresh, turning grayish-brown with age.

Chief constituents: Croton oil; tiglic acid; crotonol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: The seed of *Croton tiglium*.
Occurrence: East Indies and Philippines.
Grades: Technical.
Containers: Bags; boxes.
Uses: Medicine; source of croton oil.
Shipping regulations: None.*

tiglium oil. See croton oil.

til oil. See sesame oil.

timbo root. See cube root.

tin (stannum) Sn. Element of atomic number 50, member of group IV of the periodic system.

Properties: Silver-white, ductile metal; density (20°C) 7.29; m.p. 232°C; b.p. 2260°C; changes to brittle grey (alpha) tin at temperatures below 18°C but the transition is normally very slow. Soluble in acids, and hot potassium hydroxide solution; insoluble in water.

Derivation: By roasting the ore (cassiterite) to oxidize sulfates and to remove arsine, then reducing with coal in a reverberatory furnace, or by smelting in an electric furnace. Also recovered from tin plate.

Occurrence: The tin of commerce comes chiefly from Malaya (called Straits tin), Bolivia and Nigeria.

Grades: Tin is available in 6 grades, A, B, C, D, E, F (99.8% or higher to below 99%). Block tin is a common designation for pure tin.

Forms: Anodes (for plating), wire, tape; pipe, sheet, bar, ingot; pig form.

Uses: Tin plate,terneplate, solder, Babbitt metal; brass and bronze; foil; collapsible tubes; tinning and retinning; white, type and casting metal; manufacture of chemicals; tinned wire (all copper wire which is to be rubber covered). Block tin is used in coating copper vessels for culinary purposes. It is also used for coating lead sheet or lining lead pipe for distilled water and some chemicals.

Shipping regulations: None.*

Note: In speaking of fabricated articles "tin" is often incorrectly used when tinplate (thin sheets of steel coated with tin) is meant; e.g. "a tin can." To distinguish, articles (such as condenser coils) actually made of solid tin are said to be made of "block tin." See also block tin lining.

tin alloys. See fusible tin alloys in the tables under fusible alloys.

tin anhydride. See stannic oxide.

tin ash. See stannic oxide.

tin base Babbitt. A bearing metal with 3-8% copper, 7.5-8.3% antimony and balance tin, with or without lead. Soft, with relatively low load strength but good antiseize properties and corrosion resistance. See Babbitt metal.

tin bisulfide. See stannic sulfide.

tin bromide. See stannic bromide; and stannous bromide.

tin bronze. See stannic sulfide.

tin, butter of. See stannic chloride.

tincal. See borax.

tin chloride. See stannic chloride.

tin chromate. See stannic chromate and stannous chromate.

tin crystals. See stannous chloride.

tincture. An alcoholic or water-alcoholic solution of an animal or vegetable drug or a chemical substance. The tincture of potent drugs is essentially a 10% solution. Tinctures are more dilute than fluid extracts and less volatile than spirits (q.v.).

tincture of opium. See laudanum.

tinder. See agaric.

tin dibromide. See stannous bromide.

tin dichloride. See stannous chloride.

tin difluoride. See stannous fluoride.

tin dioxide. See stannic oxide.

tin disulfide. See stannic sulfide.

tin, flowers of. See stannic oxide.

tin fluoride. See stannous fluoride.

tin iodide. See stannic iodide.

tin monosulfide. See stannous sulfide.

tin naphthenate. See soaps, metallic.

tin octoate $\text{Sn}(\text{C}_7\text{H}_{15}\text{COO})_2$.

Properties: Pale amber viscous liquid; soluble in aliphatic and aromatic hydrocarbon solvents.

Uses: Catalyst; antioxidant, stabilizer for transformer oils.

"Tinopal." ²¹⁹ Trademark for a group of optical brighteners, which absorb ultraviolet light in the near visible range and remit the energy as visible light.

Uses: In heavy duty detergents, and detergent specialties to whiten fabrics; starch products; plastics (for example, molded grade nylon); soap bars as product brighteners.

tin ore. See cassiterite.

tin oxalate. See stannous oxalate.

tin oxides. See stannic oxide and stannous oxide.

tin peroxide. See stannic oxide.

tin phosphide. See stannic phosphide.

tin plate. Sheet steel coated with pure tin. The function of the tin coating is both to protect and beautify the steel base sheet. Also it facilitates soldering.

tin plating. The processes of covering steel, iron or other metal with a layer of tin by dipping in the molten metal, by electroplating, or by immersion in solutions which deposit tin by chemical action of their components. In the molten tin process it is first necessary thoroughly to clean the surface of the steel by pickling in sulfuric

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acid, annealing, dipping in zinc chloride flux, and subsequent to the dip, the sheet steel is passed through hot palm oil. Electrolytically deposited tin is dull in color, and a great variety of solutions and procedures have been proposed. The usual ingredients for the chemical process are cream of tartar and stannous chloride. The metal being plated also takes part in the process. The objective of all the types of tin plating is to take advantage of the superior corrosion resistance of tin and in some cases improve appearance.

tin protochloride. See stannous chloride.

tin protosulfide. See stannous sulfide.

tin protoxide. See stannous oxide.

tin pyrites. See stannite.

tin resinate. See soaps, metallic.

tin salt. See stannous chloride.

tin spirits. Solutions of tin salts used in dyeing.

tin stearate. See soaps, metallic.

tin-stone. See cassiterite.

tin, stream. See cassiterite.

tin sulfate. See stannous sulfate.

tin sulfide. See stannous sulfide.

tin tallate. See soaps, metallic.

tin tartrate. See stannous tartrate.

tin tetrabromide. See stannic bromide.

tin tetrachloride. See stannic chloride.

tin tetraiodide. See stannic iodide.

"Tinuvin P." ²¹⁹ Trademark for ultraviolet absorber. The product is a substituted benzotriazole.

Properties: Off-white, crystalline powder, m.p. 131-132°C. Soluble in acetone, styrene, methyl methacrylate, ethyl acetate, insoluble in water. Absorbs ultraviolet light from 200 millimicrons up to 380 millimicrons. Transmits 100% light at 410 millimicrons, therefore contributes no color to the systems it is used in. Stable to strong acid or alkali; to peroxide catalysts; to reducing agents; to temperatures normally encountered in production of plastics.

Uses: Protection of plastics, cosmetics, oils, and waxes, pigments and dyes, lacquers, etc.

tin, wood. See cassiterite.

"Tipagon." ³²⁸ Trademarked product consisting of a blend of nonionic agents designed to serve as a dyeing assistant for tippy wool. It is a light amber colored liquid with a faint alcoholic odor.

"Tipersul." ²⁸ Trademark for fibrous potassium titanate. Crystalline fibers 1 micron in diameter melting at 2500°F; useful to 2200°F. Used for high temperature thermal, acoustical and electrical insulation;

also for filter media. Available as lumps, blocks, and loose fibers.

TIPPS. Abbreviation for tetraiodophenolphthalein sodium. See iodophthalein sodium.

"Ti-Pure." ²⁸ Trademark for titanium dioxide (TiO₂) pigment, available in two different crystalline forms.

Properties: Fine, dry, white powder; pH 7.0-9.5. Anatase form: Sp.gr. 3.88; index of refraction 2.53. Rutile form: Sp.gr. 4.2; index of refraction 2.71.

Containers: 50-lb paper bags.

Uses: Both anatase and rutile forms as pigments in paints, linoleum, lacquers, paper, leather, inks, and rubber.

"Ti-Pure" VG. ²⁸ Trademark for titanium dioxide. Free flowing dry powder especially for vitreous enamels for iron and steel, but also for other ceramic applications. Not a pigment. Particle size 80 to 325 mesh.

"Tiron." ¹⁶⁹ Trademark for disodium-1,2-dihydroxybenzene-3,5-disulfonate used in the colorimetric determination of ferric iron, titanium, or molybdenum.

Tischenko reaction. Reaction for the formation of esters by the condensation of two molecules of aldehyde catalyzed by aluminum alcoholate in the presence of a halide.

titanelow. See titanium trioxide. (Not to be confused with titan yellow, an organic dye containing no titanium).

titania. See titanium dioxide.

titanic acid (titanic hydroxide; metatitanic acid) H₂TiO₃ or Ti(OH)₄. Water content variable.

Properties: White powder, insoluble in mineral acids and alkalies except when freshly precipitated; insoluble in water.

Derivation: From hydrochloric acid solution of titanates by treating with ammonia and then drying over concentrated sulfuric acid or by boiling titanium sulfate solution.

Grades: Technical.

Containers: 1-, 5-lb bottles; fiber containers, multiwall paper sacks.

Use: Mordant.

Shipping regulations: None.*

titanic acid, meta-. See titanic acid.

titanic acid, anhydride. See titanium dioxide.

titanic anhydride. See titanium dioxide.

titanic chloride. See titanium tetrachloride.

titanic hydroxide. See titanic acid.

titanic iron ore. See ilmenite.

titanic oxide. See titanium dioxide.

titanic sulfate. See titanium sulfate.

titanite (sphene) CaTiSiO₅. A natural calcium titanium silicate. Contains variable amounts of iron and sometimes small amounts of yttrium and cerium earths. Hardness 5-5.5; sp.gr. 3.4-3.55.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Yellow, green, brown, black, gray, rose-red; white streak; adamantine or resinous luster.

Occurrence: United States (New York, Pennsylvania, Arkansas, Maine, Massachusetts, New Jersey, North Carolina); Canada; Switzerland; France; Italy; Austria; England, Wales; Norway; Sweden; Russia.

Use: Transparent crystals of good color are sometimes used as gem stones; a source of titanium for paint pigments.

titanium Ti. Ninth most abundant element in earth's crust, very light and strong. Atomic number 22, Group IV of periodic system.

Properties: Silvery metal or dark gray amorphous powder, density 4.5 (20°C); m.p. 1730°C, b.p. greater than 3000°C; linear coefficient of thermal expansion $5.0 \times 10^{-6}/^{\circ}\text{F}$, specific heat 0.13 Btu/lb/°F, thermal conductivity 105 Btu/ft²/in/°F/hour, tensile strength up to 125,000 psi at room temperature, 96,000 psi (400°F), 20,000 psi (1000°F); very hard (scratches steel); has excellent resistance to atmospheric and seawater corrosion and to numerous chemicals when cold; reactive when hot or molten. Insoluble in cold water, decomposes hot water.

Sources: Ilmenite, rutile, titanium slag from certain iron ores.

Derivation: From titanium carbide by electrolysis; from ores by treatment with chlorine. The titanium tetrachloride is then reduced with magnesium or sodium (Kroll process) in an inert atmosphere of helium or argon. The titanium sponge is consolidated by melting.

Grades: Technical (powder); commercially pure (sheets, bars, tubes, rods, wire and sponge).

Containers: Wet powder in cans/box or 10-, 100-lb kegs; sponge in steel pails.

Uses: As metal or alloy (especially ferro-titanium) as structural material in aircraft, jet engines (replacing steel in missile frames); marine equipment, textile machinery, chemical equipment, surgical instruments, orthopedic appliances, sporting equipment, foodhandling equipment; also in x-ray tube targets, abrasives; cermets, metal-ceramic brazing, especially in nickel-cadmium batteries for space vehicles.

Uses of titanium compounds: Pigments (titanium dioxide); electronics, smoke clouds; porcelain enamels; fire retardants; waterproofing agents, gems.

Caution: The dry powder ignites in air above 250°C. It can be ignited by static sparks and by grinding.

Shipping regulations: Powder, wet (with not less than 20% water) or dry: flammable solid. Yellow label.*

titanium acetylacetonate. See titanyl acetylacetonate.

titanium acylates. Compounds whose general formula is

where $\text{RCO}-\text{O}-$ may be a saturated or unsaturated organic acid radical, and where R' is a hydrocarbon radical; e.g., isopropoxytitanium stearate.

Uses: Surface-active agents in non-polar solvents; water repellents for masonry, wood, and paper.

titanium boride (titanium diboride) TiB_2 .

Properties: Solid with oxidative resistance up to 1400°C. M.p. 2480°C; sp.gr. 4.50; hardness 9+ (Mohs); low electrical resistivity.

Uses: Metallurgical additive, high temperature electrical conductor, refractory, cermet component; coatings resistant to attack by molten metals; aluminum manufacture; super alloys; nuclear steels.

titanium butylate. See tetrabutyl titanate.

titanium carbide TiC .

Properties: Crystalline solid with gray metallic color; hardness 3200 kg/sq mm, m.p. 2700°C, b.p. 4300°C; sp.gr. 4.93; resistivity 60 micro-ohm-cm (room temperature). Insoluble in water; soluble in nitric acid and aqua regia.

Uses: Additive with tungsten carbide in making cutting tools and other parts submitted to thermal shock; arc-melting electrodes, cermets.

titanium chelates. Compounds whose general formula is $(\text{HOYO})_2\text{Ti}(\text{OR})_2$ or $(\text{H}_2\text{NYO})_2\text{Ti}(\text{OR})_2$ where Y and R may be hydrocarbon radicals, e.g., octylene glycol titanate, triethanol amine titanate.

Uses: Surface-active agents; corrosion inhibitors; cross-linking agents.

titanium diboride. See titanium boride.

titanium dichloride TiCl_2 .

Properties: Black powder; burns like tinder in air. Decomposed by water. Hygroscopic; soluble in alcohol, insoluble in chloroform, ether, carbon disulfide. Keep under water or inert gas.

Caution: Keep away from air!

titanium dioxide (titanic anhydride; titanic acid anhydride; titanic oxide, titanium white; titania) TiO_2 .

Properties: White to black powder, depending on purity; is also prepared in two crystalline forms:

anatase, sp.gr. 3.8; index of refraction 2.5; m.p. 1560°C;
rutile, sp.gr. 4.3; index of refraction 2.7, m.p. 1640°C (dec). Rutile occurs naturally and when pure is a light yellow. Both decompose at 1640°C; insoluble in water and cold dilute acids; soluble in hot concentrated sulfuric acid and alkalis. Titanium dioxide possesses the greatest hiding power of all the white pigments.

Derivation: From ilmenite or rutile (q.v.). Ilmenite is treated with sulfuric acid and the titanium sulfate further processed.

Grades: Technical, of many variations;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

pure; U.S.P. XVI.

Containers: Fiber drums; multiwall paper sacks.

Uses (in order of volume): Paint pigments; opacifying agent in paper; white rubber and plastics; floor coverings (linoleum, etc); rubber manufacture; glassware and ceramics, enamel frits; delustering synthetic fibers; printing inks; welding rods. Single crystals are high temperature transducers.

Shipping regulations: None.*

titanium disilicide Ti_2Si . Used for special alloy applications, as a flame or blast impingement resistant coating material.

titanium esters. Compounds whose general formula is $\text{Ti}(\text{OR})_4$ where R is a hydrocarbon radical, e.g., tetraisopropyl titanate. See also tetrabutyl titanate, tetra(2-ethylhexyl) titanate.

Uses: Adhesion promoters, ester exchange catalysts, cross-linking agents, and in heat-resistant paints.

titanium ferrocene. * See dicyclopentadienyl-titanium chloride.

titanium hydride TiH_2 .

Properties: A grey-black metallic powder, which dissociates above 550°F . The evolution of hydrogen is gradual and practically complete at 1200°F . The hydride is inert at room temperature, can be handled in air without the hazard of explosion associated with the powdered metal. Sp.gr. 3.8. Attacked by strong oxidizing agents.

Derivation: Direct combination of titanium with hydrogen; reduction of titanium oxide with calcium hydride in the presence of hydrogen above 600°C .

Containers: Polyethylene bags in metal drums. (100-lb net).

Uses: Powder metallurgy; production of pure hydrogen (contains approx 1800 cc (STP) hydrogen per cc of hydride), production of foamed metals; solder for metal-glass; electronic getter; reducing atmosphere for furnaces; hydrogenation agent; refractories.

titanium isopropylate. See tetraisopropyl titanate.

titanium nitride TiN .

Properties: Golden-brown, hard, brittle plates; m.p. 2927°C ; sp.gr. 5.24; specific heat 8.86 cal/mole at 25°C ; electrical resistivity 21.7 micro-ohm-cm.

Uses: High temperature bodies, cermets, alloys, rectifiers, semiconductor devices.

titanium ore. See rutile and ilmenite.

titanium oxalate (titanous oxalate)

$\text{Ti}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$.

Properties: Yellow prisms. Soluble in water; insoluble in alcohol and ether.

Derivation: By the action of oxalic acid on titanous chloride.

Method of purification: Crystallization.

titanium oxide. See titanium dioxide or trioxide.

titanium peroxide. See titanium trioxide.

titanium-potassium fluoride (potassium-titanium fluoride) TiK_2F_6 .

Properties: White leaflets. Soluble in water (hot).

Grades: Technical.

Uses: Titanic acid; titanium.

titanium-potassium oxalate

$\text{TiO}(\text{CO}_2 \cdot \text{CO}_2\text{K})_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, lustrous crystals.

Soluble in water.

Derivation: By treating titanium hydroxide with potassium oxalate and oxalic acid.

Grades: Technical; pure; 22% TiO_2 (min)

Containers: 112-lb kegs; 200-, 300-, 350-lb barrels.

Use: Mordant in cotton and leather dyeing; sensitization of aluminum for photography.

Shipping regulations: None.*

titanium sesquisulfate. See titanous sulfate.

titanium sulfate (titanium sulfate cake; titanic sulfate; basic titanium sulfate; titanyl sulfate) $(\text{TiSO}_4)_2 \cdot 9\text{H}_2\text{O}$, $\text{TiOSO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$. A commercial material, possibly a mixture of both formulas.

Properties. White cake-like solid, highly acidic, similar to 50% sulfuric acid; typical composition 20% TiO_2 , 50% H_2SO_4 , 30% H_2O ; hygroscopic, sp.gr. about 1.47; soluble in water; solutions hydrolyze readily unless protected from heat and dilution.

Derivation: By the action of sulfuric acid on ilmenite ore.

Containers: 300-lb net fiber drums.

Uses: Treatment of chrome yellow and other colors, production of titanous sulfate used as reducing agent or stripper for dyes, also a laundry chemical.

titanium sulfate, basic. See titanium sulfate.

titanium sulfate cake. See titanium sulfate.

titanium sulfates. See titanium sulfate and titanous sulfate.

titanium tetrachloride (titanic chloride) TiCl_4

Properties: Colorless liquid. Fumes strongly when exposed to moist air forming a dense and persistent white cloud. Pure Sp.gr. 1.7609 at 0°C , b.p. 136.4°C (760 mm); freezing point -30°C ; specific heat, liquid 0.188 between 13 and 99°C , vapor at constant pressure, 0.12897 between 152° and 272°C ; average cubical coefficient of expansion 0.001086 from 0 to 100°C ; critical temperature 358°C ; dielectric constant at 24°C , 2.73, heat of solution 57,870 cal at 17°C for 1 mole TiCl_4 in 1600 moles water; heat of formation 185 kg cal; vapor pressure $\log p = 7.64433 - (1947.6/T)$. Commercial: Density 14.5 lbs/gal (approx); b.p. between 132° and 137°C ; vapor pressure 8 mm (20°C); analysis (a typical analysis is as follows): free chlorine 0.0 to 0.05%; dissolved gases 0.0 to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

0.20%; vanadium and zirconium chlorides small amounts; silicon tetrachloride 1.0 to 6.00%; titanium tetrachloride 94-99%. Soluble in dilute hydrochloric acid; soluble in water with evolution of heat; concentrated aqueous solutions are stable and corrosive; dilute solutions precipitate insoluble basic chlorides.

Derivation: By heating titanium dioxide or the ores and carbon to redness in a current of chlorine.

Grades: Technical; C.P.

Containers: Glass bottles; steel drums; tank cars.

Uses: Pure titanium and titanium salts; the textile industry as a mordant; iridescent effects in glass; artificial pearls; smoke screens; titanium pigments; polymerization catalyst.

Caution: Avoid breathing fumes and vapor.

Shipping regulations: Corrosive liquid.

White label.*

titanium trichloride (titanous chloride) $TiCl_3$.

Properties: (Titanium trichloride-1). Dark violet anhydrous deliquescent crystals.

Sp.gr. 2.6, decomposes above $440^{\circ}C$; decomposes in air and water. Soluble in alcohol, acetonitrile, certain amines; slightly soluble in chloroform. Insoluble in ether and hydrocarbons.

(Titanium trichloride-2). Light red powder decomposing above $178^{\circ}C$; slightly soluble in trichloroethylene, ketones, chloroform, insoluble in benzene, carbon tetrachloride, other properties similar.

Uses: Reducing agent; organic synthesis; co-catalyst for polyolefin polymerization; organometallic synthesis involving titanium.

titanium trioxide (titanium peroxide, titanellor)

TiO_3 . (Not to be confused with titan yellow, an organic dye containing no titanium.)

Properties: Yellow powder; soluble in acids.

Containers: 1-, 5-lb bottles; fiber containers.

Uses: Dental porcelain and cements; yellow tile.

titanium white. See titanium dioxide.

titanous chloride. See titanium trichloride.

titanous oxalate. See titanium oxalate.

titanous sulfate (titanium sesquisulfate)

$Ti_2(SO_4)_3$.

Properties: Green crystalline powder; insoluble in water, alcohol, concentrated sulfuric acid; but soluble in dilute hydrochloric or sulfuric acids giving violet solutions.

Grades: Commercial grade made and supplied as a dark purple solution containing about 15% $Ti_2(SO_4)_3$.

Containers: Glass bottles; carboys.

Use: Textile industry as reducing agent for stripping or discharging colors.

Shipping regulations: (solution); Corrosive liquid. White label.*

"Titanox." ³³⁶ Trademark of an extensive series of white titanium pigments comprising titanium dioxide (TiO_2) in both anatase and rutile crystal forms, and

titanium dioxide extended with calcium sulfate (titanium-calcium pigments). The titanium dioxide pigments run 94-99% TiO_2 depending upon type of pigment and application. The titanium-calcium pigments contain the rutile form either 30% TiO_2 or 50% TiO_2 .

Properties: Fine, dry, white powders; relatively inert. Titanium dioxide pigments, anatase form: sp.gr. 3.9; refractive index 2.55. Rutile form: sp.gr. 4.2; refractive index 2.7. Rutile TiO_2 has about 25% greater tinting strength and opacity than anatase TiO_2 . Titanium-calcium pigments, 30% TiO_2 type: sp.gr. 3.25. 50% TiO_2 type: sp.gr. 3.47.

Containers: 50-lb paper bags.

Uses: Paints, enamels and lacquers; paper; plastics and rubber; floor coverings; coated fabrics; inks; delustering synthetic fibers; leather; porcelain enamels; welding rod coatings, etc.

titanyl acetylacetonate (titanium acetylacetonate) $TiO[OC(CH_3)_2CHCOCH_3]_2$.

Properties: Crystalline powder; slightly soluble in water. Resistant to hydrolysis. A chelating, non-ionizing compound.

Derivation: Reaction of titanium oxychloride with acetylacetone and sodium carbonate.

Uses: Cross-linking agent for cellulosic lacquers.

titanyl sulfate. See titanium sulfate.

titer. In solutions (1) the concentration of a dissolved substance as determined by titration, (2) the minimum amount or volume needed to bring about a given result in titration; or (3) the solidification point of the fatty acids which have been liberated from the fat by hydrolysis.

titration. A method for determining volumetrically the concentration of a desired substance in solution by adding a standard solution of known volume and strength until the reaction is completed, usually as indicated by a change in color due to an indicator or by electrical measurements.

TKP. Abbreviation for tripotassium phosphate. See potassium phosphate, tribasic.

TKPP. Abbreviation for tetrapotassium pyrophosphate. See potassium pyrophosphate.

Tl. Symbol for thallium.

Tm. Symbol for thulium.

TMA. Abbreviation for trimethylamine.

"TME." ¹³⁸ Trade name for trimethylolethane.

Properties: Non-hygroscopic, non-corrosive fine, white crystals.

Containers: 50-lb multi-wall bags.

Uses: For use in the manufacture of alkyd resins, drying oils, polyesters and isocyanate resins; also of interest as an intermediate for producing plasticizers and a variety of specialty chemicals, surface active agents, and explosives.

TMEDA. Abbreviation for tetramethylethylenediamine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

TML. Abbreviation for tetramethyllead.

TMTD. Abbreviation for tetramethylthiuram disulfide.

TNA.

1. Abbreviation for tetranitroaniline (q.v.). It is a high explosive made by nitrating aniline and is used in detonators.

2. Abbreviation for thymus nucleic acid. See deoxyribonucleic acid.

TNB. Abbreviation for trinitrobenzene.

TNT. Abbreviation for trinitrotoluene.

tobacco. See nicotine.

tobacco mosaic virus. The first virus to be obtained in crystalline form. Recently the protein portion of this virus (95% of each particle is protein) was found to contain about 2200 protein molecules, each with a molecular weight of about 18,000. The complete sequence of the 158 amino acids for this virus protein molecule has recently been determined.

tobacco stems. Tobacco stems and stalks contain from 1.2-3.3% nitrogen and 4-9% potash (K_2O).

Use: They are ground and used as a fertilizer material.

Shipping regulations: None.*

tobacco wood. See hamamelis.

Tobias acid. See 2-naphthylamine-1-sulfonic acid.

"Tobin Bronze-452." ³²⁴ A high-strength, corrosion-resistant rod alloy, developed originally for marine use. Nominal composition is copper 60%, zinc 39.25%, tin 0.75%. Produced under special procedure as propeller shafting in diameters up to 6 in. Also available as die pressed forgings. With a slight adjustment of composition used as rod and wire for oxyacetylene braze welding of steel, cast iron, and copper alloys.

"Toclase." ²⁹⁹ Trademark for carbapentane citrate.

"Tocopherex." ⁴¹² Trademark for d-alpha-tocopheryl acetate (q.v.).

tocopherols (Vitamin E). A group of related substances: alpha-, beta-, gamma-, and delta-tocopherol, which constitute vitamin E. The alpha-form, $C_{29}H_{50}O_2$, (which occurs naturally as the d-isomer), is the most potent. All are derivatives of dihydrobenzo-gamma-pyran, and differ from each other only in the number and position of methyl groups. Vitamin E is required by certain rodents (but possibly not by humans) for normal reproduction. Muscular and central nervous system depletion along with generalized edema are deficiency symptoms in all animals. The tocopherols function as antioxidants; and are used, thus, as preservatives. They are marketed as the acetate, since this is stable to oxidation. See d-alpha-tocopheryl acetate.

Properties: These vitamins are viscous oils;

soluble in lipid solvents; insoluble in water; stable to heat in the absence of oxygen, to strong acids, and to visible light; unstable to ultraviolet light, alkalis and oxidation.

Units: One international unit is the vitamin E activity of 0.1 g of the International Standard, containing 1 mg of pure synthetic racemic alpha-tocopherol acetate.

Grades: N.F. XI (d-alpha-tocopherol).

Uses: Medicine; nutrition; antioxidants.

d-alpha tocopheryl acetate (d-alpha tocopherol acetate) $C_{29}H_{49}O \cdot OOCCH_3$.

Properties: Yellow, nearly odorless, clear, viscous oil; unstable in the presence of alkalis; affected by light; m.p. about 25°. Insoluble in water; freely soluble in alcohol; miscible with ether, chloroform, acetone, and vegetable oils. Angular rotation: 10% solution in $CHCl_3$ = +0.25° in a 200 mm tube. Refractive index 1.4940-1.4985; sp.gr. 0.950-0.964.

Grade: N.F. XI.

Use: Medicine; antioxidant.

dl-alpha tocopheryl acetate (dl-alpha tocopherol acetate) $C_{29}H_{49}O \cdot OOCCH_3$.

Properties: Yellow, nearly odorless, clear, viscous oil, unstable in the presence of alkalis, affected by light. Insoluble in water, freely soluble in alcohol, miscible with ether, chloroform, acetone, and vegetable oils. 10% $CHCl_3$ solution shows no appreciable angular rotation in a 200 mm tube. Sp.gr. 0.950-0.964; refractive index 1.4940-1.4985.

Grade: N.F. XI, powdered 25%, 33%.

Containers: Bottles.

Use: Medicine.

d-alpha tocopheryl acid succinate (d-alpha tocopherol acid succinate) $C_{29}H_{49}O \cdot OOC(CH_2)_2COOH$.

Properties: White, crystalline powder; little or no taste or odor, stable to air, unstable to alkali and to heat. Insoluble in water; slightly soluble in aqueous alkali, soluble in alcohol, ether, acetone, and vegetable oils; very soluble in chloroform. Melting range 73°-78°.

Grade: N.F. XI.

Use: Medicine, antioxidant.

"Tofaxin." ¹⁶² Trademark for tocopherol.

tolan (diphenylacetylene) $C_6H_5C \cdot CC_6H_5$.

Properties: Monoclinic crystals; m.p. 59-61°C, b.p. 300°C (760 mm); 170°C (19 mm); sp.gr. 0.966 (100/4°C). Insoluble in water, soluble in ether or hot alcohol.

Grades: Technical; purified.

Use: Organic synthesis; purified grade as primary fluor or as wave length shifter in solution scintillators.

Shipping regulations: None.*

tolazoline hydrochloride (2-benzyl-2-imidazoline hydrochloride; benzazoline hydrochloride) $C_{10}H_{12}N_2 \cdot HCl$ or $NHCH_2CH_2NCCH_2C_6H_5 \cdot HCl$.

Properties: White or creamy-white, bitter, crystalline powder with slight aromatic odor. M.p. 172-176°C. Freely soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in alcohol, chloroform and water; very slightly soluble in ether and ethyl acetate. pH (2.5% solution) 4.9-5.3.

Grade: U.S.P. XVI.

Use: Medicine.

tolbutamide (1-butyl-3-para-tolylsulfonylurea) $\text{H}_3\text{CC}_6\text{H}_4\text{SO}_2\text{NHCONH}(\text{CH}_2)_3\text{CH}_3$.

Properties: White, or practically white, crystalline powder; m.p. 126-132°C. Tasteless and practically odorless. Insoluble in water; soluble in alcohol and chloroform.

Grade: U.S.P. XVI.

Use: Medicine.

"Toleron." ³²⁹ Trademark for ferrous fumarate, an anhydrous salt of a combination of ferrous iron and fumaric acid. Used in medicine.

ortho-tolidine (dimethylbenzidine; diaminoditolyl) $[\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NH}_2]_2$.

Properties: Glistening plates, white to reddish; m.p. 129-131°C. Soluble in alcohol and ether; sparingly soluble in water.

Derivation: By the reduction of ortho-nitrotoluene with zinc dust and caustic soda and conversion of the hydrazotoluene by boiling with hydrochloric acid.

Method of purification: Crystallization.

Grades: Technical, dry or paste.

Containers: 200-, 350-lb kegs.

Uses: Dyes; sensitive reagent for gold (1:10 million detectable), and for free chlorine in water.

Shipping regulations: None.*

meta-tolidine dihydrochloride

$[\text{C}_6\text{H}_3(\text{CH}_3)_2\text{NH}_2]_2 \cdot 2\text{HCl}$.

Properties: M.p. (of free amine) 107-108°C, soluble in hot water.

Use: Synthesis.

ortho-tolidine dihydrochloride (dimethylbenzidine hydrochloride) $\text{C}_{14}\text{H}_{16}\text{N}_2 \cdot 2\text{HCl}$.

Properties: White crystals. Soluble in water and in dilute hydrochloric acid solutions.

Containers: 350-lb drums (available as a paste).

Use: Determination of small amounts of chlorine in water.

Caution: Store reagent in dark or amber bottles in cool place. Do not use rubber stoppers.

tolonium chloride (3-amino-7-dimethylamino-2-methyl-phenazothionium chloride)

$\text{C}_{15}\text{H}_{16}\text{SN}_3\text{Cl}$.

Properties: Green, crystalline powder with bronze luster. Soluble in water; slightly soluble in alcohol; very slightly soluble in chloroform, practically insoluble in ether.

Grade: N.N.D.

Use: Medicine.

3-ortho-toloxyl-1,2-propanediol. See mephenesin.

3-ortho-toloxyl-1,2-propanediol-1-carbamate. See mephenesin carbamate.

"Tolrez." ⁷⁹ Trade name for tall oil pitch.

Properties: Acid number 69; flash pt (open

cup) 410°F; saponification number 113; color (Hellige) (10% n.v. in benzol) 16; viscosity (100°C) Brookfield #2 spindle (60 rpm) 118 cps., Sayboldt Fural 65 secs; specific quantity (25°/25°C) 0.99.

Containers: 55-gal drums; tank cars.

Uses: Roofing compounds, asphalt emulsions and anti-stripping compounds, etc.

"Tolseram." ⁴¹² Trademark for mephenesin carbamate.

"Tolserol." ⁴¹² Trademark for mephenesin (q.v.).

tolualdehyde. See tolyl aldehydes.

toluazotoluidine. See ortho-aminoazotoluene.

tolu balsam (Thomas balsam; tolu resin).

Properties: A brown or yellowish-brown plastic solid with a pleasant, aromatic odor resembling that of vanilla, and a mild, aromatic taste. Brittle when old or cold, soft when fresh. Soluble in alcohol, chloroform and ether; nearly insoluble in water. Soluble in alkalis.

Derivation: By incision into the wood of *Toluifera balsamum*, indigenous to Colombia.

Grades: Natural, U.S.P. XVI; cleaned.

Containers: Natural: 50-lb tins; 90-, 100-lb cases; cleaned: 1-lb bottles; 5-, 25-, 50-lb tins.

Uses: Medicine, perfumery (hyacinth); confectionery (glaze); fumigating compositions; chewing gum.

tolu balsam oil. See tolu oil.

toluene (toluol, methylbenzene; methylbenzol; phenylmethane) $\text{CH}_3\text{C}_6\text{H}_5$.

Properties: Colorless, refractory, flammable liquid; benzene-like odor. As compared with benzene its vapors are less dangerously toxic, less flammable, and it has a slower rate of evaporation; sp.gr. 0.866 (20/4°C); m.p. -94.5°C; b.p. 110.7°C; aniline equivalent 15; flash point 6-10°C. Soluble in alcohol, benzene, and ether; insoluble in water.

Derivation: (a) By catalytic reforming of petroleum. (b) By fractional distillation of coal-tar light oil. (c) By extraction from coal gas.

Method of purification: Rectification.

Grades: Pure, commercial; straw-colored; nitration; industrial. These are usually defined in terms of boiling ranges.

Containers: 5-gal can; 55-, 110-gal drums; 8000-gal tank cars.

Uses: Aviation gasoline and high-octane blending stock, solvent, for paints and coatings, gums, resins, most oils, rubber cement, vinyl organosols, chemicals, including benzoic acid, benzyl and benzoyl derivatives, saccharin, medicines, dyes, perfumes, source of toluenedisocyanates (polyurethane resins), explosives (TNT) toluene sulfonates (detergents).

Warning! Flammable; vapor harmful. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ortho-tolueneazonaphthylamine. See yellow OB.

toluene-2,4-diamine (meta-tolylenediamine; meta-tolylenediamine; diaminotoluene) $\text{CH}_3\text{C}_6\text{H}_3(\text{NH}_2)_2$, ($\text{CH}_3 = 1$).
 Properties: Colorless crystals. Soluble in water, alcohol and ether. M.p. 99°C; b.p. 280°C.
 Derivation: By the reduction of meta-dinitrotoluene with iron and hydrochloric acid.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: 175-lb barrels; 200-, 250-lb drums.
 Uses: Dye intermediate, direct oxidation black for furs and hair.
 Shipping regulations: None.*

toluene-2,4-diisocyanate (2,4-tolylene diisocyanate; meta-tolylene diisocyanate, TDI) $\text{CH}_3\text{C}_6\text{H}_3(\text{NCO})_2$
 Properties: Water-white to pale-yellow liquid, sharp, pungent odor; b.p. 251°C, flash point 270°F; m.p. (pure isomer) 19.5-21.5°C; sp.gr. 1.22 (25°/15.5°C), vapor pressure (approx) 0.01 mm at 20°C. Relatively non-corrosive; reacts with water producing CO_2 ; reacts with compounds containing active hydrogen (may be violent). Soluble in ether, acetone, and other organic solvents. Irritating to eyes and nose.
 Derivation: Reaction of 2,4-diaminotoluene with phosgene.
 Method of purification: Distillation to remove hydrochloric acid.
 Grade: 99% (min).
 Containers: Drums; tank cars.
 Uses: Polyurethane foams; elastomers and resins.
 Danger! Hazardous liquid and vapor. * Causes burns. MCA warning label.
 Availability: 100% 2,4-isomer, 80% and 65% 2,4-isomer both mixed with 2,6-isomer.

para-toluenesulfamide. See para-toluenesulfonamide.

para-toluenesulfanilide $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{C}_6\text{H}_4\text{NH}_2$.
 Properties: White to pink crystalline solid. M.p. 103°C. Soluble in most lacquer solvents.
 Derivation: Para-toluene sulfonchioride treated with aniline in presence of lime or carefully regulated amounts of alkalis.
 Grades: Technical.
 Use: Softener for acetylcellulose in quantities up to 50%; dyestuff intermediate.

toluenesulfochloride (toluene sulfochloride) $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{Cl}$.
 Properties: (a) Ortho-: oily liquid. (b) Para-: rhombic crystals. Soluble in alcohol and ether; insoluble in water. M.p. (b) 69°C; b.p. (b) 145°-146°C.
 Derivation: By the action of chlorosulfonic acid on toluene.
 Grades: Technical.
 Containers: Wooden kegs.
 Use: Organic synthesis; manufacture of

dyestuffs, saccharin.

Shipping regulations: None.*

para-toluenesulfonamide (para-toluenesulfamine; PTSA). $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH}_2$.
 Properties: White leaflets. Soluble in alcohol; very slightly soluble in water. M.p. 137°C.

Derivation: By amination of para-toluenesulfochloride.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: Wooden kegs, barrels.
 Uses: Organic synthesis; plasticizers and resins; fungicide and mildewicide in paints and coatings.

Shipping regulations: None.*

ortho-toluenesulfonate. See ortho-toluenesulfonic acid.

para-toluenesulfonate. See para-toluenesulfonic acid.

toluenesulfochloride. See toluenesulfochloride.

para-toluenesulfondichloroamide. See dichloramine-T.

ortho-toluenesulfonic acid (orthotoluenesulfonate) $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.
 Properties: Colorless crystals; m.p. 67.5°C, b.p. 129°C, soluble in alcohol, water, and ether.

Derivation: By sulfonating toluene with concentrated sulfuric acid below 100°C.
 Method of purification: Crystallization.
 Availability: Anhydrous, monohydrate; 40% aqueous solution.
 Containers: 55-gal drums.
 Uses: Dyes, organic synthesis, acid catalyst.
 Shipping regulations: None.*

para-toluenesulfonic acid (para-toluenesulfonate) $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CH}_3)$.
 Properties: Colorless leaflets; m.p. 107°C; b.p. 140°C (20 mm). Soluble in alcohol, ether, and water.

Derivation: By action of chlorosulfonic acid on toluene at a low temperature.
 Method of purification: Crystallization.
 Availability: Anhydrous; monohydrate, 40% aqueous solution.
 Containers: 55-gal drums; monohydrate, 125-lb drums.
 Uses: Dyes; organic synthesis, organic catalyst.
 Shipping regulations: None.*

para-toluenesulfonic acid, sodium salt. See sodium toluenesulfonate.

toluene-para-thiol (para-thiocresol) $\text{CH}_3\text{C}_6\text{H}_4\text{SH}$.
 Properties: Cream to white moist crystals; m.p. 43-44°C; b.p. about 195°C. Insoluble in water; soluble in alcohol or ether.
 Containers: Tinned steel drums.
 Uses: Medicine; intermediate.

toluene trichloride. See benzotrichloride.

toluene trifluoride. See benzotrifluoride.

toluhydroquinone $\text{CH}_3\text{C}_6\text{H}_3(\text{OH})_2$.
 Properties: Pink to white; m.p. 126-127°C;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ash 0.01% max; assay 99% min.
 Grade: Technical.
 Containers: Fiber drums.
 Uses: Antioxidant; polymerization inhibitor.

alpha-toluic acid. See phenylacetic acid.

meta-toluic acid (meta-toluylic acid; 3-methylbenzoic acid) $C_6H_4CH_3COOH$.

Properties: White to yellowish crystals; slightly soluble in water; soluble in alcohol and ether. Sp.gr. 1.0543; m.p. 109°C; b.p. 263°C, ionization constant 5.3×10^{-5} .

Derivation: Oxidation of meta-xylene with nitric acid.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs; 250-lb fiber drums.

Use: Organic synthesis; to form N,N-diethyl-meta-toluamide, an important broad-spectrum insect repellent.

Shipping regulations: None.*

ortho-toluic acid (ortho-toluylic acid, 2-methylbenzoic acid) $C_6H_4CH_3COOH$.

Properties: White crystals, slightly soluble in water; soluble in alcohol and chloroform. Sp.gr. 1.0621, m.p. 103.5-104°C, b.p. 259°C, refractive index (114.6°C) 1.512, ionization constant 1.2×10^{-5} .

Derivation: Oxidation of ortho-xylene with dilute nitric acid.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs, 250-lb fiber drums.

Uses: Organic synthesis, alkyl and polyester resins.

Shipping regulations: None.*

para-toluic acid (para-toluylic acid, 4-methylbenzoic acid) $C_6H_4CH_3COOH$.

Properties: Transparent crystals, slightly soluble in water, soluble in alcohol and ether. M.p. 180°C, b.p. 275°C; ionization constant 4.3×10^{-5} .

Derivation: By treating cymene or turpentine with nitric acid.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs; 175-lb fiber drums.

Use: Organic synthesis, plasticizers, dye carriers.

Shipping regulations: None.*

alpha-toluic aldehyde. See phenylacetaldehyde.

meta-toluidine (meta-aminotoluene)

Properties: Colorless liquid, sp.gr. 0.980, m.p. -31.5°C; b.p. 203.3°C, slightly soluble in water; soluble in alcohol or ether.

Derivation: By the reduction of meta-nitrobenzylidene chloride with zinc at a low temperature.

Grade: Technical.

Containers: 450-, 900-lb iron drums, tank cars.

Uses: Dyes; manufacture of organic chemicals.

Danger: Hazardous liquid and vapor rapidly

absorbed through skin. MCA warning label.
 Shipping regulations: None.*

ortho-toluidine (ortho-aminotoluene)

Properties: Light yellow liquid; becomes reddish-brown on exposure to air and light; volatile with steam. Sp.gr. 1.008

(20/20°C); m.p. -21°C; b.p. 200-202°C; flash point 87°C. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: By the reduction of ortho-nitrotoluene or obtained mixed with para-toluidine by the reduction of crude nitrotoluene.

Grade: Technical.

Containers: 450-, 900-lb iron drums; tank cars.

Uses: Dyes; saccharin; printing textiles blue-black and making various colors fast to acids; vulcanization accelerators; organic synthesis.

Danger: Hazardous liquid and vapor rapidly absorbed through skin. MCA warning label.

Shipping regulations: None.*

para-toluidine (para-aminotoluene)

Properties: White, lustrous plates or leaflets. Sp.gr. 1.046 (20/4°C), m.p. 45°C, b.p. 200.3°C. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: By the reduction of para-nitrotoluene with iron and hydrochloric acid.

Grades: Technical, flake or cast.

Containers: 450-, 900-lb iron drums.

Uses: Dyes, organic synthesis; test reagent for lignin, nitrite, phloroglucinol.

Danger: Hazardous solid and vapor rapidly absorbed through skin. MCA warning label.

Shipping regulations: None.*

toluidine maroon

$CH_3C_6H_3NO_2N_2C_{10}H_5OHCONHC_6H_4NO_2$. An organic azo pigment obtained by the azo coupling of meta-nitro-para-toluidine with the meta-nitroamide of beta-hydroxynaphthoic acid.

Properties: Good lightfastness and resistance to bleeding in oils.

Uses: Automotive finishes, sign enamels, printing inks.

ortho-toluidine-meta-sulfonic acid ($CH_3=1$).

[2-aminotoluene-5-sulfonic acid ($CH_3=1$), 4-amino-meta-toluenesulfonic acid ($SO_3H=1$)] $C_6H_3(CH_3)(NH_2)SO_3H$.

Properties: Colorless crystals; soluble in hot water; insoluble in alcohol and ether.

Derivation: By heating acid ortho-toluidine sulfate.

Method of purification: Crystallization.

Grade: Technical.

Containers: Wooden kegs or fiber drums.

Use: Dye intermediate.

Shipping regulations: None.*

para-toluidine-ortho-sulfonic acid ($CH_3=1$)

[4-aminotoluene-2-sulfonic acid ($CH_3=1$); 5-amino-ortho-toluenesulfonic acid ($SO_3H=1$)] $C_6H_3(CH_3)(NH_2)SO_3H$.

Properties: Monoclinic crystals; soluble in water; insoluble in ether and alcohol.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Derivation: From para-toluidine sulfate by heating in oven (baking process).
Method of purification: Recrystallization as sodium salt.
Grade: Technical.
Containers: Wooden barrels or fiber drums.
Use: Dye intermediate.
Shipping regulations: None.*
- 6-(para-toluidino)-metanilic acid.** See 4-amino-4'-methylidiphenylamine-2-sulfonic acid.
- tolu oil** (tolu balsam oil; albahaca oil).
Properties: Yellow liquid, hyacinth-like odor.
Soluble in alcohol, ether, chloroform and carbon disulfide.
Chief known constituents: A terpene, $C_{10}H_{16}$, and esters of cinnamic and benzoic acid.
Constants: Sp.gr. 0.945-1.09.
Derivation: From tolu balsam by distillation.
Method of purification: Rectification
Grade: Technical.
- toluol.** See toluene.
- toluquinone** (2-methylquinone, para-toluquinone) $CH_3C_6H_3O_2$.
Properties: Yellow leaflets or needles, m.p. 65-67°C; soluble in hot water, very soluble in alcohol, ether, acetone, ethyl acetate, and benzene.
Containers: 50-lb fiber drums.
- tolu resin.** See tolu balsam.
- toluyl aldehydes.** See tolyl aldehydes.
- toluylene.** See stilbene.
- meta-tolylenediamine.** See toluene-2,4-diamine.
- toluylene red.** See neutral red.
- meta-, ortho-, and para-toluylic acid.** See corresponding toluic acid.
- meta-tolylaldehyde** (meta-toluyl aldehyde, meta-tolualdehyde, meta-methylbenzaldehyde) $CH_3C_6H_4CHO$.
Properties: Colorless liquid, refractive index (n_D²⁰) 1.54068, sp.gr. 1.019 (20/4°C), b.p. 199°C, slightly soluble in water, soluble in alcohol and ether.
- ortho-tolylaldehyde** (ortho-toluyl aldehyde, ortho-tolualdehyde, ortho-methylbenzaldehyde) $CH_3C_6H_4CHO$.
Properties: Colorless liquid, refractive index (n_D²⁰) 1.54852, sp.gr. 1.039 (20/4°C), b.p. 195.5°C; slightly soluble in water; soluble in alcohol and ether.
- para-tolylaldehyde** (para-toluyl aldehyde, para-tolualdehyde; para-methylbenzaldehyde) $CH_3C_6H_4CHO$.
Properties: Colorless liquid, refractive index (n_D²⁰) 1.54693, sp.gr. 1.020, b.p. 204°C, slightly soluble in water; soluble in alcohol and ether.
Grades: Technical; pure.
Containers: Tins; drums.
Uses: Flavors; perfumes, synthetic aromatic, pharmaceutical and dyestuff intermediate.
- alpha-tolylaldehyde dimethylacetal.** See "Virdine."
- 4-ortho-tolylazo-ortho-diacetotoluide.** See diacetylaminoazotoluene.
- ortho-tolyl biguanide** $NH_2(CNHNH)_2C_6H_4CH_3$.
Properties: White to off-white powder; melting point 138°C (min).
Containers: 140-lb drums.
Use: Antioxidant for soaps produced from animal or vegetable oil.
- meta-tolyldiethanolamine** $(HOC_2H_4)_2NC_6H_4CH_3$.
Properties: Its soaps form stable emulsions that are distinguished by their mild alkalinity, noncorrosiveness, ease of preparation, and flexibility in formulation. M.p. 62°C; b.p. 297.1°C (760 mm); vapor pressure < 0.1 (20°C); sp.gr. 1.0723 (20/20°C); solubility in water 1.67% by weight (20°C), viscosity 155 cps (20°C). Very soluble in acetone, ethanol, ethyl acetate, benzene.
Containers: 500-lb drums.
Uses: Emulsifier, dyestuff intermediate.
- meta-tolylenediamine.** See toluene-2,4-diamine.
- meta-tolylenediaminesulfonic acid** [4,6-diamino meta-toluenesulfonic acid ($SO_3H=1$)] $CH_3C_6H_2(NH_2)_2SO_3H$.
Properties: White crystalline product, soluble in alkalies.
Derivation: By addition of meta-toluylenediamine sulfate to oleum and heating.
Grade: Technical.
Containers: Wooden barrels or fiber drums.
Use: Dyes.
Shipping regulations: None.*
- meta-tolylenediisocyanate.** See toluene-2,4-diisocyanate.
- ortho-tolyldiethanolamine** $(HOC_2H_4)_2NHC_6H_4CH_3$.
Properties: Its soaps form stable emulsions that are distinguished by their mild alkalinity, noncorrosiveness, ease of preparation, and flexibility in formulation; mol wt 151; m.p. 63.2°C, flash point 385°F, lbs/gal 8.93 (80°C).
Use: Emulsifier.
- (tolylhydroxyphenylaminomethyl)imidazoline hydrochloride.** See phenolamine hydrochloride.
- para-tolyl-alpha-naphthylamine** $C_{10}H_7NHC_6H_4(CH_3)$.
Properties: Colorless, short prisms. Soluble in alcohol and ether. M.p. 79°C, b.p. 236°C (15 mm).
Derivation: By heating alpha-naphthylamine hydrochloride with para-toluidine.
- para-tolyl-beta-naphthylamine** $C_{10}H_7NHC_6H_4(CH_3)$.
Properties: Short, colorless, crystalline plates, sparingly soluble in alcohol. M.p. 103°C.
Derivation: From beta-naphthol and para-toluidine by heating.
- para-tolyl-1-naphthylamine-8-sulfonic acid** (tolylperi acid) $C_{17}H_{15}NO_3S$.
Properties: Greenish-gray needles. Soluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in alcohol; rather insoluble in water.
 Derivation: Arylation of 1-naphthylamine-8-sulfonic acid with para-toluidine.
 Method of purification: Recrystallization.
 Grades: Technical; mostly as sodium salt.
 Containers: Barrels or steel drums.
 Use: Azo colors.
 Shipping regulations: None.*

tolyl-peri acid. See para-tolyl-1-naphthylamine-8-sulfonic acid.

ortho-tolylpropanolamine
 $\text{CH}_3\text{C}_6\text{H}_4\text{NH}(\text{CH}_2\text{CHOHCH}_3)$.

Properties: Slightly soluble in water; completely miscible with acetone, ethanol, ethyl acetate, benzene.
 Containers: 500-lb drums.

tolyl-para-toluene sulfonate. See cresyl-para-toluene sulfonate.

tomatidine. A steroid secondary amine; the nitrogenous aglycone of tomatine. Isolated from the roots of the Rutgers tomato plant as the hydrochloride, $\text{C}_{27}\text{H}_{45}\text{NO}_2 \cdot \text{HCl}$. Crystals decompose at 275-280°C.

tomatine. A glycosidal alkaloid prepared from the dried leaves and stems of the tomato plant. White crystals, used as plant fungicide and as a specific precipitating agent for cholesterol. The crude extract is referred to as tomatin.

"Tona." ¹⁷³ Trademark for a proteolytic enzyme meat-tenderizer. It is supplied as a powder and used as a liquid.

"Tonalid." ¹⁰⁵ Trademark for 1, 1, 2, 2, 3, 3, 5-heptamethyl indan-6-methyl ketone ($\text{C}_{19}\text{H}_{26}\text{O}$), a synthetic aromatic ketone.
 Properties: White crystalline powder, m.p. 55-60°C, odor similar to natural macrocyclic musks.
 Uses: Perfumery, as musk odorant.

toner. An organic pigment which does not contain inorganic pigment or inorganic carrying base. (ASTM definition, ASTM D16-52). See also lake.

tonka (tonka bean; coumarouna bean; snuff bean; English bean; dipteryx).

Properties: Black-brownish seeds with wrinkled surface and brittle shining or fatty skins; aromatic, bitterish taste, balsamic, vanilla-like odor; efflorescences of coumarin are often observed on the surface.
 Derivation: Bean of *Dipteryx oppositifolia* and other species of the *Dipteryx*.
 Occurrence: Tropical America, Guiana and Angostura.

Grades: Angostura; Brazilian.

Containers: Casks; cases.

Uses: Production of natural coumarin; medicine; flavoring extracts; toilet powders.

Shipping regulations: None.*

tonka bean. See tonka.

tonka bean camphor. See coumarin.

"Tonox." ²⁴⁸ Trademark for p,p'-diaminodiphenylmethane.

Properties: Brown waxy lumps; sp.gr. 1.15;

m.p. above 73°C; soluble in acetone and ethylene dichloride; moderately soluble in benzene; insoluble in water and gasoline.
 Use: A general toner for improving the properties of vulcanized rubber; curing agent for epoxy resins.

"Tontine." ²⁸ Trademark for pyroxylin or vinyl coated fabric used as a window shade cloth.

topaz $\text{Al}_2\text{SiO}_4(\text{F}, \text{OH})_2$. A natural fluosilicate of aluminum, found in igneous rocks.

Properties: Colorless, yellow, pink, bluish, or greenish; luster vitreous; hardness 8; sp.gr. 3.4-3.6; one good cleavage.

Varieties:

Brazil rubies. Red or pink. "Burnt topaz" is obtained by heating yellow topaz until it turns pink.

Brazil sapphires. Blue.

Spanish topaz, Scotch topaz, Occidental topaz are actually yellow quartz or citrine.

Oriental topaz. See corundum.

Occurrence: Colorado, California, Maine, Utah; Brazil; U.S.S.R., Japan; Mexico.

Use: Gem stone.

topaz, false. See citrine.

tops. A distillate obtained from crude petroleum.

"Toranil." ¹⁶⁸ Trademark for desugared extract of coniferous woods, consisting of 96% calcium salt of lignosulfonic acid and 1.2% glucose.

Grades: "Toranil A," a viscous coffee-colored 50% solution with a characteristic tart odor; b.p. 107-108°C, sp.gr. 1.24 (60/60°F); available in tank-car lots.

"Toranil B," a free-flowing light tan, odorless, non-hygroscopic, water-soluble powder available in 50-lb multiwall kraft bags.

Uses: Dispersants; tanning agent; adhesive base; binder, chemical raw material.

torbanite. A variety of oil shale (q.v.).

torbernite (copper uranite) $\text{Cu}(\text{UO}_2)_2(\text{PO}_4)_2 \cdot 12\text{H}_2\text{O}$. A natural hydrated copper uranium phosphate, found in the oxidized parts of uranium deposits.

Properties: Color emerald green, grass green; luster vitreous to pearly; good micaceous cleavage; hardness 2-2.5, sp.gr. 3.22; radioactive.

Occurrence: Utah, Colorado, South Dakota, New Mexico; Congo, Europe; Australia.

Use: Minor ore of uranium.

torula yeast. A yeast that utilizes fermentable sugar in industrial wastes, such as fruit cannery refuse and sulfite liquor from pulp mills. The dried yeast is high in protein and vitamin content, enabling it to be used for enriching animal feeds. The enzymes present are destroyed during drying.

tosyl (Ts). The para-toluenesulfonyl radical, $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\cdot$. Esters of para-toluenesulfonic acid are known as tosylates.

totaquine. A mixture containing 7-12% anhydrous quinine and 70-80% total anhydrous crystallizable cinchona alkaloids.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: White, to grayish white, or slightly yellowish white powder which darkens with exposure to light. It is nearly odorless, with a bitter taste. Soluble in alcohol and chloroform; partly soluble in ether; almost insoluble in water.

Containers: Cans.

Use: Medicine.

touchstone. See lydian stone.

touchwood. See agaric.

tourmaline

(Na, Ca)(Al, Fe)B₃Al₃(AlSi₂O₉)(O, OH, F)₄.

A complex borosilicate of aluminum.

Varying amounts of lithium, sodium, potassium, calcium, iron, magnesium, and manganese may be present. Found in igneous rocks.

Properties: Color variable, black, brown, yellow, pink, blue; luster vitreous to resinous; hardness 7-7.5; sp. gr. 3.0-3.2; piezoelectric and pyroelectric.

Varieties:

Schorlite. A black iron-bearing variety.

Rubellite. A pink lithium-bearing variety used as a gem.

Brazilian emerald. Green gem stone.

Indicolite. Dark blue gem stone.

Occurrence: Ceylon; Madagascar; Brazil; U.S.S.R., Island of Elba; California, Maine, Connecticut, New York.

Uses: Gem stone, pressure gauges, optical equipment; oscillator plates; source of boric acid.

"Tovex." ²⁸ Trademark for a non-nitroglycerin, water-compatible explosive slurry that gives very high loading density. For use where rock or ore is massive and hard to break.

toxaphene. Technical chlorinated camphene with the approximate formula C₁₀H₁₀Cl₈. Contains 67-69% chlorine.

Properties: Amber, waxy solid with a mild odor of chlorine and camphor, melting range 65-90°C; density 1.66 (27°C); good residual toxicity; may be stored for a year as a solid or in solution without deterioration; is attacked by bases. Soluble in common organic solvents.

Containers: 50-lb bags; 5-, 55-gal drums.

Use: As an agricultural insecticide against insects and grasshoppers.

Warning: May be fatal if swallowed. May be absorbed through skin. MCA warning label.

TPA. Abbreviation for terephthalic acid.

TPG. Abbreviation for triphenylguanidine.

TPN. Abbreviation for triphosphopyridine nucleotide. See nicotinamide adenine dinucleotide phosphate.

TPP.

1. Abbreviation for triphenyl phosphate.

2. Abbreviation for thiamine pyrophosphate. See cocarboxylase.

TPT.

1. Abbreviation for triphenyltetrazolium

chloride. See tetrazolium chloride.

2. Abbreviation for tetraisopropyl titanate.

trace elements. Elements present in soils, foods, water, etc., in extremely small amounts. Trace elements necessary in plant and animal nutrition are molybdenum, copper, iron, cobalt. Traces of zinc are necessary in plant nutrition, as are boron and manganese.

tracer. An isotopic form of an element used to allow the tracing of the element through a process in the presence of material containing the ordinary form of the element. Often a radioactive isotope is used. Usually the tracer element is incorporated into a suitable compound which is then referred to as tagged or labelled. The isotopically labelled form is for all practical purposes chemically and physically identical with the ordinary form. The two forms will follow identical paths through a complex process, and the tracer can be distinguished at any time by its radioactivity or atomic weight.

For instance, carbon 14 is widely used in studying organic reactions. A particular carbon 12 atom in a given product is replaced by carbon 14, as in adenine-8-C¹⁴, so that the carbon atom in the 8 position can be followed throughout the particular reaction. In other situations, a known proportion of all the carbons is replaced by carbon 14 and their behavior followed. Such a compound might be written, for example, as C¹⁴-adenine, 1 µc/mg.

Radioactive carbon dioxide has been used to follow the complex sequence of steps in the photosynthesis of compounds in plants. Other examples include the use of sodium-24 to determine blood circulation patterns in surgical diagnosis, the injection of radioactive oil-soluble material into the interface between two materials in a pipe-line to signal the necessity of directing the stream into a different storage container, and the use of radioactive satellite ablation coatings, along with a radiation detector and telemetering, to determine the resistance of such coatings during re-entry.

tragacanth gum.

Properties: Dull white, translucent plates or spirally twisted, yellowish powder. Soluble in alkaline solutions, aqueous hydrogen peroxide solution; swells up with water; insoluble in alcohol.

Derivation: An exudation from *Astragalus gummifer*.

Occurrence: Native to southwestern Europe, Greece, Turkey, Asia Minor, Iran.

Grades: U.S.P. XVI; Nos. 1, 2, 3.

Containers: Barrels; cases.

Uses: Pharmacy for making emulsions and trochees; adhesives; leather dressing; calico printing; emulsifying agent; food preservative; cosmetics; dyes.

Shipping regulations: None.*

tragacanthin. See bassorin.

"Tragtex" R, Number 1. ³²⁵ Gum tragacanth. Textile printing vehicle; sizing gum.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Tral." ³ Trademark for hexocyclium methyl-sulfate (q.v.).

trans-. A prefix denoting that one of two geometrical isomers (q.v.) in which certain atoms or groups are on opposite sides of a plane. In this dictionary, it is disregarded in alphabetizing. See also *cis-*.

"Trans-4." ³⁰³ Trademark for trans-1,4-polybutadiene synthetic rubber.

transferase. An enzyme whose activity causes a transfer of a radical from one molecule to another. Examples are transaminases, transacetylases, and transmethylnases, which effect the transfer of amino, acetyl, and methyl groups respectively.

transformer compound. A compound which acts as a cooling and insulating medium and for coating or impregnating electrical apparatus subject to contact with oil. The essential ingredient is a specially treated gum. The flowing point may be around 212°F.

Shipping regulations: None.*

transformer oil. Any refined petroleum fraction suitable for use in surrounding the coils of transformers. Such oils have two purposes, (1) to provide electrical insulation and (2) to conduct heat away from the coils. The usual product is nonviscous (usually less than 100 SUS at 100°F) and is refined to maintain oxidation, moisture, acid, soap, salts, and suspended matter at a minimum. A typical product is a nonviscous neutral oil with gravity 34° Bé; flash point 340°F, fire test 400°F, cold test 20°F, and Saybolt viscosity 80.

"TransistAR." ³²⁹ Trademark for chemicals specifically controlled and standardized to meet the critical requirements of semiconductor device manufacturers.

transistor. A device for electrical rectification and amplification. It consists of a semiconductor material to which contact is made by two or more electrodes, usually by metal points or soldered connections.

• A diode type transistor consists of an n-type semiconductor crystal (n meaning negative, having extra electrons in lattice) in contact with a p-type crystal (p meaning positive, having holes in lattice due to deficiency of electrons). At the area in contact an n-p boundary is formed. Commonly the crystals are high purity germanium or silicon, but with traces of appropriate impurities. Thus, germanium with arsenic as an impurity produces an n-type crystal, while with boron as the trace impurity a p-type crystal is formed. A diode transistor functions as a rectifier of alternating current because it permits current flow across the n-p boundary only from the n- to the p-crystal and not from p to n. When the transistor is connected into an electrical circuit so that the n-crystal terminal is negative and the p-crystal terminal is positive, a current will flow. This takes place because the extra electrons

in the n-crystal move across the n-p boundary, and displace lattice electrons of the p-crystal so that some of these flow into the external circuit, or, these electrons displace holes in the direction of the n-crystal and so cause further movement of extra electrons in the n-crystal to the n-p boundary, and consequent entry of electrons from the external circuit into the n-type crystal. With the opposite electrical polarity in the external circuit, current cannot flow through the transistor because the extra electrons in the n-crystal, and also the holes in the p-crystal, both start to move away from the n-p boundary and it becomes an electrical insulator.

A triode type transistor consists of an n-p-n arrangement of semiconductor crystals, with electrical connections to each part. This functions as an amplifier in a manner analogous to a vacuum tube device.

transmission oil (gear case oil). Steam refined cylinder oil with a gravity of about 25° Bé; flash point 600°F; cold test 30°F; Saybolt viscosity of 240 at 210°F.

transmutation. The transformation of atoms of one element into atoms of a different element as the result of a nuclear reaction. The reaction may be one in which two nuclei interact, as in the formation of oxygen from nitrogen and helium nuclei (alpha particles), or one in which a nucleus reacts with an elementary particle such as a neutron or a proton. Thus a sodium atom and a proton form a magnesium atom.

The term is also used in a more general sense to include reactions in which an atom is transformed into one of its isotopes.

"Transphalt." ¹⁴⁰ Trade name for a series of dark thermoplastic resins which are polymeric polynuclear hydrocarbons. Available as 100°C softening point material, as a liquid whose viscosity is 45-55 S.S.U. (210°F), and as a 60% solution in aromatic solvent.

Properties: Color, coal tar 22; sp.gr. 1.01-1.14 depending upon grade; ash < 0.1%; benzene insoluble - nil. Soluble in aromatic, chlorinated, and terpene solvents; only partially soluble in aliphatic hydrocarbons.

Containers: Liquids or solutions in 18 gauge, oil type, steel drums, tank trucks or tank cars. Higher softening point materials in light gauge, rust resistant, metal coated steel drums.

Uses: Paint, saturants for paper and wall board, pipe coatings, joint sealers, floor tile, extenders in epoxy systems, in the rubber industry under the trade name of "Resinex" in calendered and extruded goods, and secondary plasticizers.

transuranic elements. Elements of higher atomic number than uranium, not found naturally, and produced by nuclear bombardment. See actinide elements.

"Trapex." ⁴⁰¹ Trade name for a soil fumigant containing methylisothiocyanate.
Use: For injection or drench treatment of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

soil to control fungi, weeds, nematodes and soil insects.

Warning! Hazardous vapor and liquid. Irritating to eyes, nose, throat and skin. Do not inhale or swallow. Avoid skin contact.

"**Trasentine.**" ³⁰⁵ Trademark for adiphenine.

trass. A pale yellow, or gray-colored, metamorphosed, volcanic ash.

Use: In the preparation of hydraulic cements.

trass cement. See pozzolana cement.

Traulz test. Test used to determine the strength of an explosion. Measured by exploding a known weight of substance in the cavity of a standard test block of lead and measuring its increase in volume resulting from explosion of the charge.

travertine (tufa). A porous, cellular variety of limestone in banded layers, formed by precipitation of calcium carbonate from calcareous springs and rivers. Travertine forms the deposits at Mammoth Hot Springs, Yellowstone National Park.

"**Treadsure.**" ²⁰⁵ An anti-skid floor coating containing fine abrasive aggregates. Applied with a brush.

treble superphosphate. See triple superphosphate.

"**Trebo-Phos.**" ⁵⁷ Trademark for triple superphosphate.

tree of life. See thuja.

"**Trek.**" ²¹⁴ Trademark for a proprietary concentrated synthetic methanol base antifreeze containing special corrosion inhibitors.

Properties: Deep violet (dye added) liquid; practically odorless. B.p. 149°F; sp.gr. (60/60°F) 0.800; vol concentration of antifreeze to lower freezing point of water solution to 0°F, 27%; -20°F, 37%; wt/gal at 68°F, 6.6 lbs.

Containers: 1-qt, 1-gal tamper-proof cans; 54-gal drums (all nonreturnable).

Use: Antifreeze for use with water in automotive cooling systems.

tremolite $\text{Ca}_2\text{Mg}_5\text{Si}_8\text{O}_{22}(\text{OH})_2$. A variety of amphibole. Some tremolite is sold as "fibrous talc."

Properties: Color white to light green; luster vitreous to silky; hardness 5-6; sp.gr. 3.0-3.3. Resistant to acids.

Occurrence: New York, California, Maryland; South Africa.

Use: As asbestos, particularly in acid-resisting applications, ceramics; paint.

tremorine dihydrochloride

$\text{C}_4\text{H}_8\text{NCH}_2\text{C}(\text{CCH}_2\text{NC}_4\text{H}_9)_2\text{HCl}$.

1,4-Dipyrrolidino-2-butyne dihydrochloride.

Properties: Odorless, white crystalline solid; melts at about 225°C with decomposition; soluble in water, alcohol, and chloroform.

Use: Medicine.

"**Treopax.**" ³³⁷ Trade name for zirconium oxide containing 91.5% ZrO_2 . White cream

powder, with sp.gr. 5.2; average particle size 15 microns. Used as a mill addition opacifier in antimony and zirconium sheet iron and cast iron enamels, to increase reflectance and stabilize colors. See "Opax."

"**Trepidone.**" ³¹⁵ Trademark for mephenozone (q.v.).

tri. Chemical slang for trichloroethylene.

triacetin (glyceryl triacetate) $\text{C}_3\text{H}_5(\text{CO}_2\text{CH}_3)_3$. Properties: Colorless liquid with slight fatty odor and a bitter taste; sp.gr. 1.160 (20°C); b.p. 258-260°C; m.p. -78°C; flash point 300°F; wt/gal 9.7 lbs. Slightly soluble in water; very soluble in alcohol, ether, and other organic solvents.

Typical specifications: B.p. 258-259°C (760 mm); sp.gr. 1.159 (20/20°C); refractive index n_{D}^{25} 1.4288-1.4296; viscosity 15.1 cps (25°C).

Derivation: By the action of acetic acid on glycerol.

Method of purification: Vacuum distillation followed by neutralization and filtration.

Grades: Technical; C.P.; N.N.D.

Containers: Tins; 500-lb drums; tank cars.

Uses: Camphor substitute in pyroxylin industries; plasticizer, fixative in perfumery; manufacture of cosmetics, specialty solvent, to remove carbon dioxide from natural gas; medicine (external).

Shipping regulations: None.*

triacetyloleandomycin. Triacetyl ester of an antibacterial substance produced by the growth of species of *Streptomyces* antibioticus.

Properties: White, odorless, crystalline powder; pH of a solution in diluted alcohol is between 7.5 and 9.0. Soluble in alcohol, slightly soluble in ether and in water.

Specific rotation in trichloroethylene solution containing 200 mg of triacetyloleandomycin in 10 ml is -16° to -22°.

Grade: N.F. XI.

Use: Medicine.

triacontanoic acid. See melissic acid.

1-triacontanol (formerly confused with 1-hexatriacontanol under the names myricyl or melissyl alcohol) $\text{CH}_3(\text{CH}_2)_{28}\text{CH}_2\text{OH}$. A long-chain fatty alcohol.

Properties: Colorless needles from ether; m.p. about 85-88°C; soluble in most organic solvents; insoluble in water.

Derivation: The triacontanyl palmitate is one of the chief constituents of beeswax.

Purification: Crystallization from benzene.

Use: Biochemical research.

trialkyl boranes R_3B .

Properties: Stable in absence of air or oxidizing agents; do not react with water; soluble in hydrocarbons and other organic solvents; insoluble in water; act as reducing agents at high temperatures. The trialkyl boranes isomerize internal olefins to terminal olefins by exchange reactions. Oxidation of the intermediate boro-compounds leads to primary alcohols. (Mixed

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hexenes give a ninety per cent yield of 1-hexanol by this process.) Also, the trialkyl boranes can polymerize vinyl-type monomers at lower temperatures than other catalysts.

Uses: Petro-chemical, pharmaceutical, fatty acid, and essential oil industries.
See tributylborane; triethylborane.

triallyl cyanurate $(CH_2CHCH_2OC)_3N_3$. Cyclic.
Properties: Colorless liquid or solid; m.p. 27.32°C; flash point greater than 176°F. Tag open cup; sp.gr. 1.1133 (30°C); refractive index $n_{25/D}$ 1.5049. Miscible with acetone, benzene, chloroform, dioxane, ethyl acetate, ethyl alcohol, and xylene.

Uses: Polymers and organic intermediates.

triamcinolone (9- α -fluoro-16- α -hydroxyprednisolone) $C_{21}H_{27}FO_6$.
Properties: White crystalline powder; m.p. 264-268°C; insoluble in water; slightly soluble in usual organic solvents; soluble in dimethylformamide.

Grade: N.N.D.

Use: Medicine.

triamcinolone acetoneide. 9- α -Fluoro-16- α , 17 α -isopropylidenedioxyprednisolone, $C_{24}H_{31}FO_6$.

Properties: Crystals; m.p. 276-279°C. Optical rotation $(25^\circ/D) + 124.9^\circ$ (in dimethylformamide). Soluble in organic solvents; insoluble in water.

Derivation: Prepared by stirring a suspension of triamcinolone in acetone in the presence of a trace of perchloric acid.

Grades: N.N.D.

Use: Medicine.

1,3,5-triaminobenzene $C_6H_3(NH_2)_3$.

Properties: M.p., anhydrous, 129°C; hydrate, 84-86°C (1.5 moles water). Soluble in water, acetone, and alcohol. Insoluble in ether, cold benzene, carbon tetrachloride, and petroleum ether.

Containers: Bottles; fiber drums. Supplied as hydrochloride.

Uses: Possible ion exchange resin intermediate, possible wetting and frothing agent component, in photographic developers and organic reactions.

Shipping regulations: None.*

2,4,6-triaminotoluene trihydrochloride

$C_6H_2(NH_2HCl)_3 \cdot CH_3 \cdot H_2O$.

Properties: Fine light tan to cream crystals; very soluble in water, soluble in alcohol and acetone; insoluble in benzene. Melting point 119°C (free base).

Grades: Technical.

Containers: Bottles; fiber drums.

Uses: In nongelatin photographic emulsion with ethylenediamine for fixation; possible ion exchange resin component; possible wetting and frothing agent component; in photographic developers; possible intermediate in making various organic chemicals and pharmaceuticals; and as bases for varnishes and rubber chemicals.

Shipping regulations: None.*

2,4,6-triamino-sym-triazine. See melamine.

triethylamine $(C_2H_5)_3N$.

Properties: Color yellow; sp.gr. (20°C) 0.79-0.80; triethylamine content at least 98.0%; initial b.p. not below 215°C, 95% boils between 225 and 260°C; wt/gal 6.60 lbs; flash point 174°F. Viscosity (20°C) 0.02421 poise; refractive index (18°C) 1.4374; surface tension (13°C) 24.4 dynes/cm; specific heat at room temperature 0.51 cal/gm; coefficient of expansion 0.00091 at 20-60°C; vapor pressure (26°C) 7 mm; heat of vaporization 79 cal/gm; insoluble in water; soluble in gasoline.

Derivation: From the reaction of amyl chloride and ammonia.

Containers: 1-gal, 5-gal cans; 55-gal drums.

Uses: Corrosion inhibitor, insecticidal preparations.

triethylbenzene $(C_2H_5)_3C_6H_5$.

Properties: Sp.gr. (20°C) 0.87; boiling range 300-320°C; color water-white; odor faintly aromatic. Flash point 270°F.

triethyl borate $(C_2H_5)_3BO_3$.

Properties: Sp.gr. (20°C) 0.845; boiling range 220-280°C; flash point 180°F; color water-white; odor faintly alcoholic. Soluble in alcohol and ether.

Derivation: Direct heating of boric acid and amyl alcohol.

Use: Varnish.

tri-para-tert-amylphenyl phosphate

$(C_5H_{11}C_6H_4)_3PO_4$.

Properties: Boiling range 305-345°C at 5mm; m.p. 62-63°C; white solid; odorless; insoluble in water.

Use: Plasticizer.

"Triangle." ¹¹⁰ Brand name for general purpose channel black for use in paints, inks and plastics.

tri-para-anisylchloroethylene. See chlorotrianiene.

triarylmethane dyes. Dyes whose molecular structure involves a central carbon atom joined to three aromatic nuclei. The Colour Index ranges from 657 to 738. The color of these dyes is due in part to the aromatic rings and to the groups $=C=NH$ and $=C=N-$. The members of this class function as basic dyes for cotton, using tannin as a mordant, or, if they contain sulfonic acid groups, as acid dyes for wool and silk. Examples are malachite green and methyl violet.

as-triazine-3,5(2H,4H)dione riboside. See 6-azauridine.

s-triazine-2,4,6-triol. See cyanuric acid.

s-triazine-2,4,6-trione. See isocyanuric acid.

"Tribase." ³⁰⁴ Trade name for hydrous tri-basic lead sulfate $(3PbO \cdot PbSO_4 \cdot H_2O)$ vinyl stabilizer.

Properties: Fine white powder, sp.gr. 7.1, refractive index 2.1.

Containers: Fiberboard drums containing 75 and 400 lbs.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: For electrical and other vinyl compounds requiring high heat stability. Special "XL" grade available for vinyl electrical insulation.

"Tribase-E." ³⁰⁴ Trade name for basic lead silicate sulfate vinyl stabilizer.

Properties: Fine white powder, sp.gr. 5.55, refractive index 2.1.

Containers: Multiwall paper bags (50 lbs. net).

Uses: A low specific gravity stabilizer with good electrical properties and moisture repellency for vinyl insulation. Special "XL" grade available for vinyl electrical insulation.

tribasic copper sulfate $\text{CuSO}_4 \cdot 3\text{Cu}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: Aqua colored powder of extremely fine particle size; water insoluble; stable in storage, forms essentially neutral water dispersion.

Containers: 50-lb bags and 48-lb cases (8 x 6 lb bags).

Uses: A fixed copper fungicide. Also nutritional trace element for plants. Compatible with DDT, arsenicals, organic insecticides, sulfur and cryolite. Used as spray or dust. Does not inhibit photosynthesis.

tribenzoin. See glyceryl benzoate.

triboluminescence. The emission of energy as light as a result of the fracture of crystals by impact or friction. It is believed to be due to an imbalance of electric charges on the newly formed crystal cleavage planes, and a consequent transfer of electrons. Illustrations are the pulverizing of sugar crystals in a mortar or the shaking of certain liquid or solid particles in vessels of different electron affinities.

tribromoacetaldehyde (bromal) CBr_3CHO .

Properties: An oily yellowish liquid; sp.gr. 2.66, b.p. 174°C. Soluble in water, alcohol, or ether.

Derivation: (a) By adding bromine to a solution of paraldehyde in ethylacetate. (b) By adding bromine to absolute alcohol, fractionating, treating the fraction boiling at 165° to 180°C with water and distilling.

Uses: Medicine, organic synthesis.

Shipping regulations: None.*

tribromoacetic acid CBr_3COOH .

Properties: Colorless crystals; soluble in water, alcohol, or ether. M.p. 135°C, b.p. 245° to 250°C.

Derivation: By oxidizing bromal with nitric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; kegs.

Use: Organic synthesis.

Shipping regulations: None.*

tribromo-tert-butyl alcohol (acetone-bromoform) $\text{CBr}_3\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Fine white prismatic crystals; camphor odor and taste; m.p. 176°C. Slightly soluble in water; soluble in alcohol and ether.

Derivation: Reaction of acetone and bromoform with solid potassium hydroxide.

Use: Medicine.

Shipping regulations: None.*

tribromoethanol (1, 1, 1-tribromoethyl alcohol) $\text{CBr}_3\text{CH}_2\text{OH}$.

Properties: White crystals or powder with slight aromatic odor and taste; m.p. 79-82°C; b.p. 94°C (11 mm); unstable in air and light; slightly soluble in water; soluble in alcohol, ether, benzene, and amylene hydrate; aqueous and alcoholic solutions decompose on exposure to light.

Grade: U.S.P. XVI.

Derivation: By reduction of tribromoacetaldehyde with aluminum isopropylate.

Use: Medicine.

1, 1, 1-tribromoethyl alcohol. See tribromoethanol.

tribromomethane. See bromoform.

1, 1, 1-tribromo-2-methyl-2-propanol $\text{CBr}_3\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Fine white crystals; m.p. 176-177°C, soluble in water, methanol, ether.

Use: Organic synthesis.

tribromonitromethane. See bromopicrin.

tribromophenol. See bromol.

tribromophenol-bismuth. See bismuth tribromophenate.

"Triburon" Chloride. ¹⁹⁰ Trademark for a brand of triclobisomum chloride (q.v.).

tributoxyethyl phosphate.

Properties: Slightly yellow oily liquid. Insoluble or limited solubility in glycerin, glycols and certain amines. Soluble in most other organic liquids.

Typical specifications Sp.gr. 1.020 (20°C), f.p. < -70°C (viscous liquid), boiling range 215-228°C (4 mm); acidity 0.06% (max) as acetic acid, flash point 435°F; fire point 485°F, vapor pressure < 0.1 mm Hg (150°C), refractive index 1.434 (25°C), viscosity 12 cps (20°C), coefficient of thermal expansion 0.00081 from 10-40°C, wt/gal 8 lbs.

Containers: 5-gal cans (40-lb net); 55-gal steel drums (460-lbs net).

Uses: Primary plasticizer for most resins imparting low temperature flexibility, flame retardance and permanent flexibility.

tri-n-butyl aconitate $\text{C}_3\text{H}_7(\text{COOC}_4\text{H}_9)_3$.

Properties. Colorless, odorless liquid; sp.gr. 1.018 (20°C), refractive index 1.4500-1.4530 (25°C); b.p. 190°C (3 mm); insoluble in water; soluble in organic solvents; free acidity (max) 0.1%; residue on ignition (max) 0.05%; color (max) 150 APHA; water (Karl Fischer) 0.12% (max).

Containers: 8-oz sample; 450-lb drums; tank cars and wagons.

Uses: Plasticizer-stabilizer for vinylidene chloride polymers, nitrile and Buna-S rubbers, and cellulose-type lacquers. Insecticides.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tri-n-butylaluminum ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$)₃Al.

Properties: Colorless, pyrophoric liquid.

Derivation: Exchange reaction of butene-1 and isobutyl aluminum.

Uses: Production of organo-tin compounds.

tri-n-butylamine (C_4H_9)₃N.

Properties: Pale yellow liquid with amine odor. B.p. 214°C; f.p. below -70°C; sp. gr. (20/20°C) 0.7782; wt/gal 6.5 lbs; flash point (open cup) 175°F. Insoluble in water; soluble in most organic solvents.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grade: Technical.

Containers: 5-, 55-gal drums; tank cars.

Uses: Solvent; inhibitor in hydraulic fluids; intermediate.

Shipping regulations: None.*

tri-n-butylborane (tri-n-butylborine) ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$)₃B.

Properties: Colorless pyrophoric (spontaneously flammable) liquid; m.p. -34°C, b.p. +170°C (222 mm), density (25°C) 0.747 g/ml; vapor pressure (20°C) 0.1 mm; refractive index (n_D 20/D) 1.4285; insoluble in water; soluble in most organic solvents. Flash point -32°F.

See trialkyl boranes for uses and further properties.

Caution: Must be stored, transferred, or used in an inert atmosphere such as dry nitrogen or argon. Should be stored in dry, ventilated rooms at normal temperature.

Shipping regulations: Flammable liquid. Red label. (up to 150 lbs in cylinders).*

tributyl borate (butyl borate) (C_4H_9)₃BO₃.

Properties: Water-white liquid; sp. gr. 0.8550-0.8570; b.p. 232.4°C (760 mm); distillation range, 85% distills between 135°C and 140°C (40 mm); refractive index (n_D 25/D) 1.4071; m.p. less than -70°C, viscosity 1.601 cps (25°C); flash point (open cup) 185°F; hydrolyzes rapidly in presence of water; miscible with common organic liquids such as aliphatic alcohols, esters, diacetone, chloroform, carbon tetrachloride, and naphtha.

Derivation: From butyl alcohol and boric acid.

Uses: Agent for impregnating with crystalline boric acid to render textiles fire-resistant and to prevent plastic sheets and fibers from sticking together. Improves adhesion of lacquers and inks to metal surfaces, inhibits formation of wax crystals in oil at low temperatures; as gas welding flux leaves smoother, cleaner surface, drying agent to remove water from nonaqueous systems; antigelling agent.

tri-n-butylborine. See tri-n-butylborane.

tributyl citrate (butyl citrate)

Properties: Colorless or pale yellow, stable, odorless nonvolatile liquid. Practically insoluble in water.

Constants: M.p. -20°C; b.p. approximately 233.5°C at 22.5 mm; flash point 185°C

(365°F); refractive index 1.4453 at 20°C; sp. gr. (25/25°C) 1.042; wt/gal 8.7 lbs at 68°F; pour point -80°F; viscosity (25°C) 31.9 cps; evaporation rate at 105°C 0.000065 g/sq cm/hr.

Typical specifications: Purity not less than 99% ester by weight; sp. gr. 1.043-1.049 (20/20°C); acidity not more than 0.2%, calculated as citric acid; water content, no turbidity when one volume is mixed with 19 vols. of 60° Bé gasoline at 20°C; color, water-white.

Grade: Technical.

Containers: 1-gal, 25-lb cans; 55-gal, 87-lb drums; tank cars.

Uses: Plasticizer; antifoam agent; solvent for cellulose nitrate.

Shipping regulations: None.*

tri-para-tert-butylphenyl phosphate

Properties: Solid, b.p. (5 mm) 320°C; m.p. 102-105°C; flash point 275°C; insoluble in water.

Use: Plasticizer.

tributyl phosphate (C_4H_9)₃PO₄.

Properties: Stable, colorless, odorless, light-fast liquid. Miscible with most solvents and diluents.

Constants: Refractive index 1.4226 at 20°C; b.p. 177-178°C at 27 mm; latent heat of vaporization 55.1 cal/gm at 289°C; m.p. below -80°C; flash point 380°F; Saybolt viscosity 38.6 seconds at 85°F, wt/gal 8.19 lbs.

Typical specifications: Sp. gr. 0.973-0.983 at 20/20°C; acidity not more than 0.05%, calculated as phosphoric acid; water no turbidity when 1 vol. is mixed with 19 vols. of 60° Bé gasoline at 20°C; color water-white.

Grade: Technical.

Containers: 1-gal cans, 5-, 55-gal steel drums, tank cars.

Uses: Heat exchange medium; solvent extraction of metal ions from solution of reactor products, solvent for nitrocellulose, cellulose acetate; plasticizer; lacquers; plastics; pigment grinding assistant; solvent in inks; antifoam agent; dielectric; blending agent.

Shipping regulations: None.*

tri-n-butyl phosphine ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$)₃P.

Properties: Sp. gr. 0.8100 (min at 25/4°C); f.p. -60 to -65°C, b.p. 249°C (max); flash point 40°C; fire point 43°C; auto ignition point 260°C; refractive index (25°C) 1.4588; almost insoluble in water; miscible with ether, methanol, ethanol, benzene.

Uses: Fuel additive; epoxy resin curing catalyst; vinyl and isocyanate polymerization; organic intermediate.

tributyl phosphite ($\text{C}_4\text{H}_9\text{O}$)₃P.

Properties: Water-white liquid; b.p. 120°C (8 mm); sp. gr. 0.911 (25°C); refractive index (n_D 25/D) 1.4301. Soluble in common organic solvents.

Containers: Carboys.

Uses: Additive for greases and extreme-pressure lubricants; stabilizer for fuel oils and polyamides; gasoline additive. . .

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

O, O, O-tributyl phosphorothioate (tributyl thiophosphate) $(C_4H_9O)_3PS$.

Properties: Colorless liquid with characteristic odor. B. p. (4.5 mm) 142-145°C; sp. gr. 0.987; flash point (Cleveland open cup) 295°F. Insoluble in water; soluble in most organic solvents.

Containers: 1-, 4-lb bottles; 5-, 55-gal drums.

Uses: Plasticizer; lubricant additive, anti-foam agent; hydraulic fluid; intermediate.

S, S, S-tributyl phosphorotrithioate ("DEF") $(C_4H_9S)_3PO$.

Properties: A liquid with boiling point 150°C (0.3 mm). Insoluble in water; soluble in aliphatic, aromatic, and chlorinated hydrocarbons.

Use: Cotton defoliant.

tributyl thiophosphate. See tributyl phosphorothioate.

tributyltin acetate $(C_4H_9)_3SnOOCCH_3$.

Properties: White crystalline solid.

Derivation: Reaction of sodium acetate with tributyltin chloride.

Uses: Fungicide and bactericide.

tributyltin chloride $(C_4H_9)_3SnCl$.

Derivation: Reaction of tetrabutyltin with dibutyltin chloride.

Use: Rodenticide.

tributyltin oxide $(C_4H_9)_3SnOSn(C_4H_9)_3$.

Properties: Colorless to pale yellow liquid, soluble in many organic solvents, practically insoluble in water, b. p. 180°C (2 mm).

Uses: Bactericide, fungicide.

tri-n-butyl tricarballate

$(C_4H_9OCOCH_2)_2CHCOOC_4H_9$.

Properties: Sp. gr. (24°C) 1.004, refractive index (26.5°C) 1.4388, b. p. 305°C, insoluble in water.

Use: Plasticizer.

tributyrin. See glyceryl tributyrate.

tricalcic phosphate. See calcium phosphate, tribasic.

tricalcium aluminate. See calcium aluminate.

tricalcium orthoarsenate. See calcium arsenate.

tricalcium orthophosphate. See calcium phosphate, tribasic.

tricalcium phosphate. See calcium phosphate, tribasic.

tricalcium silicate. See cement, Portland, and other cement articles. Also used as an anticaking agent in foods.

tricaprin (glyceryl tricaprylate)

$C_3H_5(C_{10}H_{19}O_2)_3$. Triclinic crystals, insoluble in water, sp. gr. 0.921; m. p. 31°C.

tricarbimide. See cyanuric acid.

tricarboxylic acid cycle. See TCA cycle.

trichloroacetaldehyde. See chloral.

trichloroacetic acid (TCA) CCl_3COOH .

Properties: Deliquescent colorless crystals;

sharp pungent odor; strongly corrosive; sp. gr. 1.6298; m. p. 57.5°C; b. p. 197.5°C; soluble in water, alcohol, and ether.

Derivation: (1) Treating chloral hydrate with fuming nitric acid; (2) from glacial acetic acid by the action of chlorine in presence of sunlight, ultraviolet radiation or catalysts.

Method of purification: Crystallization.

Grades: Technical; C.P.; U.S.P. XVI.

Containers: Tightly stoppered glass bottles; drums.

Uses: Organic synthesis; reagent for detection of albumin; medicine; pharmacy; herbicides.

trichloroacetic aldehyde. See chloral.

trichloroacetic aldehyde, hydrated. See chloral hydrate.

1, 2, 3-trichlorobenzene $C_6H_3Cl_3$.

Properties: White crystals; sp. gr. (solid) 1.69; refractive index (19°C) 1.5776; b. p. (760 mm) 221°C, m. p. 52.6°C; insoluble in water; slightly soluble in alcohol, soluble in ether.

Use: Synthesis.

1, 2, 4-trichlorobenzene $C_6H_3Cl_3$.

Properties: Colorless, stable, refractive liquid. Odor similar to that of orthodichlorobenzene. Miscible with most organic solvents and oils. Insoluble in water. Sp. gr. 1.4634 (25°C), b. p. 213°C; m. p. 17°C, flash point 100°C.

Derivation: Further chlorination of monochlorobenzene.

Grades: Technical, 99%, mixture of 1, 2, 4- and 1, 2, 3- isomers distilling at 213-219°C.

Containers: 1-, 2-gal cans, 60- 650-lb drums, tank cars.

Uses: Solvent in chemical manufacturing; dyes and intermediates, dielectric fluid, synthetic transformer oils, lubricants; heat transfer medium, insecticides.

1, 1, 1-trichloro-2, 2-bis(para-chlorophenyl)-ethane. Correct chemical name for DDT.

B-trichloroborazole $\overline{BCINHB}CINHB\overline{CINHB}$.

Properties: White crystalline solid; m. p. 84.5-85.5°C; b. p. 96.5-98°C/37 mm. Soluble in many organic solvents. Highly reactive.

Uses: Intermediate, gelling agent, catalyst; complexing agent.

trichlorobromomethane. See bromotrichloromethane.

2, 2, 3-trichlorobutanal. See butyl chloral.

trichloro-tert-butyl alcohol. See chlorobutanol.

trichlorobutyraldehyde. See butyl chloral.

trichlorobutyraldehyde hydrate. See butyl chloral hydrate.

3, 4, 4'-trichlorocarbanilide

$C_6H_3Cl_3NHCONHC_6H_4Cl$. Colorless, heat resistant, highly insoluble bacteriostat, useful in soaps and detergents; plastics.

1, 1, 1-trichloroethane (methyl chloroform) CH_3CCl_3 .

Properties: A colorless liquid; sp. gr. 1.325;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

b.p. 75°C. Insoluble in water, soluble in alcohol and ether.

Containers: Drums; tank cars.

Use: Medicine; solvent.

See "Chloroethene."

1,1,2-trichloroethane (vinyl trichloride, beta-trichloroethane) $\text{CHCl}_2\text{CH}_2\text{Cl}$.

Properties: Clear, colorless liquid. Characteristic sweet odor; nonflammable. B.p. 113.7°C; latent heat of vaporization 68.7 cal/g, 123.5 Btu/lb; specific heat 0.270 (20°C) cal/g/°C; sp.gr. 1.4432 (20°C/4°C); refractive index 1.4458; vapor pressure 16.7 mm (20°C); wt/gal 12.0 lbs (20°C); f.p. -36.4°C, flash point, none, fire point, none; specific resistivity 5.2×10^8 ohms/cm, viscosity 1.20 cps (20°C). Miscible with alcohols, ethers, esters, and ketones, insoluble in water.

Grade: Technical.

Containers: 55-gal drums, tank cars.

Uses: Solvent for fats, oils, waxes, resins, other products, organic synthesis.

beta-trichloroethane. See 1,1,2-trichloroethane.

trichloroethanol $\text{CCl}_3\text{CH}_2\text{OH}$.

Properties: Viscous liquid, ether-like odor.

Slightly soluble in water, miscible with alcohol, ether, and carbon tetrachloride.

B.p. 150°C, f.p. (approx) 13°C, sp.gr (25/4°C) 1.541.

Use: Intermediate.

trichloroethylene (tri) $\text{CHCl}:\text{CCl}_2$.

Properties: Stable, low-boiling, colorless, heavy, mobile, toxic liquid. Use with adequate ventilation. Chloroform-like odor. Nonflammable, nonexplosive, and non-combustible. Will not attack the common metals, even in the presence of moisture, b.p. 86.7°C, m.p. -73°C, sp.gr. 1.456-1.462 (25/25°C), refractive index 1.4735 (27°C), surface tension 32.0 dynes/cm (25°C), vapor pressure 60.0 mm (20°C), specific heat 0.229 cal/gm (23°C); flash point (ASTM open cup) none at b.p., latent heat of evaporation 57.3 cal/g at b.p.; coefficient of expansion (per °C) 0.00115 to 0.00125 (20°C); vapor density 0.277 lbs/cu ft (90°C), 3.6 cu ft/lb (90°C), viscosity at 25°C 0.550 cps, heat of vaporization 57 kcal/kg, 104.5 Btu/lb, thermal conductivity (liquid) (64°F) 0.0672 Btu/sq ft/ft/°F/hr, wt/gal 12.16 lbs (25°C); fire point none; dielectric constant 3.27 (1000 cycle), power factor 2.2% (1000 cycle), specific resistivity 6.6×10^9 ohms/cm.

Typical specifications: Acidity not more than 0.001% (as hydrochloric); color water-white; sp.gr. 1.47-1.48 (15°C/15°C); boiling range, 95% or better distills from 86.0 to 87.5°C (760 mm); free chlorine none; residu none from filtered sample; average wt 12.20 lbs/gal (20°C). Miscible with all common organic solvents; practically insoluble in water.

Derivation: (a) From tetrachloroethane by treatment with lime or alkali in the presence of water, or by thermal decomposition,

followed by steam distillation. Tetrachloroethane is obtained by chlorination of acetylene. (b) From ethylene by chlorination followed by fractional distillation.

Grades: U.S.P. XVI; technical; high purity; ~~electronic~~.

Containers: Cans; drums, tank trucks; tank cars.

Uses (in approximate order of importance):

Metal degreasing; extraction solvent for oils, fats, waxes; dry cleaning, refrigerant and heat exchange liquid; organic syntheses; fumigant. The electronic grade is used for cleaning and drying electronic parts.

Warning: Vapor harmful. MCA warning label.

Shipping regulations: None.*

trichlorofluoromethane (fluorotrichloromethane; fluorocarbon-11) CCl_3F .

Properties: Colorless, nearly odorless, volatile liquid. B.p. 23.7°C, f.p. -111°C; sp.gr. 1.494 (17.2°C); critical pressure 43.2 atm.

Derivation: From carbon tetrachloride and hydrogen fluoride, in the presence of fluorinating agents such as antimony tri- and penta-fluorides.

Grades: Technical, 99.9% min.

Containers: Drums; cylinders.

Uses: Solvent; fire extinguishers, refrigerant; aerosol propellants; air conditioning.

Shipping regulations: Nonflammable gas.

Green label.*

trichloroisocyanuric acid (1,3,5-trichloro-s-triazine-2,4,6-trione) $\text{O}=\text{NC}(\text{Cl})\text{CONC}(\text{Cl})\text{CONC}(\text{Cl})$.

Properties: White, slightly hygroscopic, crystalline powder or granules; loose bulk density (approx) powder 31 lbs/cu ft, granular 60 lbs/cu ft.

Active ingredient: Approx. 90% available chlorine.

Containers: 200-lb fiber drums.

Uses: Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, detergent-sanitizers, and commercial laundry bleaches.

trichloroisopropyl alcohol. See isopral.

trichloromelamine (N,N',N''-trichloro-2,4,6-triazine-1,3,5-triazine)

$\text{NC}(\text{NHCl})\text{NC}(\text{NHCl})\text{NC}(\text{NHCl})$.

Properties: Fine white powder, slightly soluble in water and glacial acetic acid; insoluble in carbon tetrachloride and benzene; pH saturated aqueous solution 4.

Derivation: By chlorination of melamine.

Grades: 89% available chlorine; see also

"Sterimine."

Containers: Polyethylene bags in fiber drums. Hazard: Flammable; can ignite spontaneously with oils and other reactive organic materials.

Uses: As a chlorine bleach and bactericide.

Shipping regulations: None.*

trichloromethane. See chloroform.

trichloromethyl chloroformate (diphosgene) ClCOOCCl_3 .

Properties: Colorless, mobile liquid. Odor

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

is somewhat like that of phosgene (new-mown hay). Decomposed by heat, porous substances, activated carbons (with evolution of phosgene). Also decomposed by alkalis, hot water. Caution! Not so irritant as the mono- and di- compounds but more toxic and asphyxiating! Soluble in alcohol, benzene, and ether.

Constants: Sp.gr. 1.65 (15°C); b.p. 127-128°C; m.p. -57°C; vapor density 6.9 (air = 1); refractive index 1.45664 (22°C).

Derivation: (a) By chlorinating methyl formate. (b) By chlorinating methyl chloroformate. In both methods the mixture of chloro-derivatives is then separated by fractionation.

Grade: Technical.

Uses: Organic synthesis; military poison gas. Shipping regulations: Poison, class A. Poison gas label. Legal label name: diphosgene.*

trichloromethyl ether $\text{CHCl}_2\text{OCH}_2\text{Cl}$.

Properties: Liquid. Pungent odor. Caution! Very irritant! Lachrymatory. Sp.gr. 1.5066 (10°C); b.p. 130-132°C. Soluble in alcohol, benzene, and ether; insoluble in water.

Shipping regulations: Poison, class A. Poison gas label.*

N-trichloromethylmercapto-4-cyclohexene-1,2-dicarboximide. See captan.

trichloromethyl phenyl carbonyl acetate.

Properties: White crystalline substance, intense rose odor; m.p. 86-88°C. Clearly soluble in 18 parts of 95% alcohol.

Containers: Fibre drums.

Uses: In rose perfumes.

Shipping regulations: None.*

trichloromethylphosphonic acid $\text{CCl}_3\text{P}(\text{OH})_2$.

Strong dibasic acid, soluble in water and alcohol; insoluble in benzene and hexane. Used as an acid catalyst and condensation agent.

1,1,1,-trichloro-2-methyl-2-propanol. See chlorobutanol.

trichloromethylsulfenyl chloride. See perchloromethyl mercaptan.

N-trichloromethylthiotetrahydrophthalimide. See captan.

trichloronaphthalene. See chloronaphthalenes.

trichloronitromethane. See chloropicrin.

trichloronitrosomethane CCl_3NO .

Properties: Dark blue liquid. Unpleasant odor. Slowly decomposes, but is more stable in solution. Caution! Very irritant! Soluble in alcohol, benzene, ether; insoluble in water. Sp.gr. 1.5 (20°C); b.p. 5°C (70 mm).

Derivation: Interaction of sulfuric acid, sodium trichloromethylsulfonate, potassium nitrate, and sodium nitrate.

Grade: Technical.

Uses: Organic synthesis; military poison gas (lachrymator).

Shipping regulations: Poison, class A. Poison gas label.*

2,4,5-trichlorophenol $\text{C}_6\text{H}_2\text{Cl}_3\text{OH}$.

Properties: Gray flakes in sublimed mass with a strong phenolic odor; sp.gr. (25°/4°C) 1.678; b.p. 252°C; m.p. 61-63°C; no flash or fire point. Soluble in alcohol, ether, and acetone.

Use: Fungicide, bactericide.

Caution: May cause skin irritation. MCA warning label.

2,4,6-trichlorophenol $\text{C}_6\text{H}_2\text{Cl}_3\text{OH}$. (2,4,6-T).

Properties: Yellow flakes with strong phenolic odor; sp.gr. (25°/4°C) 1.675; f.p. 61°C; b.p. 248-249°C, no flash or fire point. Soluble in acetone, alcohol, and ether.

Use: Fungicide.

Caution: May cause skin irritation. MCA warning label.

2,4,5-trichlorophenoxyacetic acid (2,4,5-T) $\text{C}_6\text{H}_2\text{Cl}_3\text{OCH}_2\text{CO}_2\text{H}$.

Properties: Light tan solid; m.p. 151-153°C, soluble in alcohol; insoluble in water; available as sodium and amine salts.

Containers: 50-, 200-lb drums.

Uses: Plant hormone; herbicide.

Warning: Irritating to eyes, nose and throat. MCA warning label.

Also available in form of esters, as, 2,4,5-trichlorophenoxyacetic acid, isopropyl ester.

2,4,5-trichlorophenyl acetate $\text{C}_6\text{H}_2\text{Cl}_3\text{OOCCH}_3$.

Use: As fungicide, especially on cotton seed.

1,2,3-trichloropropane $\text{CH}_2\text{ClCHClCH}_2\text{Cl}$.

Properties: Colorless liquid; sp.gr. 1.3888 (20°/4°C), b.p. 156.17°C, refractive index (n_D 20) 1.4841. Slightly soluble in water; dissolves oils, fats, waxes, chlorinated rubber and numerous resins.

Derivation: Chlorination of propylene.

Uses: Paint and varnish remover, nonflammable solvent; degreasing agent.

trichlorosilane.

1. SiHCl_3 (silicocchloroform).

Properties: Colorless very volatile liquid, b.p. 31.8°C; m.p. -127°C; density 1.35 (0°C).

Use: Since this silane is relatively easy to prepare, it has been much used as a source material in laboratory synthesis of organic silanes such as trimethyl silane and triphenyl silane.

Shipping regulations: Flammable liquid. Red label.*

2. Generic name for compounds of the formula RSiCl_3 of which methyl trichlorosilane, CH_3SiCl_3 , is most important.

N,N',N''-trichloro-2,4,6-triamine-1,3,5-triazine. See trichloromelamine.

2,4,6-trichloro-1,3,5-triazine. See cyanuric chloride.

1,3,5-trichloro-s-triazine-2,4,6-trione. See trichloroisocyanuric acid.

trichlorotrifluoroacetone (1,1,3-trichloro-1,3,3-trifluoroacetone) $\text{CCl}_2\text{FCOCClF}_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Colorless lachrymatory liquid; b.p. 84.5°C. Soluble in all proportions with water and most organic solvents. Stable to acid but not alkalis.

Containers: 1-lb bottles.

Uses: Solvent in acid media; complexing agent.

1,1,2-trichloro-1,2,2-trifluoroethane (trifluorotrichloroethane; fluorocarbon 113) $\text{CCl}_2\text{FCClF}_2$.

Properties: Colorless, nearly odorless, volatile liquid. B.p. 47.6°C, f.p. -35°C; critical pressure 33.7 atm; sp.gr. 1.42 (25°C).

Grade: Technical.

Containers: Drums.

Uses: Solvent; fire extinguishers; refrigerant; to make chlorotrifluoroethylene.

tricholine citrate (tris(2-hydroxyethyl)trimethylammonium citrate).

Containers: Carboys (65% solution).

Use: Medicine, nutritional factor.

"Triclene." ²⁸ Trademark for trichloroethylene. Available in five grades.

Technical and Dry Cleaning Grade. Boiling range 86.6°-88.0°C. Wt/gal 12.19 lb at 20°C.

Uses: Dry cleaning and spotting; textile cleaning, as solvent for adhesives and waxes, asphaltic paint remover, for coating paper, organic reagent.

Metal Degreasing Grade. Boiling range 86.4°-87.9°C. Wt/gal 12.16 at 20°C.

Uses: Specifically stabilized for vapor degreasing of metals, liquid flushing of liquid oxygen and missile fuel systems and their component parts, low temperature heat transfer liquid, vapor drying of metals.

Paint Grade. Boiling range 85.4°-87.9°C. Wt/gal 12.14 lb at 20°C.

Uses: As a thinner for paints based on several types of alkyd resins; on asphaltic materials, including gilsonite and on some specialty resins, such as certain acrylics, epoxy esters, chlorinated rubbers, ethyl cellulose, etc.

Extraction Grade. Boiling range 86.5°-87.5°C. Wt/gal 12.23 lb at 20°C.

Uses: Extraction solvent for many waxes, resins, and alkaloids, flushing solvent; cold cleaner.

Freezing-point Depressant Grade. Wt/gal 12.21 lb at 20°C.

Containers: All grades, 55-gal (660-lb) drums, tank trucks, tank cars.

Uses: Freezing-point depressant for fire extinguisher fluids.

triclobisonium chloride $\text{C}_{36}\text{H}_{74}\text{Cl}_2\text{N}$. N,N'-Bis-[1-methyl-3-(2,2,6-trimethylcyclohexyl)-propyl]-N,N'-dimethyl-1,6-hexanediamine bis(methochloride). A crystalline powder; soluble in water, alcohol, chloroform; insoluble in ether. Used in medicine (external).

tricobalt tetraoxide. See cobalto-cobaltic oxide.

"Tricoloid." ³⁰¹ Trademark for tricyclamol, an anticholinergic, used in medicine.

tricosane (n-tricosane) $\text{CH}_3(\text{CH}_2)_{21}\text{CH}_3$.

Properties: Glittering leaflets. Soluble in alcohol; insoluble in water. Sp.gr. 0.779 (48°C); b.p. 234°C (15 mm); m.p. 48°C.

Grade: Technical.

Containers: 1- and 5-lb glass bottles; fiber containers.

Use: Organic synthesis.

n-tricosanoic acid $\text{CH}_3(\text{CH}_2)_{21}\text{COOH}$. A saturated fatty acid not normally found in natural fats or oils. Synthetic compound is a white crystalline solid; m.p. 79.1°C. Purified product is used in medical research and as reference standard for gas chromatography.

tricresyl phosphate (tritoyl phosphate; TCP) $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_3\text{PO}$. A mixture of isomers.

Properties: Practically colorless, odorless liquid. Stable, nonvolatile. The ortho isomer is reputed to be the toxic element when present in isomeric mixtures. B.p. 420°C; dilution ratio with toluene 3.2; evaporative residue at atmospheric pressure not weighable; ignition temperature, nonflammable; refractive index 1.556 (25°C), sp.gr. 1.162 (25/25°C), wt/gal 9.7 lbs; crystallizing point below -35°C. Typical specifications: (of "ortho-free" grade) Form, clear oily liquid; essentially colorless; sp.gr. 1.166±0.007 (25/25°C), refractive index 1.556±0.001 (20°C); acidity (as H_3PO_4) 0.01% max; free phenols (permanganate test) a distinct purple color to be present after 30 minutes. (10 gram sample-40 cc N/100 KMnO_4). Miscible with all the common solvents and thinners, also with vegetable oils; insoluble in water.

Derivation: From cresylic acid and phosphorus oxychloride.

Grades: Coal tar; petroleum, to meet custom specifications.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Plasticizer for polyvinyl chloride, polystyrene, nitrocellulose, fire retardant for nitrocellulose; solvent mixtures; gasoline additive as lead scavenger; waterproofing and fireproofing compositions; additive to extreme pressure lubricants; hydraulic fluid and heat exchange medium.

tricresyl phosphite $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_3\text{P}$. (Not to be confused with tricresyl phosphate.)

Properties: Colorless liquid, slight phenolic odor. B.p. (0.11 mm) 191°C; sp.gr. (20/4°C) 1.115; flash point (open cup) 440°F. Insoluble in water; miscible with acetone, alcohol, benzene, ether, and kerosine.

Grades: Technical.

Uses: Stabilizer, plasticizer, and flame retardant for plastics and resins.

tricyanic acid. See cyanuric acid.

tricyclamol chloride

$\text{C}_6\text{H}_{11}\text{C}(\text{C}_6\text{H}_5)(\text{OH})\text{CH}_2\text{CH}_2\text{C}_4\text{H}_9\text{N}\cdot\text{CH}_3\text{Cl}$.

1-Cyclohexyl-1-phenyl-3-pyrrolidino-1-propanol methylchloride.

Properties: White, extremely bitter, crystalline powder; faint characteristic odor; soluble in alcohol and in water; stable.

Grade: N.N.D.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

n-tridecane $\text{CH}_3(\text{CH}_2)_{11}\text{CH}_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp.gr. 0.755 (20/4°C); b.p. 236°C; f.p. -5.45°C; refractive index 1.4250 (20/D); flash point 80°C.

Grades: 95%; 99%; research.

Containers: Glass bottles; 1-, 5-gal drums.

Use: Organic synthesis.

Shipping regulations: None.*

n-tridecanoic acid (tridecylic acid; tridecoic acid) $\text{CH}_3(\text{CH}_2)_{11}\text{COOH}$. A saturated fatty acid normally not found in vegetable fats but prepared synthetically.

Properties: Colorless crystals; m.p. 44.5°C; sp.gr. 0.8458 (80/4°C); b.p. 312.4°C (760 mm), 192.2°C (16 mm); refractive index 1.4328 (50°C). Slightly soluble in water; soluble in alcohol and ether.

Available as 99% pure product for organic synthesis; medical research.

tridecanol. See tridecyl alcohol.

tridecoic acid. See n-tridecanoic acid.

tridecyl alcohol (tridecanol). General term for a commercial mixture of isomers of the formula $\text{C}_{12}\text{H}_{25}\text{CH}_2\text{OH}$.

Properties: Water-white liquid with pleasant odor; boiling range 252-272°C; sp.gr. (20/20°C) 0.845; wt/gal 7.0 lbs; flash point (Tag open cup) 180°F.

Derivation: By Oxo process (q.v.) from C_{12} hydrocarbons.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Uses: Esters for synthetic lubricants; detergents; antifoam agent; tridecyl mercaptan; perfumes; tridecyl phthalate (plasticizer).

tri-n-decylaluminum $(\text{C}_{10}\text{H}_{21})_3\text{Al}$. A colorless liquid.

Derivation: From n-decene and isobutyl-aluminum.

Use: Polyolefin catalyst.

tridecyl bromide $\text{C}_{13}\text{H}_{27}\text{Br}$.

Properties: Colorless liquid; density 1.025 (20°C); b.p. 158-160°C (15 mm); insoluble in water.

tridecylic acid. See n-tridecanoic acid.

tridecyl phosphite $(\text{C}_{10}\text{H}_{21}\text{O})_3\text{P}$.

Properties: Water-white liquid; decyl alcohol odor; sp.gr. 0.892 (25/15.5°C); m.p. less than 0°C; refractive index 1.4565 (25°C).

Containers: 55-gal drums.

Uses: Chemical intermediate; stabilizer for polyvinyl and polyolefin resins.

tridihexethyl chloride

$\text{C}_6\text{H}_{11}(\text{C}_6\text{H}_5)(\text{OH})\text{CH}_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{C}_2\text{H}_5\text{Cl}$. 3-Diethylamino-1-phenyl-1-cyclohexylpropanol ethochloride; triethyl(3-hydroxy-3-cyclohexyl-3-phenyl propyl) ammonium chloride.

Properties: White, odorless, crystalline powder, bitter taste. Freely soluble in water, in methanol, in chloroform, and in alcohol. Practically insoluble in ether and

in acetone. Melting range 198-202°C.

Grade: N.F. XI.

Use: Medicine.

tri(dimethylphenyl)phosphate (trixylenyl phosphate) $[(\text{CH}_3)_2\text{C}_6\text{H}_4\text{O}]_3\text{PO}$.

Properties: Sp.gr. 1.155; refractive index 1.5535; b.p. (10 mm), 243-265°C; flash point, 233°C; solubility in water (85°C), 0.002% by weight.

Use: Plasticizer.

"Tridione." ³ Trademark for trimethadione.

tridodecyl amine. See trilauryl amine.

tridymite SiO_2 . A vitreous, colorless or white, native form of pure silica. Found variously but not so commonly as quartz (q.v.). Quartz will change into tridymite with a 16.2% increase in volume at 870°C. Unlike quartz, it is soluble in boiling sodium carbonate solution. Sp.gr. 2.28-2.3; hardness 7.

triethanolamine (TEA; tri(2-hydroxyethyl)-amine) $(\text{HOCH}_2\text{CH}_2)_3\text{N}$.

Properties: Colorless, viscous, hygroscopic liquid with slight ammoniacal odor; m.p. 21.2°C, b.p. 360°C; vapor pressure < 0.01 mm (20°C); sp.gr. 1.126; flash point (open cup) 375°F; wt/gal 9.4 lbs; miscible with water, alcohol; soluble in chloroform; slightly soluble in benzene and ether; slightly less alkaline than ammonia. Commercial product contains up to 25% diethanolamine and up to 5% monoethanolamine.

Derivation: Reaction of ethylene oxide and ammonia.

Grades: Technical; regular, 98%; N.F. XI.

Containers: 5-, 10-, 55-, 110-gal drums; 6000-, 8000-gal tank cars.

Uses: Fatty acid soaps used in drycleaning, cosmetics, household detergents, and a wide variety of oil emulsions (cutting oils, lubricants, textile processing, leather fatliquoring, etc.); wool scouring; textile anti-fume agent and water-repellent; dispersion of dyes, casein, shellac, rubber latex; corrosion inhibitor; softening agent, humectant, and plasticizer for textiles, glues, leather coatings, waxes, polishes; insecticide.

triethanolamine lauryl sulfate. A liquid or paste.

Containers: Drums, tank cars; tank trucks.

Uses: Detergent; wetting, foaming and dispersing agent for industrial, cosmetic and pharmaceutical applications.

triethanolamine oleate. See trihydroxyethylamine oleate.**triethanolamine stearate**. See trihydroxyethylamine stearate.**triethanolamine titanate**. See titanium chelates.**triethanolamine trinitrate phosphate**. See trinitrate phosphate.**1,1,3-triethoxyhexane**

$\text{CH}(\text{OC}_2\text{H}_5)_2\text{CH}_2\text{CH}(\text{OC}_2\text{H}_5)\text{C}_3\text{H}_7$.

Properties: Liquid; sp.gr. 0.8746 (20/20°C); b.p. 133°C (50 mm); f.p. -100°C; wt/

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

7.3 lb; flash point 210°F. Insoluble in water.

Use: Starting point for synthesis of aldehydes, acids, esters, chloride, amines, etc.

triethoxymethane. See triethyl orthoformate.

1,1,3-triethoxy-3-methoxypropane (triethylmethyl malonaldehyde diacetal)
(CH₃O)(C₂H₅O)CHCH₂CH(OC₂H₅)₂.

Properties: Sp. gr. (25/4°C), 0.9300; b.p. (6 mm) 86°C.

Grade: 99%.

Use: Intermediate; crosslinking and insolubilizing agent.

triethyl aconitate

C₂H₅OOCCHC(COOC₂H₅)CH₂COOC₂H₅.

Properties: Sp. gr. (25°C) 1.096; refractive index (26°C) 1.4517; b.p. (5 mm) 154-156°C.

Use: Plasticizer.

triethylaluminum (ATE) (C₂H₅)₃Al.

Properties: Clear colorless liquid; sp. gr. 0.837; m.p. -52.5°C; b.p. 194°C; specific heat 0.527 (91.4°F). Miscible with saturated hydrocarbons. Reacts violently with water; ignites on exposure to air. Also reacts vigorously with acids, halogens, alcohols and amines.

Derivation: Synthesized by introduction of ethylene and hydrogen into an autoclave containing aluminum. The reaction proceeds under moderate temperature and varying pressures.

Grade: 88-94%.

Containers: Cylinders.

Uses: Catalyst intermediate for polymerization of olefins, especially ethylene; pyrophoric fuels; production of alpha-olefins and long-chain alcohols; gas plating of aluminum.

Shipping regulations: Flammable liquid. Red label.*

triethylamine (C₂H₅)₃N.

Properties: Colorless liquid; strong ammoniacal odor. B.p. 89.7°C; f.p. -115.3°C; sp. gr. (20/20°C) 0.7293; wt/gal (20°C) 6.1 lbs; flash point (open cup) 25°F. Slightly

*soluble in water above 20°C; miscible with water below 18°C, alcohol, and ether.

Derivation: From ethyl chloride and ammonia under heat and pressure.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Catalytic solvent in chemical synthesis; manufacture of accelerator activators for rubber, and wetting, penetrating and waterproofing agents of quaternary ammonium types; solvent, corrosion inhibitor, propellant.

Shipping regulations: Flammable liquid. Red label.*

triethylbenzylammonium chloride

(C₂H₅)₃C₆H₅CH₂NCl.

Properties: White crystals; odorless; decomposes on heating; soluble in water and alcohol.

triethylborane (triethylborine) (C₂H₅)₃B.

Properties: Colorless, spontaneously flammable liquid. Density 0.68 (25°C); flash point -32°F; m.p. -93°C; b.p. 95°C; refractive index 1.3971; heat of combustion 20,000 Btu/lb. Miscible with most organic solvents; immiscible with water.

Derivation: Reaction of triethylaluminum and boron halide, or of diborane and ethylene.

Use: Igniter or fuel for jet and rocket engines.

Shipping regulations: Flammable liquid. Red label (up to 140 lb in cylinders).*

triethylborine. See triethylborane.

triethyl citrate C₃H₅O(COOC₂H₅)₃.

Properties: Colorless, mobile liquid. Bitter taste; b.p. (760 mm) 294°C; b.p. (1 mm) 126-127°C; sp. gr. 1.136 (25°C); refractive index 1.4405 (24.5°C); evaporation rate 0.000676 g/sq cm/hr (105°C); pour point -50°F; viscosity (25°C) 35.2 cps; solubility in water 6.5 g/100 cc; solubility in oil 0.8 g/100 cc.

Derivation: Esterification of citric acid.

Grades: Technical; refined.

Containers: Metal drums and cans; tank cars.

Uses: Solvent for cellulose nitrate, acetate and ethers, natural resins such as dammar and ester gums, starch ethers; plasticizer for cellulose nitrate and acetate and vinyl resins; softener; paint removers; agglutinant; perfume base.

Shipping regulations: None.*

triethylene glycol (TEG) HO(C₂H₄O)₃H.

Properties: Colorless, hygroscopic, practically odorless liquid. Similar in properties to diethylene glycol. Sp. gr. 1.1254 (20/20°C); b.p. 287.4°C (760 mm); vapor pressure less than 0.01 mm (20°C); flash point 330°F; wt/gal 9.4 lbs (20°C); coefficient of expansion 0.00069 (20°C); freezing point -7.2°C, viscosity 0.478 poise (20°C). Soluble in water; immiscible with benzene, toluene and gasoline.

Typical specifications: Acidity not more than 0.02% (as acetic); color (500 mm tube) not more than 5 yellow Lovibond; sp. gr. 1.122-1.127 (20/20°C); boiling range (760 mm) below 270°C none, below 280°C not more than 20%, below 290°C not less than 85%, below 300°C not less than 95%; average wt/gal 9.36 lbs (20°C).

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Solvent for nitrocellulose, various gums and resins; lacquers; organic synthesis; in air-conditioning units; bactericide (in vapor form); humectant in printing inks; textile conditioner.

Shipping regulations: None.*

triethylene glycol diacetate

CH₃COOCH₂CH₂OCH₂CH₂OCH₂CH₂OOCCH₃.

Properties: Sp. gr. (25°C) 1.112, refractive index n(25°C) 1.437; b.p. 300°C; m.p. less than -60°C.

Use: Plasticizer.

triethylene glycol dicaprylate (triethylene glycol dioctoate).

Properties: (typical specification) Clear

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

liquid; sp. gr. 0.973 (20°C); acidity 0.3% max. (caprylic); moisture 0.05% max; m. p. -3°C; b. p. 243°C (5 mm).

Uses: Low temperature plasticizer for synthetic resins and rubbers.

triethylene glycol dichloride. See triglycol dichloride.

triethylene glycol didecanoate

$C_9H_{19}COO(C_2H_4O)_3OCC_9H_{19}$.

Properties: B. p. 237°C at 2.0 mm Hg; sp. gr. 0.9584 (20/20°C); viscosity 28.6 cps (20°C).

Use: Plasticizer.

triethylene glycol di(2-ethylbutyrate)

$C_5H_{11}OCOCH_2(CH_2OCH_2)_2CH_2OCC_5H_{11}$.

Properties: A light-colored liquid, sp. gr. 0.9946 (20/20°C); 8.3 lb/gal (20°C), b. p. 196°C (5 mm); vapor pressure 5.8 mm Hg (200°C); solubility in water 0.02% by wt (20°C); viscosity 10.3 cps (20°C).

Use: Plasticizer.

triethylene glycol di(2-ethylhexoate)

$C_7H_{15}OCOCH_2(CH_2OCH_2)_2CH_2OCC_7H_{15}$.

Properties: A light-colored liquid, sp. gr. 0.9679 (20/20°C); 8.1 lb/gal (20°C); b. p. 219°C (5 mm), vapor pressure 1.8 mm Hg (200°C); insoluble in water, viscosity 15.8 cps (20°C).

Use: Plasticizer.

triethylene glycol dihydroabietate

$C_{19}H_{31}COOCH_2CH_2OCH_2CH_2OCH_2CH_2OCC_{19}H_{31}$.

Properties: Sp. gr. (25°C) 1.080-1.090, refractive index (20°C) 1.5180; vapor pressure (225°C) 2.5, flash point 226°C, insoluble in water.

Use: Plasticizer.

triethylene glycol dimethyl ether

$CH_3(OCH_2CH_2)_3OCH_3$.

Properties: Water-white liquid with mild ether odor, sp. gr. (20/20°C) 0.9862, refractive index 1.4233 (n_D 20/D); flash point 232°F; b. p. (760 mm) 216.0°C, b. p. (100 mm) 153.6°C, m. p. -46°C. Completely soluble in water and hydrocarbons at 20°C. May contain dangerous peroxides.

Containers: Glass bottles; 1-, 5-gal cans; 55-gal drums.

Uses: Solvent, for gases; for coupling immiscible liquids.

triethylene glycol dioctoate. See triethylene glycol dicaprylate.

triethylene glycol dipropionate

$C_2H_5CO(OCH_2CH_2)_3OCC_2H_5$.

Properties: Sp. gr. (25°C) 1.066; refractive index (25°C) 1.436; b. p. (2 mm) 138-142°C; m. p. less than -60°C, solubility in water, 6.70% by weight.

Use: Plasticizer.

triethylenemelamine

(TEM; 2,4,6-tris(1-aziridinyl)-s-triazine; 2,4,6-tris(ethylenimine)-s-triazine)
 $NC[N(CH_2)_2]NC[N(CH_2)_2]NC[N(CH_2)_2]$.

Properties: White, crystalline, odorless powder; m. p. 160°C (polymerizes); polymerizes

readily with heat or moisture; soluble in alcohol, water, methanol, chloroform, and acetone.

Grade: U.S.P. XVI.

Hazard: Very poisonous!

Use: Medicine. See nitrogen mustards.

triethylenephosphoramidate

(TEPA; tris-(1-aziridinyl)phosphine oxide; APO) $(NCH_2CH_2)_3PO$.

Properties: Colorless crystals; m. p. 41°C; soluble in water, alcohol and ether.

Use: Medicine. See nitrogen mustards.

Also used with tetrakis(hydroxymethyl)phosphonium chloride (THPC) to form a condensation polymer suitable for flameproofing cotton. See also tris[1-(2-methylaziridinyl)phosphine oxide].

Caution! Toxic.

triethylenetetramine $NH_2(C_2H_4NH)_2C_2H_4NH_2$.

Properties: Moderately viscous yellowish liquid. It is less volatile than diethylenetriamine but resembles it in many other properties. Soluble in water.

Constants: B. p. 277.5°C, sp. gr. 0.9818 (20/20°C); vapor pressure < 0.01 mm (20°C); flash point 260°F, wt 8.2 lbs/gal (20°C), coefficient of expansion 0.00081 (20°C), viscosity 0.267 poise (20°C).

Typical specifications: Sp. gr. 0.980-0.985 (20/20°C), boiling range 260-290°C (760 mm).

Grades: Technical; anhydrous.

Containers: 1-gal cans; 5-, 10-, 55-gal drums, tank cars.

Uses: Making detergents and softening agents; synthesis of dyestuffs, pharmaceuticals and rubber accelerators.

Danger! Causes severe eye and skin burns. MCA warning label.

triethylenethiophosphoramidate

(TSPA, thio-TEPA; tris(1-aziridinyl)phosphine sulfide).

Properties: White crystals, m. p. 51°C; moderately hygroscopic; soluble in benzene, acetone, water, warm petroleum ether, and warm diethyl ether. Slight turbidity in aqueous solution. Polymerizes in aqueous solution or in presence of moisture, especially at an acid pH.

Use: Medicine. See nitrogen mustards.

Caution! Toxic.

tri(2-ethylhexyl)phosphate

$[C_4H_9CH(C_2H_5)CH_2]_3PO_4$.

Properties: A light-colored liquid; sp. gr. 0.9260 (20/20°C), 7.7 lb/gal (20°C); b. p. 220°C (5 mm), vapor pressure 2.0 mm Hg (200°C); insoluble in water; viscosity 14.1 cps (20°C). Used as a plasticizer.

triethylmethane. See 3-ethylpentane.

triethylmethyl malonaldehyde diacetal. See 1,1,3-triethoxy-3-methoxypropane.

triethyl orthoformate (orthoformic ester; triethoxy methane) $CH(OC_2H_5)_3$.

Properties: Colorless liquid; pungent odor; b. p. 145.9°C (760 mm); refractive index 1.39218 (18.8°C); sp. gr. 0.895 (20/20°C). Soluble in alcohol, ether, and water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Reaction of sodium ethylate on chloroform or reaction of hydrochloric acid on hydrogen cyanide in ethyl alcohol solution.

Method of purification: Fractional distillation.

Containers: 55-gal steel drums.

Use: Organic synthesis; pharmaceuticals.

triethyl phosphate (TEP) $(C_2H_5)_3PO_4$.

Properties: Colorless, high-boiling liquid. Mild odor; very stable at ordinary temperatures. Compatible with many gums and resins. Is very difficultly flammable and contributes fireproofing characteristics to some products in which it is used. Soluble in most organic solvents; is completely miscible in water. When mixed with water is quite stable at ordinary temperatures, but at elevated temperatures it hydrolyzes slowly.

Constants: M.p. $-56.4^\circ C$; b.p. $216^\circ C$ (760 mm); flash point $115.6^\circ C$ ($240^\circ F$); refractive index 1.4055 ($20^\circ C$); wt/gal 8.90 lbs ($68^\circ F$).

Typical specifications: Purity not less than 97% ester by weight; sp.gr. 1.068-1.072 at $20/20^\circ C$, acidity not more than 0.02%, calculated as phosphoric acid; water no turbidity when 1 vol. is mixed with 19 vols. of 60° B \acute{e} gasoline at $20^\circ C$; b.p. $215-216^\circ C$; wt/gal 8.9 lbs.

Grades: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars; tank trucks.

Uses: High-boiling solvent; plasticizer for resins, plastics, gums; in manufacture of pesticides; catalyst; lacquer remover.

triethyl phosphite $(C_2H_5)_3PO$.

Properties: Colorless liquid, sp.gr. 0.9687 ($20^\circ C$), b.p. $156.6^\circ C$, insoluble in water; soluble in alcohol and ether.

Containers: Glass bottles, 5-, 55-gal drums.

Uses: Synthesis; plasticizers; stabilizers, lube and grease additives; flameproofing composition.

O, O, O-triethyl phosphorothioate (triethyl thiophosphate) $(C_2H_5O)_3PS$.

Properties: Colorless liquid with characteristic odor. B.p. (10 mm) $93.5-94^\circ C$, sp.gr. 1.074; flash point (Cleveland open cup) $225^\circ F$.

Containers: 1-, 4-lb bottles; 5-, 55-gal drums.

Uses: Plasticizer; lubricant additive, anti-foam agent; hydraulic fluid; intermediate.

triethyl thiophosphate. See triethyl phosphorothioate.

triethyl tricarallylate

$(C_2H_5OCOCH_2)_2CHCOOC_2H_5$.

Properties: Sp.gr. ($20^\circ C$) 1.087; refractive index ($26^\circ C$) 1.4234; b.p. (5mm) $158-160^\circ C$, solubility in water ($20^\circ C$) 0.62% by weight.

Uses: Plasticizer.

"Triexcel." ³⁴² Trademark for rotenone and isome-synergized pyrethrin extracts in concentrate form for insecticidal formulations.

trifluoroacetic acid CF_3COOH .

Properties: Colorless fuming liquid; hygroscopic; pungent odor. A strong acid. B.p. $72.4^\circ C$; sp.gr. 1.535; m.p. $-15.25^\circ C$; index of refraction (n $20/D$) 1.2850; very soluble in water.

Containers: Custom packed.

Use: Very strong non-oxidizing acid; reaction medium; solvent; catalyst.

trifluorochloroethylene. See chlorotrifluoroethylene.

trifluorochloromethane. See chlorotrifluoromethane.

trifluoromethylbenzene. See benzotrifluoride.

trifluoromethylhydrothiazide. See hydroflumethiazide.

3-trifluoromethyl-4-nitrophenol (alpha, alpha, alpha-trifluoro-4-nitro-meta-cresol) $CF_3C_6H_3(NO_2)OH$.

Properties: Crystals; m.p. $74-76^\circ C$.

Use: To exterminate lampreys, especially in the Great Lakes. It is placed in tributary streams where it kills the lamprey larvae.

alpha, alpha, alpha-trifluoro-4-nitro-meta-cresol. See 3-trifluoromethyl-4-nitrophenol.

trifluoronitrosomethane CF_3NO .

Properties: Bright blue, fairly stable gas. Disagreeable odor. Caution! Very irritant. B.p. $-84^\circ C$; m.p. $-150^\circ C$.

Derivation: (a) Interaction of fluorine and silver cyanide in the presence of silver nitrate; (b) from nitric oxide and iodotrifluoromethane or bromotrifluoromethane in the presence of ultraviolet light.

Use: Monomer for nitroso rubber.

trifluoropentachloropropane $CF_3CCl_2CCl_3$.

Properties: Flash point $109^\circ C$; b.p. $153^\circ C$.

trifluorotrchloroethane. See trichlorotrifluoroethane.

trifluorovinylchloride. See chlorotrifluoroethylene.

triflupromazine hydrochloride

(10-(3-dimethylaminopropyl)-2-(trifluoromethyl)phenothiazine hydrochloride) $C_{18}H_{19}F_3N_2S \cdot HCl$.

Properties: White crystalline powder; decomposes $173-174^\circ C$. Soluble in water, alcohol acetone; solutions are sensitive to air and light.

Grade: N.N.D.

Use: Medicine.

triformol. See sym-trioxane.

"Trigamine." ⁷³ Trademark for buffered aliphatic amine.

Properties: Water-white to pale-yellow viscous liquid with a pleasant odor. Soluble in water, ethyl alcohol (50%), glycerin and diethylene glycol. Insoluble in oils and hydrocarbon solvents.

Constants: Sp.gr. ($25^\circ C$) 1.17; pH (10% solution) 9.5; neutralization value 208-210.

Containers: 1-gal cans (10 lbs); 5-gal cans (48 lbs); 55-gal drums (525 lbs).

Uses: Solvent and plasticizer for aqueous solutions of casein and shellac in place of bor-

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ammonia, etc. Emulsifying agent for the manufacture of "soluble" waxes for sizing and finishing of textiles, leather, paper, etc. Emulsifying agent for the manufacture of automobile, furniture and floor polishes.

triglycerides. Triglycerides, the chief constituents of fats and oils, are naturally occurring esters of normal acids (fatty acids) and glycerol. They have the general formula

where R_1 , R_2 , and R_3 are usually of different chain length. Refining processes will often yield a commercial product in which R_1 , R_2 , and R_3 are the same chain length.

See stearin, olein, etc.

Derivation: Extraction from animal, vegetable and marine matter.

Uses: Fatty acids and derivatives; manufacture of edible oils and fats (such as cooking oil and margarine), manufacture of mono-glycerides.

triglycol dichloride (triethylene glycol dichloride) $\text{Cl}(\text{C}_2\text{H}_4\text{O})_2\text{C}_2\text{H}_4\text{Cl}$.

Properties: Colorless liquid, sp. gr. 1.1974 (20/20°C), b. p. 241.3°C (760 mm); vapor pressure 0.03 mm (20°C); flash point 250°F, wt/gal 10.0 lbs (20°C), freezing point -31.5°C, viscosity 0.0493 poise (20°C); coefficient of expansion 0.00092 (20°C). Insoluble in water.

Typical specifications: Sp. gr 1.1950-1.2000 (20/20°C), boiling range 230-245°C (760 mm); acidity not more than 0.01% (as hydrochloric acid).

Grades: Technical.

Containers: 1-gal cans, 5-gal (tin-lined) drums; 55-gal (galvanized) drums.

Uses: Solvent for hydrocarbons, oils, other products, extractant, intermediate for making dyes, resins and insecticides, organic synthesis.

triglycollamic acid (nitrilotriacetic acid) $\text{N}(\text{CH}_2\text{COOH})_3$.

Properties: Odorless, white to grayish white crystals; m. p. 246-249°C, insoluble in water and most organic solvents; soluble in caustic alkalis.

Use: Synthesis; sequestering agent.

trigonella foenum graecum. See fenugreek.

trigonelline (coffeagine, cafferine, gynesine): $\text{CH}_3\text{N}^+\text{C}_8\text{H}_4\text{COO}^-\text{H}_2\text{O}$. N-Methylnicotinic acid betaine. A base formed in the seeds of many plants.

Properties: Colorless prisms, m. p. 218°C (dec); very soluble in water; slightly soluble in alcohol, nearly insoluble in ether and benzene.

Use: Biochemical research.

tri-n-hexylaluminum $(\text{C}_6\text{H}_{13})_3\text{Al}$.

Properties: Colorless liquid; b. p. (0.001 mm) 105°C.

Derivation: Exchange reaction between hexene and isobutyl aluminum.

Use: Polyolefin catalyst.

triethylene glycol diborate $(\text{C}_6\text{H}_{12}\text{O}_2)_3\text{B}_2$.

A colorless liquid.

Derivation: Reaction of hexyleneglycol with boric oxide.

Use: Gasoline additive.

triethyl phosphite $(\text{C}_2\text{H}_5)_3\text{P}$.

Properties: Mobile, colorless liquid with characteristic odor, sp. gr. 0.897 (20/4°C); b. p. 135-141°C (0.2 mm); flash point 320°F (C.O.C.). Miscible with most common organic solvents; insoluble in water, hydrolyzes very slowly in water. High degree of thermal stability. Exposure to air should be kept to a minimum.

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive; specialty solvent.

trihephenidyl hydrochloride (cyclohexyl-phenyl-1-piperidinepropanol hydrochloride, 3-(1-piperidyl)-1-cyclohexyl-1-phenyl-1-propanol hydrochloride)

Properties: White, odorless solid. M. p. 249.0-249.5°C (dec); freely soluble in methanol, soluble in alcohol and chloroform; slightly soluble in water; very slightly soluble in ether and benzene. pH (1% solution) 5.5-6.0

Grade: U.S.P. XVI.

Use: Medicine

trihydrated telluric oxide. See telluric acid.

1, 2, 3-trihydroxyanthraquinone. See anthra-gallol.

1, 2, 4-trihydroxyanthraquinone. See purpurin.

1, 2, 7-trihydroxyanthraquinone. See anthrapur-purin.

1, 2, 3-trihydroxybenzene. See pyrogalllic acid.

1, 3, 5-trihydroxybenzene. See phloroglucinol.

3, 4, 5-trihydroxybenzoic acid. See gallic acid.

2, 4, 5-trihydroxybutyrophene

Properties: Yellow-tan crystals, m. p. 149-153°C. Very slightly soluble in water; soluble in alcohol and propylene glycol.

Use: Solid antioxidant for polyolefins and paraffin waxes.

tri(2-hydroxyethyl)amine. See triethanolamine.

trihydroxyethylamine oleate (triethanolamine oleate) $(\text{HOCH}_2\text{CH}_2)_3\text{N} \cdot \text{HOOC}\text{C}_{17}\text{H}_{33}$. A surface active agent made by reaction of triethanolamine with oleic acid.

Use: Emulsifying agent.

trihydroxyethylamine stearate (triethanolamine stearate) $(\text{HOCH}_2\text{CH}_2)_3\text{N} \cdot \text{HOOC}\text{C}_{17}\text{H}_{35}$.

Properties: Cream colored, wax-like solid. Faint fatty odor. Soluble in methyl alcohol, ethyl alcohol, mineral spirits, mineral oil, vegetable oil. Dispersible in hot water. Constants: Titer 42°C; sp. gr. 0.968; pH (25°C) 8.8-9.2 (5% aqueous dispersion); m. p. 42-44°C.

Containers: 1-, 5-gal cans; 50-gal drums.

Uses: Emulsifying agent for the manufacture of fluid oil emulsions for the cosmetic and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers" page v.

pharmaceutical industries; in general a surface active agent.

tri(hydroxymethyl)aminomethane. See tris(hydroxymethyl) aminomethane.

2,4,6-trihydroxytoluene. See methylphloroglucinol.

triiodomethane. See iodoform.

triiodothyronine

$\text{HOC}_6\text{H}_3\text{IOC}_6\text{H}_2\text{I}_2\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. 3,5,3'-Triiodothyronine. Either a derivative or precursor of thyroxine (q.v.). Triiodothyronine may be the true hormone of the thyroid gland; some evidence indicates that the physiological activity of triiodothyronine is at least three times that of thyroxine. It increases the metabolic rate and oxygen consumption of animal tissues.

Use: Biochemical and physiological research.

triisobutylaluminum (TIBAL)

$[(\text{CH}_3)_2\text{CHCH}_2]_3\text{Al}$.

Properties: Clear, colorless liquid; sp.gr. 0.7876 (20°C); f.p. 1.0°C; b.p. 114°C (30 mm); reacts violently with water, fumes violently or ignites with air. Also reacts vigorously with acids, halogens, alcohols and amines.

Derivation: Reaction of isobutylene and hydrogen with aluminum under moderate temperature and varying pressures.

Uses: Polyolefin catalyst; manufacture of primary alcohols and olefins; pyrophoric fuel.

Shipping regulations: Flammable liquid. Red label.*

triisobutylene. A mixture of isomers of the formula $(\text{C}_4\text{H}_8)_3$ readily prepared by polymerizing isobutylene under suitable conditions of temperature and pressure and usually in the presence of a catalyst. A typical mixture is 2,2,4,6,6-pentamethylheptane-3 and 2-neopentyl-4,4-dimethylpentene-1. May be depolymerized to simpler isobutylene derivatives.

Properties: Sp.gr. 0.764 (60°F); boiling range 348-354°F.

Containers: 55-gal drums; tank cars.

Uses: For synthesis of resins, rubbers, and intermediate organic compounds; lubricating oil additive, raw material for alkylation in producing high octane motor fuels.

triisooctyl phosphite.

Properties: Mobile, colorless liquid with characteristic odor. Miscible with most common organic solvents; insoluble in water. Hydrolyzes very slowly in water. Exposure to air should be kept to a minimum. High thermal stability. Sp.gr. 0.891 (20/4°C); b.p. 161-164°C (0.3 mm), flash point 385°F (C.O.C.).

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive, specialty solvent.

O, O, O-triisooctyl phosphorothioate (triisooctyl thiophosphate) $(\text{C}_8\text{H}_{17}\text{O})_3\text{PS}$.

Properties: Colorless liquid with character-

istic odor. B.p. (0.2 mm) 160-170°C; sp.gr. 0.933; flash point (Cleveland open cup) 410°F. Insoluble in water, soluble in most organic solvents.

Containers: 1-, 4-lb bottles; 5-, 55-gal drums.

Use: Plasticizer; lubricant additive; hydraulic fluid; intermediate.

triisooctyl thiophosphate. See triisooctyl phosphorothioate.

triisopropanolamine $\text{N}(\text{C}_3\text{H}_7\text{OH})_3$.

Properties: Crystalline pure-white solid.

Mild base. (A mixture of isopropanolamines which has sp.gr. of 1.004-1.010 and is liquid at room temperature is also marketed). Sp.gr. 0.9996 (50/20°C); m.p. 45°C; b.p. 305°C; vapor pressure < 0.01 mm (20°C); freezing point 58°C; viscosity 1.38 poise (60°C). Soluble in water.

Typical specifications: Melts 46-50°C.

Grade: Technical.

Containers: Drums; tank cars.

Use: Making emulsifying agents.

triisopropyl borate $[(\text{CH}_3)_2\text{CH}]_3\text{BO}_3$.

Properties: Colorless liquid; b.p. 138-140°C.

Derivation: Reaction of isopropyl alcohol with boric oxide.

triisopropyl phosphite $[(\text{CH}_3)_2\text{CH}]_3\text{PO}_3$.

Properties: Mobile, colorless liquid with a characteristic odor, sp.gr. 0.914 (20/4°C); b.p. 94-96°C (50 mm); flash point 165°F (C.O.C.). Miscible with most common organic solvents; insoluble in water. Hydrolyzes slowly in water. Exposure to air should be held to a minimum. High thermal stability.

Containers: 55-gal, 5-gal steel drums.

Uses: Intermediate for insecticides; component of vinyl stabilizers; lubricant additive; specialty solvent.

triketohydrindene hydrate $\text{C}_9\text{H}_4\text{O}_3 \cdot \text{H}_2\text{O}$. 1,2,3-Indantrione hydrate.

Properties: White crystals, becomes red at 125°C, swells at 193°C, melts at 239-240°C; freely soluble in water.

Use: Biological test reagent.

trilaurin. The glyceride of lauric acid, glyceryl trilaurate.

trilauryl amine (tridodecyl amine) $(\text{C}_{12}\text{H}_{25})_3\text{N}$.

A liquid; sp.gr. 0.82; m.p. 14°C; soluble in organic solvents; insoluble in water.

Uses: Chemical intermediate; metal complexes.

"**Trilene.**" ²⁰⁷ Trademark for trichloroethylene.

A volatile liquid used by inhalation to produce anesthesia and analgesia.

"**Triluxe.**" ⁵⁶ Trademark for dry cleaning solvent consisting of trichloroethylene.

trimagnesium phosphate. See magnesium phosphate, tribasic.

"**Tri-Mal.**" ³⁰⁴ Trademark for tribasic lead maleate vinyl stabilizer.

Properties: Soft, yellowish-white crystalline powder, sp.gr. 6.0, refractive index 2.08.

Containers: 75-, 400-lb fiberboard drums.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Stabilizer in vinyl plastics; vulcanizing agent for chlorosulfonated polyethylene.

"Trimene Base." ²⁴⁸ Trademark for a reaction product of ethyl chloride, formaldehyde, and ammonia. Rubber accelerator. **Properties:** Dark-brown, viscous liquid; sp. gr. 1.10; soluble in water and acetone; insoluble in gasoline and benzene.

trimer. A molecule formed by union of three identical simpler molecules. Also applied to the substances composed of such triple molecules; thus C_6H_6 is a trimer of C_2H_2 . See polymer.

trimer acid. See dimer acid.

trimercuric orthophosphate. See mercuric phosphate.

trimercurous orthophosphate. See mercurous phosphate.

trimethadione (3,5,5-trimethyl-2,4-oxazolinedione) $C_6H_9NO_3$ or $OC(O)N(CH_3)C(O)C(CH_3)_2$.

Properties: White, granular, crystalline substance. Camphorlike odor. M.p. 45-47°C; soluble in water; freely soluble in alcohol, chloroform, and ether; pH (5% solution) about 6.0.

Grade: U.S.P. XVI.

Use: Medicine.

trimethaphan camphorsulfonate

$C_{22}H_{25}N_2OS \cdot C_{10}H_{15}O_4S$. d-3,4-(1',3'-Dibenzyl-2'-ketoimidazolido)-1,2-trimethylenethiophanium d-camphorsulfonate.

Properties: White crystals; slight odor.

M.p. 230-235°C. Soluble in water, alcohol and chloroform; insoluble in ether.

Grade: U.S.P. XVI.

Use: Medicine.

trimethobenzamide hydrochloride

$C_{21}H_{28}N_2O_5 \cdot HCl$. 4-(2-Dimethylaminoethoxy)-N-(3,4,5-trimethoxybenzoyl)benzylamine hydrochloride.

Properties: Crystals, m.p. 187-190°C, soluble in water and alcohol, insoluble in ether.

Use: Medicine.

trimethoxyborine. See trimethyl borate.

trimethoxyboroxine (methyl metaborate) $(CH_3O)_3B_3O_3$.

Properties: Colorless liquid; m.p. 10-11°C; b.p., dissociates; density 1.216 (25°C), refractive index 1.3986.

Derivation: Reaction of methyl borate with boric oxide.

Grade: 99%.

Use: Metal-fire extinguishing fluid.

3,4,5-trimethoxyphenethylamine. See mescaline.

trimethylacetylhydrazide ammonium chloride. See Girard's T Reagent.

trimethylacetic acid (pivalic acid) $(CH_3)_3CCOOH$.

Properties: Colored crystals; sp. gr. 0.905

(50°C); refractive index 1.3931 (36.5°C); m.p. 35.5°C; b.p. 163.8°C; soluble in water, alcohol and ether.

Use: Intermediate.

trimethylaluminum (ATM) $(CH_3)_3Al$.

Properties: A clear colorless pyrophoric liquid; b.p. 126°C; f.p. 15.4°C; sp. gr. 0.752. Flames instantly on contact with air; reacts violently with water, vigorously with acids, halogens, alcohols and amines.

Derivation: By sodium reduction of dimethylaluminum chloride.

Use: Catalyst for olefin polymerization; pyrophoric fuel; manufacture of straight-chain primary alcohols and olefins.

Shipping regulations: Flammable liquid. Red label.*

trimethylamine (TMA) $(CH_3)_3N$.

Properties: Colorless, liquefied gas; fishy, ammoniacal odor; flammable; sp. gr. 0.662 (-5°C); b.p. 2.87°C; m.p. -117.1°C; flash point of 25% solution (Tag open cup) 38°F. Soluble in water, alcohol, and ether.

Derivation: By the interaction of methanol and ammonia over a catalyst at high temperature. The mono-, di-, and trimethylamines are all produced, and yields are regulated by conditions.

Method of separation: Azeotropic distillation.

Grades: Anhydrous 99% min; aqueous solution 25, 30, 40%.

Containers: Solution: 1-gal glass bottles, 5-, 55-gal drums; tank cars. Anhydrous: 25-, 50-, 100-, 1400-lb cylinders, tank cars.

Uses: Organic synthesis; warning agent for gas, manufacture of disinfectants, flotation agent; insect attractant; quaternary ammonium compounds; synthetic resins.

Danger! Extremely flammable. Hazardous liquid and vapor under pressure. Liquid causes burns. Vapor extremely irritating. MCA warning label for anhydrous form.

Shipping regulations: Anhydrous: Flammable gas. Red gas label. Aqueous solution: Flammable liquid. Red label.*

1,2,4-trimethyl-5-aminobenzene. See pseudocumidine.

2,4,5-trimethylaniline. See pseudocumidine.

1,2,4-trimethylbenzene. See pseudocumene.

1,3,5-trimethylbenzene. See mesitylene.

sym-trimethylbenzene. See mesitylene.

uns-trimethylbenzene. See pseudocumene.

trimethyl borate (methyl borate, trimethoxyborine) $(CH_3O)_3B$.

Properties: Water-white liquid. B.p. 67-68°C; sp. gr. 0.915; f.p. -29°C. Miscible with ether, methanol, hexane, tetrahydrofuran; decomposes in presence of water.

Derivation: Reaction of boric acid and methanol.

Containers: Truck and car lots.

Uses: Solvent; dehydrating agent; flame retardant for plastics, paints, and lacquers; fungicide for citrus fruit; neutron

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

scintillation counters; brazing flux; boron compounds intermediate.

2, 2, 3-trimethylbutane (isopropyltrimethylmethane; triptane) C_7H_{16} ; and $CH_3C(CH_3)_2C(CH_3)CH_3$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water.

Constants: Sp. gr. 0.691; b. p. 81.0°C; f. p. -24.96°C; refractive index 1.3895 (20°C).

Grade: Technical.

Uses: Organic synthesis; aviation fuel.

trimethyl carbinol. See tert-butyl alcohol.

trimethylchlorosilane $(CH_3)_3SiCl$.

Properties: Colorless liquid. B. p. 57°C; sp. gr. 0.854 (25/25°C); refractive index (n_D²⁵) 1.3893; flash point (Cleveland open cup) 0°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and methylmagnesium chloride.

Grade: Technical.

Use: Intermediate for silicone fluids, as a chain terminating agent.

Shipping regulations: Flammable liquid. Red label.*

3, 3, 5-trimethylcyclohexanol-1 $C_6H_{14}(CH_3)_3OH$.

Properties: Sp. gr. 0.878 (40/20°C); m. p. 35.7°C; b. p. 198°C (760 mm). Soluble in most organic solvents, hydrocarbons, oils, insoluble in water.

Uses: Menthol and camphor substitute; anti-foaming agent; manufacture of hydraulic fluids and textile soaps; odor masking.

Caution: Vapor harmful. MCA warning label.

4-(2, 6, 6-trimethyl-1-cyclohexenyl)-buten-3-one-2 (beta-ionone). See ionone.

3, 3, 5-trimethylcyclohexyl mandelate. See cyclandelate.

trimethyl dihydroquinoline polymer (TDQP)

$(C_{12}H_{15}N)_n$ (n approx 3). Consists of polymer containing probably three or more quinoline groups.

Properties: Amber pellets; sp. gr. 1.08; softening point 75°C. Insoluble in water, miscible with ethanol, acetone, benzene, monochlorobenzene, isopropyl acetate and gasoline.

Use: Antioxidant, stabilizer or polymerization inhibitor.

Handle with caution. Toxic!

trimethylene. See cyclopropane.

trimethylene bromide (1, 3-dibromopropane) $CH_2BrCH_2CH_2Br$.

Properties: Colorless liquid; sweet odor; sp. gr. 1.979 (20/4°C); b. p. 166°C; insoluble in water; soluble in organic solvents; m. p. -34.4°C.

Derivation: Synthetic.

Method of purification: Distillation after washing with concentrated sulfuric acid.

Grades: Technical; C.P.

Containers: Carboys, drums.

Use: Intermediate for dyestuff and pharma-

ceutical industries; cyclopropane manufacture.

Shipping regulations: None.*

trimethylene chlorobromide. See 1-bromo-3-chloropropane.

trimethylenedicyanide. See glutaronitrile.

trimethylene glycol (1, 3-propylene glycol; 1, 3-propanediol) $CH_2OHCH_2CH_2OH$.

Properties: Colorless, odorless liquid; sp. gr. 1.0537 (25°C); b. p. 210-211°C; soluble in water, alcohol and ether.

Derivation: From acrolein.

Grades: Technical, 95%; pure, 99%.

Use: Intermediate.

sym-trimethylene trinitramine. See cyclonite.

trimethylethylene. See 3-methyl-2-butene.

trimethylglycine. See betaine.

trimethylheptanoic acid. See isodecanoic acid.

2, 2, 5-trimethylhexane $(CH_3)_3CCH_2CH_2CH(CH_3)_2$.

Properties: Liquid; f. p. -105.84°C; b. p.

124.06°C; sp. gr. 0.711 (60/60°F); refractive index 1.399 (20/D); flash point 15°C.

Grades: 95%, 99%; research.

Containers: Bottles; drums.

Use: Synthesis.

Shipping regulations: Flammable liquid. Red label.*

3, 5, 5-trimethylhexan-1-ol $C_9H_{20}O$.

Properties: A colorless, mobile liquid of mild odor; b. p. 194°C; sp. gr. 0.8236 (25/4°C); wt/gal 6.86 lbs (25°C); refractive index (n_D²⁵) 1.4300; flash point (open cup) 200°F. Insoluble in water.

Derivation: High-pressure synthesis.

Uses: Suggested for synthetic lubricants; additives to lubricating oils; wetting agent; softener in manufacture of various plastics; disinfectants and germicides.

trimethylmethane. See isobutane.

trimethylnonanol. See 2, 6, 8-trimethylnonyl-4 alcohol.

2, 6, 8-trimethyl-4-nonanone

$(CH_3)_2CHCH_2COCH_2CH(CH_3)CH_2CH(CH_3)_2$.

Properties: Practically water-white liquid with pleasant odor, possesses a high solvent power for vinyl resins and certain other synthetic resins, the cellulose esters and ethers, and many substances soluble with difficulty in other solvents; insoluble in water; sp. gr. 0.8165 (20/20°C); wt/gal 6.8 lbs (20°C); f. p. -75°C, b. p. 211-219°C (760 mm), viscosity 1.91 cps (20°C).

Uses: Solvent, dispersant; intermediate; lube oil dewaxing.

2, 6, 8-trimethylnonyl-4 alcohol (trimethylnonanol) $CH_3CH(CH_3)CH_2CHOHCH_2CH(CH_3)CH_2CH(CH_3)CH_3$.

Properties: Colorless liquid with characteristic odor; sp. gr. 0.8913 (20/20°C); wt/gal 6.9 lbs (20°C), b. p. 225.2°C (760 mm); f. p. -60°C; viscosity 21.4 cps. Insoluble in water.

Uses: Surface-active and flotation agents; lube additives; rubber chemicals.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

trimethylolethane (pentaglycerine; methyltrimethylol methane) $\text{CH}_3\text{C}(\text{CH}_2\text{OH})_3$.

Properties: Colorless hygroscopic crystals. Soluble in water and alcohol.

Containers: 200-lb drums.

Uses: Conditioning agent; manufacture of varnishes, alkyd and hard resins, synthetic drying oils.

trimethylolpropane (hexaglycerine)

$\text{C}_2\text{H}_5\text{C}(\text{CH}_2\text{OH})_3$.

Properties: Colorless hygroscopic crystals. Soluble in water and alcohol.

Containers: 200-lb drums.

Uses: Conditioning agent; manufacture of varnishes, alkyd and hard resins, synthetic drying oils.

trimethylolpropane monooleate. Theoretically $\text{C}_2\text{H}_5\text{C}(\text{CH}_2\text{OH})_2\text{CH}_2\text{OOC}\text{C}_{17}\text{H}_{33}$. The commercial product is a mixture of mono-, di-, and tri- esters, free polyol and free oleic acid.

Properties: Oily liquid, sp. gr. 0.954 (25°C); f. p. less than -20°C. Insoluble in water; soluble in most organic solvents.

Uses: Water-in-oil emulsifier, corrosion inhibitor; low-temperature plasticizer, deicing agent for gasoline.

3, 5, 5-trimethyl-2, 4-oxazolidinedione. See trimethadione.

2, 2, 4-trimethylpentane. See isooctane.

2, 3, 4-trimethylpentane

$(\text{CH}_3)_2\text{CHCH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}_3$.

Properties: Liquid, f. p. -109.43°C; b. p. 113°C; sp. gr. 0.723 (60/60°F); refractive index 1.4042 (20/D), flash point 5°C.

Grades: 95%, 99%; research.

Containers: Bottles; drums.

Use: Intermediate.

Shipping regulations: Flammable liquid. Red label.*

2, 4, 4-trimethylpentene-1 (alpha-diisobutylene) $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{CH}_2\text{C}(\text{CH}_3)_2$.

Properties: Colorless liquid, b. p. 101.44°C; f. p. -93.5°C; refractive index 1.4086 (20°C); density 0.7150 (20°C); flash point 0°C.

Derivation: Polymerization of isobutene.

Grades: 95%, 99%; research.

Containers: Bottles; drums.

Use: Organic synthesis; motor fuel synthesis, particularly isooctane.

Shipping regulations: Flammable liquid. Red label.*

See diisobutylene.

2, 4, 4-trimethylpentene-2 (beta-diisobutylene) $\text{H}_3\text{CC}(\text{CH}_3):\text{CHC}(\text{CH}_3)_2$.

Properties: Colorless liquid; b. p. 104.55°C; sp. gr. 0.724 (60/60°F); f. p. -106.4°C; refractive index 1.416 (20/D); flash point 0°C.

Grade: 95%.

Containers: Bottles; drums.

Use: Organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

See diisobutylene.

tri-2-methylpentylaluminum

$[(\text{CH}_3)_2\text{CH}(\text{CH}_2)_3]_3\text{Al}$.

Properties: Colorless liquid.

Derivation: Reaction of 2-methylpentene and isobutylaluminum.

Use: Polyolefin catalyst.

N, alpha, alpha-trimethylphenethylamine. See mephentermine.

N-alpha, alpha-trimethylphenethylamine sulfate. See mephentermine sulfate.

trimethyl phosphate $(\text{CH}_3\text{O})_3\text{PO}$.

Typical properties: Colorless liquid; 22.1% phosphorus; density 1.210 g/ml at 68°F; flash point greater than 305°F; boiling point 379°F; refractive index (n 20/D) 1.397; pour point -51°F. Soluble in both gasoline and water.

Uses: For controlling spark plug fouling, surface ignition and rumble in gasoline engines.

Warning: Do not take internally. Avoid contact with skin and eyes; flush immediately with much water if contact occurs.

trimethyl phosphite $(\text{CH}_3\text{O})_3\text{P}$.

Properties: Colorless liquid; b. p. 108-108.5°C, pour point, less than -75°F; sp. gr. (20/4°C) 1.046; flash point (Cleveland open cup) 100°F. Insoluble in water; soluble in hexane, benzene, acetone, alcohol, ether, carbon tetrachloride, and kerosine.

Uses: Chemical intermediate, especially for insecticides.

trimethylpropylmethane. See 2, 2-dimethylpentane.

2, 4, 6-trimethylpyridine. See 2, 4, 6-collidine.

2, 4, 6-trimethyl-1, 3, 5-trioxane. See paraldehyde.

trimethylvinylammonium hydroxide. See neurine.

trimethylxanthine. See caffeine.

"Trimeton." ³²¹ Brand name for pheniramine maleate.

"Trimulso." ²³⁶ Trademark for a liquid synthetic surfactant used in the preparation of oil-in-water emulsion drilling muds; effective in both fresh water and brine muds. Containers: 5-gal cans and 55-gal drums.

trimyristin. The glyceride of myristic acid; glyceryl trimyristate.

trinickelous orthophosphate. See nickel phosphate.

Trinidad pitch. See asphalt.

1, 3, 5-trinitrobenzene (TNB) $\text{C}_6\text{H}_3(\text{NO}_2)_3$.

Properties: Yellow crystals with a sp. gr. of 1.688 (20/4°C); m. p. 122°C; soluble in alcohol and ether; insoluble in water.

Derivation: From TNT by removal of methyl group.

Use: Explosive.

Shipping regulations: (Dry) explosive, class A. High explosive label. (Wet) (not to exceed 16 ozs) flammable solid. Yellow label.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

2,4,6-trinitrobenzoic acid (trinitrobenzoic acid) $C_6H_3(NO_2)_3COOH$.

Properties: Orthorhombic crystals; m.p. 228.7°C; sublimes with decomposition forming carbon dioxide and trinitrobenzene; slightly soluble in water and benzene; soluble in alcohol, ether, and acetone.

Derivation: Oxidation of 2,4,6-trinitrotoluene with chromic acid.

Use: Synthesis.

Shipping regulations: Dry; high explosive, class A. High explosive label. Wet: Label varies.*

trinitrocellulose. A nitrocellulose (q.v.).

2,4,6-trinitro-1,3-dimethyl-5-tert-butylbenzene. See musk xylol.

trinitroglycerin. See nitroglycerin.

trinitrophenol. See picric acid.

2,4,6-trinitroresorcinol. See styphnic acid.

2,4,6-trinitrotoluene (TNT; trinitrotoluol; methyltrinitrobenzene) $CH_3C_6H_2(NO_2)_3$.

Properties: Yellow, monoclinic needles; sp. gr. 1.654; m.p. 80.9°C; soluble in alcohol and ether; insoluble in water.

Derivation: By the nitration of toluene with mixed acid. Small amounts of the 2,3,4- and 2,4,5-isomers are produced which may be removed by washing with aqueous sodium sulfite solution.

Grade: Technical.

Containers: Wooden cases or kegs; multi-wall paper sacks.

Uses: Explosive; intermediate in dyestuffs and photographic chemicals.

Fire hazard: Dangerous.

Shipping regulations: Dry: explosive, class A. High explosive label. Wet (not to exceed 16 ozs): flammable solid. Yellow label.*

trinitrotoluol. See trinitrotoluene.

trinitrotrimethylenetriamine. See cyclonite.

tri-n-octylaluminum (C_8H_{17})₃Al.

Properties: Colorless liquid.

Derivation: Reaction between octene and isobutylaluminum.

Use: Polyolefin catalyst.

triocetyl phosphate (ocetyl phosphate) ($C_{18}H_{37}$)₃PO₄.

Properties: Sp. gr. 0.924 (26°C); b.p. 220-30 (8 mm), soluble in alcohol, acetone, and ether.

Uses: Solvent, antifoaming agent; plasticizer.

"Triiodine." ²⁸⁴ Trademark for a cleaner-santizer-disinfectant particularly formulated for use in the bottling industry. Contains monionic-iodine complexes. Claimed to be non-toxic, non-irritating, non-staining when used as directed.

"Tri-Ol." ⁴⁵ Trade name for a combination of concentrated sulfonated solubilized oils, fortified with a white mineral oil of U.S.P. purity.

Uses: Soapless shampoos; brushless shaving creams; non-lathering soaps.

triolein. See olein.

"Triosul." ⁵⁸ Trademark for sulfur trioxide, stabilized liquid. Colorless to pale yellow liquid; b.p. 44.8°C; freezing point 16.8°C.

"Triox." ²⁵³ Brand name for a weed killer containing sodium arsenite.

sym-trioxane (triformol; trioxin; metaformaldehyde) $(CH_2O)_3$ or $CH_2OCH_2OCH_2O$. A trimer of formaldehyde; not to be confused with paraformaldehyde (q.v.) which may consist of many more formaldehyde units.

Properties: White crystals with formaldehyde odor; m.p. 62°C; b.p. 115°C; flash point (open cup) 113°F. Slightly soluble in water; soluble in alcohol and ether.

Derivation: By distillation of formaldehyde.

Containers: Drums.

Uses: Organic synthesis; disinfectant; non-luminous, odorless fuel.

See also formaldehyde.

trioxin. See sym-trioxane.

2,6,8-trioxypurine. See uric acid.

tripalmitin (palmitin; glyceryl tripalmitate) $C_3H_5(OC_{16}H_{31}O_2)_3$.

Properties: White, crystalline powder. Soluble in ether and chloroform. Insoluble in water.

Constants: M.p. 65.5°C; sp. gr. 0.866 (80/4°C).

Derivation: From glycerine and palmitic acid.

Grade: Technical.

Containers: Tins; fiber containers.

Uses: Medicine, soap; leather dressing.

Shipping regulations: None.*

triparanol. 1-(para-beta-Diethylaminoethoxyphenyl)-1-(para-tolyl)-2-(para-chlorophenyl) ethanol. Said to act as a cholesterol depressant in the body.

tripelennamine citrate $C_{16}H_{21}N_3 \cdot C_6H_8O_7$.

N-Benzyl-N',N'-dimethyl-N-2-pyridylethylenediamine citrate.

Properties: White, bitter crystalline powder. Solutions are acid to litmus. M.p. 107°C. Soluble in water and alcohol, very slightly soluble in ether; practically insoluble in chloroform and benzene. 1% solution in water has a pH of about 4.3.

Grade: U.S.P. XVI.

Use: Medicine.

tripelennamine hydrochloride $C_{16}H_{21}N_3 \cdot HCl$.

2-[Benzyl(2-dimethylaminoethyl)amino]pyridine hydrochloride; $C_6H_5CH_2N(C_2H_5)_2CH_2CH_2N(CH_3)_2 \cdot HCl$.

Properties: White, crystalline powder, bitter taste. Affected by light. M.p. 188-193°C. Freely soluble in water; soluble in alcohol and chloroform; very slightly soluble in acetone; insoluble in benzene, ether, and ethyl acetate. Solutions neutral to litmus.

Grade: U.S.P. XVI.

Use: Medicine.

tripentaerythritol

$(CH_2OH)_3CCH_2OCH_2C(CH_2OH)_2$

$CH_2OCH_2C(CH_2OH)_3$. See "Tripentek" for properties and uses.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Tripentek." ¹³⁸ Trade name for triphenylerythritol, technical.

Properties: A non-hygroscopic, white to ivory powder; has eight primary hydroxyl groups, all of which are esterifiable.

Containers: 50-lb multiwall bags.

Uses: For hard resins, varnishes, and fast drying tall oil vehicles.

triphenylantimony (triphenylstibine) $\text{Sb}(\text{C}_6\text{H}_5)_3$.

Properties: White crystalline solid; sp. gr. 1.434 (25°C); m.p. 46-53°C; b.p. less than 360°C. Insoluble in water; slightly soluble in alcohol; soluble in most organic solvents.

Derivation: Reaction of antimony trichloride with phenyl magnesium bromide or phenyl sodium.

Containers: 10-, 50-, 200-lb drums.

Uses: Forms stibonium salts; co-catalyst in converting trienes to aromatics and hydroaromatics; reacts with nitric-sulfuric acid to give trinitro derivatives; polymerization inhibitor catalyst; lubricating oil additive.

triphenylbismuth $(\text{C}_6\text{H}_5)_3\text{Bi}$.

Properties: White crystalline solid; sp. gr. 1.585; m.p. 77.6°C. Slightly soluble in alcohol. Soluble in chloroform, ether and acetone.

Derivation: Reaction of bismuth chloride with phenylmagnesium bromide.

triphenylfluorosilane $(\text{C}_6\text{H}_5)_3\text{SiF}$.

Properties: White solid; m.p. 63°C.

Uses: Silicone modifier.

triphenyl formazan $\text{CN}_4\text{H}(\text{C}_6\text{H}_5)_3$. Red insoluble derivative of tetrazolium chloride; formed when the latter comes into contact with viable portions of a seed. Used in germination and viability tests.

triphenylguanidine (TPG) $\text{C}_6\text{H}_5\text{NC}(\text{C}_6\text{H}_5\text{NH})_2$.

Properties: White crystalline powder; soluble in alcohol.

Constants: Sp. gr. 1.10; m.p. 144°C.

Derivation: Desulfurization of thiocarbonyl in presence of aniline.

Method of purification: Crystallization.

Grade: Technical.

Containers: 100-lb barrels.

Use: Accelerator for vulcanization of rubber.

Shipping regulations: None.*

triphenylmethane dyes. Dyes whose molecular structure is basically derived from $(\text{C}_6\text{H}_5)_3\text{CH}$, usually by substitution of NH_2 , OH , HSO_3 , or other groups or atoms for some of the hydrogen of the C_6H_5 groups. A very large number of the coal tar and other synthetic dyes are of this class, including rosaniline, fuchsine, malachite green, fast green and crystal violet.

triphenylmethyl $(\text{C}_6\text{H}_5)_3\text{C}$. The first free radical to be isolated (by Gomberg in 1900).

Exists only in solution in inert solvents, producing a deep yellow color. Combines with itself to form hexaphenylethane

$(\text{C}_6\text{H}_5)_3\text{CC}(\text{C}_6\text{H}_5)_3$ when solvent is removed, and reacts vigorously with oxygen, halogen elements and metallic sodium.

See free radical and carbonium ion.

triphenyl phosphate (TPP) $\text{PO}(\text{OC}_6\text{H}_5)_3$.

Properties: Colorless, odorless, nonflammable, crystalline powder. Soluble in most lacquers, solvents, thinners, oils.

Constants: M.p. 48.5°C; b.p. 370°C; sp. gr. 1.268 (60°C); wt/gal 10.5 lbs; fire retardation excellent; refractive index 1.550 (60°C).

Typical specifications: Appearance white flakes; odor very faintly aromatic; m.p. 48.5°C min; not more than faintly opalescent; permanganate test, distinct purple color to be present after 30 minutes; purity 99% min; phenol 0.1% max; acidity 0.003% max (as phosphoric acid).

Derivation: Phenol and phosphorus oxychloride are boiled in presence of a little zinc chloride, until no more hydrogen chloride is given off. The product is shaken with caustic soda solution, filtered and the residue dissolved in ether. The ethereal solution is dehydrated and the ether evaporated.

Method of purification: Crystallization.

Grade: Technical.

Containers: 200-lb fiber drums; barrels; multiwall paper sacks.

Uses: Fire-retarding agent; plasticizer for cellulose acetate and nitrocellulose.

triphenylphosphine. See triphenylphosphorus.

triphenyl phosphite $(\text{C}_6\text{H}_5\text{O})_3\text{P}$.

Properties: Water white to pale yellow solid or oily liquid; clean pleasant odor; sp. gr. 1.184 (25/25°C); m.p. 22-25°C; refractive index 1.589 (25°C); color APHA 50 max.

Containers: 55-gal drums.

Uses: Chemical intermediate; ingredient in stabilizer systems for resins; acts as a metal scavenger by chelating.

triphenylphosphorus (triphenylphosphine) $(\text{C}_6\text{H}_5)_3\text{P}$.

Properties: White, crystalline solid; m.p. 79-82°C; b.p. above 360°C, sp. gr. 1.132 (25°C). Insoluble in water; slightly soluble in alcohol; soluble in benzene, acetone, carbon tetrachloride.

Derivation: By a modified Grignard synthesis.

Containers: 10-, 50-, 150-lb drums.

Uses: Synthesis of organic compounds, phosphonium salts, other phosphorus compounds.

triphenylsilanol $(\text{C}_6\text{H}_5)_3\text{SiOH}$.

Properties: White solid; m.p. 155°C.

Derivation: Reaction of triphenylchlorosilane with ammonium hydroxide.

triphenylstibine. See triphenylantimony.

triphenyltetrazolium chloride. See tetrazolium chloride.

triphenyltin acetate $(\text{C}_6\text{H}_5)_3\text{SnOOCCH}_3$. An agricultural biocide. White crystalline solid, made by reaction of sodium acetate with triphenyltin chloride.

triphenyltin chloride $(\text{C}_6\text{H}_5)_3\text{SnCl}$.

Properties: White crystalline solid; m.p. 106°C; b.p. 240°C (13.5 mm). Insoluble in water; soluble in organic solvents.

Derivation: Reaction of tin tetrachloride with phenylmagnesium bromide.

Use: Biocidal intermediate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Triphosaden." ⁹¹ Trademark for a brand of adenosine triphosphate used for biochemical and clinical research, and medicine.

triphosgene. See hexachloromethyl carbonate.

triprophosphoryridine nucleotide. See nicotinamide adenine dinucleotide phosphate.

"Triple Mix." ⁵⁵ Trade name for insect repellents which contain dimethyl phthalate, butyl dimethyl-dihydro-gamma-pyronecarboxylate (see "Indalone"), and 2-ethylhexanediol-1,3 (Rutgers 612). Known in World War II as "622."

triple point. The temperature and pressure at which the solid, liquid, and vapor of a substance are in equilibrium with one another. The term can also be applied to the similar equilibrium between any three phases, i.e., two solids and a liquid, etc. The triple point of water is of especial importance because it is a basic fixed point (273.16°K) for the absolute scale of temperature.

triple superphosphate. A dry, granular, free-flowing product, gray in color. It is produced by the addition of phosphoric acid to phosphate rock, thus avoiding the formation of insoluble gypsum as in superphosphate and achieving about three times the amount of available phosphate (as P_2O_5).

Typical chemical analysis: Moisture 2%; available P_2O_5 50%, water soluble P_2O_5 45%; free phosphoric acid 1%; also minor ingredients.

Containers: Bags; bulk; carloads.

Use: Fertilizer.

See also superphosphate and nitrophosphate.

tripoli (rotten stone).

Derivation: A porous, siliceous rock resulting from the natural decomposition of siliceous sandstone.

Grades: Various grades according to fineness for polishing; rose, cream, white.

Containers: 150-, 200-, 220-lb bags, 500-lb barrels.

Uses: Abrasive; polishing powder; filtering material; absorbent for insecticidal chemicals; paints (inert filler, wood filler), rubber filler; base for scouring soaps and powders.

tripolite. See diatomite.

tripoly. See sodium tripolyphosphate.

tripolyphosphate. See sodium tripolyphosphate.

tripotassium orthophosphate. See potassium phosphate, tribasic.

tripotassium phosphate. See potassium phosphate, tribasic.

triprolidide hydrochloride

$CH_3C_6H_4C(C_6H_5N):CHCH_2C_6H_5N \cdot HCl$.

trans-1-(4-Methylphenyl)-1-(2-pyridyl)-3-pyrrolidinoprop-1-ene hydrochloride.

Properties: Crystals; m.p. 116.5-118°C; moderately soluble in water, ethanol and methanol.

Use: Medicine.

tri-n-propylaluminum (C_3H_7)₃Al.

Properties: Colorless pyrophoric liquid.

Derivation: Reaction of propylene and isobutylaluminum.

Uses: Polyolefin catalyst.

tripropylamine ($CH_3CH_2CH_2$)₃N.

Properties: Water white; amine odor; boiling range 150-156°C; sp.gr. (20/20°C) 0.754; refractive index 1.417 (20°C); flash point 105°F.

Containers: 5-gal cans; 55-gal drums; tank cars.

tripropylene (propylene trimer) C_9H_{18} . Mixture of C_9 monoolefins.

Properties: Liquid; sp.gr. (20/20°C) 0.738; boiling range 133.3°-141.7°C. Weight 6.17 lb/gal (60°F); flash point 75°F (TOC).

Derivation: Catalytic polymerization of propylene.

Containers: Drums; barges or tank cars.

Uses: Oxo feed stock; lubricant additive; plasticizers; nonyl phenol.

Shipping regulations: Flammable liquid. Red label.*

tripropylene glycol $HO(C_3H_6O)_2C_3H_6OH$.

Properties: Colorless liquid, supercools instead of freezing; b.p. 268°C (760 mm); sp.gr. 1.019 (25/25°C), lbs/gal 8.51; refractive index 1.442 (n_D 25/D); flash point 285°F. Soluble in water, methanol, ether.

Containers: Drums; tank cars; tank trucks.

Uses: Synthesis; intermediate in resins, plasticizers, pharmaceuticals; insecticides; dyestuffs; mold lubricants.

tripropylene glycol, methyl ether

$HO(C_3H_6O)_2C_3H_6OCH_3$.

Properties: Sp.gr. 0.961 (25°C), b.p. 242°C (760 mm); 116°C (10 mm), viscosity 5.5 cps (25°C); refractive index 1.427 (25°C), fire point 127°C, completely miscible with water, VMP naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene, and petroleum ether.

Use: Ingredient in hydraulic fluids.

triptane. See 2,2,3-trimethylbutane.

"Triptide." ⁹¹ Trademark for a brand of lyophilized monosodium glutathione used for biochemical and clinical research, and medicine.

tris amine buffer. See tris(hydroxymethyl)-aminomethane.

tris(1-aziridinyl)phosphine oxide. See triethylenephosphoramide.

tris(1-aziridinyl)phosphine sulfide. See triethylenethiophosphoramide.

2,4,6-tris(1-aziridinyl)-s-triazine. See triethylenemelamine.

trisazo dyes. A subdivision in the chemical classification of dyes; one of the four kinds of azo dyes. They are characterized by the presence of three azo couplings ($-N=N-$) in each molecule. The Colour Index number of this class of dyes is C.I. 531-605.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tris-(beta-chloroethyl) phosphate(C₁C₂H₄O)₃PO.

Properties: A clear transparent liquid; sp. gr. 1.425 (20/20°C).

Use: A flame-retardant plasticizer.

tris(2-chloroethyl) phosphite(C₁C₂H₄O)₃P

Properties: Mobile, colorless liquid with characteristic odor. Sp.gr. 1.353 (20/4°C); b.p. 119°C (0.15 mm); flash point 375°F (C.O.C.). Miscible with most common organic solvents. Undergoes intramolecular isomerization at higher temperatures. Exposure to air should be kept at a minimum. Insoluble in water, and hydrolyzes in water.

Containers: 5-gal, 55-gal steel drums.

Uses: Intermediate; component of vinyl-stabilizers; grease additives; flameproofing compositions; color inhibitor.

tris(beta-chloroisopropyl)thionophosphate
[CH₃(CH₂Cl)CHO]₃PS.

Typical properties: Phosphorus content 9.0%, density 1.282 g/ml at 68°F, flash point (open cup) greater than 347°F; pour point less than -58°F. Readily soluble in gasoline, insoluble in water.

Uses: To extend spark plug life, to control deposit-induced knocking and to reduce rumble in gasoline engines.

tris(2,3-dibromopropyl) phosphate(CH₂BrCHBrCH₂O)₃PO. Used as a flame retardant for plastics.**tris(2,3-dichloropropyl) phosphate**(CH₂ClCHClCH₂O)₃PO. Used as a flame retardant in plastics.**tris(diethylene glycol monoethyl ether) citrate**HOC[CH₂COO(CH₂CH₂O)₂C₂H₅]₂-COO(CH₂CH₂O)₂C₂H₅. Plasticizer.

Properties: Sp gr (25°C) 1.28, m.p. 16-19°C; soluble in water.

2,4,6-tris-(ethyleimino)-s-triazine. See triethylene melamine.**tris-2-ethylhexyl phosphite** P(OC₈H₁₇)₃.

Properties: Colorless liquid, sp.gr. 0.902; b.p. (0.3 mm) 163-164°C, insoluble in water; soluble in alcohol and ether.

Containers: Glass bottles, 5-, 55-gal drums.

Uses: Synthesis, plasticizers, stabilizers, lube and grease additives, flameproofing compositions.

tris(2-hydroxyethyl) (phenylmercuri) ammonium lactate. See phenylmercuritriethanolammonium lactate.**tris(2-hydroxyethyl)trimethylammonium citrate.** See tricholine citrate.**tris(hydroxymethyl)aminomethane** [tri(hydroxymethyl)aminomethane, THAM; tris amine buffer] (CH₂OH)₃CNH₂.

Properties: White crystalline solid. Solubility in water, 80 g/100 cc at 20°C. M.p. 171-172°C; b.p. (10 mm) 219-220°C; pH 0.1M aqueous solution 10.36. Corrosive to copper, brass, aluminum.

Containers: Fiberpak boxes; drums.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic

gases; chemical synthesis; buffer.

Hazard: Avoid repeated exposure to skin.

Shipping regulations: None.*

tris(hydroxymethyl)nitromethane(CH₂OH)₃CNO₂.

Properties: White crystals or amorphous solid, m.p. 175°C; b.p. decomposes. Soluble in water and alcohol. Non-flammable; non-irritating to eyes and skin.

Uses: Bactericide and slimicide for aqueous systems, cutting oil emulsions, pulp and paper industry, industrial water systems, drilling muds.

tris[1-(2-methyl)aziridinyl]phosphine oxide(C₃H₆N)₃PO. ("MAPO").

Properties: Amber-colored liquid; high boiling amine odor; completely soluble in water and all common organic solvents.

Derivation: Reactive, tri-functional imine derivative.

Containers: 5-gal and 55-gal steel containers.

Uses: Addition products for textile treatments, adhesives, paper and rubber processing; crosslinking agent in polymer systems which contain active hydrogens; as monomer for polymers.

trisodium dipotassium tripolyphosphateNa₃K₂P₃O₁₀.

Properties: White crystalline solid; m.p. 620-640°C, density 2.48; solubility in water (26°C) 80 g/100 ml.

Use: Sequestrant.

trisodium EDTA, monohydrate. See ethylenediaminetetraacetic acid salts.**trisodium EDTA, trihydrate.** See ethylenediaminetetraacetic acid salts.**trisodium orthophosphate.** See sodium phosphate, tribasic.**trisodium phosphate.** See sodium phosphate, tribasic.**trisodium phosphate monohydrate.** See sodium phosphate, tribasic, monohydrate.**tristearin.** See stearin.**tritium T.** Radioactive hydrogen of mass number 3.

Properties: Half-life 12.5 years; radiation, beta, radiotoxicity, very low.

Derivation: Pile irradiation of lithium. If tritium occurs naturally it is present in amounts which are less than one part in 10¹⁷ parts of ordinary hydrogen.

Forms available: As a gas packaged in ampules and in tagged compounds such as water, streptomycin, cortisone, epinephrine, octadecane, stearic acid, etc.

Uses: In the hydrogen bomb. The fusion of tritium nuclei to form helium releases about seven times the energy per hydrogen nucleus which is obtained from nuclear fission. Also used as a bombarding particle in cyclotrons; an activator in self-luminous phosphors; in cold cathode tubes; as a tracer in studying hormone metabolism, the solubility of water in various organic compounds, the bulk and surface diffusion of hydrogen

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

on metals, the distribution of water in pre-cooked foods, the moisture gradient in attached protective coatings, petroleum products and fuels, etc.

Tritium is the significant exception to the general rule that the radioactive isotopes of the elements behave chemically and physically the same as the usual form. This is because the mass of tritium is quite different from that of hydrogen. However when tritium is incorporated into heavy molecules, this mass difference becomes insignificant, and tritium is used extensively to label organic molecules to follow their behavior.

Shipping regulations: Class D poison, radioactive material. Blue label.*

tritolyol phosphate. See tricresyl phosphate.

triton. Nucleus of tritium or hydrogen 3.

"Triton."²³ Trademark for surfactants based on alkylaryl polyether alcohols, sulfonates and sulfates; nonionic, cationic and anionic types; oil-soluble and water-soluble types. Supplied as viscous liquids, pastes, or aqueous solutions. Surface activity includes detergency, emulsification, wetting, spreading, dispersing action.

Use: Processing of textile fabrics and yarns, leather tannery operations; emulsification of pesticides; sanitizing and cleansing formulations; cosmetic preparations, medicinal soaps, paper manufacture; oil well flooding; polymer manufacture, petroleum oil additives.

"Triton B-1956."²³ Trademark for a free-flowing emulsifier, spreader, sticker, and depositing agent for insecticides.

tritopine. See laudamidine.

"Tri-Una-Sol."⁵⁸ Trademark for nitrogen fertilizer solution.

Properties: Clear water solution; varying analysis of 28, 30, and 32% nitrogen containing urea, ammonium nitrate and water. Containers: Insulated and uninsulated tank cars, tank trucks.

Uses: Direct application to soil, formulation of mixed fertilizers.

triuranium octoxide (uranous-uranic oxide; uranyl uranate) U_3O_8 .

Properties: Olive green to black solid, crystals or granules; insoluble in water; soluble in nitric acid and sulfuric acid. Sp.gr. 8.39; decomposes when heated to 1450°C.

Source: It is the naturally occurring uranium oxide found in pitchblende.

Derivation: (a) As one of the forms of uranium produced from the ores, often by a solvent extraction process. The solvent used is dodecylphosphoric acid. (b) A common form of triuranium octoxide is yellow cake, the powder obtained by evaporating an ammonia solution of the oxide.

Uses: Nuclear technology; preparation of other uranium compounds.

trixylenyl phosphate. See tri-dimethylphenyl phosphate.

"Tro-Grees."²⁵ Brand name for a proprietary, odorless and tasteless mineral type grease for lubricating troughs, chutes, etc. in the baking industry.

troilite. A variety of pyrrhotite (q.v.)*found in meteorites.

troinitrate phosphate (triethanolamine trinitrate phosphate; aminotrate phosphate)
 $N(CH_2CH_2ONO_2)_3 \cdot 2H_3PO_4$.

Properties: Crystals; banana-like odor; m.p. 107-109°C. Pure compound is potentially explosive.

Derivation: Prepared by the nitration of triethanolamine followed by precipitation with phosphoric acid.

Grade: N.N.D. (is dispensed as a 1:1 trituration with lactose).

Use: Medicine.

"Troluol."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white, initial boiling point 194-205°F, 95% distills between 235 and 247°F; sp.gr. 0.741 (60°F); flash point (TCC) 25°F; mild, nonresidual odor.

Uses: In lacquer formulations, rubber cements, and roto inks.

Shipping regulations: Flammable liquid. Red label.*

trona (urao) $Na_2CO_3 \cdot NaHCO_3 \cdot 2H_2O$. A natural sodium sesquicarbonate and the most important of the natural sodas.*

Properties: White, gray or yellow with vitreous, glistening luster; contains 41.2% Na_2O , 38.9% CO_2 , 19.9% H_2O with some impurities.

Occurrence: Extensive deposits in Hungary, Egypt, Africa, Venezuela, and United States (Wyoming, California, especially Searles Lake, Owens Lake).

Use: *Source of sodium compounds.

"Tronabor."⁸⁸ Trademark for crude borax pentahydrate, from Searles Lake brines.

Trona process. The method used for separation and purification of soda ash, anhydrous sodium sulfate, boric acid, borax, potassium sulfate, bromine and potassium chloride from the Searles Lake (California) brine.

"Tronothane."³ Trademark for pramoxine hydrochloride (q.v.).

troostite. A transition substance occurring in the heat treatment of steel. It is a special mixture of iron and Fe_3C .

troostite (mineral). See willemite.

tropacocaine hydrochloride $C_{15}H_{19}NO_2 \cdot HCl$.
An alkaloidal salt.

Properties: White crystals; poisonous!

Soluble in water, alcohol, and ether. M.p. 271°C.

Derivation: From a variety of Erythroxylon coca.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

3-tropanol. See tropine.

tropeolin D. See methyl orange.

tropeolin OO $\text{NaSO}_3\text{C}_6\text{H}_4\text{NNC}_6\text{H}_4\text{NHC}_6\text{H}_5$, para-Diphenylamino-azobenzene-sodium sulfonate. A biological stain and acid-base indicator, red at pH 1.4, yellow at pH 2.6. See indicators.

"Tropicel." ²⁴⁸ Trademark for a family of translucent and highly styled sandwich panels of reinforced polyester resin. Two flat panels are bonded to geometric cores forming a rigid panel for architectural applications.

tropine (3-tropanol) $\text{C}_8\text{H}_{15}\text{NO}$.

Properties: White, crystalline alkaloid; very hygroscopic; poisonous! Soluble in water; alcohol, ether, and chloroform.

Constants: M.p. 61.2-63°C; b.p. 233°C.

Derivation: By heating atropine or hyoscyamine with barium hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles, boxes.

Use: Medicine.

Shipping regulations: None.*

Trouton's rule. States that the molal heat of vaporization of normal liquids, at the boiling point and under atmospheric pressure, divided by the absolute boiling temperature is a constant, approximately 22.

true lavender. See lavender.

"Truline." ²⁶⁶ Trademark for a dry, pulverized resin used to bind core and molding sands. Made from a high-melting resin extracted from pine wood.

"Trycite." ²³³ Trademark for an oriented polystyrene film.

tryptaflavine. See acriflavine hydrochloride.

tryptaflavine neutral. See acriflavine.

tryparsamide (sodium N-phenylglycineamide-para-arsonate) $\text{NaOAs}(\text{OOH})\text{C}_6\text{H}_4\text{NHCH}_2\text{CONH}_2 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: White crystalline powder, odorless. Contains 24.6% arsenic. May affect eyes. Soluble in water; almost insoluble in alcohol, ether, chloroform, benzene.

Grades: Medicinal; U.S.P. XVI.

Use: Medicine.

Shipping regulations: None.*

trypsin. The proteolytic enzyme of the pancreatic juice. Yellow to grayish-powder, soluble in water, insoluble in alcohol or glycerin. It acts on the albuminoid material producing amino acids. The maximum result is obtained in a neutral or slightly alkaline medium. Trypsins or similar materials are found not only in the pancreas but also in the spleen, leucocytes and urine and also in beer yeast, molds and bacteria. Used in medicine.

Grade: N.F. XI.

trypsinogen. An inactive precursor of trypsin (q.v.).

tryptophan (indole-alpha-aminopropionic acid; 1-alpha-amino-3-indolepropionic acid) $\text{C}_8\text{H}_4\text{NHCH}(\text{CH}_2\text{CHNH}_2\text{COOH})$. One of the essential amino acids occurring naturally in the L(-)-form.

Properties:

DL-: White crystals; slightly soluble in water; stable in alkaline solution; decomposed by strong acids.

D(+)-: Characteristic sweet taste; m.p. 275-290°C (dec); soluble in water, hot alcohol, alkali hydroxides; insoluble in chloroform.

L(-)-: Flat taste (other properties identical with D(+)-tryptophan).

Derivation: Synthetic tryptophan can be made by the conversion of indole to gramine, followed by methylation, interaction with acetylaminomalonic ester and hydrolysis; hydrolysis of proteins.

Grades: Reagent; technical.

Containers: 1-, 5-lb bottles; drums.

Uses: Nutrition and research; medicine.

Available commercially in all three forms, as well as acetyl-DL-tryptophan.

"Trysben" 200. ²⁸ Trademark for a weed killer based on an aqueous solution of the dimethylamine salt of trichlorobenzoic acid, containing 2 lb of acid equivalent per gallon. Use. Control of broadleaf weeds (especially deep-rooted perennials) and woody vines and brush.

Containers: 1-gal cans, 5- and 30-gal drums.

Ts. Abbreviation for tosyl.

TSA. Abbreviation for toluene sulfonic acid.

TSH. See thyrotropic hormone.

TSP. Abbreviation for trisodium phosphate. See sodium phosphate, tribasic.

TSPA. Abbreviation for triethylenethiophosphoramide.

TSPP. Abbreviation for tetrasodium pyrophosphate. See sodium pyrophosphate.

TTC. Abbreviation for tetrazolium chloride.

TTD. Abbreviation for tetraethylthiuram disulfide.

"Tuamine." ¹⁰⁰ Trademark for tuaminoheptane sulfate, N.F.

tuaminoheptane. See 2-aminoheptane.

tuaminoheptane sulfate

$[\text{CH}_3(\text{CH}_2)_4\text{CHNH}_2\text{CH}_3]_2 \cdot \text{H}_2\text{SO}_4$.

Properties: White odorless powder; readily soluble in water and alcohol.

Grade: N.F. XI.

Use: Medicine.

"Tubarine." ³⁰¹ Trademark for d-tubocurarine chloride (q.v.).

tubatoxin. See rotenone.

tuberosc oil.

Properties: Colorless to very light colored oil, sp. gr. 1.007-1.035 at 15°C; taken from *Polianthes tuberosa*, by enfleurage.

Use: Perfume.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tubocurare. A tube form of curare.

d-tubocurarine chloride $C_{38}H_{44}Cl_2N_2O_6 \cdot 5H_2O$.

Properties: White to light tan, odorless, crystalline powder. M.p. (anhydrous) 274-275°C with decomposition; soluble in water and alcohol; insoluble in acetone, chloroform, and ether. Aqueous solution is strongly dextrorotatory. (Specific rotation for 1% solution of anhydrous +208° to +218°.)

Grade: U.S.P. XVI.

Use: Medicine.

"Tuex." ²⁴⁸ Trademark for tetramethylthiuram disulfide.

Properties: Grayish white powder; sp.gr. 1.29; m.p. not less than 135°C; soluble in benzene and ethylene dichloride; moderately soluble in acetone; insoluble in water and gasoline.

Uses: Rubber accelerator for natural rubber wire insulation; inner tubes; druggist sundries; mechanicals; proofing; footwear; sponge rubber and transparent pure gum stocks. In SBR and butyl rubber, a general-purpose accelerator.

tufa. See travertine.

tuff. See volcanic ash

"Tuftop." ³²⁹ Trademark for a sensitized cold top enamel.

Use: Photoengraving.

"Tumerol." ³⁴² Trademark for oleoresin of tumeric for food coloring and flavoring.

"Tumescal." ²⁰⁶ Brand name for proprietary swelling agents for "Terylene" and other polyester fibers.

tuna oil (tunny-fish oil).

Properties: Pale yellow to red-brown liquid; characteristic odor. Soluble in alcohol, ether, chloroform, carbon disulfide and ligroin.

Constants: Iodine value 156.

Derivation: By expressing the livers of *Thynnus vulgaris*.

Method of purification. Filtration

Grades: Crude, refined.

• Containers: Wooden barrels and steel drums.

Uses: Paints; source of vitamins A and D.

Shipping regulations: None.*

tung oil (Chinese-wood oil, China-wood oil; wood oil).

Properties: Yellow, drying oil. Jellies or solidifies when kept. Reputed to be poisonous. Soluble in chloroform, ether, carbon disulfide, and oils. Sp.gr. 0.9360-0.9432; saponification value 193; iodine value 150-165; refractive index 1.5030.

Derivation: From the seeds of *Aleurites cordata*, a tree indigenous to China and Japan, by roasting, grinding and pressing. The tree is now being grown on a commercial scale in Florida and Mississippi.

Impurities: Tung oil, being expensive, is frequently adulterated with cottonseed oil, soya bean oil, etc.

Grades: White; black; cold-pressed, yellow; hot-pressed, dark. Japanese tung oil is an

inferior grade with notably poorer drying qualities. Also domestic; imported.

Containers: 75-lb cases; drums; 8000-gal tank cars.

Uses: Varnishes; linoleum; making varnish dryers; india rubber substitutes; insulating masses; waterproofing paper and other tissues.

Shipping regulations: None.*

tungstated green. See phosphotungstic pigments.

tungstated pigments. See phosphotungstic pigments.

tungstate white. See barium tungstate.

tungsten (wolfram) W. Element with atomic number 74, group VI of the periodic system. An official ruling of the commission on Inorganic Nomenclature, International Union of Pure and Applied Chemistry, recognizes the use of tungsten for English-speaking countries. Wolfram is also official, however.

Properties: Hard, brittle, gray metal; very heavy. Not found native. The ores are scheelite and wolframite. Sp.gr. 19.3 (20°C); m.p. about 3400°C (the highest melting point of all the metals). Soluble in a mixture of nitric acid and hydrofluoric acid.

Derivation: By the aluminothermic reduction of tungstic oxide; hydrogen reduction of tungstic acid or its anhydride. The metal can be plated onto objects by vapor deposition from tungsten hexafluoride or hexacarbonyl. Tungsten powder is converted into solid metal by powder metallurgical techniques. Large single crystals now grown by an arc-fusion process.

Occurrence: Found in Korea, China, Mexico, Spain and in the United States in Arizona, California, Colorado, Nebraska, Nevada, New Mexico, and Texas.

Grades: Technical, ultrapure.

Container: 5-, 10-, 25-lb cans, barrels, drums (powder).

Uses: High-speed tool steel; nonferrous alloy electric lamp industry, contact points in automotive and telegraph industries (wireless apparatus); dentistry; pen points, targets of x-ray tubes; phonograph needles; shell steel; chemical apparatus; high speed rotors as used in gyroscopes, counterweights; vibration damping devices, shielding radioactive materials and missile surfaces.

Shipping regulations: None.*

tungsten carbide WC.

Properties: A fine gray powder; sp.gr. 15.6 m.p. 2780°C; b.p. 6000°C, hardness approaches that of diamond (Mohs hardness 9+); insoluble in water but readily attacked by a nitric acid-hydrofluoric acid mixture. Stable to 400°C with chlorine; burns with fluorine at room temperature; oxidizes on heating with air to tungstic oxide.

Derivation: Chemical combination of tungsten metal powder and lamp black at 1500-1600°

Uses: Cemented carbide tools; dies; wear-resistant parts; cermets; electrical resistors

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tungsten carbide, cemented. A mixture consisting of tungsten carbide, 85-95% and cobalt, 5-15%.

Properties: Sp.gr. 12-16; hardness about that of corundum, and not affected by severe high industrial temperatures.

Derivation: Ball milling of powdered tungsten carbide with metallic cobalt, followed by sintering.

Uses: Machine tools and abrasives for machining and grinding metals, rocks, molded products, porcelain and glass; in gages, knife edges, blast nozzles.

tungsten hexacarbonyl $W(CO)_6$.

Properties: White, volatile, highly refractive, crystalline solid; decomposes without melting at 150°C. One of the more stable carbonyls. Sp.gr. 2.65; vapor pressure 0.1 mm (20°C). Insoluble in water; soluble in organic solvents.

Derivation: By the reaction of tungsten with carbon monoxide at high pressures; reduction of tungsten hexachloride with iron alloy powders in CO atmosphere.

Use: To obtain tungsten coatings on base metals through deposition and decomposition of the carbonyl.

tungsten hexachloride WCl_6 .

Properties: Dark blue or violet hexagonal crystals; volatile; m.p. 275°C, b.p. 347°C; sp.gr. 3.52, vapor pressure 43 mm (215°C); electrical conductivity (fused state) poor. Soluble in organic solvents including ligroin and ethanol. Decomposed by moist air and water, reduced by hydrogen to the metal.

Derivation: By treating tungsten metal with dry chlorine at red heat.

Uses: Formation of tungsten coatings on base metals; formation of single crystal tungsten wire, additive to tin oxide to produce electrically conducting coating for glass.

tungsten hexafluoride WF_6 .

Properties: Colorless gas or light yellow liquid. M.p. 2.5°C, b.p. 19.5°C. Similar to fluorine in toxicity.

Derivation: Direct fluorination of powdered tungsten. Purified by distillation under pressure.

Uses: Vapor phase deposition of tungsten; fluorinating agent.

tungsten lakes. See phosphotungstic pigments.

tungsten oxychloride $WOCl_4$.

Properties: Dark-red, acicular crystals. Decomposed by water and moist air. Caution! Keep in sealed glass containers! B.p. (approx) 227.5°C; m.p. (approx) 211°C; sp.gr. 11.92; soluble in carbon disulfide.

Derivation: By the action of chlorine on tungsten or tungstic oxide at elevated temperatures.

Purification: Vacuum distillation.

Grade: Technical.

Use: Incandescent lamps.

tungsten silicide. A ceramic. Probably WSi_2 .

Grades: Cylindrical shapes, lumps, standard sieve sizes.

Uses: Oxidation resistant coatings; electrical resistance applications.

tungsten steel. In many of its alloying effects, tungsten is similar to molybdenum, and therefore is not used for any standard SAE or AISI alloy steels, since the cheaper molybdenum will give the same properties. Tungsten increases the density of alloys to which it is added. It is used to obtain steels with great wear resistance and special resistance to tempering, as indicated by the following examples:

high speed steels: The outstanding application. Typical composition 18% tungsten, 4% chromium, 1% vanadium, 0.70% carbon. Tungsten makes steel very resistant to tempering and the carbide has great wear resistance, making an ideal high speed cutting tool.

hot work steels: 10% tungsten, 3% chromium, 0.30% vanadium, 0.35% carbon. This can be used even where surface working temperatures exceed tempering temperature due to very slow loss of hardness occurring in these conditions.

finishing steels: 3.5% tungsten, 1.35% carbon; maintains keen cutting edge and has great wear resistance.

creep resisting steels: 3% tungsten, 0.12% carbon, 12% chromium, 2% nickel; useful in resisting creep at temperatures up to 1100°F.

oxidation resistant, high temperature, high strength alloys: Used in stainless steels for high temperature work, i.e., in exhaust valves. Most promising alloys—iron, cobalt, nickel, chromium with tungsten, molybdenum, titanium and niobium.

magnet steels: Tungsten was used for magnets but is now completely superseded by the iron, nickel, aluminum, and iron, nickel, aluminum, cobalt alloys.

tungsten trioxide. See tungstic oxide.

tungstic acid (wolframic acid, orthotungstic acid) H_2WO_4 .

Properties: Yellow powder; sp.gr. 5.5. Insoluble in water, soluble in hydrofluoric acid and alkalis. A white form of tungstic acid exists, having the formula $H_2WO_4 \cdot H_2O$. This is formed by acidifying tungstate solutions in the cold.

Derivation: Decomposition of sodium tungstate with hot sulfuric acid.

Method of purification: Crystallization.

Grades: Technical, C.P.; reagent.

Containers: Drums; in tonnage lots.

Uses: Textiles (mordant, color resist); plastics; tungsten metal, wire, etc.

Shipping regulations: None.*

tungstic acid anhydride. See tungstic oxide.

tungstic anhydride. See tungstic oxide.

tungstic oxide (tungstic acid anhydride; tungstic anhydride; tungsten trioxide; wolframic acid, anhydrous) WO_3 .

Properties: Canary yellow, heavy powder; dark orange when heated and regains

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

original color on cooling; m.p. 1473°C; sp. gr. 7.16. Insoluble in water; soluble in caustic alkalies; only soluble with difficulty in acids.

Derivation: Scheelite ore is treated with hydrochloric acid and the resulting product dissolved out with ammonia. The complex ammonium tungstate can then be ignited to tungstic oxide.

Uses: To form metal by reduction; alloys; preparation of tungstates for x-ray screens and for fire-proofing fabrics, yellow coloring agent in ceramics.

"Tungstide." ²⁸⁹ Brand name for a line of coatings consisting of metallic tungsten of near-colloidal particle-size suspended in a liquid plastic and incorporated with a form of "Liqui-Moly", (a molybdenum disulfide product) to produce a hard, abrasion-resistant self-lubricating coating.

tunicine (animal cellulose). A variety of cellulose found in the tunic of the ascidians (e.g., sea-squirts).

tunny-fish oil. See tuna oil.

turbine oil. The desirable characteristics of an oil for use with heavy horizontal turbines are bright yellow color, high flash test, low viscosity, the ability to maintain its body and efficiency under high temperatures and low moisture-absorptive capacity. One good steam-turbine oil is said to have the following characteristics: Gravity 30° Bé, flash point, 420°F, Saybolt viscosity, 150 at 70°F.

Shipping regulations: None.*

turbith mineral. See mercuric subsulfate.

turkey brown (turkey umber). Natural earth which serves as permanent pigment. Contains iron and manganese oxides with some clay.

Use: In paint.

turkey galls. See galls.

Turkey red. See iron oxide reds.

Turkey red oil (castor oil, sulfonated; castor oil, soluble). It is also known as alizarin

- assistant and alizarin oil because of its use in dyeing with alizarin.

Properties: Sp. gr. 0.95; iodine no. 82.1, acid no. 174.3, saponification no. 189.3. Soluble in water.

Derivation: By sulfonating castor oil with sulfuric acid and washing.

Grades: Sulfonated castor oil graded as to moisture and color.

Containers: 55-gal barrels and drums; 500-lb barrels.

Uses: Textiles, leather, manufacture of soaps; alizarin dye assistant.

Shipping regulations: None.*

"Turkey Red Oil PO." ²⁰⁶ Brand name for product combining emulsifying action of turkey red oil with improved wetting properties.

turkey umber. See turkey brown.

Turkish geranium oil. See palmarosa oil.

turmeric. See curcuma.

turmeric oil. See curcuma oil.

turmeric root. See hydrastis.

turmeric yellow. See curcumin.

Turnbull's blue. Blue precipitate or pigment resulting from reaction of a ferrous salt and potassium ferricyanide. See iron blues.

turpentine (gum turpentine; thus, American; thus, gum). The gum or oleoresin from which spirits of turpentine (turpentine oil, popularly called turpentine) is produced. It is an exceedingly sticky, viscid, liquid balsam, a mixture of rosin and volatile oil, obtained from coniferous trees. Yellowish, opaque masses, sticky and more or less glossy with characteristic odor and taste. Soluble in alcohol, ether, chloroform, and glacial acetic acid.

Chief constituents: A volatile oil (turpentine oil) and a resin.

Derivation: By incision into the wood of coniferous trees in the spring of the year or by solvent extraction from stumps of coniferous trees.

Containers: Tins; bottles; barrels.

Use: Source of spirits of turpentine and rosin

turpentine camphor. See bornyl chloride.

turpentine, Canadian. See Canada balsam.

turpentine, destructively-distilled wood. See turpentine, spirits of.

turpentine gum. See turpentine.

turpentine, gum spirits. See turpentine, spirits of.

turpentine, oil of. See turpentine, spirits of.

turpentine, spirits of (turps; turpentine, oil of). General formula $C_{10}H_{16}$. A volatile oil obtained by distilling the oleoresin exuded by or contained in the wood of certain species of pine trees. See turpentine. The principal countries producing the oil are America, France, Russia, Spain, Austria, Greece and (recently) Mexico.

Chief known constituents: Pinene; dipentene. Four kinds of turpentine oil are now recognized:

(a) Gum turpentine or gum spirits of turpentine, made from the gum (oleoresin) collected from living trees.

(b) Steam-distilled wood turpentine, obtained from the oleoresin within the wood by steam distillation of the wood itself or of an extract therefrom.

(c) Sulfate wood turpentine, recovered during the conversion of wood to paper pulp by the sulfate process.

(d) Destructively-distilled wood turpentine obtained by fractionation of certain oils recovered by condensing the vapors formed during the destructive distillation of pine wood.

American turpentine oil.

Species from which crude is derived:

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Pinus palustris, Mill.; *Pinus heterophylla*, Sudw.; *Pinus echinata*, Mill.

Properties: Colorless, mobile liquid; rosin-like odor.

Constants: Considerable variation appears in constants reported. The following are based on tests made by the U. S. Department of Agriculture, Forest Products Laboratory; Sp. gr. (15°C) 0.860-0.875; moisture content-trace; refractive index 1.463-1.483 (20°C); Kauri-Butanol Solvency Test 80.2; flash point (closed cup) 102.5°F; acidity none; unpolymerized residue (28 N H₂SO₄) 2%; color water-white (not below Saybolt plus 16); wt in lbs/gal 7.18; representative distillation 10% (161.2°C), 50% (165.2°C), 80% (171°C), 90% (175.5°C), end (181°C).

Grades: Technical; N. F. XI.

Containers: Bottles; cans; drums.

Uses: Medicine; solvent; thinner for paints, varnishes and lacquers; rubber solvent and reclaiming agent.

Shipping regulations: None.*

turpentine, steam-distilled wood. See turpentine, spirits of.

turpentine substitute. See naphtha, painters'. The term turpentine substitute is misleading and should not be used.

turpentine, sulfate wood. See turpentine, spirits of.

turpentine, Venice (larch turpentine).

Properties: Yellowish to green oleoresin; pleasant aromatic odor, hot, pungent, bitter taste; becomes hard and brittle on exposure to air, sp. gr. 1.09-1.19, soluble in most organic solvents.

Chief constituents: Volatile oil and resin.

Derivation: Distilled from *Larix europaea*.

Occurrence: Middle and southern Europe.

Uses: Varnish; sealing wax; lithography.

Shipping regulations: None.*

turpentine, Venice, artificial. A mixture of rosin and oil of turpentine and similar to pine oleoresin.

Properties: Soluble in ether, acetone, acetic acid, aqueous alkalies and slowly soluble in alcohol.

Uses: In making varnishes, sealing wax and plasters; lithographic work.

turpeth mineral. See mercuric subsulfate.

"Turpol" Brand Rubber Plasticizer NC-1200.¹⁵⁸

A plasticizer and processing aid that has a wide range of compatibility with various synthetic rubbers. A non-extractable plasticizer used for the compounding of low durometer stocks such as in printing rolls. Exerts softening effect upon harder, tougher, drier rubbers and it imparts a cohesiveness to all rubbers during the mixing process. Mold flow, particularly in transfer molding, is aided by the addition of the plasticizer.

Properties: Amber colored rubbery terpene-derived synthetic polymer. Sp. gr. 1.20 at 25°C., resists all common solvents, Shore "A" hardness, 5-10 with nil ash percentage.

Containers: 50-lb cartons.

"Turpol" Brand Terpene Based Resin.¹⁵⁸ A reactive diluent for epoxy resins which improves adhesion and peel strength.

Containers: Quart, 1-gal, 5-gal and 55-gal drums.

turps. See turpentine, spirits of.

turquoise CuAl₆(PO₄)(OH)₃·2H₂O. A natural basic hydrated phosphate of copper and aluminum.

Properties: Color blue, blue-green, green; luster waxy; streak white or green; hardness 6, sp. gr. 2.6-2.9.

Occurrence: New Mexico, Arizona, Nevada, California, Colorado; Iran.

Use: Gem stone.

turtle oil.

Properties: A yellow semi-solid oil with an odor of beef-drippings.

Derivation: In South America from turtle eggs; in Seychelle Islands and Jamaica from turtle fat.

Use: Similar to cod-liver oil.

tuscan oxide. See tuscan red.

tuscan red (tuscan oxide). A red iron oxide pigment.

tutia. See zinc carbonate, precipitated.

tutocaine (butamin) C₁₄H₂₂O₂N₂·HCl (para-aminobenzoyldimethylamino-1,2-dimethylpropanol hydrochloride).

Properties: Light, ivory-colored, crystalline powder, virtually odorless; faintly bitter taste. More toxic than procaine. M. p. 212-215°C. Soluble in water; with difficulty in alcohol.

Use: Medicine.

Shipping regulations: None.*

"TVM."¹⁹⁴ Trademark applied to a series of protective and decorative thermosetting vinyl color metal coatings.

Tw. Abbreviation for Twaddell, used in reporting specific gravities for densities greater than water, as °Tw. A Twaddell reading, multiplied by five and added to 1000, gives specific gravity with reference to water as 1000.

Twaddell. See Tw.

"Twecotan."⁵⁷ Brand name for a group of proprietary products. Combination of natural and synthetic tanning materials used for retanning leather where a fine grained full leather is required.

"Tween."⁸⁹ Trademark for each member of a series of general purpose emulsifiers and surface active agents. They are polyoxyethylene derivatives of fatty acid partial esters of hexitol anhydrides. Generally soluble or dispersible in water, and differ widely in organic solubilities.

twist setting agents. Following twisting operations in the manufacture of silk and rayon yarns, the threads are likely to be too lively or "springy" to process easily. Consequently

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

they are subjected to a steaming operation to render the yarns limp. To avoid loss of twist during steaming, especially in yarns for crepes, they are treated with compounds which assist in holding the twist. Modified casein and caseinates, highly sulfated oils, and various other sulfonated penetrants or a combination of a melamine-formaldehyde resin and 2-mercaptoethanol are among the products used for twist setting.

"Twitchell." ²⁴² Trademark for a group of textile processing oils, fat-splitting reagents, and bases for soluble oils.

Twitchell process. Acid hydrolysis of fats in the presence of the Twitchell reagent to produce fatty acids and glycerine.

Twitchell reagent. A catalyst for the Twitchell process. Consists of a sulfonated addition product of naphthalene and oleic acid, a naphthalenestearosulfonic acid.

"Two-Sixty-Two." ²⁸ Trademark for a urea feed compound.

Properties: Free-flowing, non-caking granular product having a nitrogen content of 42%, all in the form of urea, equivalent to 262% protein from nonprotein nitrogen. Containers: 80-lb multiwall moisture-resistant paper bags.

Use: As ingredient of feeds for ruminants in an amount not more than one-third of the total equivalent protein in the mixture. Since too large a content of urea in such feeds is toxic, the product is recommended for use by commercial feed-manufacturers only.

"Ty-Bond." ⁴²⁸ Trademark for a line of phosphate coatings for dip or spray application to steel, iron and zinc base die castings.

"Tybrene." ²³³ Trademark for tert-butylstyrene and similar materials.

"Tygobond 30." ³²⁶ Trade name for a vinyl rubber resin adhesive for cementing porous and semiporous substances to each other.

"Tygofil." ³²⁶ Trade name for a modified epoxy base metal filler.

"Tygoflex." ³²⁶ Trade name for a plastisol-vinyl compound derived from "Tygon." For specialty corrosion protection.

"Tygon." ³²⁶ Trademark for a series of vinyl compounds used as linings, coatings, adhesives, tubing, and extruded shapes applied to chemical process equipment as corrosion protection.

"Tygonite." ³²⁶ Trade name for a group of general utility cements or adhesives derived from vinyls and rubber. Available in several consistencies.

"Tygorust." ³²⁶ Trade name for a vinyl-based primer for application to damp or dry rusted steel.

"Tygoweld." ³²⁶ Trade name for a modified epoxy base adhesive for bonding both similar and dissimilar materials.

"Tylose." ⁴⁵⁰ Trademark for a wide range of water-soluble cellulose ethers.

"Tylose" UM, UMK and UH are grades of methylcellulose, prepared by treating alkali cellulose with methyl chloride. The sodium chloride formed during this etherification is washed out with boiling water in which methylcellulose itself is not soluble.

"Tylose" UC, UCB, UCBR and UCR are grades of sodium carboxymethylcellulose (q.v.). The UC and UCB grades are highly purified; the UCR and UCBR grades contain some of the sodium chloride from the original reaction.

Properties: The "Tylose" products differ from one another in the type of substituent and also in the degree of substitution and polymerization. The numerical nomenclature refers to the viscosity, for example "Tylose" UM 4000 (high viscosity) and "Tylose" UM 70 (low viscosity). They also differ in purity, in the active ingredient content and in appearance (granular or powder form). (The types assigned the letter K after the numeral must not be used for foodstuffs, pharmaceuticals or cosmetics.) They are not affected by fats, oils or most organic solvents.

Uses: As thickeners, binders, dispersing agents, emulsifiers, protective colloids, lubricants and film forming materials. They are used as drilling muds; in detergents; in textile, paper, print, and varnish industries; in ceramics; and in cosmetics and pharmaceuticals.

"Tynex." ²⁸ Trademark for nylon filaments. Available tapered with an essentially uniform taper from butt to tip, and also level, i.e., in a wide range of constant diameters. The tapered form used primarily in paint brushes; the level form in other brushes and wigs, surgical sutures and racquet strings.

type metal. Alloy of 75-95% lead, 2½-18% antimony with a little tin and sometimes copper which expands slightly upon solidification and produces sharp castings.

tyramine (tyrosamine; para-beta-amino-ethylphenol) $\text{HOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NH}_2$. A base which is found in mistletoe, putrefied animal tissue, certain cheeses, and ergot. It is usually made synthetically.

Properties: Colorless crystals; m.p. 164-165°C; soluble in boiling alcohol, slightly soluble in water, benzene, and xylene.

Use: Medicine.

tyramine hydrochloride $\text{C}_8\text{H}_{11}\text{NO} \cdot \text{HCl}$. A solid with m.p. 269°C. Soluble in water with neutral reaction.

Use: Medicine.

"Tyril." ²³³ Trademark for a rigid resin which is a copolymer of styrene and acrylonitrile.

tyrocidine. An antibiotic produced by the metabolic processes of the bacteria, *Bacillus brevis*. It is a cyclic polypeptide which is active against most grampositive pathogen (disease-causing) bacteria. It is one of the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

two antibiotic components of tyrothricin (q.v.) but has been isolated and used alone.

Properties (probably the hydrochloride):

Fine crystalline needles which decompose at 240°C. Soluble in 95% alcohol, acetic acid and pyridine; slightly soluble in water, acetone and absolute alcohol; insoluble in ether, chloroform and hydrocarbons. Depresses surface tension; forms fairly stable colloidal emulsion in distilled water.

Use: Medicine (usually as component of tyrothricin); possible fungistat and bacteriostat.

tyrosamine. See tyramine.

tyrosinase. An enzyme containing copper which occurs in plant and animal tissue and is responsible for turning peeled potatoes black when exposed to air.

Use: Medicine.

tyrosine (beta-para-hydroxyphenylalanine; alpha-amino-beta-para-hydroxyphenylpropionic acid) $C_6H_4OHCH_2CHNH_2COOH$. A nonessential amino acid.

Properties: White crystals, readily oxidized by the animal organism, soluble in water, slightly soluble in alcohol, insoluble in ether; optically active.

DL-tyrosine m.p. 316°C,

D(+)-tyrosine m.p. 310-314°C,

L(-)-tyrosine m.p. 295°C with decomposition, sp.gr: 1.456 (20/4°C).

Derivation: Hydrolysis of protein (casein), organic synthesis.

Uses: A growth factor in nutrition; biochemical studies.

Available commercially as DL-tyrosine.

tyrothricin. An antibiotic produced by growth of *Bacillus brevis*. It consists of a mixture

of antibiotics, principally gramicidin and tyrocidine (the latter usually present as the hydrochloride). Gramicidin is the more active component. Use is generally limited to local external applications. It is active against some gram-positive bacteria; including species of pneumococci, streptococci and staphylococci.

Properties: White to buff-colored powder; nearly odorless and tasteless; soluble in alcohol, acetone and dioxane; insoluble in water, chloroform and ether. Resistant to action of pepsin and trypsin.

Grade: N.F. XI.

Use: Medicine.

"Tysonite." ⁶⁹ Trademark for an organic rubber-like plastic for use in rubber products.

Properties: Dark brown; no odor in rubber compounds.

Constants: Sp.gr. 1.04.

Uses: To resist the deteriorating effect of ozone and improve electrical properties of rubber insulation compounds.

tyuyamunite $Ca(UO_2)_2(VO_4) \cdot nH_2O$. A natural hydrated vanadate of calcium and uranium, similar to carnotite (q.v.).

Properties: Color yellow; luster adamantine to pearly, usually occurs as fine crystals or as a powder, radioactive.

Occurrence. New Mexico, Utah, Colorado, U.S.S.R.

Use: Ore of uranium.

"Tyzine." ²⁹⁹ Trademark for tetrahydrozoline hydrochloride.

"Tyzor" Organic Titanates. ²⁸ Trademark for a series of esters of orthotitanic acid.

Use: As adhesion primers, binders for high temperature paints, pigment dispersants and moisture scavengers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

U

U. Symbol for uranium.

U-233. See uranium 233.

U-235. See uranium 235.

U-238. See uranium 238.

"Ubatol." ²² Trademark for a series of fine particle size styrene- and acrylic-based polymer and co-polymer emulsions, some less than .01 microns. Films deposited from compounded polymer emulsions exhibit high gloss, increased water resistance and durability. Film characteristics of straight polymers range from hard non-film forming to soft-flexible. U-2000 series - modified styrene homo-polymers; U-3000, U-4000, and U-7000 series - acrylic and acrylic-styrene homo-polymers, co-polymers and inter-polymers.
Uses: Coatings for paper, leather, textiles, tapes, vehicle for gloss latex paints; self polishing floor wax, latex compounding, de-tackifying agents, detergent opacifying agent.

"Ucar." ²¹⁴ Trademark for various types of synthetic organic chemicals.

"Ucar" butylene oxide 12 (1,2-epoxy-butane).

Properties: Water white reactive liquid; b.p. 63.2°C; f.p. -150°C, sp.gr. 0.8312 (20/20°C); 6.9 lb/gal; 5.9% soluble in water; flash point less than 20°F.

Uses: Intermediate for detergents; oil additives; lubricants, stabilizer chlorinated solvents.

"Ucar" butylphenol 4T (CH₃)₃CC₆H₄OH.

Properties: Flaked white solid, melting point 97°C, b.p. 237°C, sp.gr. 0.9081 (114/4°C).

Uses: Intermediate oil soluble phenolic resins; oil additives; paint driers; rubber vulcanizers; insecticides; antioxidant.

"Ucar" nonylphenol C₉H₁₉C₆H₄OH.

Properties: Clear liquid, b.p. 297.6°C, f.p. -20°C; sp.gr. 0.9385 (20/20°C), viscosity 563 cps at 20°C.

Uses: Intermediate surface active agents; oil soluble phenolic resins; oil additives; plasticizers.

"Ucar" triphenol P [1,1,3-tris(hydroxyphenyl)propane] (C₆H₄OH)₂CHCH₂CH₂C₆H₄OH.

Properties: White solid, m.p. 84°C; sp.gr. 1.226 (25/20°C).

Uses: Antioxidant; intermediate polyester and alkyl type resins.

"Ucet." ²¹⁴ Trademark for epoxy resin type of textile wrinkle resistant finishes for cotton and rayon.

"Ucilon." ²⁸⁸ Trademark for corrosion resisting coating materials (paint) and thinners.

"Ucon." ²¹⁴ Trademark for various types of synthetic organic chemicals.

"Ucon" fluids and lubricants: polyalkylene glycols and diesters. Available as both water-soluble or water-insoluble products. Non-corrosive to metals; little effect on rubber. Numerous grades available; viscosities range from 50 to 90,000 SUS; pour points as low as -85°F. Used as high-temperature lubricants, low temperature fluids, compressor lubricants, hydraulic brake fluids, leather and paper-treating compounds, rubber lubricants, plasticizers and solvents, chemical intermediate.

"Ucon" fluorocarbons, for refrigerant and propellant use, include the following:

"Ucon" 11: trichlorofluoromethane (q.v.).

"Ucon" 12: dichlorodifluoromethane (q.v.).

"Ucon" 22: chlorodifluoromethane (q.v.).

"Ucon" 113: 1,1,2-trichloro-1,2,2-trifluoroethane (q.v.).

"Ucon" 114: 1,2-dichloro-1,1,2,2-tetrafluoroethane (q.v.).

"Ucon" JL-6, a diester: sp.gr. 0.9265; (20/20°C); pour point lower than -85°F; viscosity index 151.

"Udex." ²³³ Trademark for glycols, such as diethylene glycol (q.v.), specially prepared for use in liquid-liquid extraction processes such as the "Udex" process.

"Udex" Process. ^{233, 416} Patented process for extracting aromatic hydrocarbons from mixed hydrocarbons by using a glycol-water mixture as solvent. The aromatic extract is distilled from the solvent and extremely high purity individual aromatics separated from one another by further distillation.

UDMH. Abbreviation for uns-dimethylhydrazine

UDP. Abbreviation for uridine diphosphate. See uridine phosphates.

UDPG. Abbreviation for uridine diphosphate glucose.

"U. F. Concentrate-85." ¹⁹⁷ Trade name for a solution of formaldehyde and urea. Typical analysis: Formaldehyde, 60%; urea, 25%; water, 15%, methanol <0.3%; salts <0.2%; free formic acid, nil.

Properties: Clear, colorless, viscous solution; sp.gr. 1.33 at 25/15°C; refractive index 1.472 at 25°C; b.p. about 100°C; f.p. -20 to -30°C; wt/gal 11.1 lbs; viscosity, 260 cps (25°C); flash point (Cleveland open cup) none; pH, approx. 8.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 55-gal lined drums; 8000-, 10,000-gal tank cars; 3500-gal tank trucks.
 Hazards: Toxicity: similar to 50% formaldehyde.

Uses: Adhesives; textile finishing agents; treating paper products to impart wet strength; industrial finishes; molding powders.

"Uformite." ²³ Trademark for synthetic resins based on urea-formaldehyde, melamine-formaldehyde, and triazine condensates. Supplied as colorless or light-colored aqueous solutions or solutions in volatile solvents. Solvent type produces hard, alkali-resistant, colorless coatings on curing, with adhesion to a variety of surfaces.

Use: With alkyd resins in coatings; industrial finishes on appliances, automobiles and other commercial products; adhesive for paperboard boxes, paper coatings; manufacture of wet-strength paper; textile pigment binding.

uintahite. See gilsopite.

uintaite. See gilsonite.

ulexine. See cytisine.

ulexite (cotton balls) $\text{NaCaB}_5\text{O}_9 \cdot 8\text{H}_2\text{O}$. A natural hydrated borate of sodium and calcium. Properties: Color white, luster silky; hardness 1-2.5; sp.gr. 1.96, usually found as rounded, loose-textured masses of fine crystals.

Occurrence: Chile, Argentina, California, Nevada.

Use: Source of borax.

Ullmann reaction. A modification of the Fittig synthesis (q.v.) in which copper powder is used instead of the sodium.

ulmin brown. See Van Dyke brown.

ulmins. Class of amorphous substances resulting from the decomposition of the cellulose and lignite tissues of plants. Ulmins represent one of the initial changes by which vegetable matter is converted into coal.

ulmus (elm, slippery elm). Flat pieces, externally light brown with dark brown patches; mucilaginous taste.

Derivation: Dried bark of *Ulmus fulva*, deprived of its periderm.

Occurrence: Eastern and central North America.

Grade: Technical.

Containers: Burlap bags; boxes, barrels.

Use: Medicine.

Shipping regulations: None.*

"Ultandren." ³⁰⁵ Trademark for fluoxymesterone N,N,D.

Use: Medicine.

"Ultex." ⁹⁴ Trade name for a rubber accelerator; composed of a selected organic salt of dithiocarbamic acid, containing no metallic radicals.

Properties: White powder, sp.gr. 1.14; m.p. 121-124°C; stable in storage; soluble in acetone and ethylene dichloride;

insoluble in water, gasoline, and carbon disulfide.

Containers: 100-lb fiber drums.

Use: In rubber drug sundries, sponge rubber, pure gum translucent products, patching rubber, cements, footwear, mechanical goods, molded goods, heels and soles.

Hazards: No health hazards when used in rubber, GR-S, and Buna N in amounts recommended.

ultra-accelerator. An unusually powerful accelerator of rubber vulcanization, typified by thiuram sulfides and dithiocarbamates.

"Ultraflex." ¹²⁸ Brand name for a grade of petroleum microcrystalline wax.

Properties: Color, amber or white; m.p. 140-145°F.

Containers: 10-lb slabs, 8/carton or 168/pallet, 350-lb drums, tank cars.

Uses: Coating and laminating paper, foil, and board; impregnating and waterproofing fabrics.

"Ultralan." ²⁰⁶ Brand name of proprietary line of metal complex acid dyestuffs for wool, leather, and synthetic fibers.

ultramarine. See ultramarine blue.

ultramarine blue (imitation ultramarine blue; ultramarine). Blue pigment of variable composition, probably a double silicate of sodium and aluminum, with some sodium sulfide, the latter appearing to influence the color.

Properties: Light blue powder or lumps with a reddish hue that is transparent in oils and enamels and comparatively weak tinctorially. Better in tints than in dark blue shades.

Does not retain color on exterior exposure, but reverts toward the dry appearance of the pigment when the enamel or paint film disintegrates. (This is not a true fading of pigment.) Color-fast to light, soap and alkalis, but sensitive to even weak acids.

Derivation: (a) Found in nature as the mineral lapis lazuli (q.v.). (b) Artificial product: (1) Direct method, by heating in muffles or crucibles a charge of soda ash, kaolin (or zeolites), charcoal, and sulfur; sometimes with the addition of powdered quartz, sand, or kieselguhr in order to make the product less sensitive to acids. (2) Indirect method, by first producing green ultramarine by heating in crucibles a mixture of kaolin or zeolites, anhydrous sodium sulfate, and charcoal or rosin. The green ultramarine is then powdered and "colored" by heating in contact with powdered sulfur. The product is ground, washed, and then boiled with sodium sulfide solution.

Containers: Kegs, barrels, or fiber drums, or multiwall paper sacks.

Uses: Paint pigment; paper manufacture (neutralizing yellow color); calico printing; laundry blue; printing inks; coloring mottled soaps, rubber, linoleum, plastics, etc.; feed additive in salt for animals. The artificial product has now superseded the ground mineral for these uses.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Shipping regulations: None.*
For cobalt ultramarine, see cobalt blue.
- ultramarine, green.** A green pigment formed as an intermediate product in the production of artificial ultramarine blue (q.v.).
- ultramarine, red.** A red pigment prepared by heating ultramarine blue to not over 145°C in the presence of nitric acid vapors.
Shipping regulations: None.*
- ultramarine, violet.** A violet pigment prepared by heating a silica-rich ultramarine blue to 175°C, in an atmosphere of chlorine and steam. It has poor tinctorial properties.
Shipping regulations: None.*
- ultramarine, yellow.** See barium chromate; also calcium chromate and chrome yellows.
- "Ultramins."** ⁴⁴⁹ Trademark for a series of amine condensates used in the softening and finishing of textile fabrics.
- "Ultran."** ¹⁰⁰ Trademark for phenaglycodol (q.v.).
- "Ultrapoles."** ⁴⁴⁹ Trademark for a series of alkanolamine condensates, detergent base and surface active materials used as detergents and ingredients of detergents, wetting and foaming agents, foam stabilizers, ingredients for cosmetic preparations, emollients, thickening agents.
- ultraquinine.** See cupreine.
- ultrasonics.** The study of effects of sound vibrations at and beyond the limit of audible range of frequencies. Suggested or used for dust, smoke and mist precipitation; preparation of colloidal dispersions or emulsions such as homogenizing of milk; formation of catalysts, degassing and solidification of molten metals; extracting flavor oils in brewing; speeding electroplating; drilling of hard or brittle materials; fluxless soldering; and in nondestructive testing of metals. Also used for investigation of physical properties, determination of molecular weights of liquid polymers, degree of association of water, and for causing chemical reactions to occur. Biological effects are also under study.
- ultraviolet.** The region of the electromagnetic spectrum including wave lengths from 100 to 3900Å. (i.e., longer than x-rays and shorter than visible light).
- ultraviolet absorber.** A substance which absorbs radiant energy of wave length in the ultraviolet range (100-3900 Angstrom units-just below the range of visible radiation). The energy absorbed is dissipated in some harmless form other than visible light. Double bonds, triple bonds, and (to a less degree) unbonded electron pairs all contribute to the ultraviolet absorbing capacity of molecules. Ultraviolet absorbers are added to unsaturated substances (plastics, rubbers, etc.) to decrease light sensitivity.
- "Ultrawets."** ¹³⁶ Trade name for alkyl aryl sulfonate anionic detergents or surface active materials (dodecyl benzene cyclic type).
Use: Light and heavy duty household detergent formulations; liquid dishwashing formulations; penetrating; wetting and emulsifying agents.
- "Ultron."** ⁵⁸ Trademark for vinyl chloride flexible films or rigid sheets.
- "Ultrox."** ²⁸⁸ Trademark for zirconium silicate opacifiers.
Grades: Ultrox - fineness all through 400 mesh, all below 7 microns; average particle size 2 microns. Ultrox 500 W - fineness all through 400 mesh, all below 5 microns; average particle size 1 micron.
- umber.** A naturally occurring brown earth containing ferric oxide together with silica, alumina, manganese oxides and lime. See limonite and ferric oxide, yellow. Raw umber is umber which is ground and then levigated. Burnt umber is umber calcined at low heat.
Grades: Based on tinctorial power and iron content; the best come from Cyprus or Turkey.
Containers: Bags.
Uses: Paint pigment; lithographic inks; wall paper (pigment).
Shipping regulations: None.*
- UMP.** Abbreviation for uridine monophosphate. See uridine phosphates and also uridylic acid.
- "UN-32."** ²⁶⁶ Brand name for a urea-ammonium nitrate liquid fertilizer containing 32% nitrogen.
- "Unadol."** ²²¹ A line of unsaturated fatty alcohols used in protective coatings, resins, polymers, defoamers and as chemical intermediates.
- "Unads."** ⁶⁹ Trademark for tetramethylthiuram monosulfide $[(CH_3)_2NC(S)]_2S$.
Properties: Yellow powder (also supplied as rods); sp.gr. 1.37 ± .03; melting range 103-114°C; slightly soluble in water and gasoline; very soluble in acetone, benzol, chloroform.
Uses: In natural and nitrile rubber and in SBR, primary accelerator; secondary accelerator (with thiazoles). In sponge, tile, soles.
- gamma-undecalactone** (aldehyde C-14 "so-called"; peach aldehyde; gamma-undecyl lactone; persicol). $CH_3(CH_2)_6CHCH_2CH_2COO$
Properties: Colorless to light yellow liquid with a fruity odor like that of peach. Sp.gr. 0.941-0.944; refractive index 1.450-1.454. Soluble in 4 to 5 vols. of 60% alcohol; soluble in benzyl alcohol and benzyl benzoate.
Derivation: By heating undecylenic acid in the presence of sulfuric acid.
Grades: Chlorine-free.
Uses: Perfumery; flavors.
- n-undecane** (hendecane) $CH_3(CH_2)_9CH_3$.
Properties: Colorless liquid; sp.gr. 0.7402 (20/4°C); f.p. -25.75°C; b.p. 195.6°C;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

refractive index 1.41725 (n_D 20/D); flash point 65°C.

Grades: 95%; 99%; research.

Containers: Bottles and drums.

Use: Petroleum research; organic synthesis.

undecanoic acid (n-undecylic acid; hendecanoic acid) $\text{CH}_3(\text{CH}_2)_9\text{COOH}$. Small amounts occur in castor oil. It is best derived from undecylenic acid by hydrogenation.

Properties: Colorless crystals. Sp.gr. 0.8505 (80/4°C); m.p. 28.5°C; b.p. 284.0°C (760 mm), 222.2°C (128 mm); refractive index 1.4319 (40°C); insoluble in water, soluble in alcohol and ether.

Grades: Technical; 99%.

Uses: Organic synthesis.

1-undecanol (n-undecyl alcohol; decyl carbinol; 1-hendecanol; alcohol, C-11)

$\text{CH}_3(\text{CH}_2)_9\text{CH}_2\text{OH}$.

Properties: Colorless liquid with a citrus odor. Sp.gr. 0.829-0.834, refractive index 1.435-1.443; m.p. 15°C. Soluble in 60% alcohol.

Use: Perfumery.

2-undecanol (2-hendecanol)

$\text{CH}_3(\text{CH}_2)_8\text{CHOHCH}_3$.

Properties: Colorless liquid, sp.gr. 0.8363 (20°C); m.p. 12°C, b.p. 228-229°C, insoluble in water, soluble in alcohol and ether.

Containers: Drums.

Uses: Anti-foaming agent, intermediate; perfume fixatives; plasticizer.

2-undecanone. See methyl nonyl ketone.

10-undecenoic acid. See undecylenic acid.

10-undecen-1-ol. See undecylenic alcohol.

undecoylium chloride-iodine. Iodine complex of acylcolaminoformylmethylpyridinium chloride.

Grade: N.N.D.

Use: Medicine (topical).

n-undecyl alcohol. See 1-undecanol

undecylenic acid (10-undecenoic acid)

$\text{CH}_2=\text{CH}(\text{CH}_2)_8\text{COOH}$.

Properties: Light colored liquid with characteristic fruity-rosy odor. Almost insoluble in water, miscible with alcohol, chloroform, ether, benzene, and with fixed and volatile oils. Congealing point 21°C; sp. gr. (25/25°C) 0.910-0.913; refractive index (25°C) 1.4475-1.4485.

Derivation: Destructive distillation of castor oil.

Grades: Technical; N.F. XI.

Containers: 6-, 13-gal carboys, 5-, 10-, 50-gal drums.

Uses: Perfumery; flavoring materials; medicinal; plastics, modifying agent (plasticizer, lubricant additive, etc.).

undecylenic alcohol (n-undecylenic alcohol; 10-undecen-1-ol; 10-11-undecylenic alcohol; alcohol C-11)

$\text{CH}_2=\text{CH}(\text{CH}_2)_8\text{CH}_2\text{OH}$.

Properties: Colorless liquid with fatty, somewhat citrus odor; sp.gr. 0.842-0.847; refractive index n_D 20 1.449-1.454; m.p.

-3.0°C; soluble in 70% alcohol.

Use: Perfumes.

undecylenic aldehyde (aldehyde C-11; 10-hendecen-1-al) $\text{CH}_2=\text{CH}(\text{CH}_2)_8\text{CHO}$.

Properties: Colorless liquid; strong odor suggesting rose. Sp.gr. 0.842-0.850; refractive index 1.442-1.447. Soluble in 80% alcohol.

Use: Perfumery.

undecylenyl acetate (acetate C-11; 10-hendecenyl acetate) $\text{CH}_3\text{COO}(\text{CH}_2)_9\text{CH}=\text{CH}_2$.

Properties: Colorless liquid with a floral-fruity type odor. Sp.gr. 0.876-0.883; refractive index 1.438-1.442. Soluble in 80% alcohol.

Use: Perfumery.

n-undecylic acid. See undecanoic acid.

gamma-undecyl lactone. See gamma-undecalactone.

underglaze colors. Finely ground calcined oxides for colored designs beneath the glaze on ceramic surfaces.

Use: For coloring or decorating pottery, tile, terra cotta and similar glazed ceramic surfaces.

underground gasification. A process for decomposing coal in place. Two or more wells are drilled to the vein of coal. At one of these the coal is ignited and supplied with a forced draft of air or oxygen. The products of combustion are drawn off from the other wells and used as fuel or chemical raw materials.

unguentum. Ointment, a fatty base in which a drug or mixture of drugs is incorporated.

UNH. Abbreviation for uranyl nitrate hydrated. See uranyl nitrate

"Unicel" ND. ²⁸ Trademark for rubber chemical comprising 40% dinitrosopentamethylene-tetramine and 60% inert organic filler.

Properties: Light cream-colored powder.

Containers: Drums (100 lbs net).

Use: A non-discoloring blowing agent for the manufacture of natural and synthetic rubber sponge.

"Unicel" NDX. ²⁸ Trademark for a mixture of rubber blowing agent 80% di-N-nitrosopentamethylene-tetramine (see "Unicel" ND) and 20% inert filler. Cream-colored spongy crumbs, sp.gr. 1.40.

Containers: 100-lb drums.

Use: A non-discoloring blowing agent for natural or synthetic rubber sponge.

"Unicel" S. ²⁸ Trademark for rubber chemical comprising a 50% dispersion of finely divided sodium bicarbonate in oil.

Properties: A cream-colored, free-flowing liquid.

Containers: Drums (500 lbs net).

Use: Blowing agent for the manufacture of natural and synthetic rubber sponge.

"Unichrome". ²⁸⁸ Trademark for (1) synthetic resinous materials in the form of solutions for use to form coatings on electroplating

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

apparatus; (2) organic solvents used as thinners for solutions of synthetic resinous materials; (3) papers impregnated with dyestuffs of the class known as "Indicators," for testing hydrogen ion concentration (pH) of solutions; (4) cleaning compositions for use in making up solutions used for cleaning metals preparatory to electroplating; (5) cements in liquid and solid (plastic) form, used for sealing joints of containers of chemical solutions.

"Unicor." ⁴¹⁶ Trademark for ash free, oil-soluble, surface active film-former.

Properties: Oily liquid; density, 7.3 lbs/gal at 60°F; API, 29.4 at 60°F; flash point (Pensky-Martin), 118°F; pour point, -5°F, cold point, -10°F; viscosity (kinematic) 103.8 cs at 100°F, (universal) 481 sec; completely combustible; insoluble in water and LPG.

Uses: Corrosion inhibitor in various refinery operations in crude units, thermal cracking units, Platformers, etc., it is also effective in run-down and storage tanks, pipelines and tankers.

"Unicor LHS." ⁴¹⁶ Trademark for film-forming, organic phosphate base anti-icer, corrosion inhibitor and carburetor detergent.

Properties: Liquid, sp.gr. 0.909 at 68°F; pour point, -30°F; PM flash point (open cup), 110°F, viscosity (kinematic) 11.82 cs at 100°F, (universal) 65.4 sec; soluble in liquid propane and light hydrocarbons.

Containers: 55-gal steel drums; tank wagons. Uses: Corrosion inhibitor in refinery environments where acidic gases and moisture collect on condenser tubes and exchangers, particularly in areas condensing propane and butane; detergent and anti-icer to prevent engine-stalling caused by ice formation in carburetors and induction systems.

"Unicor V." ⁴¹⁶ Trademark for an oil-soluble, film-forming corrosion inhibitor for the petroleum industry

Properties: Oily liquid; density, 0.854, b.p. 680-698°F, pour point, below -30°F; flash point (Pensky-Martin), 325°F; viscosity (kinematic) 9.426 cs at 100°F, 2.228 cs at 200°F, will evaporate at atmospheric pressure without decomposition, low order of reactivity.

Uses: Corrosion inhibitor in process units, where its non-fouling and volatility properties give it an advantage over more reactive and less stable inhibitors.

"Unifining" Process. ⁴¹⁶ Patented process for the removal of sulfur, nitrogen and metals; for the saturation of olefins and for the decomposition of oxygen compounds from all petroleum derived distillate stocks. The process is also applied to the purification of coal tar distillates. The process operates at moderate pressures in an environment of hydrogen, employing a catalyst containing cobalt and molybdenum.

"Uniflo." ⁵¹ Trademark for a multi-grade motor oil, an all-weather lubricant which

reduces the amount of engine deposits.

Available in two grades: 5W-20 and 10W-30.

union dyes. Those that are suitable for dyeing fabrics containing both cotton and wool.

"Uniphats." ²⁵⁹ Trade name for the monohydric alcohol esters of a series of fatty acids ranging from technically pure fatty acids to natural and synthetic mixtures.

Uses: Chemical raw material; detergents; gasoline additives.

"Unisol." ¹³⁶ A process for removing mercaptans from gasoline and burning oils by use of caustic methanol solutions.

"Unisol" Process. ⁴¹⁶ Patented process for removing mercaptans from gasoline and burning oils by use of caustic methanol solutions.

"Unitane." ⁵⁷ Trademark for titanium dioxide (TiO₂) pigment available in both anatase and rutile crystal forms.

Anatase form: Sp.gr. 3.8-3.9; index of refraction 2.52.

Rutile form: Sp.gr. 4.2; index of refraction 2.76. Rutile TiO₂ has approximately 25% greater tinting strength and opacity than the anatase type.

Containers: 50-lb paper bags.

Uses: Both anatase and rutile forms are used in paints, lacquers, enamels, printing inks, paper, rubber, leather, linoleum, ceramics, welding rods, etc.

"Unitol CMT." ⁴²⁰ Trade name for tall oil fatty acids.

Composition:

	Range	
	min	max
Rosin acids, %	0.2	0.6
Unsaponifiables, %	0.1	0.6
Fatty acids, %	98.8	99.7
Saturated fatty acids, %	2.0	2.8
Acid number	198	201
Saponification number	198	202
Color, Gardner	1	2
Iodine number	128	133
Titre	-1.0	+1.0

Containers: 55-gal resin-lined steel drums; resin-lined tank cars.

unit operation. A particular kind of a physical change that is repeatedly and frequently encountered as a step in the processes for industrial production of various chemicals and related materials. Filtration, evaporation, distillation, fluid flow and heat transfer are examples.

unit process. A process characterized by a particular kind of chemical reaction and equipment, of which many specific examples are encountered, to which the same basic principles of designs and operation may be applied. Oxidation, hydrolysis, esterification, and nitration are examples.

"Univis." ⁵¹ Trademark for a series of power transmission or hydraulic oils. They have viscosity indexes of 150 or higher and pour points of -50°F or lower, permitting wide temperature ranges in operation.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Univolt."⁵¹ Trademark for oils used as electrical insulating mediums in transformers, switches and some electrical cables. Suitable for transformers, whether used indoors or outdoors or under low-temperature conditions.

"Unox."²¹⁴ Trademark for epoxides and wetting agent.

"Unox" epoxide 101 - vinyl cyclohexene monoxide. Viscosity 1.69 cps (20°C); sp.gr. 0.9598 (20/20°C).

"Unox" epoxide 201 - 3,4-epoxy-6-methylcyclohexylmethyl 3,4-epoxy-6-methylcyclohexanecarboxylate. Viscosity 1810 cps (25°C); sp.gr. 1.121 (20/20°C).

"Unox" epoxide 206 - vinyl cyclohexene dioxide. Viscosity 7.77 cps (20°C); sp.gr. 1.098 (20/20°C).

"Unox" epoxide 207 - dicyclopentadiene dioxide. Density 1.331 (25°C).

"Unox" epoxide 269 - dipentene dioxide. Sp.gr. 1.032 (20/20°C).

Uses: Intermediate for epoxy resins, plasticizers, pharmaceuticals; polymer cross linking agents.

"Unox" fire-fighting penetrant. Trademark for a wetting agent. Increases the effectiveness of water in extinguishing fires. It helps water to penetrate dense burning materials, putting out the fire quickly with less smoke, less water damage, and less overhaul.

uns- (unsym). Abbreviation for unsymmetrical. A prefix denoting the structure of organic compounds in which substituents are disposed unsymmetrically with respect to the carbon skeleton or to a functional group, such as a double bond. For example, uns-dichloroethane is CH_3CHCl_2 . In this dictionary, it is disregarded in alpha-betizing. See also sym-.

unsaturation. The property of an organic compound that causes or allows its ready combination with hydrogen, chlorine, oxygen and various other substances. An unsaturated compound (as ethylene, C_2H_4 , butadiene, C_4H_6 , acetylene, C_2H_2) has therefore fewer hydrogen atoms or equivalent groups than the corresponding saturated compound (ethane, C_2H_6 , butane, C_4H_{10} , ethane respectively). This phenomenon can be conveniently visualized by the assumption of the presence in a molecule of one or more double or triple bonds (unsaturated bonds). Thus ethylene can be represented by the line formula $\text{H}_2\text{C}=\text{CH}_2$, butadiene by $\text{H}_2\text{C}=\text{CHCH}=\text{CH}_2$, and acetylene, $\text{HC}\equiv\text{CH}$. (The double bond may also be represented by a colon, as $\text{H}_2\text{C}:\text{CH}_2$.) Each of these multiple bonds connects just two atoms.

The unsaturated character results from the ability of the second and third bonds to detach and connect with additional atoms taken up by the molecule. A cyclic structure, however, which contains double bonds alternating with single bonds (benzene, naphthalene, etc., and derivatives) is said to have aromatic character. Such a molecule does not participate in addition reac-

tions. This lack of unsaturation in aromatic substances is explained by resonance (q.v.).

unsym- See uns-.

"UOP #5."⁴¹⁶ Trademark for N,N'-di-secondary butyl-para-phenylenediamine.

Properties: Normally exists as a supercooled liquid below 64°F; sp.gr. (60/60) 0.94; pour point ASTM, below 0°F; flash point, 285°F; viscosity (kinematic) 10.1 cs at 100°F; miscible in all proportions with absolute alcohol and benzene; insoluble in water or caustic solutions.

Uses: Oxidation inhibitor and stabilizer in both aviation and motor gasoline; catalyzes air-oxidation of mercaptans; prevents gum formation and decomposition of tetraethyllead in gasoline.

"UOP 88."⁴¹⁶ Trademark for an N,N'-dioctyl-para-phenylenediamine inhibitor and antiozonant.

Properties: Liquid; b.p. about 735°F at 760 mm; sp.gr. 0.912 at 60°F; pour point, 25°F; flash point (Pensky-Martin), 395°F; viscosity (kinematic) 43.85 cs at 100°F, (universal) 204.0 sec; refractive index, (n 20/D) 1.5129; completely miscible in methanol, pentane and benzene; vapor pressure (absolute) 0.33 mm Hg at 302°F.

Containers: Steel drums, tank cars, tank trucks.

Uses: Antioxidant, antiozonant. Prevents gum formation; stabilizes tetraethyllead in both motor and aviation gasoline; catalyst in air-oxidation of mercaptans, reduces engine deposits; retards cracking of synthetic rubbers due to ozone attack.

"UOP 288."⁴¹⁶ Trademark for an N,N'-dioctyl-para-phenylenediamine, isomeric with "UOP 88."

Properties: Liquid, m.p. (solid isomer), 99.5°F, b.p. 788°F; flash point (Pensky-Martin), 325°F; viscosity (kinematic) 25.9 cs at 122°F; vapor pressure (absolute), 0.18 mm Hg at 302°F; density, 0.901 (20/4°C); refractive index, 1.5098 (n 20/D).

Uses: Antiozonant for protection against cracking in natural rubber formulations, in SBR synthetic rubber, buna-N and oil-extended polymers.

"UOP Copper Deactivator."⁴¹⁶ Trademark for formulations based primarily on disalicylaminopropane.

Properties: Liquid; sp.gr. (60/60) 1.08; density, 9.0 lbs/gal, pour point, 0°F; flash point (Tag closed cup), above 70°F; viscosity 25 cs at 100°F; insoluble in water; miscible with benzene.

Grades: Regular (properties as above); "UOP AW(50)" is 50% active and gasoline soluble.

Uses: Prevents traces of copper from harming civilian and "combat grade" gasolines; synergist for fuel oil inhibitors and dispersants.

"UOP #1 Inhibitor."⁴¹⁶ Trademark for a phenolic fraction of hardwood tar.

Properties: Liquid; sp.gr. (60/60) 1.08; pour point ASTM, 0-5°F; b.p. above 400°F;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

viscosity 17.6 cs at 100°F; slightly soluble in water.

Uses: Oxidation inhibitor for gasolines which are completely free of water and caustic contamination.

"UOP #4 Inhibitor." ⁴¹⁶ Trademark for an alcoholic solution of N-n-butyl-para-amino-phenol.

Properties: Liquid; sp.gr. (60/60) 0.90; pour point ASTM, below -35°F; flash point (Cleveland Open Cup Fire), 60°F; viscosity (kinematic) 4.4 cs at 100°F; miscible in all proportions with absolute alcohol and benzene; soluble in caustic solutions; very slightly soluble in water.

Uses: Oxidation inhibitor to protect unstable gasolines; particularly effective in reducing copper dish gum.

"UOP #7 Inhibitor." ⁴¹⁶ Trademark for 2,6-di-tert-butyl-4-methylphenol.

Properties: F.p., 156°F, flash point, 260°F, soluble in aromatic hydrocarbons; insoluble in either acid or alkali.

Grades: Crystalline (No. 7), 33% solution in toluene (No. 7-S).

Uses: Oxidation inhibitor for relatively stable gasolines; prevents tetraethyllead decomposition. Approved for use in military fuels.

"UOP #5-S." ⁴¹⁶ Trademark for a modified phenylenediamine type antioxidant.

Properties: Liquid (supercools), sp.gr. (60/60) 0.94, pour point ASTM, below 0°F, viscosity (kinematic) 11.9 cs at 100°F; miscible with absolute alcohol and benzene, insoluble in caustic.

Uses: Oxidation inhibitor for gasoline; more rapid sweetener than UOP #5. Approved for addition to "combat grade" gasoline; prevents gum formation and decomposition of tetraethyllead in gasoline.

"Urab." ⁵⁰ Trademark for a complex of fenuron and TCA, available in liquid concentrate, granular, and pelleted formulations. A brush and weed killer for control of woody plants and deep-rooted weeds in non-crop land.

uracil HNC(O)NHC(O)CHCH 2,4-Dioxypyrimidine. A pyrimidine that is a constituent of ribonucleic acids and the coenzyme, uridine diphosphate glucose (q.v.).

Properties: Crystalline needles; m.p. 335°C (dec). Soluble in hot water, ammonium hydroxide and other alkalies; insoluble in alcohol and ether; $A_M = 8.2 \times 10^3$ at 260 millimicrons and pH 7.0.

Derivation: Hydrolysis of nucleic acids; precipitation from urea and ethyl formylacetate. Radioactive forms available.

Use: Biochemical research.

uracil-6-carboxylic acid. See orotic acid.

uracil, D-ribosyl. See uridine.

"Urac" Resins. ⁵⁷ Trademark for proprietary products based on urea-formaldehyde condensates used mainly as adhesives for the production of moisture-proof bonds in

plywood manufacture, plywood assembly, and furniture manufacture.

"Uramite." ²⁸ Trademark for an odorless yellow or gray white granular solid containing nitrogen principally in the form of methylene ureas, remains free-flowing under all conditions; contains 38% nitrogen, only slightly soluble in water.

Containers: 25-, 50-, 80-lb paper bags.

Use: As a direct application fertilizer for turf grasses and ornamental plants, or other crops requiring a long period of a continuous and uniform supply of nitrogen.

"Uramon" Ammonia Liquors. ²⁸ Trademark for solutions of crude urea and ammonium sulfate in aqueous ammonia.

	Nitrogen Content	Vapor Pressure (lb/sq in, 70°F)
UAL-B	45.5%	22
UAL-K	40.5%	1.0
UAL-37	37.0%	2
UAL-S	43.5%	20

UAL-37 also supplies water-insoluble organic nitrogen.

Containers: Tank cars.

Use: In manufacture of fertilizers.

urania-thoria. Crystals of the mixed oxides of uranium and thorium are available. Used as nuclear fuel. The crystals are denser and cheaper than the old pellet form.

uranic chloride. See uranium tetrachloride.

uranic oxide. See uranium dioxide.

uranine (uranine yellow; fluorescein-sodium; resorcinolphthalein sodium) $\text{Na}_2\text{C}_{20}\text{H}_{10}\text{O}_5$. Colour Index No. 766

Properties: Orange red, odorless powder; hygroscopic; soluble in water and sparingly soluble in alcohol.

Derivation: By treatment of fluorescein with sodium carbonate solution and crystallizing. Method of purification: Recrystallization. Grades: Technical; U.S.P. XVI (as fluorescein sodium).

Containers: Custom packed.

Uses: Dyeing silk and wool yellow, following the course of subterranean waters, marking water for air-sea rescues; clinical test solution.

Shipping regulations: None.*

uranine yellow. See uranine.

uraninite UO_2 . A natural oxide of uranium, usually partly oxidized to UO_3 , with variable amounts of lead, radium, thorium, rare earth metals, helium, argon, and nitrogen.

Varieties:

Broggerite. A thorium-bearing variety. Nivenite and Cleveite. Contain rare earth metals.

Pitchblende (q.v.) A very finely crystalline variety.

The name uraninite is also used to refer to a well-crystallized variety of uranium dioxide found in pegmatites, while the term pitchblende has been used both for uraninite found in metallic veins and for a distinct

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

species.

Occurrence: Colorado, Utah, Connecticut, North Carolina, Texas, Canada, Czechoslovakia, Norway, Congo, Germany, England.

Use: Source of uranium and radium.

uranite. A mineral consisting either of autunite (lime uranite) or torbernite (copper uranite) (q.v.).

uranium U. Element number 92, a member of the actinide series, and the heaviest naturally occurring element. More important, it is the only primeval element that can readily undergo direct, spontaneous nuclear fission. Natural uranium is a mixture of three radioactive isotopes: U-234 (0.006%), U-235 (0.7%), and U-238 (99%). U-235 is the isotope which can capture slow neutrons to undergo fission with large energy release in nuclear reactors (q.v.) or in uranium bomb explosions. U-238 isotope will not directly support fission, it will also absorb neutrons to eventually form plutonium-239, which has fission properties similar to U-235. Natural uranium can serve as fuel for an atomic pile, but uranium fuel enriched in U-235 is easier to regulate. This enrichment is usually achieved by gas diffusion; but other gas methods, including gas centrifugation, have been proposed. (For the diffusion separation, which is the production method in use at Oak Ridge, Tenn., uranium hexafluoride is forced through a series of barriers, which permit the lighter isotope to pass through slightly more rapidly than the heavy one.)

Properties: Very dense, silvery metal; strongly electropositive; ductile and malleable, poor conductor of electricity; sp.gr. 18.685; m.p. 1132°C; b.p. 3818°C, heat of fusion 4.7 kcal/mole, heat capacity 6.6 cal/mole -°C. Powdered uranium is spontaneously flammable. Forms solid solutions (for nuclear reactors) with molybdenum, niobium, titanium and zirconium. The metal reacts with nearly all nonmetals. It is attacked by water, acids, and peroxides; but is inert towards alkalis. Green tetravalent uranium and yellow uranyl ion (UO_2^{++}) are the only species which are stable in solution.

Occurrence: Pitchblende (essentially UO_2), a variety of uraninite, coffinite (USiO_4) and carnotite are the most important sources. Other ores include autunite, torbernite, tyuyamunite, thoriantite, uranophane, samarskite, davidite, schroöckingerite, and various rare earth minerals. Low-grade ore occurs in phosphate deposits, bituminous shales, and lignite. Principal locations are the Congo, Canada, the Colorado Plateau, U.S.S.R., and North Carolina (samarskite).

Derivation: Finely ground ore is leached under oxidizing conditions to give uranyl nitrate solution. The uranyl nitrate, purified by solvent extraction (ether, alkyl phosphate esters), is then reduced with

hydrogen to uranium dioxide. This is treated with hydrogen fluoride to obtain uranium tetrafluoride. Winning of the free metal proceeds by either electrolysis of the tetrafluoride in fused salts or, more often, by reduction with calcium or magnesium. Fluorination of uranium tetrafluoride yields the hexafluoride, the form used in gas diffusion and centrifugation techniques for uranium isotope separation.

Uses: As nuclear fuel when alloyed with zirconium, molybdenum, etc. (the oxide and carbide are more recent nuclear fuels); as atomic bomb explosive. Uranium compounds are coloring agents in ceramics.

See also uses for uranium 238.

uranium 233 (U-233). A fissionable isotope of uranium produced, artificially by bombarding thorium with neutrons.

uranium 235 (U-235). The readily fissionable isotope of uranium used in one type of atomic bomb. Concentrated from natural uranium by gaseous diffusion, centrifugation, or electromagnetic methods.

uranium 238 (U-238). The abundant isotope of uranium; 140 times as plentiful as U-235. It is nonfissionable, but will capture neutrons in a nuclear reactor to eventually produce Pu-239, a nuclide which can substitute for U-235 as a fuel or explosive. This production of Pu-239 is called "breeding." U-238 (obtained as natural uranium from which U-235 has been removed) can also be used as a coloring agent; analytical reagent; "getter" for vacuum tubes; for cathodic protection; alloys, catalysis; ion exchange systems, etc.

uranium acetate. See uranyl acetate.

uranium ammonium carbonate. See uranyl ammonium carbonate.

uranium ammonium fluoride. See uranyl ammonium fluoride.

uranium barium oxide (barium diuranate; barium uranium oxide) BaU_2O_7 .

Properties: Yellow or orange powder.

Caution! Poison! Soluble in acids.

Grade: Technical.

Use. Ceramics (coloring porcelain).

uranium-bismuth. A liquid metal alloy suggested as a liquid metal fuel for nuclear reactors.

uranium carbides. See uranium dicarbide, uranium monocarbide.

uranium decay series (uranium-radium series). The series of elements produced as successive intermediate products when the element uranium undergoes its spontaneous natural radioactive disintegration into lead. Radium and radon are members of this series.

uranium, depleted. Uranium from which most of the U-235 isotope has been removed. See uranium-238.

uranium dicarbide (uranium carbide) UC_2 .

Properties: Gray crystals; sp.gr. 11.28 (18°C); m.p. 2260°C; b.p. 4100°C.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Decomposes in water; slightly soluble in alcohol.

Use: As crystals, pellets, or microspheres for nuclear reactor fuel.

uranium dioxide (uranium oxide; uranic oxide) UO_2 .

Properties: Black crystals, insoluble in water, soluble in nitric acid and concentrated sulfuric acid, frequently pyrophoric in finely divided form, sp.gr. 10.9, m.p. $3000 \pm 200^\circ\text{C}$.

Derivation of pure oxide: The powdered uranium ore is digested with hot nitric-sulfuric acid mixture and filtered to remove the insoluble portion. Sulfate is precipitated from the solution with barium carbonate and uranyl nitrate is extracted with ether. The uranyl nitrate, after re-extraction into water, is heated to drive off nitric acid, leaving uranium trioxide. The latter is reduced with hydrogen to the dioxide. More recently prepared from uranium hexafluoride by treating with ammonia and subsequent heating of the ammonium diuranate to get the dioxide.

Uses: A crystalline (or pellet) form is used to pack nuclear fuel rods. Used also in ceramics, pigments, photographic chemicals, catalyst, a source of uranium for the fluorides used for isotope separation.

uranium, enriched. Uranium containing more than the normal proportion of uranium-235 isotope.

uranium hexafluoride UF_6 .

Properties: Colorless volatile crystals, sublimates, triple point 64.0°C (1134 mm); m.p. 64.5°C (2 atm), sp.gr. 5.06 (25°C), soluble in liquid bromine, chlorine, carbon tetrachloride, sym-tetrachloroethane and fluorocarbons. Reacts vigorously with water, alcohol, ether, and most metals. Vapor behaves as nearly perfect gas.

Derivation: Fluorination of uranium tetrafluoride, which is obtained by hydrofluorination of uranium dioxide. The dioxide, in turn, results from fluid bed reduction of higher oxides by hydrogen.

Use: In gas diffusion process for separating isotopes of uranium.

uranium hydride UH_3 .

Properties: Brown gray to black powder, sp.gr. 10.92; conductor of electricity.

Derivation: Action of hydrogen on hot uranium.

Uses: Preparation of finely divided uranium metal by decomposition; separation of hydrogen isotopes, reducing agent; laboratory source of pure hydrogen.

Hazards: Pyrophoric, should be handled in inert gas atmosphere, protective clothing should be worn.

uranium monocarbide (uranium carbide) UC .

Properties: Lumps or powder that can be formed into desired shapes by powder metallurgy or arc-melt casting; m.p. 2375°C , density 13.63 g/cc; thermal conductivity 0.08 cal/sec/cm²/°C/cm; must be

stored in inert atmosphere.

Use: Nuclear reactor fuel.

uranium nitrate. See uranyl nitrate.

uranium nitride U_3N_4 . Dark brown crystals; sp.gr. 10.09; decomposed by water. Said to be used as a nuclear fuel.

uranium oxides. Uranium forms several oxides, including U_2O_3 (uranous oxide), UO_2 (uranium dioxide, uranic oxide), UO_3 (uranium trioxide), U_3O_8 (triuranium octoxide), $\text{UO}_4 \cdot x\text{H}_2\text{O}$ (uranium peroxide).

uranium oxychloride. See uranyl chloride.

uranium peroxide (uranium oxide; uranium tetroxide). $\text{UO}_4 \cdot x\text{H}_2\text{O}$. (The water of hydration varies according to the conditions under which oxide is made.)

Properties: Yellow crystals, hygroscopic; sp.gr. (15°C) 2.5; decomposes at 115°C , insoluble in water; decomposes in hydrochloric acid.

Derivation: Precipitation from solutions of uranyl salts by hydrogen peroxide.

Uses: Ceramics, pigments.

uranium-radium series. See uranium decay series.

uranium sodium acetate. See uranyl sodium acetate.

uranium sulfate. See uranyl sulfate.

uranium tetrachloride (uranic chloride) UCl_4 .

Properties: Dark green volatile crystals; soluble in water and in alcohol; hygroscopic, sp.gr. 4.98; m.p. 590°C , b.p. 792°C .

Derivation: By the reaction of uranium dioxide with carbon tetrachloride or phosphorus pentachloride or other strong chlorinating agents.

Purification: Sublimation or fractional distillation.

uranium tetrafluoride (green salt) UF_4 .

Properties: Green, non-volatile crystalline powder, sp.gr. 6.70; m.p. 1036°C , insoluble in water.

Derivation: Treatment of uranium dioxide with hydrogen fluoride. See uranium hexafluoride.

Uses: Preparation of uranium metal and uranium hexafluoride.

uranium tetroxide. See uranium peroxide.

uranium trioxide (uranium oxide) UO_3 .

Properties: Red or yellow powder, insoluble in water, soluble in nitric acid; sp.gr. 8.34, decomposes with heating.

Derivation: Thermal decomposition of uranyl nitrate or ammonium diuranate. See uranium dioxide.

Uses: Ceramics and pigments.

uranium yellow. See sodium diuranate.

uranocircite $\text{Ba}(\text{UO}_2)_2(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$. A natural phosphate of barium and uranium, found in the oxidized portions of some uranium deposits.

Properties: Color yellow-green; luster pearly; one good cleavage; hardness 2-2.5;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sp.gr. 3.5, radioactive.
Occurrence: South Dakota, Europe.

"Uranon." ¹⁶⁹ Trademark for dibenzoylmethane used in the colorimetric determination of uranium.

uranophane $\text{Ca}(\text{UO}_2)_2\text{Si}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$. A natural hydrated silicate of calcium and uranium.
Color green; sp.gr. 3.8-3.9; radioactive.
Occurrence: Wyoming, North Carolina.

uranospinit $\text{Ca}(\text{UO}_2)_2(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$. A natural hydrated arsenate of uranium and calcium.
Properties: Color yellow to green, good micaceous cleavage; hardness 2-3, sp.gr. 3.5; radioactive.
Occurrence: Utah, Europe.

uranous oxide U_2O_3 . The least important of the several oxides of uranium.

uranous-uranic oxide. See triuranium octoxide.

uranyl acetate (uranium acetate)

Properties: Small, yellow crystals, decomposed by light; poisonous! M.p., loses $2\text{H}_2\text{O}$ at 110°C , decomposes at 275°C ; sp.gr. 2.893 at 15°C . Soluble in cold water and alcohol, decomposes in hot water.
Derivation: By the action of acetic acid on uranium oxide.

Method of purification: Crystallization

Grades: Technical; C.P.

Containers: Amber glass bottles.

Uses: Medicine; analytical chemistry; bacterial oxidations.

uranyl ammonium carbonate (ammonium uranium carbonate; uranium ammonium carbonate) $\text{UO}_2\text{CO}_3 \cdot 2(\text{NH}_4)_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: Monoclinic yellow crystals.

M.p. 100°C (dec); sp.gr. 2.773. Decomposes in air, soluble in cold water.

Grade: Technical.

Use: Uranium-yellow glazes.

uranyl ammonium fluoride (uranium ammonium fluoride, ammonium uranium fluoride) $\text{UO}_2\text{F}_2 \cdot 3\text{NH}_4\text{F}$.

Properties: Greenish-yellow, crystalline powder. Soluble in water, slightly soluble in hydrofluoric acid, insoluble in alcohol.

Grade: Technical.

Use: In x-ray work because of its fluorescence.

uranyl chloride (uranium oxychloride)

Properties: Yellow, deliquescent crystals, decomposed on heating; soluble in water, alcohol, and ether.

uranyl nitrate (uranium nitrate; UNH; yellow salt) $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Yellow, rhombic crystals. Sp.gr. 2.807; m.p. 60.2°C ; b.p. 118°C . Soluble in water, alcohol, and ether.

Derivation: By the action of nitric acid on uranium oxide.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Glass bottles, boxes.

Uses: Source of uranium dioxide; photog-

raphy; uranium glaze; medicine; extraction of uranium into non-aqueous solvents.

Caution! Fire hazard; dangerous in contact with organic or other readily oxidizable (combustible) substances. It will cause violent combustion on ignition.

Shipping regulations: Oxidizing material.

Yellow label.*

uranyl sodium acetate (uranium sodium acetate) $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{NaC}_2\text{H}_3\text{O}_2$.

Properties: Yellow crystals. Soluble in water and alcohol.

Derivation: By mixing sodium acetate and uranyl acetate solutions and crystallizing.

Impurities: Sodium acetate.

Grades: Technical.

Containers: Wooden kegs.

Use: Uranium compounds.

uranyl sulfate (uranium sulfate) $\text{UO}_2\text{SO}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Yellow crystals; soluble in water and concentrated hydrochloric acid.

Grades: Technical; purified.

Use: Chemical analysis.

uranyl uranate. See triuranium octoxide.

urao. See trona.

urea (carbamide) $\text{CO}(\text{NH}_2)_2$. Occurs in urine and other body fluids, basis of urea-formaldehyde resins. Urea was the first organic compound to be synthesized (Wöhler, 1828).

Properties: White crystals or white powder, almost odorless; cool saline taste; sp.gr. 1.335, m.p. 132.7°C ; decomposes before boiling. Soluble in water, alcohol and benzene, slightly soluble in ether, almost insoluble in chloroform.

Derivation: (a) Liquid ammonia and liquid carbon dioxide at 1750-3000 psi and $160-200^\circ\text{C}$ react to form ammonium carbamate, which decomposes at lower pressure (about 80 psi) to urea and water. Several variations of the process have been devised to improve yields and reduce corrosion. (b) Hydrolysis of calcium cyanamid with a solution of carbon dioxide.

Method of purification: Crystallization.

Grades: Technical; C.P.; N.F. XI, fertilizer (45-46% nitrogen); feed grade (about 42% nitrogen).

Containers: 80-, 100-lb bags; 100-, 225-lb drums. Solution in tank cars and tank trucks.

Uses (in approximate order of volume): Fertilizer; animal feed; resins; miscellaneous, including chemical intermediate, stabilizer in explosives, medicine, adhesives; separation of hydrocarbons (as urea adducts); sulfamic acid production.

Shipping regulations: None.*

urea adducts. See inclusion complexes.

urea ammonia liquor. A solution of crude urea in aqueous ammonia containing ammonium carbamate.

Containers: Tank cars.

Use: Reaction with superphosphate in preparation of fertilizers, furnishing combined nitrogen.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

urea-form. A urea formaldehyde reaction product that contains more than one molecule of urea per molecule of formaldehyde. It can be used as a fertilizer because of its high nitrogen content, its insolubility in water and its gradual decomposition in the soil during the growing season to produce soluble nitrogen.

urea-formaldehyde resins. Urea and formaldehyde are united in a two-stage process in the presence of pyridine, ammonia, or certain alcohols with heat and control of pH to form intermediates (methylolurea, dimethylolurea) that are mixed with fillers to produce molding powders. These are converted to the thermosetting insoluble infusible resin by further controlled heating and pressure in the presence of catalysts. The resins are strong and rigid, free of odor and taste, and have excellent light diffusion characteristics. See also dimethylol ethylene urea and dimethylol ethyltriazone, which are cyclic examples. Melamine resins (q.v.) are similar.

Uses: Buttons, baking enamels, tableware, light reflectors, housings for apparatus and equipment such as scales; also in textile finishes for wrinkle resistance.

urea half-chloride $(\text{NH}_2\text{CONH}_2)_2 \cdot \text{HCl}$.

Properties: Practically white, odorless powder. Very soluble in water.

Use: Catalyst.

urea hydrogen peroxide. See urea peroxide.

urea nitrate (acidogen nitrate) $\text{CO}(\text{NH}_2)_2 \cdot \text{HNO}_3$.

Properties: Colorless crystals. Decomposes 152°C . Slightly soluble in water, soluble in alcohol.

Shipping regulations: Variable according to weight and moisture content, sometimes calling for high explosives label, sometimes yellow label (flammable solid).*

urea peroxide (urea hydrogen peroxide; carbamide peroxide) $\text{CO}(\text{NH}_2)_2 \cdot \text{H}_2\text{O}_2$.

Properties: White crystals or crystalline powder, m.p. (dec) $75-85^\circ\text{C}$. Decomposed by moisture and temperatures above 40°C . Soluble in water, alcohol, and ethylene glycol.

Solvents such as ether and acetone extract the hydrogen peroxide and may form explosive solutions. Active oxygen (min) 16%.

Grade: Technical.

Containers: 100-lb fiber drums.

Uses: Source of water-free hydrogen peroxide; bleaching; disinfectant; cosmetics; pharmaceuticals; blue print developer, modification of starches.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

urea phosphoric acid. See carbamide phosphoric acid.

urea-quinine. See quinine-urea hydrochloride.

urease. Enzyme present in the soy bean and in the jack bean and possibly in other legumes. Also present in blood and urine, and

secreted by certain microorganisms. Its principal use is in the determination of urea in urine and in blood. It splits urea into ammonia and carbon dioxide or ammonium carbonate.

"Urecholine." ¹²³ Trademark for bethanechol chloride, a choline ester used in medicine.

para-ureidobenzene arsonic acid. See carbar-sone.

5-ureidohydantoin. See allantoin.

urethan. See urethane.

urethane (urethan; ethyl carbamate; ethyl urethane) $\text{CO}(\text{NH}_2)\text{OC}_2\text{H}_5$. Not used directly in urethane (polyurethane) resins and foams, but its structure is typical of the repeating unit in such polymers. See polyurethane resins.

Properties: Colorless crystals or white, granular powder; odorless; saltpeter-like taste; solutions are neutral to litmus. Soluble in water, alcohol, ether, glycerol and chloroform; slightly soluble in olive oil. Sp. gr. 0.9862; m.p. 49°C , b.p. 180°C .

Derivation: (a) By heating ethyl alcohol and urea nitrate at $120-130^\circ\text{C}$; (b) by action of ammonia on ethyl carbonate or ethyl chloroformate.

Method of purification: Crystallization.

Grades: Technical, U.S.P. XVI.

Containers: 55-gal steel drums; 250-lb fiber drums.

Uses: Medicine; intermediate or solvent for pharmaceuticals, pesticides and fungicides; biochemical research.

urethane foams. See polyurethane foams.

6,6'-ureylenebis-1-naphthol-3-sulfonic acid.

Preferred name for 5,5'-dihydroxy-7,7'-disulfonic-2,2'-dinaphthylurea.*

uric acid (lithic acid, uric oxide, 2,6,8-trioxy-purine) $\text{OCNHC(O)NHCCNHC(O)NH}$ (keto form). May also be written in phenolic form. The end-product of purine metabolism in man and other primates, the Dalmatian dog, birds, and some reptiles.

Properties: Odorless, tasteless, white crystals. Soluble in hot concentrated sulfuric acid, very slightly soluble in water; insoluble in alcohol and ether; soluble in glycerol, solutions of alkali hydroxides, sodium acetate, and sodium phosphate. Sp. gr. 1.855-1.893; m.p., decomposes on heating with evolution of hydrogen cyanide. Caution!

Derivation: From urine or bird excrement.

Method of purification: Crystallization.

Grades: Technical; reagent.

Use: Organic synthesis.

Shipping regulations: None.*

uric oxide. See uric acid.

uridine (D-ribosyl uracil) $\text{C}_9\text{H}_{12}\text{N}_2\text{O}_6$. The nucleoside of uracil. It is a constituent of ribonucleic acid and some coenzymes (such as uridine diphosphate glucose).

Properties: White, odorless powder, of slightly acid and faintly sweet taste; m.p. 165°C (uncorrected); soluble in water, acid,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and base; slightly soluble in dilute alcohol; insoluble in strong alcohol.

$M_n = 10.1 \times 10^3$ at 262 millimicrons and pH 7.0.

Derivation: From nucleic acid hydrolyzates, from yeast.

Use: Experimental biochemical studies.

Radioactive forms available.

uridine diphosphate glucose (UDPG). A co-enzyme which acts in the transfer of glucose from the coenzyme to another chemical compound during the process for which coenzyme is a catalyst. Important in biochemical research.

uridine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (UMP), the diphosphate (UDP), and the triphosphate (UTP).

See also uridine diphosphate glucose (UDPG).

uridine-phosphoric acid. See uridylic acid.

uridylic acid (uridine-phosphoric acid, UMP) $C_9H_{13}N_2O_9P$. The nucleotide of uracil.

Properties: Crystallizes in prisms from methanol. M.p. 202°C (dec). Freely soluble in water and alcohol. Dextrorotatory in solution. $M_n = 10.1 \times 10^3$ at 262 millimicrons and pH 7.0.

Derivation: From yeast ribonucleic acid.

Radioactive forms available.

Use: Biochemical research.

urine salt, fusible. See sodium ammonium phosphate.

"Uritone." ³³⁰ Trademark for hexamethylenetetramine.

Urner's liquid. See dichloroacetic acid.

"Urokon Sodium." ³²⁹ Trademark for sodium acetrizolate, a water-soluble, x-ray contrast medium.

uronic acids. A class of compounds similar to sugars but differing from them in that the terminal carbon has been oxidized from an alcohol to a carboxyl group. The most commonly occurring are galacturonic acid and glucuronic acid.

"Urox." ⁵⁰ Trademark for a complex of monuron and TCA, available as 11% and 22% granular formulations, and as liquid oil concentrate. Used on non-crop lands for control of most annual and perennial grasses and broadleaved weeds.

ursin. See arbutin.

usnic acid (usnicic acid) $C_{18}H_{16}O_7$. A constituent of many lichens. Known in *d*-, *l*-, and *dl*- forms.

Properties: Crystalline yellow solid; melting range 193-203°C. Insoluble in water, slightly soluble in alcohol and ether.

Derivation: From *Usnea barbata*, a lichen

growing on trees.

Use: Medicine.

usnicic acid. See usnic acid.

U.S. P. Abbreviation for United States Pharmacopoeia, the official United States book of standard drugs. The latest edition at the time that this dictionary was written was the 16th, noted as U.S.P. XVI.

"U.S. P.-12" pharmaceutical zinc oxide. ²⁶⁸

Trademark for a pharmaceutical zinc oxide of extreme fineness and whiteness. Meets the specifications of the United States Pharmacopoeia, including the tests prescribed for heavy metals, lead and arsenic.

Containers: 50-lb cartons and 100-lb drums.

Uses: Especially suitable for cosmetics, ointments and other medical purposes. For chemical purposes where high purity is required.

ustilagic acid. An antibiotic from corn smut.

UTP. See uridine phosphates.

uvanite $U_2V_6O_{21} \cdot 15H_2O$. A natural hydrated uranium vanadate. Color brownish-yellow. Found in Utah.

uvarovite. See garnet.

"Uverite." ¹³⁴ Trademark for opaquing agent for vitreous enamels.

"Uversoft." ¹³⁴ Trade name for softening agents for fabrics and paper products. Based on a quaternary ammonium salt containing two long straight chain hydrocarbon chains attached to the nitrogen atom. Are cationic and substantive to cellulose.

"Uversol." ¹³⁴ Trademark for metal salts of naphthenic acids. Available as solids and liquids of most of the common metals. Used as paint driers, wetting agents, catalysts, etc.

"Uvinul." ³⁰⁷ Trademark for a series of ultraviolet absorbers, designated as "Uvinul" 400, 490, D-49, M-40, and D-50. These are nearly pure substituted benzophenones, containing only traces of inorganic salts. Properties: Cream or tan powders; somewhat soluble in alcohols, ethyl acetate, methanol, methyl ethyl ketone, insoluble in toluene and water.

Uses: Organic ultraviolet light absorbers effective in the range from 200 millimicrons (2000 Angstrom units). They do not darken or decompose upon prolonged exposure to an intense ultraviolet source. The absorbed energy is not reemitted in the visible spectrum.

Typical applications include protection of plastics, oils, cosmetics, paper, wood, and leather, for most protective uses, 0.05 to 2.0% of "Uvinul" is recommended.

"UVO-Cryst." ³⁰⁹ Trademark for vitamin D concentrates in milk constituents for use in milk and foods where milk is used as an ingredient.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

V

V. Symbol for vanadium.

"V-90." ¹⁷² Trademark for a proprietary product, an anhydrous, heat-treated monocalcium phosphate.

Properties: Finely granulated, white, free-flowing particles having thin coatings of relatively insoluble phosphate which delay solution in aqueous liquids.

Containers: 100-lb paper bags.

Uses: Acid-reacting leavening ingredient in self-rising flour, pancake flour, self-rising cornmeal, baking powder, and prepared flours. In the production of commercial angel food cakes.

"Vabar." ¹⁹⁵ Trade name for a cementitious product used as a vapor barrier and plaster bond to seal the surface and to provide a bond for gypsum plaster.

vacuum deposition of metals. Aluminum and other metals can be caused to deposit in the form of a smooth reflective film on other metals by heating a sample of the aluminum or other metal in an evacuated space which also contains the metal on which the deposit is desired. This surface must be kept relatively cool. Deposition of metals is also made by this means on plastics, paper, glass, and fabrics or yarns. The process is essentially one of molecular distillation.

vacuum distillation. Distillation at a pressure less than atmospheric but not so low that it would be classed as molecular distillation. Since lowering the pressure also lowers the boiling point, vacuum distillation is useful for distilling high boiling and heat-sensitive materials such as heavy distillates in petroleum, fatty acids, etc.

valence. In the simplest sense, valence is an integer representing the number of hydrogen or chlorine atoms which one atom of an element can hold in combination. Thus, silver, sodium and bromine have a valence of one in silver chloride, AgCl, sodium chloride, NaCl, and hydrogen bromide, HBr, while aluminum and nitrogen have a valence of three in aluminum chloride, AlCl₃, and ammonia, NH₃. Groups of atoms, i.e., radicals, also have valences. Thus SO₄ has a valence of two in H₂SO₄, and PO₄ of three in H₃PO₄. Each element usually enters into compounds on the basis of one or two characteristic valences, but there are many exceptions and complexities, and the term valence has been and is used in many special ways, some of which are subject to controversy.

Valence varies in a rather regular way according to position in the periodic system, the underlying reasons being similarities and variations in the number and energies of the electrons in the outermost parts of atoms of the different elements. Helium and other inert gases which form no compounds occupy a position in the Periodic System corresponding to a valence of zero.

valentinite (antimony trioxide, ortho-rhombic; white antimony) Sb₂O₃. White or gray mineral, sometimes pale red. White streak and adamantine or silky luster. An alteration product of stibnite and other antimony minerals. Contains 83.3% antimony. Constants: Sp.gr. 5.57-5.76; hardness 2-3. Occurrence: Algeria; Yugoslavia; Italy; Germany.
Use: Ore of antimony.

valeral. See n-valeraldehyde.

n-valeraldehyde (valeric aldehyde, valeral; amyl aldehyde; pentanal) CH₃(CH₂)₄CHO. Properties: Colorless liquid; sp.gr. 0.8095; (20/4°C); f.p. -91°C, b.p. 102-103°C; refractive index (n_D 20/D) 1.3944, flash point (open cup) 54°F. Slightly soluble in water; soluble in alcohol and ether. See isovaleraldehyde.

Derivation: Oxidation of amyl alcohol, also by the Oxo process.

Shipping regulations: Flammable liquid. Red label.*

valerian. Dried rhizome and roots of *Valeriana officinalis*.

Occurrence: Europe, northern Asia and eastern United States.

Grades: Belgian; Indian.

Containers: Bags.

Uses: Medicine; valerian oil.

Shipping regulations: None.*

valerian, American. See cypripedium.

valerianic acid. See n-valeric acid.

valerian oil.

Properties: Yellowish or brownish liquid; characteristic, penetrating odor. Soluble in alcohol, ether, chloroform, acetone, benzene, and carbon disulfide.

Chief known constituents: Pinene, camphene, borneol and esters of borneol and valeric acid.

Constants: Sp.gr. 0.930-0.960; refractive index (n_D 20/D) about 1.486.

Derivation: Distilled from roots and rhizome of *Valeriana officinalis*.

Method of purification: Rectification.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: Technical.

Containers: Iron drums; glass bottles.

Uses: Medicine; tobacco perfume; industrial odorant, flavors.

valerian oil, Japanese (kesso oil).

Properties: Green, thick liquid, essential oil. Cannot be distinguished from the ordinary valerian oil. Soluble in alcohol, ether, chloroform, benzene, acetone, and carbon disulfide.

Constants Sp. gr. 0.960-1.004, refractive index (n_D 20) 1.47-1.48.

Derivation: Distilled from the rhizome and roots of *Valeriana officinalis*, var. *angustifolia*.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums, glass bottles.

Uses: Medicine; industrial odorants.

valeric acid (valerianic acid, n-pentanoic acid) $\text{CH}_3(\text{CH}_2)_3\text{COOH}$.

Properties: Colorless liquid, penetrating odor and taste; sp. gr. 0.9394 (20/4°C), b. p. 185.4°C, refractive index 1.4081 (20°C), vapor pressure 0.08 mm (20°C), f. p. -34°C, slightly soluble in water, soluble in alcohol and ether. Undergoes reactions typical of normal monobasic organic acids.

Derivation: With other C_5 acids by distillation from valerian, by oxidation of n-amyl alcohol.

Grades: Technical, reagent.

Containers: Drums, tank cars.

Uses: Intermediate for flavors and perfumes, ester-type lubricants, plasticizers, pharmaceuticals, vinyl stabilizers.

valeric aldehyde. See n-valeraldehyde.

gamma-valerolactone ($\text{C}_5\text{H}_8\text{O}_2$). A solvent miscible with water and most organic solvents, resins, waxes, etc. Slightly miscible with zein, beeswax, petrolatum. Not miscible with anhydrous glycerin, glue, casein, arabic gum, and soybean protein.

Properties: Sp. gr. (25/25°C) 1.0518, b. p. 205-206.5°C, crystallizing point -37°C, flash point (Cleveland open cup) 205°F; fire point (Cleveland open cup) 220°F, refractive index (25°C) 1.4301. Surface tension (25°C) 39 dynes/cm, viscosity (25°C) 2.18 cps, pH, anhydrous 7.0, pH 10% solution in distilled water 4.2.

Uses: In dye baths (coupling agent), brake fluids, cutting oils, and as solvent for adhesives, insecticides and lacquers.

valeryl diethylamide (diethylvaleramide, iso-valeryl diethylamide) $\text{C}_4\text{H}_9\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid, burning taste, characteristic odor. Produces convulsions of cerebral origin. B. p. 210°C, slightly soluble in water; soluble in alcohol and ether. Used as medicine.

valethamate bromide

$\text{C}_6\text{H}_5\text{CH}(\text{C}_4\text{H}_9)\text{COOC}_2\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{CH}_3\text{Br}$.
2-Diethylaminoethyl 3-methyl-2-phenylvalerate methylbromide.

Properties: Crystals. Freely soluble in water. Aqueous solutions are stable to storage.

Grade: N.N.D.

Use: Medicine.

valine (alpha-aminoisolvaleric acid) $(\text{CH}_3)_2\text{CHCH}(\text{NH}_2)\text{COOH}$. An essential amino acid.

Properties: White crystalline solid, soluble in water, very slightly soluble in alcohol, insoluble in ether. Shows the following optical activity:

DL-valine: M. p. 298°C with decomposition.

D-valine (natural isomer): M. p. 315°C with decomposition.

L-valine: M. p. 293°C with decomposition.

Derivation: Hydrolysis of proteins; synthesized by the reaction of ammonia with alpha-chloroisovaleric acid. Available commercially as D-, L-, or DL-valine.

Containers: Drums.

Uses: Medicine, food, culture media; biochemical and nutritional investigations.

"Vallestril." ⁷⁰ Trademark for a brand of methallenestril, 3-(6-methoxy-2-naphthyl)-2,2-dimethylpentanoic acid, used in medicine.

"Valmid." ¹⁰⁰ Trademark for ethinamate (q.v.).

valonia.

Derivation. The acorn cups of an oak *Quercus aegilops*, native of Greece, Asia Minor and France. The cups are very large and are covered with coarse hair or "beard" which is very rich in tannin. Good valonia contains 30-40% tannin.

Containers: Cups: 100- to 200-lb (average about 150-lb) burlap bags. Extract. Wooden barrels.

Use: Tanning industry.

vanadic acid (a) meta- HVO_3 , (b) ortho- H_3VO_4 , (c) pyro- $\text{H}_4\text{V}_2\text{O}_7$. These acids apparently do not exist in the pure state, but are represented in the various alkali and other metal vanadates. Ordinarily, when vanadic acid is mentioned, vanadium pentoxide (vanadic acid anhydride) is meant.

vanadic acid anhydride. See vanadium pentoxide

vanadic sulfate. See vanadyl sulfate.

vanadic sulfide. See vanadium sulfide

vanadinite $\text{Pb}_5\text{Cl}(\text{VO}_4)_3$. A natural chlorovanadate of lead. Grades into mimetite, and endlicheite (q.v.).

Properties: Color ruby red, orange red, brown, yellow, luster resinous to adamantine, hardness 3, sp. gr. 6.7-7.1. Soluble in strong nitric acid.

Occurrence: New Mexico, Arizona, Africa, Scotland; U.S.S.R.

Use: Ore of vanadium and lead.

vanadium V. Element having atomic number 23, of group V of the periodic system.

Properties: Silvery-white ductile metal. Insoluble in water; soluble in nitric, hydrofluoric, and concentrated sulfuric acids;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

attacked by alkali, forming water-soluble vanadates. Sp. gr. 6.11; m.p. $1900 \pm 25^\circ\text{C}$. Vanadium exists in five states of valence, behaves chemically as either a metal or a nonmetal, and forms a variety of complex compounds.

Source: Not found native. More than sixty-five vanadium minerals have been identified. The principal ores are patronite, roscelite, carnotite and vanadinite.

Occurrence: Found in Colorado, Utah, New Mexico, Arizona; Mexico and Peru.

Derivation: Calcium iodide reduction of vanadium pentoxide yields 99.8+ % pure ductile vanadium. Aluminum, cerium, etc. reduction produces a less pure product. Large, single crystals of vanadium can now be produced by an arc-fusion process.

Uses: Target material for x-rays, manufacture of steel (see ferrovanadium); vanadium compounds, especially catalysts for sulfuric acid manufacture; vanadium alloys.

vanadium acetylacetonate.

Properties: Blue to blue-green crystals. Decomposes before melting.

Derivation: Reaction of vanadyl sulfate with acetyl acetone and sodium carbonate.

vanadium carbide.

Properties: Crystals with hardness 2800 kg/sq mm; sp. gr. 5.77, m.p. 2800°C , resistivity 150 micro-ohm cm (room temp.).

Use: Alloys for cutting tools.

vanadium catalyst.

Properties: Alkali salt of vanadium within a porous siliceous carrier. Density 42-48 lb/cu ft, activation temperature $750\text{-}850^\circ\text{F}$.

Uses: Conversion of sulfur dioxide to the trioxide.

vanadium dichloride (vanadous chloride) VCl_2 .

Properties: Apple green hexagonal plates. Soluble in alcohol and ether, decomposes in hot water. Sp. gr. 3.23 (18°C).

Derivation: From vanadium trichloride by heating in atmosphere of nitrogen.

Method of purification: Sublimation in nitrogen.

Grade: C.P.

Containers: Sealed glass containers.

Uses: As strong reducing agent, purification of hydrogen chloride from arsenic.

vanadium ethylate $(\text{C}_2\text{H}_5\text{O})_4\text{V}$.

Properties: Dark reddish-brown solid.

Derivation: Reaction of vanadium chloride with sodium ethylate.

Uses: Polymerization catalyst.

vanadium ore. See vanadinite.

vanadium oxides. See vanadium pentoxide, vanadium tetraoxide and vanadium trioxide.

vanadium oxydichloride. See vanadyl chloride.

vanadium oxytrichloride VOCl_3 .

Properties: Sp. gr. 1.811 (32°C); m.p. -78.9°C ; b.p. $125\text{-}127^\circ\text{C}$, nonionizing solvent; dissolves most nonmetals; dissolves and/or reacts with many organic compounds.

Uses: Catalyst in olefin polymerization; organovanadium synthesis.

vanadium pentasulfide. See vanadium sulfide.

vanadium pentoxide (vanadic acid anhydride) V_2O_5 .

Properties: Yellow to red crystalline powder; sp. gr. 3.357 (18°C); m.p. 690°C ; b.p., decomposes at 1750°C . Soluble in acids and alkalis, slightly soluble in water.

Derivation: (a) Alkali or acid extraction from vanadium minerals. (b) By igniting ammonium meta-vanadate. (c) From concentrated ferrophosphorus slag by roasting with sodium chloride, leaching with water, and purification by solvent extraction followed by precipitation and heating.

Method of purification: Alkali solution, precipitation as ammonium meta-vanadate and ignition to V_2O_5 .

Grades: Commercial air dried; commercial fused; C.P. air dried; C.P. fused.

Containers: Compressed paper drums; multi-wall paper sacks.

Uses: Starting material for other vanadium salts; catalyst for oxidation of sulfur dioxide; ferrovanadium (q.v.); gasoline catalyst; catalyst for organic reactions, including automobile exhaust hydrocarbon elimination; ceramic coloring material; inoculation of plant life, inhibiting ultraviolet transmission in glass; black inks; photographic developer; dyeing textiles; medicine; nuclear energy uses.

Shipping regulations: None.*

vanadium sesquioxide. See vanadium trioxide.

vanadium steel.

Vanadium in steel (1) elevates coarsening temperature of austenite (promotes fine grain), (2) increases hardenability (when dissolved), (3) resists tempering and causes marked secondary hardening.

It increases tensile strength and elastic limit without decreasing ductility. Prevents hardening and embrittlement in welding and castings. Refinement of grain size permits excellent ductility and impact resistance during the development of high tensile strength and yield strength. Vanadium retards rate of softening in tempering condition, hence vanadium steels retain hardness at elevated temperatures. Also improves creep strength at elevated temperatures. Used in tool steels to improve serviceability, refine carbide structure, improve "red hardness" and abrasion resistance. Vanadium raises the endurance limit and ratio of endurance limit to tensile strength in constructional steels.

See also ferrovanadium.

vanadium sulfate. See vanadyl sulfate.

vanadium sulfide (vanadium pentasulfide; vanadic sulfide) V_2S_5 .

Properties: Black-green powder. Soluble in acids, alkali-metal sulfides and alkalis; insoluble in water. Sp. gr. 3.0.

Derivation: By the action of hydrogen sulfide on vanadium chloride solution.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grade: Technical.

Containers: Wooden kegs or fiber drums.

Use: Vanadium compounds.

Shipping regulations: None.*

vanadium tetrachloride VCl_4 .

Properties: Red liquid. Soluble in absolute alcohol and ether; decomposes slowly to vanadium trichloride and chlorine at temperatures below 63°C . Sp.gr. 1.8584 (0°C), b.p. 154°C .

Derivation: Chlorination of ferrovandium.

Method of purification: Distillation and fractionation.

Grades: Technical; C.P.

Containers: Sealed glass bottles.

Uses: Medicinal; starting material for preparation of vanadium trichloride and vanadium dichloride.

vanadium tetraoxide V_2O_4 .

Properties: Blue-black powder, sp.gr. 4.339, m.p. 1967°C ; insoluble in water; soluble in alkalis and acids.

Derivation: (1) From vanadium pentoxide by oxalic acid reduction. (2) From vanadium pentoxide by carbon reduction.

Grades: Technical, C.P.

Containers: Glass bottles.

Use: Catalyst at high temperature.

vanadium trichloride VCl_3 .

Properties: Pink deliquescent crystals, soluble in absolute alcohol and ether. Decomposes in water. Sp.gr. 3.0 (18°C), decomposes on heating.

Derivation: From vanadium tetrachloride boiling under reflux condenser.

Grade: C.P.

Containers: Glass bottles.

Use: Starting material for preparation of vanadium dichloride.

vanadium trioxide (vanadium sesquioxide) V_2O_3 .

Properties: Black crystals; soluble in alkalis and HF; slightly soluble in water. Sp.gr. 4.87 (18°C), m.p. 1970°C .

Derivation: From vanadium pentoxide by either hydrogen or carbon reduction.

Grades: Technical, C.P.

Containers: Glass bottles.

Uses: Catalyst of ethylene to ethyl alcohol.

vanadous chloride. See vanadium dichloride.

vanadyl chloride (vanadium oxydichloride; vanadyl dichloride; divanadyl tetrachloride) $\text{V}_2\text{O}_3\text{Cl}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Green, very deliquescent crystals. Slowly decomposed by water. Usual technical product is a dark green syrupy mass 76-82% pure, or a solution. Poisonous. Soluble in water, alcohol, and acetic acid.

Grade: Technical.

Use: Mordanting textiles.

Shipping regulations: None.*

vanadyl dichloride. See vanadyl chloride.

vanadyl sulfate (vanadic sulfate; vanadium sulfate) $\text{VOSO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Blue crystals; soluble in water.

Derivation: Reduction of cold solution of

concentrated sulfuric acid and vanadium pentoxide by sulfur dioxide gas.

Method of purification: (a) Recrystallization; (b) wash with alcohol.

Grades: Technical; C.P.

Containers: Glass bottles; kegs.

Uses: Mordant, catalyst; aniline black preparation; reducing agent; blue and green colors in glasses and ceramics.

Shipping regulations: None.*

"Vanaldol." ¹⁹ Brand name for a proprietary product. Ethyl vanillin. Claimed to be $3\frac{1}{2}$ times stronger than vanillin.

"Van Caloria." ⁵¹ Trademark for lubricants consisting of "Caloria" to which colloidal graphite has been added. When high operating temperatures cause the lubricant base to vaporize, the graphite film remains to reduce solid friction.

"Vancide 89." ⁶⁹ Trademark for a proprietary product, N-(trichloromethylmercapto)-4-cyclohexene 1,2-dicarboximide.

Use: Fungicide for vinyl compositions.

"Vancide 26EC." ⁶⁹ Trademark for the lauryl pyridinium 5-chloro-2-mercaptobenzo-thiazole.

Use: Preservative for cotton fabrics used in rubber structures. Applied directly to cotton from an aqueous solution.

"Vancide 51Z." ⁶⁹ Trademark for a proprietary product, zinc dimethylthiocarbamate $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2\text{Zn}$, with a small proportion of zinc 2-mercaptobenzo-thiazole.

Use: Fungicide for neoprene rubber compositions.

"Vancocin." ⁶⁰ Trademark for vancomycin hydrochloride (q.v.).

vancomycin hydrochloride. An antibiotic substance.

Properties: White solid. Soluble in water, moderately soluble in dilute methanol, insoluble in higher alcohols, acetone, ether.

Derivation: Produced by *Streptomyces orientalis* from Indonesian and Indian soil. Isolated as the hydrochloride.

Grade: N.N.D.

Use: Medicine.

Van der Waal's equation. A modified equation of state for gases to compensate for actual volume of molecules and for attractive forces existing between the molecules. The latter are known as Van der Waal's forces.

"Vandex." ⁶⁹ Trademark for a proprietary product. Finely ground selenium. A secondary vulcanizing agent for rubber products.

"Vandrynilla." ³⁴² Trademark for concentrated extract of vanilla adsorbed on non-caloric adsorbents for dietetic flavoring.

Van Dyke brown (Cassel brown; Cassel earth; Cologne brown; Cologne earth; ulmin brown). A naturally occurring pigment.

Derivation: Indefinite mixtures of iron oxide and organic matter. Obtained from bog-earth, peat deposits or from others containing bituminous matter.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Grades: Based on iron oxide content and tinctorial value.
Containers: Wooden barrels or fiber drums.
Use: Pigment for artists' color and stains.
Shipping regulations: None.*
- Van Dyke red.** A brownish-red pigment consisting of copper ferrocyanide; sometimes used to refer to red varieties of ferric oxide. See iron oxide reds.
Use: Pigments.
- "Van Estan."** ⁵¹ Trademark for lime-base lubricants that consist of "Estan" and graphite. This makes them suitable for use on plungers in water pumps, stuffing boxes, elevator plungers and slides, etc.
- "Vanfre."** ⁶⁹ Trademark for a series of proprietary release agents.
- "Vanfre."** Milky liquid, total solids 18-20%; sp. gr. $0.87 \pm .02$; flash point, 52°F min, vehicle, isopropanol. Release agent for lead press cured items.
- "Vanfre Clear."** Clear amber liquid, total solids 15-17%, sp. gr. $0.88 \pm .02$; vehicle, water.
- "Vanfre No. 3."** Clear amber liquid, total solids 14-16%, sp. gr. $1.00 \pm .02$, vehicle, water. General purpose, for molded goods and frame cured sponge.
- "Vanfre No. 4."** Milky liquid, total solids 9-11%, sp. gr. $1.00 \pm .02$, flash point, 118°F min.; vehicle, water plus isopropanol. For molded goods and frame cured sponge.
- vanilla bean.** Cured, full grown, but immature fruit of *Vanilla planifolia*.
Chief known constituents: Coniferin and two ferments which later change coniferin to vanillin during the process of curing. Resins and considerable sugar are also present.
- Grades: Whole, cuts, Bourbon, Mexican, South American, N.F. XI.
Containers: Bags, boxes, tins.
Occurrence: Mexico, West Indies, Madagascar.
Uses: Confectionery; flavoring (source of vanillin), perfumery, pharmaceuticals.
Shipping regulations: None.*
- vanillal.** See ethyl vanillin.
- vanilla plant.** See *hatis*.
- vanillic aldehyde.** See vanillin.
- vanillin** (3-methoxy-4-hydroxybenzaldehyde, vanillic aldehyde) $(\text{CH}_3\text{O})(\text{OH})\text{C}_6\text{H}_3\text{CHO}$.
The methyl ether of protocatechuic aldehyde. It occurs in vanilla bean extract and in many balsams and resins.
- Properties: White crystalline needles; pleasant aroma; vanilla taste. M.p. $80-82^{\circ}\text{C}$, b.p. 285°C . Soluble in 125 parts water; in 20 parts glycerol and in 2 parts 95% alcohol.
- Derivation: By dichromate oxidation of isoeugenol; treatment of guaiacol with formaldehyde, hydrochloric acid, and para-nitrosodimethylaniline; or by extraction of the vanilla bean. Also from sulfite waste liquor upon heating with alkali at 160°C , and from lignin, or wood itself (especially spruce).
- Method of purification: Crystallization.
Grades: Technical; U.S.P. XVI.
Containers: 1-, 5-lb cartons; 5-lb bottles; 5-, 25-lb cans; 25-, 100-lb drums.
Uses: Perfumes; flavoring; pharmaceuticals; a reagent.
- vanillin, ethyl.** See ethyl vanillin.
- vanilrom.** See ethyl vanillin.
- "Vanitrope."** ⁸⁵ Trademark for propenyl guaethol (1-ethoxy-2-hydroxy-4-propenylbenzene) $\text{C}_{11}\text{H}_{14}\text{O}_2$.
Properties: Free-flowing white powder; odor and taste strongly similar to vanilla; 16-25 times stronger flavor than vanillin, depending on use; m.p. $85-86^{\circ}\text{C}$; very soluble in fats, edible solvents, and essential oils; very slightly soluble in water; appears to stimulate the sense of taste, thus intensifies many other flavors.
Containers: 1-, 5-, and 25-lb packages.
Use: Artificial vanilla flavoring (F.D.A. approved).
- "Van Nakta."** ⁵¹ Trademark for lubricant for uses where the grease must contain graphite.
- "Vanstay."** ⁶⁹ Trademark for a series of heat and light stabilizers for vinyl resins.
- "Vantoc."** ²⁰⁶ Brand name of proprietary bactericides for the food industries.
- "Vanwax."** ⁶⁹ Trademark for proprietary wax emulsions.
- "Clear"** Total solids, 12-13%, sp. gr. $1.00 \pm .02$, pH 9.5 - 10.5.
- "Black"** Total solids 13-15%; sp. gr. $1.00 \pm .02$, pH 9.5 - 10.5.
- "Vapam."** ¹ Soil fumigant composed of sodium N-methyldithiocarbamate dihydrate $\text{CH}_3\text{NHC(S)SNa} \cdot 2\text{H}_2\text{O}$.
Properties: White crystalline solid, readily soluble in water, moderately soluble in alcohol, sparingly soluble in other common organic solvents, stable in concentrated aqueous solution but decomposed in dilute aqueous solution, acids and heavy metal salts promote decomposition, compound is unstable in all types of moist soil.
Uses: Fungicide, nematocide, weed killer, and insecticide.
Hazards: Irritating to the eyes, skin and mucous membrane. May be toxic to living plants.
- "Vapona."** ¹²⁵ Trademark for an insecticide which contains not less than 93%w 2,2-dichlorovinyl dimethyl phosphate (see DDVP) and not more than 7%w active, related compounds.
Properties: Colorless to amber liquid with a mild, fruity odor, b.p. approx. 183°F (1 mm). Miscible with aromatic and chlorinated hydrocarbons, solvents and alcohols. Moderately soluble in diesel oil, kerosene, isoparaffinic hydrocarbons and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

mineral oil; slightly soluble in water (about 1%) but undergoes hydrolysis in the presence of water and is readily decomposed by strong acids and bases.

Containers: 55-gal steel drums with molded polyethylene insert containing 590 lbs; 5-gal steel pails with molded polyethylene insert containing 55 lbs.

Warning: (technical insecticide and formulations containing over 15%); Poisonous if swallowed, inhaled, or absorbed through skin.

vapor-liquid chromatography. See gas chromatography.

vapor pressure. The pressure (usually expressed in millimeters of mercury) characteristic at any given temperature of a vapor in equilibrium with its liquid or solid form.

vapor tension. Same as vapor pressure.

"Vapotone." ²⁵³ Brand name for a line of insecticides containing tetraethylpyrophosphate.

"Varjamine." ³⁰⁷ An azoic composition for printing blues on cotton and rayon.

"Varidase." ⁵⁷ Trade name for streptokinase-streptodornase derived from the fermentation of a group C streptococcus. After purification for removal of toxic components, it is prepared for clinical use as a sterile frozen-dried powder containing buffer and a preservative. The mixture contains streptokinase, the activator of human plasminogen, which digests fibrin, and streptodornase, a group of enzymes attacking deoxyribonucleo protein, the main constituent of pus.

Properties: Water and saline soluble, may be destroyed in presence of organic solvents at room temperature; compatible with major antibiotics at pH 7.4. Denatured by heat at 56°C, powder stable at refrigeration temperatures approximately 18 months, solutions stable for 1 week at refrigeration temperatures.

Use: Medicine.

"Varkon." ³⁰⁰ Trademark for sequestering agents of the ethylenediaminetetraacetate type. Used in kier boiling, peroxide bleaching, dyeing and stripping operations. Available in both powdered and liquid forms.

varnish. An unpigmented, oil-base paint (see paint) composed of a solvent and either of two types of binders: (1) those which form a film by oxidation or polymerization, such as drying oils (q.v.), alone or in combination with natural or synthetic resins, chlorinated rubber, etc. (see resins, natural; resins, synthetic; rubber, chlorinated), and (2) those which form films by evaporation of the solvent, such as the shellac, cellulose ester or ether, alkyl and phenolic resin varnishes. The first type of binders characterizes oil varnishes, which contain such solvents as turpentine and petroleum

naphtha. A "long" oil varnish contains a larger proportion of oil to resin than a "short" varnish and forms a more elastic film. Spar varnish is "long;" rubbing and furniture varnishes are "short." The second type of binders listed above characterize spirit varnishes, which employ such solvents as methanol, methyl isobutyl ketone, butyl acetate, toluene, etc.

Bituminous varnish contains asphalt or bituminous materials and may be either of the oil or spirit type.

Shipping regulations: May be classified as flammable liquid. Red label.*

varnish-makers' naphtha. See naphtha, painters'.

varnish oil. An oil obtained by the distillation of a gum resin and used in the manufacture of varnishes.

varnish remover. See paint remover.

"Varnon." ⁴⁴⁶ Trade name for hard fired super duty fireclay brick which resists the destructive action of carbon monoxide and other reducing gases. Dense, strong, good volume stability at high temperatures and has high rigidity under soaking heat conditions. Used as glass tank regenerator checkers, also to line various metallurgical furnaces, rotary kilns, shaft kilns, carbon baking furnaces, and incinerators.

"Varox." ⁶⁹ Trademark for proprietary product, a 50% active blend of 2,5-bis(tert-butylperoxy)-2,5-dimethylhexane with an inert mineral carrier.

Properties: White powder, sp.gr. (calc) 1.50. Uses: Cross-linking agent for polymers such as polyethylene.

Shipping regulations: Oxidizing material. Yellow label.*

"Varox Liquid." ⁶⁹ Trademark for proprietary product, 2,5-bis(tert-butylperoxy)-2,5-dimethylhexane.

Properties: Water-white to light yellow liquid, sp.gr. 0.87 ± .02; min. assay 92%; active O₂ 10.1% min.

Uses: Cross-linking agent for polymers such as polyethylene.

Shipping regulations: Oxidizing material. Yellow label.*

"Varsol." ⁵¹ Trademark for straight petroleum aliphatic solvents used as paint and varnish thinners, for dry cleaning and for general plant machinery cleaning. Conform to CS3-40, the U.S. Dep't. of Commerce commercial standard for Stoddard Solvent and have minimum Tag closed cup flash points of 100°F.

"Vaseline" Petroleum Jelly. ⁹⁷ Trademark for a familiar brand of petrolatum. A commercial product of petroleum, largely employed in pharmacy, alone and as a vehicle for external applications of medicinal agents, especially when local action rather than absorption is desired; as a protective coating for metallic surfaces, and for other purposes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Vaseline" petroleum jelly consists of a semisolid mixture of hydrocarbons, having a m.p. usually ranging between 38° and 45°C. It is colorless, or of a pale yellow color, translucent, fluorescent, and amorphous. It does not readily oxidize on exposure to the air and is not readily acted on by chemical reagents. It is soluble in chloroform, benzene, carbon disulfide, and oil of turpentine. It also dissolves in warm ether and is slightly soluble in hot alcohol, but separates from the latter in flakes on cooling.

vasopressin (betahypophamine; antidiuretic hormone). One of the hormones secreted by the posterior lobe of the pituitary gland. It causes an increase in blood pressure and an increase in water retention by the kidney. Vasopressin is an octapeptide consisting of eight different amino acids. It is available as the tannate in solution for injection (vasopressin injection, U.S.P. XVI).

"Vasoxyl." ³⁰¹ Trademark for methoxamine hydrochloride, used in medicine.

vat dyes. Vat dyes are those that can be easily reduced to a soluble and usually colorless leuco or vat form in which they can readily impregnate fibers. Subsequent oxidation then produces the insoluble colored dye-stuff in a form that is remarkably fast to washing, light and chemicals. Examples are indigo (C.I. 1177), Indanthrene Blue GCD (C.I. 1113), and Anthraquinone Vat Yellow GC (C.I. 1095). The reducing agents are usually an alkaline solution of sodium hydrosulfite ($\text{Na}_2\text{S}_2\text{O}_4$) or some derivative of the latter. Oxidation is by air, perborate, dichromate or similar materials.

vat printing assistants. Compounds of gums, reducing and wetting agents used to carry the dye in printing fabrics with vat dyes. They assist in securing penetration of the fabric and help to convert the dyes from a semi-leuco state to a leuco state.

•"Vatro Gum." ¹⁵⁹ Trademark for fully prepared gums. Contain everything necessary for printing except glycerin, dyestuff and necessary amount of water to bring them to printing consistency.

Use: For printing vat colors in both screen and roller printing.

"Vatrolite." ¹⁵⁹ Trademark for a proprietary product. Sodium hydrosulfite.

Uses: As a reducing agent. For bleaching soaps, removing color from textile fabrics. As a reducing agent in vat dyeing of textiles or fast color dyeing.

"Vatrolite" 58 Series. ¹⁵⁹ A series of buffered sodium hydrosulfites used as bleaching agents. Available as "Vatrolite" 58-E, 58-ELD, 58-EAC.

"Vatsol." ⁵⁷ Brand name for a proprietary product. Wetting agents consisting of several different grades for use with

insecticide dusts and sprays.

Grades: Made in several different types and grades: OS, sodium isopropyl naphthalene sulfonic acid; OT, sodium dioctyl sulfosuccinate.

Containers: Fiber and stainless steel drums.

Uses: When used in insecticide dusts, brings the insecticide into more intimate contact with bodies of insects, thus increasing insect kill; when used in insecticide sprays, reduces the surface tension thus giving better contact and coverage.

Fire hazard: None.

Shipping regulations: None.*

"V-Bor." ⁸⁸ Trademark for refined borax pentahydrate $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$; 99.8% purity. Obtained from Searles Lake brines.

"VBR Ester Gums." ²⁹⁶ Brand name for a series of esters of rosin acids prepared by reaction with polyhydric alcohols under conditions to yield substantially neutral esters of pale color and high softening point. Used extensively in paints, varnishes, lacquers, and printing inks.

"VBR-700 Modified Maleic Resins." ²⁹⁶

Brand name for a series of partial esters of maleic anhydride and rosin acids with polyhydric alcohols. Thermoplastic and oil soluble resins used in lacquers, printing inks, and paints requiring good color retention.

"VBR-900 Modified Phenolic Resins." ²⁹⁶

Brand name for a series of condensation products of phenol and/or substituted phenols with formaldehyde modified with rosin acids and subsequently esterified with polyhydric alcohols to produce a series of resins of various softening points and solubility characteristics.

Use: Principally in varnishes and printing inks.

"VBR-800 Pure Phenolic Resins." ²⁹⁶ Brand name for a series of unmodified condensation products of substituted phenols and formaldehyde. These resins are produced from both acid and alkaline catalyzed systems. All resins are of the oil soluble type and are used in chemical resistant, fast drying, protective coatings.

VC. Abbreviation for vinyl chloride or vinylidene chloride.

"V-Cillin." ¹⁰⁰ Trademark for phenoxymethyl penicillin, U.S.P.

"V-Cillin K." ¹⁰⁰ Trademark for potassium phenoxymethyl penicillin, U.S.P.

"V-C 13 Nemacide." ⁴⁰ Trademark for a 75% emulsifiable concentrate used for control of nematodes and as an insecticide for lawn chinch bugs and onion maggots. The active ingredient is O-2,4-dichlorophenyl-O,O-diethylphosphorothioate.

Properties (typical): Dark, straw-colored liquid with a mildly unpleasant odor; insoluble in water; readily soluble in most organic solvents. B.p. (0.1 mm) 106-127°C;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sp.gr. (20°C) 1.30; refractive index (25°) 1.532.

vegetable black (Frankfort black). In general any form of more or less pure carbon produced by incomplete combustion or destructive distillation of vegetable matter, wood, vines, wine lees. See active carbon; charcoal.

vegetable calomel. See podophyllum.

vegetable char. See vegetable black.

vegetable dyes. Vegetable substances which yield coloring matter. In general, the majority of the natural dyes belong to the mordant class, though a few will combine with wool directly after the manner of the acid dyes, and a limited number act in the same manner as substantive dyes. Typical dyes of this class are logwood, natural indigo, fustic, hyperic, cochineal, madder, cutch, camwood, brazil-wood, archil, quercitron, safflower, Persian berries, turmeric, etc. Logwood is still used to a considerable extent, and small amounts of cochineal, fustic and cutch are still employed.

vegetable gelatin. Erroneous name for agar-agar.

vegetable glue. Made by treating starch with caustic soda. See also glue.

vegetable gum. See dextrin.

vegetable ivory. A mannose polysaccharide obtained from the hardened albumin of the seeds of the ivory-nut (corozo-nut) tree (*Phytelphas macrocarpa*). The latter must be distinguished from the cohune-palm (*Attalea cohune*) whose seeds are also sometimes referred to as corozo nuts. Uses: Button manufacture; mannose production.

vegetable oils. Edible oils extracted from the seeds, fruit or leaves of plants and generally considered to be mixtures of mixed glycerides (e.g., cottonseed, flaxseed, peanut, perilla, oiticica, etc.).

vegetable parchment. A product made by immersing unsized paper in 75-84% sulfuric acid for a short period of time followed by immediate washing and drying. The process results in a layer of semi-transparent gelatinous amyloid or cellulose hydrate being deposited on the surface. The paper becomes tough and resembles natural parchment in appearance. Thick sheets can be made by pressing together layers of paper which have been processed.

Uses: Semi-permeable membranes, packing greasy materials, substitute for natural parchment.

Shipping regulations: None.*

vegetable pepsin. See papain.

vegetable spermaceti. See Chinese wax.

vegetable sulfur. See lycopodium.

vegetable tanning. The tanning of leather by

plant extracts. See tannic acid; tanning extracts.

vegetable wax of Japan. See Japan wax.

"Vegimal." ¹⁷⁰ Trademark for a vegetable base adhesive.

Properties: Viscous, light tan liquid; difficult to spread at 20°C, but spreads easily at 52°C.

Derivation: By conversion of domestic starches with plasticizing chemicals to produce various drying and setting speeds.

Uses: To glue fabric to wood and paper to fabric; as sealer coats, fillers, stiffener for fabrics.

"Velban." ¹⁰⁰ $C_{46}H_{58}O_9N_4$.

Properties: A dimeric alkaloid containing both indole and dihydroindole. Extracted from the common garden shrub periwinkle.

Use: Medicine.

"Velvapex." ¹⁶⁵ Trade name for a series of cation-active softeners which are compatible over a pH range of 4 to 10. Used in the textile, leather, and cosmetic industries for substantive action on natural and synthetic fibers with unusually wide compatibilities.

"Velvasil." ²⁴⁵ Trademark for a group of drug grade silicone fluids available in viscosities ranging from 50 to 100,000 centistokes.

These materials provide resistance to water-borne irritants; are non-sticky.

They are physiologically inert, have excellent water repellency, low surface tension, excellent chemical, thermal and physical stability, are essentially colorless, odorless and tasteless and readily emulsify.

Uses: In protective skin creams and lotions, sun tan lotions, lip pomades, lipstick bases, hair dressings, ointment bases, waterless hand cleaners and medicinal bases.

"Velvoray." ¹⁵⁹ Trademark for a high-grade finishing oil made from a blend of sulfonated vegetable oil combined with specially selected fats.

Properties: Compatible with all commonly used textile finishing materials; no foaming, no smoking, no oxidizing, no rancid odor; adds "body" and has emulsion stability and uniformity.

Uses: To impart a silky softness to fabrics of all kinds of fibers.

"Velvosheen." ³²⁸ A blend of sulfonated vegetable oils used as a softening agent for textile fabrics, particularly rayon.

"Velvo Softener." ¹⁵⁹ Trade name for sulfonated tallow. A creamy white paste containing total fats amounting to 25% and pH of 9.3 - 9.5.

Uses: General finishing of all types of textile fabrics.

veneer. A thin layer or sheet of wood.

Venetian red. A high-grade ferric oxide pigment of a purer red hue than either light red (q.v.) or Indian red (q.v.). It is obtained either native as a variety of hematite red (q.v.) or more often artificially, by

*See "I. C. C. Shipping Regulations," page xlii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

calcining copperas in the presence of lime. The composition ranges from 15 to 40% ferric oxide and from 60 to 80% calcium sulfate. The 40% ferric oxide is the "pure" grade and has a sp.gr. of 3.45.

Grades: 20 to 40% ferric oxide.

Containers: Bags.

See also iron oxide reds.

Venice turpentine. See turpentine, Venice.

Venice turpentine, artificial. See turpentine, Venice; artificial.

"Veon." ²³³ Trademark for herbicides consisting of amine salts of 2,4-D and 2,4,5-T.

"Vera Blanc." ¹⁴⁸ Brand name for a proprietary calcium carbonate product.

Properties: White; inert; water-ground, water-floated, and silk-bolted; sp.gr. 2.72; wt/gal 22.66 lbs; one pound bulks 0.04413 gal; oil absorption, 13.5; calcium carbonate, 99.5%; 100% through 325 mesh; average particle size, 4 microns.

Containers: 50-lb paper bags (net).

Uses: Inert extender pigment for oil and water paints, colors, rubber compounds, adhesives, oil-cloth, linoleum, textile fabrics, fur dressing, putty, plastics, ceramics, etc.

"Verabore." ³⁴² Trademark for extract of antihypertensive alkaloids from *Veratrum* species.

"Verafleurs." ¹⁸⁸ Brand name for a series of synthetic replacements for natural floral absolutes.

veratria. See veratrine.

veratridine. See veratrine.

veratrine (veratria).

Properties: A mixture of colorless, crystalline alkaloids; very poisonous! M.p. 145-155°C. Probably includes cevadine (also called veratrine), veratridine, cevadilline, sabadine, cevine. Soluble in alcohol, chloroform, and ether, very slightly soluble in water.

Derivation: By extraction from the seeds of *Asagraea officinalis* (sabadilla).

Method of purification: Crystallization.

Grade: Technical.

Containers: $\frac{1}{8}$ -, 1-, 5-oz vials and bottles.

Use: Medicine.

Shipping regulations: None.*

veratrole (ortho-dimethoxybenzene, pyrocatechol dimethyl ether) $C_6H_4(OCH_3)_2$.

Properties: Colorless crystals or liquid; m.p. 21-22°C; b.p. 206-207°C; sp.gr. 1.084 (25/25°C). Soluble in alcohol and ether, slightly soluble in water.

Derivation: Treatment of catechol in methyl alcohol with dimethyl sulfate and caustic.

Use: Medicine (antiseptic).

veratrum viride (American hellebore; green hellebore; Indian poke). Dried rhizome and roots of *Veratrum viride*.

Occurrence: North America.

Constituents: Several alkaloids, including jervine, cevadine, and protoveratrine.

Grade: Technical.

Containers: Boxes; burlap bags.

Use: Medicine.

Shipping regulations: None.*

"Verban." ⁵⁷ Trademark for piperazine.

verbena oil. Oil distilled from the leaves of *Verbena triphylla* L. which is cultivated as an ornamental plant in Spain, northern France and Central America. Very pleasant, lemon-like odor, resembling that of lemon-grass oil. Principal component is the aldehyde citral. Not a regular article of commerce due to its scarcity and high price. Used in perfumes.

verbena oil, East Indian. See lemon-grass oil.

verde antique. A dark-green rock composed essentially of serpentine (hydrous magnesium silicate). Usually criss-crossed with white veinlets of marble. Used as an ornamental stone. In commerce often classed as a marble.

Occurrence: California, Georgia, Maryland, Massachusetts, New York, and Virginia. Not to be confused with verte antique (q.v.).

verde salt. See thenardite.

verdigris. True verdigris is basic copper acetate, also called blue or green verdigris according to variety. A false verdigris formed on uncleaned copper vessels may consist of basic copper carbonate, while the green patina which coats old copper and bronze statues is a basic copper sulfate, or if on copper exposed to sea air or water, a basic copper chloride.

verdigris, blue. See copper acetate, basic.

verdigris, crystallized. See copper acetate.

verdigris green. See copper acetate, basic.

"Verelite." ²³³ Trademark for light stabilized polystyrene resins.

"Vergitryl." ⁴¹² Trademark for veratrum viride (q.v.).

vermiculite. A mineral of the mica group but hydrated, and with the property of expanding six to twenty times the volume of the unexpanded mineral when heated to about 2000°F.

Composition: It is a hydrated magnesium-aluminum-iron silicate containing approximately 39%SiO₂, 21%MgO, 15%Al₂O₃, 9%Fe₂O₃, 5-7%K₂O, 1%CaO, 5-9%H₂O and small quantities of Cr, Mn, P, S, Cl. Free oxides as such do not exist in the vermiculite crystals.

Occurrence: Montana, North Carolina, South Carolina, Wyoming, Colorado; South Africa.

Properties: Platelet-type crystalline structure; high porosity; high void volume to surface area ratio, low density; relative chemical inertness; large range of particle size; insoluble in water and organic solvents; water vapor adsorption capacity of expanded vermiculite less than 1%, liquid adsorption dependent on conditions and particle size, ranges 200-500%.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Unexpanded (ore concentrate); expanded (also called exfoliated); flake; activated.

Containers: Multiwall paper bags, 4 cu ft.

Uses: Lightweight concrete aggregate; insulation; sound conditioning; fireproofing, plaster; soil conditioner; additive for fertilizers; seed bed for plants; refractory; lubricant; oil well drilling mud; filler in rubber, paint plastics; in wall paper printing; extender in gold and bronze printing ink or paint; for packing; carrier for more active materials, such as insecticides; catalyst and catalyst support; litter for hatcheries; adsorbent.

vermillion. See mercuric sulfide, red.

vermillion, natural. See cinnabar.

vermillion, permanent. This is usually orange mineral (q.v.) tinted with parantraniline. It has great tinctorial strength.

vermillion, quicksilver. See mercuric sulfide, red.

Verneuil process. Production of artificial corundum for jewels and bearings by fusing pure alumina with a hydrogen-air flame.

"Veronal." ¹⁶² Trademark for barbital.

"Versacaine." ⁵⁷ Trademark for chlorprocaine hydrochloride.

"Versalide." ²²⁷ Trademark for 1,1,4,4-tetramethyl-6-ethyl-7-acetyl-1,2,3,4-tetrahydronaphthalene, a polycyclic musk. It is a white crystalline solid, stable both in color and odor over a wide range of pH.

"Versamid." ²⁵⁹ Trademark for a series of polyamide resins.

Derivation: Condensation product of diacetic fatty acid with polyamines.

Grades: Thermoplastic resins with softening points from 90 to 190°C. Reactive resins for copolymerization with epoxy resins. Amine values from 83 to 400. Solutions of the reactive resins are also available.

Containers: Thermoplastics: multiwall bags. Reactive resins: 7-, 40-, 100- and 400-lb net pails; drums.

Uses: Thermoplastic resins: flexographic inks, overprint varnish, heat seal and hot melt adhesives. Reactive resins: copolymerized with epoxy resins for coatings, adhesives, concrete topping, and patching compounds; castings; laminates, potting and encapsulating.

"Versenate." ²³³ Trademark for disodium salt of ethylenediaminetetraacetic acid and related compounds.

"Versene." ²³³ Trademark for sodium salts of ethylenediaminetetraacetic acid useful as complexing, chelating, or sequestering agents for hard water salts and other polyvalent metals. Recommended as general complexing agents for all polyvalent metals. Iron is complexed efficiently only in acid pH range. In addition to their water-softening properties, these products are recommended as cleaning and degreasing

agents, as textile processing assistants, as decontaminating agents for radioactive materials, and as dissolving agents for proteins.

"Versene Fe-3 Specific." ²³³ Trademark for an organic complexing agent that exhibits preferential complexing action towards iron. Formula of active ingredient given as $C_6H_{12}O_4NNa$. It forms extremely stable complexes with ferric iron in the pH range of 3.5 to 12.5. It is also capable of complexing cobalt, nickel, copper, and zinc although its action on these divalent metals is not as strong as that of "Versene."

"Versenex." ²³³ Trademark for pentasodium salt of diethylenetriaminepentaacetic acid.

"Versenol." ²³³ Trademark for the trisodium salt of N-hydroxyethylethylenediaminetriacetic acid, useful as complexing, chelating, or sequestering agent for hard water salts and other polyvalent metals. This product is very soluble in water and is particularly useful in alkaline media.

"Versilad." ²⁴⁴ Trademark for a fortified sodium silicate admixture, containing basically sodium silicate, clay, and urea.

Properties: Suspension of solids; thixotropic. Uses: Adhesives for bonding corrugated boxboard. Made up in users' plant.

"Versilate." ²⁴⁴ Trademark for a composition of fortified sodium silicate.

Properties: Viscous liquid; opalescent. Containers: Tank trucks and tank cars. Uses: Base for "Versilad" adhesives.

"Versilube." ²⁴⁵ Trademark for silicone lubricating and hydraulic fluids. "Versilube F-50" is a lubricating fluid with an operating range from -100 to 400°F, and is unusually inert chemically. F-44 is an improved silicone fluid which possesses lubricating properties superior to other types of silicones. It is designed for use at -100 to 500°F. The bulk of the fluid has such a high boiling point that it has essentially no vapor pressure until some degradation or rearrangement occurs at 600°F. This defines the maximum temperature to which the fluids can be subjected without thermal degradation.

Uses: "Versilube F-50" is useful in all kinds of antifriction or rolling equipment and has greatly improved ability over other types of silicones to lubricate many metal combinations under conditions of sliding friction, except where both bearing surfaces are soft metals. "Versilube F-44" is designed for use as an engine oil or hydraulic fluid.

"Versimine." ²³³ Trademark for hydroxyiminodiacetic acid for use as a chelating agent.

verte antique (copper green). A paint pigment, essentially bicarbonate of copper, used for producing a corroded copper effect. Note: Not to be confused with the mineral known as verde antique (q.v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Vertifume."²³³ Trademark for fumigants containing carbon tetrachloride and carbon bisulfide.

"Vesperin."⁴¹² Trademark for trifluoromazine hydrochloride (q.v.).

vesuvianite (idocrase)

$\text{Ca}_{10}\text{Al}_4(\text{MgFe})_2(\text{SiO}_4)_5(\text{Si}_2\text{O}_7)_2(\text{OH})_4$. Natural hydrous silicate of aluminum, calcium, magnesium and iron; found in metamorphic rocks. May contain boron, fluorine, or beryllium.

Properties: Color brown or green; luster vitreous to resinous; hardness 6.5; sp.gr. 3.4.

Occurrence: Maine, New York, New Jersey, California, Europe, U.S.S.R.

Use: Gem stone; possible source of beryllium.

"Vetamox."⁵⁷ Trademark for sulfonamide.

"Veticillin."⁵⁷ Trademark for penicillin.

vetivenol. See *vetiverol*.

vetiver oil (cuscus oil; vetivert).

Properties: Viscid, very aromatic oil; violet-like odor, sp.gr. 0.990-1.040 (15°C); optical rotation +15 to +45°; refractive index (n 20/D) 1.5200-1.5280; saponification value 14-45; soluble in 1-3 volumes of 80% alcohol, in fixed oils, diethyl phthalate, benzyl benzoate, mineral oil, ether, chloroform, acetone, carbon disulfide; insoluble in glycerin and propylene glycol.

Derivation: Steam distillation of partially dried roots of East Indian grass, *Vetiveria zizanioides*. Purified by rectification.

Grades: The oil is characterized by its geographical origin (Java, Haiti, East Indian, Bourbon Reunion, French).

Containers: Bottles; cans.

Use: Perfumery.

vetiverol (vetivenol, vetivol) $\text{C}_{15}\text{H}_{24}\text{O}$. An alcohol or a mixture of alcohols, structure not certain, obtained from vetiver oil.

Properties: Straw-colored, viscous liquid with pleasant odor, sp.gr. 0.980-1.002

• (25/25°C); refractive index (n 20/D) 1.510-1.517.

Use: Perfumery.

vetivert. See *vetiver oil*.

vetivert acetate $\text{C}_{15}\text{H}_{23}\text{OOCCH}_3$ (an approximation).

Properties: Viscous, yellow liquid with pleasant odor; sp.gr. 0.979-0.999 (25/25°C); soluble in 80% alcohol.

Derivation: Treatment of vetiver oil or vetiverol with acetic anhydride.

Grade: Technical (about 50% pure).

Use: Perfumery.

vetivol. See *vetiverol*.

"Vetstrep."¹²³ Trademark for a veterinary preparation containing streptomycin sulfate.

"V-G-B."²⁴⁸ Trademark for reaction product of acetaldehyde and aniline.

Properties: Brown resinous powder; sp.gr. 1.152; m.p. 60-80°C; soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Uses: Rubber antioxidant for pure gum, mechanicals, solid tires, rubber-covered rolls, and specialties.

"Viadril."²⁹⁹ Trademark for hydroxydione sodium.

"Vialon."⁴⁴⁰ Trademark for a series of metal complex dyestuffs used in dyeing and printing on polyamide fibers.

"Vilandarome."¹⁸⁸ Trademark for a flavor base for meat products.

"Vibrathane."²⁴⁸ Trademark for a group of polyurethane raw materials for manufacture of foam and elastomers. Includes isocyanates, polyesters, polyether glycols, polyester and polyether prepolymers, liquid casting resins and gums and catalysts.

"Vibrin."²⁴⁸ Trademark for resin compositions of polyesters and cross-linking monomers which, when catalyzed, will polymerize to infusible solid resins without evolving water or other by-products. Consistencies range from low viscosity liquids to waxlike solids, and the cured resins are of many types from soft, flexible to hard and rigid.

Properties: Resistant to aging, abrasion, weathering, and chemical reagents; good electrical properties; good compressive, tensile, and flexural strength. Self-extinguishing types are available.

Uses: Molding; laminating; impregnating; casting; automotive and aircraft structural parts; wall panels, table tops; coating for paper; boat hulls; chemically inert tanks; large-diameter pipe.

viburnum opulus (cramp bark; high cranberry; cranberry tree; water elder; squaw bush; snowball bush). Dried bark of *Viburnum opulus*.

Occurrence: Europe, Asia and northern North America south to Pennsylvania.

Chief constituents: Valeric acid, an enzyme and viburnin.

Grade: Technical.

Containers: Burlap bags; bales.

Use: Medicine.

Shipping regulations: None.*

viburnum prunifolium (black haw; sweet viburnum; sheep-berry; stag bush; sloe). Dried bark of root of *Viburnum prunifolium* or *Viburnum rufidulum*.

Occurrence: United States.

Grade: Technical.

Containers: Burlap bags.

Use: Medicine.

Shipping regulations: None.*

vic-. Prefix meaning vicinal (q.v.).

vicinal (abbreviated as vic-). Neighboring or adjoining positions on a carbon ring or chain; the term is used in naming derivatives with substituting groups in such locations in the structural formula or molecule.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Vitalube 5810." ¹⁷² Trade name for a brown viscous oil, not volatile at ordinary temperature.

Properties: Insoluble in water. Soluble in hydrocarbons.

Containers: 5-, 55-gal steel drums.

Use: Rust-inhibiting additive for industrial oils.

"Victamide." ¹⁷² Trade name for a proprietary product. Ammonium salt of an amido polyphosphate.

Properties: Exceedingly fine particles, practically all less than five microns. Slowly soluble in cold water; more rapidly soluble in hot water.

Uses: Sequestering agent for metallic ions; flameproofing agent of non-crystalline type; deflocculating agent for oil drilling muds, paint pigments, and clay slips.

"Victamines." ¹⁷² Trade name for proprietary products. Cationic surface-active phosphorus compounds.

Properties: Tan, waxy solids which disperse in water.

Containers: 90-lb fiber drums.

Uses: Softening agents for textiles and leather; oil additives.

"Victamuls." ¹⁷² Trade name for nonionic, surface-active phosphorus compounds.

Containers: Carboys and drums.

Uses: Wherever properties of spreading, emulsifying, penetrating, solubilizing, or dispersing are indicated.

"Victawets." ¹⁷² Trademark for surface-active phosphorus compounds.

Properties: Anionic and nonionic wetting agents.

Uses: Penetrants, dye carriers, and dispersing agents.

"Victor Cream." ¹⁷² Trade name for sodium acid pyrophosphate. $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$.

Properties: White, crystalline material.

Purity meets all requirements of Federal and State Pure Food laws.

Containers: 100-lb paper bags.

Uses: Baking acid in doughnut and prepared flours. Manufacture of commercial baking powders and instant puddings. For conditioning the mud used in drilling oil wells. Formulation of acid-type metal cleaners.

Victoria blue $\text{C}_{33}\text{H}_{31}\text{N}_3 \cdot \text{HCl}$.

Properties: Crystalline powder, bronze colored. Soluble in hot water, alcohol or ether.

Derivation: Michler's ketone is condensed with phenyl-alpha-naphthylamine.

Uses: In textile industry for dyeing silk, wool, and cotton; biological stain; dye intermediate for producing complex acid pigment toners.

Victoria blue toners. See phosphotungstic pigments.

Victoria green. See malachite green.

Victoria red. See chrome red.

"Victory." ¹²⁸ Brand name for a series of

petroleum microcrystalline waxes.

Properties: Colors, brown, amber or white; m.p. 155 or 165°F min.

Containers: 10-lb slabs, 8/carton or 168/pallet; 350-lb drums; tank cars.

Uses: Coating and laminating paper, foil, and board; impregnating and waterproofing fabrics.

"Vi-Delta." ⁵⁷ Trademark for vitamins A, D.

"Videne." ²⁶⁵ Trademark for thermoplastic polyester resin film.

Properties: Available in roll form in both glass clear and satin finish. It can also be reverse printed with any grain a camera can capture. It is resistant to water, oils, greases and most solvents. It is heat sealable and can be readily laminated to various surfaces by heat and pressure.

Vienna caustic. See caustic, Vienna.

Vienna green. See copper acetoarsenite.

Vienna paste. See caustic, Vienna.

"Vigofac." ²⁹⁹ Trademark for an animal feed supplement containing a growth ingredient.

"Vinac." ¹⁴⁴ Trademark for polyvinyl acetate homopolymer emulsions, beads, powders. Emulsions Properties: Water-white; 55-57% solids; viscosity varies according to grade; range 500-4200 cps (60 RPM-RVO Brookfield), pH 4.0-6.0. Excellent adhesive characteristics.

Grades: XX-210, XX-220, HF-300, WR-20, WR-50, CE 1-P, AA-63.

Containers: 5-, 10-, 30-gal drums; lined 55-gal drums.

Uses: Bases for compounding adhesives, binders, paints, coatings, textile finishes, paper coatings.

Bead Properties: Spherical granules; odorless, tasteless, nontoxic, light-stable; 98.5%-100% resin solids; softening point varies according to grade: range 105-155°C; molecular weight varies according to grade. Soluble in alcohols, chlorinated solvents; esters, hydrocarbons, ketones, dimethyl furane, nitromethane, nitropropane.

Grades: B-7, B-15, B-25, B-100, B-800, ASB-10.

Containers: 250-lb fiber drums; 50-lb multi-wall paper bags.

Uses: Adhesives; coatings, textile finishes.

Powder Properties: White polyvinyl acetate powder which redisperses readily in cold water. Dispersions resemble polyvinyl acetate homopolymer emulsions, with adhesive and binding characteristics. Particle size of powder -98 8 through 100 mesh; bulk density 0.53 grams/cc; in dispersion mean particle size 2-6 microns; pH 4-6; viscosity (50% dispersion, No. 3 spindle, 60 RPM) 1,000 cps; viscosity (60% dispersion, No. 4 spindle, 60 RPM) 9,500 cps. Grades: RP-250.

Containers: 55-gal fiber drums.

Uses: Formulation of dry-mix products, such as joint cements for dry-wall construction; spackling compounds; cement and cinder

*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

block fillers; powder paints. Also compounding adhesives, textile binders and stiffening agents, heat-seal coatings.

"Vinactane." ³⁰⁵ Trademark for viomycin.
Use: Medicine.

vinal. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 50% by weight of vinyl alcohol units, $-\text{CH}_2\text{CHOH}-$, and in which the total of the vinyl alcohol units and any one or more of the various acetal units is at least 85% by weight of the fiber (Federal Trade Commission). It has been developed and first used in Japan. It has good chemical resistance, low affinity for water; good resistance to mildew and fungi.

Uses (suggested): Fishing nets, stockings, gloves, hats, rainwear, swimsuits.

vinasse. The residue obtained from beet sugar molasses fermentation, containing mineral salts.

vinbarbital (5-ethyl-5(1-methyl-1-butenyl) barbituric acid) $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White powder with characteristic odor and bitter taste. Very slightly soluble in water; sparingly soluble in ether; soluble in alcohol. M.p. 160-163°C.

Grade: N.F. XI.

Use: Medicine

vinbarbital sodium (sodium 5-ethyl-5(1-methyl-1-butenyl)barbiturate) $\text{C}_{11}\text{H}_{15}\text{N}_2\text{NaO}_3$.

Properties. White odorless powder with bitter taste. Soluble in alcohol and water; slightly soluble in chloroform and ether. Unbuffered aqueous solutions unstable. Powder is hygroscopic and is affected by moisture and carbon dioxide. pH (1% solution) 8.5-9.5

Grade: N.N.D

Use: Medicine.

"Vincel." ³³² Trademark for a line of woven fabrics of polyvinyl chloride fibers for liquid and pneumatic filtration.

vine black. The charcoal resulting from incomplete combustion (destructive distillation)

- of grape vines.

vinegar (cider vinegar). A dilute impure solution of acetic acid. Unless otherwise stated, it is assumed to be made from apple cider and to contain not less than 4% acetic acid. It can be made by the traditional process of slow fermentation through the alcohol stage to the acid stage, or by the quick vinegar process of trickling the fermented liquid mixed with some vinegar over shavings. See also vinegar, malt; vinegar, distilled, vinegar, wine

vinegar acid. See acetic acid.

vinegar, cider. See vinegar.

vinegar, distilled. A colorless vinegar which has been distilled after its formation. It is usually stronger in acetic acid than cider vinegar.

vinegar, malt. A vinegar made from fermented malted barley liquor.

vinegar naphtha. See ethyl acetate.

vinegar salts. See calcium acetate.

vinegar, wine. A vinegar made from wine and having a characteristic flavor. It contains about 8% acetic acid.

"Vinethene." ¹²³ Trademark for an anesthetic preparation consisting of vinyl ether.

vinetine. See oxyacanthine.

"Vinol." ¹⁴⁴ Trademark for polyvinyl alcohol resins.

Properties: White powders; soluble in water; form tough, flexible, transparent films which are impermeable to oxygen and other gases, abrasion resistant, grease and solvent resistant. Films range from water soluble to water resistant. Viscosity and hydrolysis vary according to grade; hydrolysis ranges from 99.85% to 87%. Excellent adhesive and binding properties.

Grades: 125, 260, 230, 205, 350, 325, 540, 523, 505.

Containers: 50-lb multiwall bags.

Uses: Adhesive compounding; textile sizing and finishing; paper sizing and coating; packaging films; water soluble films; protective coatings, molded and foamed plastics.

"Vinsol." ²⁶⁶ Trademark for a dark brittle thermoplastic resin; ruby-red by transmitted light, dark-brown by reflected light; sp. gr. 1.218, acid number 94; softening point 116°C.

Uses: Asphalt emulsions; in Portland and mortar cements, thermoplastic stiffener in rubber and paper board; phonograph records; oil resistant compounds; resins; lacquers; varnishes and plastics.

"Vinsol NVX." ²⁶⁶ Brand name for sodium salt of Vinsol resin.

Properties: Dark dry powder. soluble in water.

Uses: Emulsifying asphalt; agent for air-entraining cement.

"Vinycol." ²³³ Proprietary products consisting of pigments dispersed in "Vinylite" resins for coatings

Grades and Uses:

"Vinycol" No. 100 White: Titanium dioxide dispersed in "Vinylite" resin and plasticizer. Used in high-gloss vinyl finishes.

"Vinycol" No. 200 Black: High-color carbon black dispersed in "Vinylite" resin and plasticizer. Used in high-gloss vinyl finishes.

"Vinylac." ⁶⁵ Trademark for a series of resinous tackifier dispersions for modification of polyvinyl acetate adhesive systems.

vinyl acetate $\text{CH}_3\text{COOCH}:\text{CH}_2$. A major raw material for vinyl plastics (q.v.). See also polyvinyl acetal resins; polyvinyl acetate.

Properties: Colorless liquid, which is stabilized with either hydroquinone or diphenylamine inhibitors. The HQ-stabilized

material can be polymerized without re-distillation. The DPA-stabilized material must be distilled prior to polymerization.

Typical specifications: Vinyl acetate 99.8% min; acetaldehyde 0.013% max; acid (as acetic acid) 0.007% max; moisture 0.04% max; colorless to light yellow; b.p. 72.3-73.0°C; m.p. -100.2°C; sp.gr. 0.9335-0.9345 (20/20); refractive index 1.3941; flash point 22°F (open cup); wt/gal 7.79 lbs; vapor pressure 3.7 lbs/sq in; hydroquinone 14-17 ppm; diphenylamine 275-325 ppm. Soluble in most organic solvents including chlorinated solvents; insoluble in water.

Derivation: Obtained by the reaction of acetylene and acetic acid in the presence of a mercuric oxide catalyst. Purified by distillation.

Grade: Technical.

Containers: 1-, 5-gal cans; 55-gal steel drums. All nonreturnable. 8000-gal tank cars.

Uses: Polyvinyl acetate, polyvinyl alcohol, polyvinyl butyral, and polyvinyl chloride-acetate resins. Also in latex paints; adhesives; textile finishing; safety glass interlayers.

Danger! Extremely flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label.* (For vinyl acetate, inhibited.)

vinylacetonitrile. See allyl cyanide.

vinylacetylene C_4H_4 or $H_2C:CHC:CH$ The dimer of acetylene, formed by passing it into a solution of cuprous and ammonium chlorides in hydrochloric acid.

Properties: Colorless gas or liquid; sp.gr. 0.6867 (0/20°C); b.p. 5°C.

Use: Intermediate in manufacture of neoprene synthetic rubber and for various organic syntheses.

See also divinyl acetylene.

vinyl alcohol (ethenol) $CH_2:CHOH$. Isolated only in form of its esters, or the polymer, polyvinyl alcohol (q.v.).

vinylation. The formation of a vinyl derivative by reaction with acetylene. Thus vinylation of alcohols yields vinyl ethers such as vinyl ethyl ether, $C_2H_5OC_2H_3$. The process was used in Germany during World War II (Repe chemistry), and requires catalysts as well as some heat, pressure, and dilution of acetylene with nitrogen. Amines, mercaptans, and fatty acids can be vinylated. The products are useful as intermediates for further synthesis, especially polymerization.

vinylbenzene. See styrene.

vinyl n-butyl ether (n-butyl vinyl ether; BVE) $CH_2:CHOC_4H_9$.

Properties: Liquid; sp.gr. 0.7803 (20°C); b.p. 94.1°C (760 mm), f.p. -92°C; refractive index 1.3997; flash point 30°F; wt/gal 7.45 lbs (20°C). Slightly soluble in water; soluble in alcohol and ether.

Derivation: Reaction of acetylene with n-butyl alcohol.

Method of purification: Washing with water; drying in presence of alkali, and distillation from metallic sodium.

Grade: Technical (95%).

Containers: Glass bottles; drums; tank cars.

Uses: Synthesis; copolymerization.

Shipping regulations: Flammable liquid. Red label.*

vinyl butyrate $CH_3:CHOOCC_3H_7$.

Properties: Liquid; sp.gr. 0.9022 (20/20°C); b.p. 116.7°C; f.p. -86.8°C. Very slightly soluble in water. Flash point 68°F.

Containers: 55-gal drums.

Uses: Polymers; emulsion paints.

Shipping regulations: Flammable liquid. Red label.*

N-vinylcarbazole $C_{12}H_8NCH:CH_2$.

Derivation: From acetylene and carbazole.

Use: Polymerizes to form heat resistant and insulating resins somewhat similar to mica in dielectric properties. See polyvinyl carbazole.

vinyl chloride (VC; chloroethene; chloroethylene) $CH_2:CHCl$. The most important of the vinyl monomers.

Properties: Easily liquefied gas, with a pleasant ethereal odor. Usually handled as the liquid. A small amount of phenol is added as a polymerization inhibitor. Sp.gr. 0.9121 (liquid, at 20/20°C), b.p. -13.9°C (760 mm); f.p. -159.7°C, vapor pressure 2300 mm (20°C); flash point -108°F. Slightly soluble in water; soluble in alcohol and ether.

Typical specifications: Color water-white and clear; boiling range (760 mm) not less than 95% distills over before the temperature of the liquid reaches 10°C; water, no water layer present in the cylinder when sampled, acetaldehyde not more than 0.5% by weight; residue not more than 0.5% by vol; average wt/gal (liquid) 7.59 lbs (20°C).

Derivation: (a) Reaction of acetylene and hydrochloric acid, either as liquids or gases. Mercuric chloride is a catalyst for the dry process, cupric chloride for the liquid process. (b) Cracking of ethylene dichloride (made from ethylene and chlorine) at high temperatures. (c) Reaction of ethylene dichloride and caustic soda.

Method of purification: Distillation.

Grades: Technical; pure, 99.9%.

Containers: Cylinders, tank cars.

Danger! Extremely flammable liquid and gas under pressure. MCA warning label.

Uses: Mainly for polyvinyl chloride (q.v.), and copolymers (see also vinyl plastics); organic synthesis.

Shipping regulations: (For vinyl chloride, inhibited). Flammable gas. Red gas label.*

vinyl 2-chloroethyl ether $CH_2:CHOCH_2CH_2Cl$.

Properties: Liquid having sp.gr. 1.0498 (20°C); b.p. 109.1°C; m.p. -69.7°C; very slightly soluble in water; flash point (open cup) 80°F.

Use: Copolymerization to produce plastics.

Shipping regulations: Flammable liquid. Red label.*

*See "I. C. C. Shipping Regulations," page xiii.
Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

vinyl beta-chloroethyl sulfide

Properties: Liquid. B.p. 71-72°C (50 mm).

Grade: Technical.

Use: Organic synthesis.

vinyl compounds. Compounds having the vinyl grouping ($\text{CH}_2=\text{CH}-$), specifically vinyl chloride, vinyl acetate and similar esters, but also referring more generally to other types of compounds such as styrene $\text{C}_6\text{H}_5\text{CH:CH}_2$, methyl methacrylate $\text{CH}_2\text{:C}(\text{CH}_3)\text{COOCH}_3$ and acrylonitrile $\text{CH}_2\text{:CHCN}$. The vinyl compounds are highly reactive and polymerize easily, hence are basic materials for plastics. For typical inhibitors used to avoid polymerization, see vinyl acetate. See vinyl plastics.

vinyl cyanide. See acrylonitrile.

vinylcyclohexene (1-vinylcyclohexene-3; 4-vinylcyclohexene-1, cyclohexenylethylene)

Properties: Liquid, sp.gr. 0.8303 (20/4°C), f.p. -108.9°C, b.p. 128°C; refractive index 1.464 (n_D20/D); flash point 70°F. Temperatures above 80°F and prolonged exposure to oxygen-containing gases should be avoided as these conditions lead to discoloration and gum formation.

Typical specifications: Boiling range 126.5°C min; 133.5°C max; sp.gr. 0.830-0.835 (15.5/15 5°C); color, not less than 10 Saybolt; appearance, clear and free of suspended matter; flash point (open cup) 74°F. Grades: Technical, 95%; pure, 99%; re-search

Containers: 1-, 5-gal cans; 55-gal drums; tank trucks; tank cars.

Uses: Polymers; organic synthesis.

Shipping regulations: Flammable liquid. Red label.*

vinyl cyclohexene monoxide $\text{CH:CHC}_6\text{H}_9\text{O}$.

Properties: Liquid; sp.gr. 0.9598 (20/20°C); b.p. 169°C; f.p. -100°C; flash point 126°F.

Very slightly soluble in water.

Uses: Polymers, organic synthesis.

vinyl ether (divinyl ether; divinyl oxide)

Properties: Clear colorless liquid with characteristic odor, sp.gr. 0.773; b.p. 28-31°C, refractive index (20/D) 1.3989. Slightly soluble in water; miscible with alcohol, acetone, chloroform, and ether. Must be protected from light.

Derivation: Treatment of dichloroethyl ether with alkali.

Grade: U.S.P. XVI required about 96% vinyl ether, 4% dehydrated alcohol and allows 0.025% harmless preservative which may impart purple fluorescence.

Containers: 50- and 75-cc bottles.

Cautions: Highly volatile flammable liquid.

Flash point below -22°F. Gives off even at comparatively low temperatures vapors which form flammable mixtures with air or oxygen.

Use: Medicine (anesthetic).

vinyl beta-ethoxyethyl sulfide

Properties: Colorless, mobile liquid. Pungent, camphor-like odor.

Constants: Sp.gr. 0.9532 (15°C); b.p. 65°C (8 mm).

Grade: Technical.

Use: Organic synthesis.

vinylethylene. See butadiene.

vinyl ethyl ether (ethyl vinyl ether; EVE)

Properties: Colorless liquid. Extremely reactive and can be polymerized in either the liquid or vapor phase; slightly soluble in water: 0.9% by wt; sp.gr. 0.754 (20/20°C); 6.28 lbs/gal (20°C); b.p. 35.5°C (760 mm); vapor pressure 428 mm (20°C); f.p. -115.0°C; viscosity 0.22 cps (20°C); refractive index 1.3739; flash point, less than 0°F. Commercial material contains inhibitor to prevent premature polymerization.

Derivation: Reaction of acetylene with ethyl alcohol.

Method of purification: Washing with water, drying in presence of alkali, distillation from metallic sodium.

Grade: Technical.

Containers: Drums; tank cars.

Uses: Copolymerization; intermediate.

Shipping regulations: Flammable liquid. Red label.*

vinyl 2-ethyl hexoate $\text{CH}_2\text{:CHOCCCH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9$.

Properties: Liquid; sp.gr. 0.8751 (20/20°C); b.p. 185.2°C; f.p. -90°C; flash point 165°F. Insoluble in water.

Containers: 55-gal drums.

Uses: Polymers; emulsion paints.

vinyl 2-ethylhexyl ether

Properties: Liquid; sp.gr. 0.8102 (20/20°C); b.p. 177.7°C; f.p. -100°C; flash point 135°F. Insoluble in water.

Containers: 55-gal drums.

Uses: Intermediate for pharmaceuticals, insecticides, adhesives; viscosity index improver.

Shipping regulations: None.*

2-vinyl-5-ethylpyridine ($\text{CH}_2\text{:CH/C}_5\text{H}_3\text{N}(\text{C}_2\text{H}_5)$).

Properties: Sp.gr. (20/20°C) 0.9449; b.p. (100 mm) 138°C, vapor pressure (20°C) 0.2 mm; f.p. -50.9°C; flash point 200°F (Cleveland open cup); solubility in water (20°C) less than 0.01% by weight.

Use: Copolymer; synthesis.

vinyl fluoride (fluoroethylene) $\text{CH}_2\text{:CHF}$.

Properties: Colored gas; b.p. -51°C; insoluble in water; soluble in alcohol and ether.

Containers: Cylinders.

Use: Monomer for resins. See polyvinyl fluoride.

Shipping regulations: (Inhibited) flammable gas. Red gas label.*

vinylformic acid. See acrylic acid.

vinylidene chloride (VC) $\text{CH}_2\text{:CCl}_2$.

Properties: Colorless volatile liquid;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

f.p. -122.53°C ; b.p. 32°C ; flash point (open cup) -10°C . The material readily undergoes polymerization, and in commerce is always encountered with a small proportion of polymerization inhibitor present.

Uses: Vinylidene chloride is copolymerized with vinyl chloride (principal use) or acrylonitrile to form various kinds of saran. Other copolymers are also used.

Shipping regulations: Flammable liquid. Red label.*

vinylidene fluoride (1,1-difluoroethylene)
 CH_2CF_2 . A monomer of growing importance.

Properties: Colorless gas; b.p. less than -70°C ; insoluble in water; soluble in alcohol, and ether.

Use: To make elastomers with such copolymers as chlorotrifluoroethylene and hexafluoropropylene. "Genetron" 1132A and "Viton" A are examples. See also polyvinylidene fluoride.

vinylidene resins (polyvinylidene resins).

These are resins in which the unit structure in the polymer molecule is $(-\text{H}_2\text{CCX}_2-)$, in which X is usually chlorine, fluorine, or cyanide radical. Examples are saran, "Viton" A, "Genetron" 1132 A.

vinyl isobutyl ether (isobutyl vinyl ether, IVE)
 $\text{CH}_2\text{:CHOC(CH}_3)_2\text{CH(CH}_3)_2$.

Properties: Colorless liquid, sp. gr. 0.7706 ($20/20^{\circ}\text{C}$); b.p. 83.3°C , vapor pressure 68 mm (20°C); f.p. -112°C , refractive index 1.3938; flash point 20°F . Very slightly soluble in water; soluble in alcohol and ether; easily polymerized.

Derivation: Catalytic union of acetylene and isobutyl alcohol.

Method of purification: Washing with water, drying in presence of alkali, and distillation from metallic sodium.

Grade: Technical.

Containers: Drums; tank cars.

Uses: Polymer and copolymers used in surgical adhesives, coatings and lacquers, modifier for alkyd and polystyrene resins, plasticizer for nitrocellulose and other plastics; chemical intermediate.

Shipping regulations: Flammable liquid. Red label.*

"Vinylite." ²¹⁴ Trademark for a series of synthetic thermoplastic resins and plastics. Available in four series—A, Q, V, and X. Data on these are as follows:

Series A:

Type: Polymerized vinyl acetate, vinyl alcohol-acetate.

Grades: AYAA, AYAF, AYAT, AYAC, A-35, A-70, MA-28-14, MA-28-18, T-24-9, W-125.

Properties: White granular powder, solutions, dispersions. Colorless, odorless, tasteless, nontoxic, resistant to dilute salt and acid solutions. Stable to both heat and light. Soluble in most alcohols, ketones, esters, glycol-ethers, chlorinated hydrocarbons, and lower-boiling coal-tar hydro-

carbons, or mixtures of these solvents. Insoluble in petroleum naphtha, glycols, turpentine, and vegetable and mineral oils. Insoluble in water, although from 5-20% water, mixed with lower alcohols, improves their solubility characteristics. Some nonsolvents, such as xylol, can be used as diluents in the presence of active solvents.

Uses: Solvent-type and thermoplastic adhesives for cloth, paper, cardboard, porcelain, metal, mica, stone, glass, wood, leather, and plastic sheets and film. Also binding agent for artificial wood.

Series Q:

Type: Polymerized vinyl chloride.

Grade: QYNA.

Properties: White, granular powder. Soluble in dioxane, ethylene dichloride, chlorobenzene and mesityl oxide. Partially soluble in acetone. Insoluble in acids, alcohols, water, and most other solvents.

Uses: In plasticized compositions for the production of calendered products, cloth coatings with the chemical resistance, permanence and performance depending on the type of plasticizer used.

Series V:

Type: Copolymerized vinyl chloride and vinyl acetate.

Grades: VYHH, VYLF, VYNS, VYNW, VYDR, VYNY, VYNV, VYCM, VYCC, VMCH, and VAGH.

Properties: White granular powders. Colorless, tasteless, odorless, nontoxic. Nonburning except on direct exposure to flame. Thermoplastic, having high internal plasticity. Can be plasticized to any degree of flexibility. Soluble in lower-boiling ketones, chlorinated hydrocarbons, dioxane, propylene oxide and mesityl oxide. Softens in higher-boiling ketones, aldehydes, esters, ethers, ether-alcohols, carbon disulfide and aromatic hydrocarbons. Insoluble in most other solvents.

Uses: Injection and compression molding compounds, flexible film and sheeting, rigid sheets, coated paper, extrusion compounds for electrical insulation and other uses. Base resins for coatings, formulations for paper, cloth, metal and wood as supplied by leading lacquer manufacturers.

Series X:

Type: Polyvinyl butyral.

Grades: XYSG, XYSL, XYSG-XYHL.

Properties: Colorless granular powder. Very resistant to sunlight and ultraviolet radiation, also very heat-stable. Soluble in methanol, ethanol, isopropanol, butanol, methyl "Cellosolve" methyl ether, "Cellosolve" ethyl ether, "Cellosolve" butyl ether, dioxane, and dioxolane. Swelled by ketones, aromatic hydrocarbons, chlorinated hydrocarbons, and many esters. Insoluble in water and aliphatic hydrocarbons.

Uses: Compounded as interlayer for safety glass for automotive and aircraft use. Adhesive and leather finishing base. As the base resin, compounded by lacquer manufacturers into wash primer of cohesive and protective properties for metals, wood.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

vinyl methyl ether (methyl vinyl ether; MVE)
 $\text{CH}_2\text{CHOCH}_3$.

Properties: Colorless, easily liquefied gas, colorless liquid; sp. gr. 0.7500 (20/20°C); b. p. 6.0°C; vapor pressure 1052 mm (20°C); flash point -60°F; f. p. -121.6°C. Slightly soluble in water; soluble in alcohol and ether; easily polymerized, and commercial material contains a small proportion of polymerization inhibitor to avoid reaction during shipment or storage.

Derivation: Catalytic union of acetylene and methyl alcohol.

Method of purification: Washing with water, drying in presence of alkali, distillation from metallic sodium.

Grades: Technical (95% min); pure.

Containers: 150-lb cylinders; tank cars.

Uses: Copolymers used in coatings and lacquers, modifier for alkyl and polystyrene resins, plasticizer for nitrocellulose and other plastics. Also potentially useful as a starting point in synthesis. See polyvinyl methyl ether.

Shipping regulations: (Inhibited) flammable gas. Red gas label.*

vinyl methyl ether copolymers. See PVM/MA.

vinyl methyl ketone (3-butene-2-one)

$\text{CH}_3\text{OCH}:\text{CH}_2$.

Shipping regulations: (Inhibited) flammable liquid. Red label.*

vinyl plastics. Polymers and resins derived by polymerization or copolymerization of vinyl monomers (vinyl compounds) including vinyl chloride and acetate, vinylidene chloride, methyl acrylate and methacrylate, acrylonitrile, styrene, the vinyl ethers, and numerous others characterized by presence of a carbon double bond in the monomer molecule, which opens during polymerization to make possible the carbon chain of the polymer. A simple case is the conversion of vinyl chloride $\text{H}_2\text{C}:\text{CHCl}$ to polyvinyl chloride $(-\text{CH}_2-\text{CHCl}-)_n$. In a narrower sense the term vinyl plastics refers to polyvinyl chloride, acetate, alcohol, etc., and copolymers or closely related materials. See under both vinyl and polyvinyl.

Uses: Adhesives, protective coatings (lacquers, etc.); inks; films; sheets, solid molded objects; textile sizing, stiffening and coating; paper sizing; as a binder-fuel in solid rocket propellants, and a variety of other applications. See especially polyvinyl chloride.

vinyl propionate $\text{CH}_2\text{CHOOCCH}_3$.

Properties: Liquid; sp. gr. 0.9173 (20/20°C); b. p. 95.0°C, f. p. -81.1°C; flash point 34°F. Almost insoluble in water.

Containers: 55-gal drums; tank cars.

Use: Polymer; emulsion paints.

Shipping regulations: Flammable liquid. Red label.*

2-vinylpyridine $\text{C}_5\text{H}_4\text{NCH}:\text{CH}_2$.

Properties: Colorless liquid, boils with resinification at about 159°C (760 mm); sp. gr. 0.9746 (20°C); refractive index

1.5509 (n 20/D). Dissolves in water to extent of 2.5%; water dissolves in it to about 15%; soluble in dilute acids, hydrocarbons, alcohols, ketones, esters. Commercial material contains inhibitor to prevent premature polymerization.

Containers: Drums; tank cars.

Uses: Production of synthetic rubber, polymers, pharmaceuticals.

4-vinylpyridine $\text{CH}_2\text{CHC}_4\text{H}_4\text{N}$.

Properties: Liquid; b. p. (150 mm) 121°C; sp. gr. (20°C) 0.988; refractive index (n 20/D) 1.5525. Slightly soluble in water.

Grade: 95% min.

Uses: Polymers; synthesis of pyridine derivatives.

Caution! Both the liquid and its vapor are irritants to the skin, eyes, and respiratory tract. Avoid contact with the liquid and prolonged exposure to high vapor concentration.

N-vinyl-2-pyrrolidone $\text{CH}_2\text{CH}:\text{NCH}_2\text{CH}_2\text{CH}_2\text{CO}$.

Made from acetylene and formaldehyde by high pressure synthesis.

Use: See polyvinylpyrrolidone.

vinyl resins. See vinyl plastics.

vinyl stabilizers. Substances added to vinyl chloride resins during compounding, to retard the rate of deterioration due to formation of hydrogen chloride from the polyvinyl chloride. Many of these substances are of such a chemical nature as to combine readily with hydrogen chloride but do not otherwise interfere with the properties and uses of the final plastic product. Amines, basic oxides, and metallic soaps are commonly used.

vinyl stearate $\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}:\text{CH}_2$.

Properties: White, waxy solid. M. p. 28-30°C, b. p. 175°C (3 mm); sp. gr. 0.9037 (20/20); refractive index 1.4355-1.4362 (n 55/D); iodine no. 80-82. Insoluble in water and alcohol; moderately soluble in ketones and vegetable oils; soluble in most hydrocarbon and chlorinated solvents.

Containers: 35-, 210-, and 390-lb drums.

Use: Plasticizer (copolymerizer).

vinylstyrene. See divinyl benzene.

vinyltoluene $\text{CH}_2\text{CHC}_6\text{H}_4\text{CH}_3$.

Properties: Colorless liquid; f. p. -76.8°C; b. p. 170-171°C (760 mm); sp. gr. 0.890 (25/25°C), lb/gal 7.41; refractive index 1.534 (n 35/D); flash point 140°F. Very slightly soluble in water. Soluble in methanol, ether.

Containers: Drums; tank cars.

Use: Solvent; intermediate.

vinyl trichloride. See 1,1,2-trichloroethane.

vinyltrichlorosilane $\text{CH}_2\text{CHSiCl}_3$.

Properties: Colorless or pale yellow liquid. B. p. 90.6°C; sp. gr. 1.265 (25/25°C); refractive index (n 20/D) 1.432; flash point (Cleveland open cup) 70°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid; polymerizes easily.

Derivation: By the reaction of acetylene and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

trichlorosilane in the presence of a peroxide catalyst; reaction of trichlorosilane with vinyl chloride.

Grade: Technical.

Use: Intermediate for silicones.

Shipping regulations: Flammable liquid. Red label.*

"Vinymul." ¹⁷⁰ Trademark for a textile finisher for all fabrics or fibers where flexibility is desired at low temperatures, such as back-coating or immersion finishing of automobile fabrics.

Properties: White, fluid stable synthetic vinyl resin copolymer, giving tough, non-brittle film which is oil, fat, solvent and water resistant. Material does not require curing temperatures and has no plasticizer migration. Has good specific adhesion to vinyl surfaces without adverse effect on chemical or dimensional properties of the vinyl.

Uses: As primer with adhesives on vinyl pressure sensitive tapes or as a prime coat on metal for adhesion to metal and improved adhesion for second protective coating.

vinylon. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of vinyl chloride units, $-\text{CH}_2\text{CHCl}-$ (Federal Trade Commission). It has good resistance to chemicals, bacteria, moths; is unaffected by water and sunlight; and has a low softening point.

Uses: Mixing with other fibers for heat bonding; for fishing nets and lines; industrial filters.

"Vinyzene." ⁸ Trade name for a series of fungicides and bactericides formulated as additives to vinyl films.

viobin process. Process for desiccating and defatting tissues such as liver, pancreas, thyroid, etc., for pharmaceutical use. The process is a combination of azeotropic distillation and solvent extraction.

"Viocin." ²⁹⁹ Trademark for viomycin sulfate.

"Vioform." ³⁰⁵ Trademark for iodochlorhydroxyquin, U.S.P.

"Violamine." ³⁰⁷ Brand name of proprietary line of acid dyestuffs. Used on wool and silk. Characterized by fairly good fastness to light, washing, fulling, etc. Can also be used on paper and leather.

violanthrone. See dibenzanthrone.

"Violite." ⁴ Trademark for phosphorescent and fluorescent pigments (ZnS-CdS , CaS-SrS); compatible with a variety of vehicles.

Uses: Lacquers, paints, printing inks, paper, tape, and plastics.

viomycin. An antibiotic produced by *Streptomyces puniceus*. It is unique among antibiotics in that it is more active against acid-fast organisms than it is against other groups of bacteria. Mycobacteria

are most sensitive to viomycin, and the antibiotic is active against strains of *Mycobacterium tuberculosis* which are resistant to other antibiotics.

Properties: It is a strongly basic polypeptide, which readily forms neutral salts with acids. The sulfate and the hydrochloride are very soluble in water. Moderately stable at pH 5-6 at room temperature but loses activity at high temperatures.

Units: Unit established arbitrarily as 1 microgram of the pure base.

Use: Medicine.

Available commercially as sulfate.

viomycin sulfate.

Properties: White, odorless, hygroscopic powder; soluble in water; only slightly soluble in alcohol; pH (1% solution) 4.5-7.0.

Grade: N.N.D.

Use: Medicine.

viosterol. Vitamin D₂. See vitamin D.

"Vircol-82." ⁴⁰ Trademark for a neutral phosphorus polyol used as co-reactant flame retardant for urethane foams.

Properties: Nearly colorless, pleasant-smelling, high-boiling fluid; insoluble in water up to 45% but miscible above this level, soluble in a variety of organic solvents; insoluble in ether and aliphatic hydrocarbons. Typical product has sp.gr. (20°C) 1.10; refractive index (25°C) 1.445; flash point (open cup) 260°F.

Uses: Chemically bound, permanent flame retardancy, nonmigrating and not extracted by solvents; useful with both polyesters and polyethers with prepolymer and one-shot techniques in flexible and rigid foams.

"Vircol-189." ⁴⁰ Trademark for a neutral phosphorus polyol with outstanding properties as a plasticizer for poly(vinyl alcohol).

Properties: Colorless, pleasant-smelling, high-boiling fluid; soluble in water below 2% and above 20%, but forms two phases between these levels; soluble in a variety of organic solvents; insoluble in ether and aliphatic hydrocarbons. Typical product has sp.gr. (20°C) 1.130; refractive index (20°C) 1.448, viscosity (100°F) 27.2 centistokes; flash point (open cup) 205°F.

Uses: Plasticizer for poly(vinyl alcohol); films prepared therefrom are less water sensitive and retain properties over a wide range of conditions; useful in films, moldings, paper sizing, textile sizing and other applications.

"Virco-Pet 20." ⁴⁰ Trademark for a neutral organic phosphorus chemical for use as a corrosion inhibitor for steel and aluminum.

Properties: A tan, viscous liquid; forms an emulsion with water; miscible with a variety of organic solvents; sp.gr. (20°C) 0.96-1.00.

Uses: Protection of petroleum-handling facilities, in protective coatings such as paints and waxes; additive to antifreeze compounds (forms stable emulsions with glycol-water mixture), cleaners and polishes; and

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

wherever a liquid is in contact with a metal under corrosive conditions.

"Virco-Pet 30." ⁴⁰ Trademark for a neutral organic phosphorus chemical which gives outstanding corrosion protection to aluminum and its alloys.

Properties: A tan, viscous liquid; soluble in water and a variety of organic solvents; insoluble in ether and aliphatic hydrocarbons; sp. gr. (20°C) 1.06; refractive index (20°C) 1.447.

Uses: Complements and extends protection offered by Virco-Pet 20; protects aluminum and its alloys even when the aluminum is galvanically coupled with other metals; affords protection also for steel, iron, copper, bronze and brass.

"Virflux." ²⁸⁸ Trademark for titanium ore and titanium oxide.

Grades: "Virflux" W (Standard M and T Virginia rutile). Mineral consisting principally of titanium dioxide. "Virflux" C (Ceramic Grade M and T Virginia rutile). Rutile having a minimum chromium and iron content.

Uses: In the metallurgical and ceramic industries.

virginium. See francium.

"Virgo." ³⁰⁶ Trademark for a line of descaling, desanding, degraphitizing and enameling salts used in molten baths. The descaling operation is primarily applied to various steels and some alloys.

"Viridine." ²²⁷ Trademark for phenylacetaldehyde dimethylacetal. $C_6H_5CH_2CH(OCH_3)_2$. **Properties:** Colorless liquid; a very potent green odor; more stable than phenylacetaldehyde; not known to cause discoloration; sp. gr. (25/25°C) 1.000-1.004; refractive index (20°C) 1.493-1.496; soluble in 2 parts of 70% alcohol.

Uses: Substitute for phenylacetaldehyde, adding freshness to the lighter bouquets, and an attractive note to lilac, rose, muguet and geranium bouquets.

"Viscarin." ¹²⁴ Trade name for a carrageenan extractive, a hydrocolloid which may be derived from a number of sea plants in the class of Rhodophyceae, order of Gigartinales, principally, Irish moss sea plants. Used in food, pharmaceutical and cosmetic industries as a viscosity producing agent, a stabilizer for emulsions, suspensions, foams; a binding agent, as in toothpaste, and for its emollient properties as in hand lotions.

"Viscasil." ²⁴⁵ Trademark for a series of polish-grade silicone fluids. These fluids are a group of dimethyl silicone fluids characterized by small change of viscosity with temperature change, a high order of thermal and oxidative stability, excellent water repellency, and a low order of physiological activity. They also have a high order of chemical inertness and offer excellent release properties between many kinds of surfaces. Available in viscosities

from 50 to 1,000 centistokes at 25°C (77°F). Low viscosities provide easier rubout whereas high viscosities yield superior gloss.

Uses: In wax and nonwax polishes for furniture and enameled metal surfaces. Are not compatible with waxes and act as lubricants, producing a polish which is more easily rubbed out and which gives a higher gloss.

viscose process. A process for making rayon by converting cellulose to the soluble xanthate, which can be spun into fibers and then reconverted to cellulose by treatment with acid. Wood pulp is steeped with 17-20% caustic soda; the resulting alkali cellulose is pressed to remove excess liquor and the soluble beta- and gamma-cellulose, and then shredded and aged. During this period, absorption of atmospheric oxygen degrades the cellulose polymer, producing shorter units and resulting in decreased viscosity at later stages of the process. When the material has aged sufficiently it is treated with carbon disulfide and sodium hydroxide to form an orange, viscous solution of cellulose xanthate. After filtration and deaeration, this solution (viscose) is forced through minute spinneret openings (or long slit dies in the case of cellophane film) into a bath containing sulfuric acid and various salts as sodium and zinc sulfate. The salts cause the viscose to gel immediately, forming a fiber of sufficient strength to permit it to be drawn through the bath under tension. At the same time the sulfuric acid decomposes the xanthate, converting the fibers to cellulose, in which form they are washed and dried.

High tenacity viscose rayon is made by modifications of the process which lead to greater crystallinity of the fiber and longer polymer units. These modifications include reduced aging of the alkali cellulose, additional carbon disulfide in the xanthate solution, a high concentration of salts in the spinning bath (which permits greater tension), and reduced acid concentration in the bath. The latter factor slows the regeneration process so that the fiber can be stretched 50-150% while in the bath and the molecules become highly oriented before they are completely converted to cellulose.

viscose rayon. Regenerated cellulose fibers made by the viscose process. Available in staple and filament forms.

Properties: Tensile strength (psi) 29,000-46,000 (regular), 46,000-58,000 (medium), and 58,000-88,000 (high tenacity); elongation 15-30%; sp. gr. 1.50-1.52; moisture regain 11-13% (70°F, 65% relative humidity); loses strength at 300°F; does not melt; burns readily. Similar to cotton in chemical resistance, dyeing, and resistance to insects and mildew.

Uses: All types of woven and knitted fabrics, alone or blended with cotton, wool, or other fibers. High tenacity rayon is used especially in tires.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

viscosity. The resistance to flow exhibited by a liquid resulting from the combined effects of cohesion and adhesion. The units of measurement are the poise and the stoke. A liquid has a viscosity of one poise if a force of one dyne per square centimeter causes two parallel liquid surfaces one square centimeter in area and one centimeter apart to move past one another at a rate of one centimeter per second. One poise equals 100 centipoises (cp). A viscosity in centipoises divided by liquid density gives viscosity in centistokes (cs). One hundred centistokes equal 1 stoke. Viscosity is most frequently measured by noting the time required for a definite quantity of liquid to flow through a standard capillary. The time is directly proportional to stokes or centistokes. Water is the universal standard for viscosity and has a viscosity of almost exactly one centistoke (1.0038) at 20°C. Gasoline hydrocarbons such as hexane are less viscous (around 0.4 cs). Molasses may have a viscosity of several hundred centistokes, while for a very heavy lubrication oil the viscosity may be one thousand centistokes. An asphalt, although not a true liquid, may have its viscosity expressed as several hundred thousand centistokes. There are a great many crude and empirical methods for measuring viscosity which generally involve measurement of the time of flow or movement of a ball, ring or other object in a specially shaped or sized apparatus.

"Viscotone." ²⁷¹ Trademark for a mineral by-product used for oil well drilling muds, tanning agents, ore dressing, and as a dispersant and emulsifier.

viscous flow (streamline flow; laminar flow). Flow of fluids usually at low velocities in which fluid elements flow in a straight line parallel to the axis of the conduit with little or no bulk mixing. Flow characterized by absence of turbidity.

"Viscrome." ²⁰⁶ Brand name for dyestuffs for wool-spun viscose unions.

"Visqueen." ⁸⁰ Trademark for an unsupported, polyethylene film

Uses: Packaging; moisture vapor barrier; waterproofing membrane, protective covering.

"Vistac." ²³⁰ Trademark for a series of synthetic hydrocarbon polymers, highly compatible with rubber, used in compounding rubber base adhesives and cements, and as softeners and modifiers for waxes and asphalts. Also used in paints and caulking compounds, and in latex and asphalt emulsions.

"Vistanex." ²⁹ Trademark for polyisobutylene, a completely saturated polymer unvulcanizable by itself, but frequently added to impart special properties of vulcanized compounds to other elastomers and natural rubber. Also used in unvulcanized compositions, alone and in combinations. Out-

standing properties include exceptional electrical properties, chemical inertness, high ozone resistance, low gas permeability, excellent aging and high degree of tackiness. Soluble in hydrocarbon solvents. Principal uses include cable insulation compounds, pressure sensitive tapes and adhesives, caulking and sealing compounds, additives to wax, asphalt, and polyethylene.

"Vistaril." ²⁹⁹ Trademark for hydroxyzine pamoate.

"Vitalium." ⁴⁰⁴ Trademark for a cobalt-chromium alloy used for cast full and partial dentures, and for surgical appliances, prostheses and instruments.

vitamins. Relatively complex organic compounds present in small and variable amounts in natural products, and essential in small amounts in the diet for life and growth. Earlier practice led to the use of letters of the alphabet in naming the vitamins; the recent trend is to use chemical names where possible. The vitamins listed in the following articles are those needed in human nutrition, others are being found essential for microorganisms and other forms of life. For individual vitamins see: para-aminobenzoic acid, ascorbic acid (vitamin C), biotin, choline, folic acid, inositol, nicotinamide, nicotinic acid, pantothenic acid, pyridoxine (vitamin B₆), riboflavin (vitamin B₂), thiamine (vitamin B₁), tocopherol (vitamin E), vitamin A, vitamin B₁₂, vitamin D, vitamin K, and vitamin P.

vitamin A Usually considered synonymous with vitamin A₁, but may also mean collectively vitamin A₁ and A₂. Both are alcohols, A₁ being C₂₀H₂₉OH or 3,7-dimethyl-9-(2,6,6-trimethyl-1-cyclohexen-1-yl)-2,4,6,8-nonatetraen-1-ol, (CH₃)₃C₆H₆CH:CHC(CH₃):CHCH:CHC(CH₃):CHCH₂OH. A₂ is C₂₀H₂₇OH, identical except for an additional double bond in the cyclohexyl ring

Vitamin A active substances function in night vision through their conversion to retinene and rhodopsin (visual pigment); they also function in the control of cell differentiation, in normal bone growth and in carbohydrate metabolism. Vitamin A active substances are: the provitamin A's, carotene and cryptoxanthin (q.v.); natural vitamins A₁ and A₂; and synthetic vitamin A. Vitamin A₁ is the most widely distributed of these in nature.

Properties: Vitamin A₁ (retinol, xerophthol). Yellow prisms; m.p. 62-64°C, optically active, soluble in fats and most organic solvents; insoluble in water, unstable in air (stabilized with antioxidants). Vitamin A₂ has not been crystallized.

Source: Vitamin A is found in animal tissues as the free alcohol or in the ester form. The provitamins carotene and cryptoxanthin are found in plant tissue. Food source: Green and yellow vegetables, apricots, yellow peaches, butter, cream, milk, cheddar, eggs, liver, fish liver oils. Commercial source: Concentrates of fish

liver oils and cereal grass; synthetic.
Derivation: Synthetic crystalline vitamin A₁ esters are synthesized from citral, acetone, formaldehyde, and acetylene in a patented process.

Units: One U.S.P. or IU unit is the specific biologic activity of 0.3 mcg vitamin A alcohol.

Containers: Bottles and drums.

Grade: U.S.P. XVI (as oleovitamin A).

Uses: Medicine; nutrition.

vitamin A acetate C₂₀H₂₉OOCCH₃. Synthetic vitamin A acetic acid ester.

Properties: Finely divided, dry, light yellow crystalline powder; nearly odorless and tasteless; insensitive to oxidation and humidity.

Containers: Bottles; drums.

Use: See vitamin A.

vitamin A aldehyde. See retinene.

vitamin A palmitate C₂₀H₂₉OOC(C₁₅H₃₁). Synthetic vitamin A palmitic acid ester.

Properties: Yellow liquid; nearly odorless and tasteless.

Containers: Under nitrogen in aluminum bottles.

Use: See vitamin A.

vitamin A, water-miscible. Water-miscible vitamin A is oleovitamin A (q.v.) rendered miscible by harmless dispersing agents.

Properties: A pale yellow to yellow liquid; viscous; neutral or slightly acid to litmus in its 1 to 10 solution; miscible with 10 volumes of water or alcohol.

Grades: U.S.P. XVI.

Uses: Medicine and nutrition.

vitamin B₁. See thiamine.

vitamin B₂. See riboflavine.

vitamin B₄. Abandoned name for choline.

vitamin B₆. See pyridoxine.

vitamin B₁₂ (cobalamin) C₆₃H₉₀N₁₄O₁₄PCo. The antipernicious anemia vitamin. All vitamin B₁₂ compounds contain the cobalt atom in its trivalent state. There are now thought

- to be three active forms: vitamin B_{12a} (cyanocobalamin), containing a cyano radical attached to the cobalt; B_{12b} (hydroxycobalamin), in which the cyano is replaced by hydroxyl; B_{12c} (nitrocobalamin), in which the replacement is the nitro radical. The exact metabolic mechanism has not been defined, although vitamin B₁₂ is known to have an influence on nucleic acid synthesis, fat metabolism; conversion of carbohydrate to fat, and metabolism of glycine, serine, methionine and choline.

Properties: Dark-red crystals (B_{12a}); nearly black crystals (B_{12b}), hygroscopic; soluble in water and alcohol; insoluble in acetone, chloroform, ether. Aqueous solutions deteriorate in the presence of acacia, aldehydes, ascorbic acid, ferrous gluconate, ferrous sulfate. Destroyed by alkalis and strong acids.

Source: Food source: Liver, eggs, milk, meats, and fish. Commercial source:

Produced by microbial action on various nutrients (spent antibiotic liquors, sugar beet molasses, whey, etc.).

Containers: Bottles.

Grades: U.S.P. XVI (cyanocobalamin).

Uses: Medicine; nutrition; animal feed supplements.

vitamin B complex. Term for a group of B vitamins, often found associated in foods. The group is not clear-cut, but has been thought to include: thiamine, riboflavine, nicotinic acid, pantothenic acid, biotin, pyridoxine, folic acid, vitamin B₁₂. See individual entries.

vitamin C. See ascorbic acid.

vitamin D. The anti-rachitic vitamin. It aids in the utilization of calcium and phosphorus, and is essential to the development and maintenance of strong bones and teeth. It prevents rickets in children and osteomalacia in adults. Four crystalline forms have been isolated: (1) vitamin D₂ (C₂₈H₄₄O), irradiated ergosterol (natural and synthetic), also called calciferol or vosterol; (2) vitamin D₃ (C₂₇H₄₄O), irradiated 7-dehydrocholesterol (natural and synthetic) (see the activated form); (3) vitamin D₄ (C₂₈H₄₆O), irradiated 22-dihydroergosterol (synthetic); (4) vitamin D₅ (C₂₉H₄₈O), irradiated 7-dihydrostosterol (synthetic). Vitamin D₂ and vitamin D₃ are the common forms.

Properties: The D vitamins are white, odorless crystals; soluble in fats and organic solvents; insoluble in water; stable to heat and aeration; have characteristic ring structure, but differ in side chain structure.

Vitamin D₂: Melting point 121°C (highly purified), 116°C (commercial); crystallizes from methanol in clusters of needles, from acetone in long prisms.

Vitamin D₃: M.p. 84-85°C (see 7-dehydrocholesterol, activated).

Vitamin D₄: M.p. 96-98°C; crystallized from acetone in long needles.

Sources: Food source: Milk, fish, eggs.

Commercial source: Fish liver oils and irradiation of provitamins.

Units: One U.S.P. or IU unit is the vitamin D activity of one milligram International Standard solution of irradiated ergosterol found equal to 0.025 micrograms of crystalline vitamin D₂.

Grade: U.S.P. XVI (calciferol).

Uses: Medicine and nutrition.

See also ergosterol.

vitamin D₃. See 7-dehydrocholesterol, activated.

vitamin E. See tocopherols.

vitamin H. See biotin.

vitamin K. Vitamin K active substances aid in the clotting of blood and the prevention of hemorrhage through maintaining the prothrombin content of blood. The four most important forms are: (1) vitamin K₁ or phytonadione (2-methyl-3-phytyl-1,4-naphthoquinone) C₃₁H₄₆O₂ (see phytonadione); (2) vitamin K₂ (2-methyl-3-difarnesyl-1,4-naphthoquinone) C₄₁H₅₆O₂; (3) vitamin K₃

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or menadione (q.v.); (4) phthiocol (q.v.).
Properties: K vitamins are fat soluble;
fairly stable to heat; unstable to alkali and light.

Vitamin K₂: Yellow, crystalline solid; m.p. 53-54°C.

Sources: Food source: Green leafy vegetables, tomatoes, vegetable oils. Commercial source: Preparations of dried cereal grasses; synthetic 3-alkyl and 3-alkenyl derivatives of 2-methyl-1,4-naphthoquinone.

Grade: U.S.P. XVI (phytonadione).

Units: A unit of vitamin K is the minimum amount which will render the blood clotting of a K-depleted chick normal within six hours. One unit is equivalent to one microgram of menadione.

Uses: Medicine; nutrition.

vitamin P. A term no longer accepted that has been used to designate a group of plant pigments and related compounds with similar biological activities. See bioflavonoids.

vitamin P complex. See bioflavonoids.

vitamin PP. See nicotinamide.

"VitaStain." ¹⁰⁹ Trademark for (2,3,5-triphenyltetrazolium chloride) C₁₅H₁₅N₄Cl. Properties: White to pale yellow crystalline powder; m.p. 245°C (decomposes).

Uses: Reagent for the determination of the germinability of seeds, for staining the cambium layer of living twigs, for staining yeasts, bacteria and a wide variety of other living tissue.

"Vitel." ²⁶⁵ Trademark for polyester resins used in making fiber and film. Fibers are useful in various textile fabrics, particularly for clothing.

"Viterra." ²⁹⁹ Trademark for a vitamin supplement preparation.

"Viterra Therapeutic." ²⁹⁹ Trademark for a high potency vitamin supplement preparation.

"Vitex." ³⁰⁹ Trademark for fat-soluble vitamin concentrates.

"Viton." ²⁸ Trademark for several fluoroelastomers.

Properties: White translucent solids; sp.gr. 1.81-1.86. "Viton" A is standard type, A-HV has high viscosity, B has superior heat and chemical resistance.

Containers: 50-lb drums.

Uses: For rubber products that must withstand unusually high temperatures up to 600°F in air, chemicals or moist liquids.

"Vitrafix." ²⁰⁶ Brand name for proprietary bonding assistant for glass fiber laminates.

"Vitrafos." ¹⁷² Trademark for a clear, glassy, granular sodium phosphate.

Properties: Phosphorus pentoxide, 63% min; sieve size, 10- to 80-mesh screen; pH (1% soln), 7.8; bulk density 79 lbs/cu ft.

Containers: Moisture-proof bags, 100 lbs net.

Uses: Builder in household and industrial cleaning compounds; deflocculating agent in oil well drilling muds; a sequestering agent in the textile industry.

vitrain. One of the types of physical structure found in coal (see also clarain, durain, and fusain). Vitrain has a bright, glassy appearance, a conchoidal fracture and is usually free from striations. It is associated with good coking qualities. See also anthraxylon.

"Vitra-Tint." ¹⁹⁴ Trade name used to cover an organic spray coat system of transparent and opaque color coatings for glass.

"Vitreosil." ²²⁰ Trademark for heat and acid-proof utensils fashioned from pure fused silica. Used in laboratory ware.

vitreous. Glass-like in luster, color, brittleness, or composition.

vitreous antimony. See antimony glass.

"Vitrex." ⁴¹ Trade name for an acid-proof silicate cement which sets by chemical action. Inert to acids, except hydrofluoric, at temperatures up to 1600°F.

"Vitric 10." ³²⁶ Trade name for a silicate base acid proof, chemical setting cement suitable for use with strong oxidizing acids such as nitric and chromic.

vitrification. The process of converting into glass or a glassy substance by heat and fusion.

vitriol, blue. See copper sulfate, also chalcantite.

vitriol, green. See ferrous sulfate.

vitriol, iron. See ferrous sulfate.

vitriol, lead. See lead sulfate.

vitriol, oil of. See sulfuric acid.

vitriol, white. See zinc sulfate.

vitriol, zinc. See zinc sulfate, also goslarite.

"Vitrobond." ⁴¹ Trade name for a silica-filled, sulfur-based compound for use as a hot-pour cement for jointing acid brick, used where temperatures do not exceed 200°F.

"Vitroplast." ⁴¹ Trade name for a silica-filled, synthetic-resin, acid-proof cement of the vinyl type which sets in contact with concrete, metal, etc. Good up to 275°F. Excellent resistance to oxidizing materials such as chlorine dioxide.

"Vivana." ²³³ Trademark for fibers, filaments and yarn of polymers and interpolymers of vinylidene chloride.

vivianite Fe₃(PO₄)₂·8H₂O. A natural hydrated ferrous phosphate. Colorless when unaltered but gradually changing to blue or bluish-green on exposure; colorless to bluish-white streak changing to indigo blue and liver brown; vitreous or pearly luster. Contains 43.0% FeO, 28.3% P₂O₅. Sp.gr. 2.58-2.69; hardness 1.5-2.

Occurrence: United States (New Jersey, Virginia, Colorado, Kentucky); Canada;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

England; Germany; Japan; Russia; Austria; Guatemala; Bolivia; Australia; Greenland.

"Viz-Thin." ⁴⁸ Trademark for a ferro-chrome lignin sulfonate, used as a thinner for gypsum base oil well drilling muds.

V.M.&P. naphtha. See naphtha, V.M.&P.

"Volan." ²⁸ Trademark for a Werner type chromium complex (methacrylate chromic chloride) in isopropanol.

Properties: Dark green liquid with an alcoholic odor; miscible with water; sp.gr. 1.026; b.p. 180.3°F.

Containers: 6½-gal carboys; 55-gal drums.

Uses: As a bonding agent applied to glass fibers, it is used in reinforced plastic laminates to improve the adhesion between glass and resin, especially under moist conditions; also to improve adhesive bond between other hydrophilic surfaces such as paper and wood and polymeric coatings or impregnants.

volatility. In general, the tendency of a solid or liquid material to pass into the vapor state at ordinary temperature. Specifically the vapor pressure of a component divided by its mole fraction in the liquid or solid.

volcanic ash (volcanic tuff). A material made up of either loose or solidified small fragments and dust of lava, commonly glassy in character, blown from a volcano and deposited either on land or under water. If numerous large fragments are embedded in the ash, the deposit is called volcanic agglomerate or volcanic breccia.

Occurrence: Colorado, Montana, Nevada, Oklahoma and South Dakota.

Uses: Abrasive, building stone and in the manufacture of fire-brick, hydraulic mortar and concrete.

volcanic glass. See obsidian.

volcanic tuff. See volcanic ash

Volhard's solution. A solution of potassium thiocyanate used in analytical chemistry.

"Voltex." ¹¹⁰ Brand name for medium color channel black for use in paints and plastics. Also classified as a conductive channel black - CC.

vomit nut. See nux vomica.

"Voranate." ²³³ Trademark for a series of urethane intermediates which are the reaction products of polyols and isocyanates. They are adducts or quasi-prepolymers to be used in combination with "Voranol" products to obtain rigid urethane foams.

"Vorane." ²³³ Trademark for a group of polyurethane chemicals, raw materials for polyurethane elastomers, coatings and foams.

"Voranol." ²³³ Trademark for a series of urethane intermediates which are polypropylene diols, polyether triols of alkylene oxides, or polyether glycols. Used as crosslinkers in conjunction with "Voranate"

adducts to obtain rigid urethane foams, or to make prepolymers for elastomer or flexible foams.

"Voraspan." ²³³ Trademark for urethane resins.

Vorce cell. A diaphragm-type electrolytic cell (see diaphragm cell) for the production of chlorine and caustic soda. The Vorce cell is the most widely used cylindrical cell in the U.S. It consists of a steel pot in which the hydrogen and caustic are collected. Within the pot is mounted a vertical cylindrical cathode of wire mesh, on the inside of which a diaphragm of asbestos paper is clamped. Carbon anodes are arranged in a ring within the cathode. In some designs, a second, smaller cylindrical cathode and diaphragm are placed at the center of the ring of anodes. Brine is fed to the anode chamber, where chlorine is released, and trickles through the diaphragm to the cathode, where caustic forms with the evolution of hydrogen. The Vorce cell produces about 7 lbs of chlorine per day per square foot of floor space.

"Vorlex." ⁴⁰¹ Trade name for a soil fumigant containing methylisothiocyanate and chlorinated C₃ hydrocarbons, including 1,3-dichloropropene.

Containers: 6 and 30 gallon drums.

Use: For injection or drench treatment of soil to control fungi, weeds, nematodes and soil insects.

Warning: Hazardous vapor and liquid. Irritating to eyes, nose, throat and skin. Do not inhale or swallow. Avoid skin contact.

"VPM." ²⁸ Trade name for a soil fumigant solution containing sodium methylthiocarbamate. Used for control of certain weeds, soilborne fungus disease, nematodes and garden centipedes in plant propagation beds, crop-land and in the preparation of new turf areas.

Containers: 1-gal bottles; 5-gal cans; 30-gal drums.

"Vuepak." ⁵⁸ Trademark for cellulose acetate. Properties: Crystal-clear rigid film available in sheets and rolls.

Uses: Protective film; "see through" pack.

"Vulca." ⁵³ Trademark for a series of ether derivatives of ungelatinized starch. They are graded according to their resistance to swelling in boiling water. "Vulca" 100 is completely non-swelling, resistant to agents that gelatinize starch, retains stability during autoclaving and pressure cooking, and may be steam sterilized without any appreciable change in its powdery appearance. Uses: Thickeners; cosmetics; dusting powders.

"Vulcabond." ²⁰⁶ Brand name for a proprietary line of adhesives based on rubber and for bonding to rubber, metals, cotton and textiles.

"Vulcel." ²⁰⁶ Brand name for proprietary blowing agent for cellular rubber.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Vulcaflex.**" ²⁰⁶ Brand name of line of proprietary anti-oxidant and anti-flex crack-peptizing products for use in rubber compounding.

"**Vulcafor.**" ²⁰⁶ Brand name of line of proprietary vulcanization accelerators for use in rubber.

"**Vulcamel.**" ²⁰⁶ Brand name for proprietary peptizing agents for natural and synthetic rubber.

"**Vulcan.**" ³⁰⁷ Trademark for a series of organic pigments used for the coloring of rubber. Characterized by their fastness to vulcanizing.

"**Vulcan.**" ²⁷⁵ Trade name for a series of oil furnace carbon blacks. Available as:

"Vulcan C." Conductive furnace black (CF).

"Vulcan SC." Super-conductive furnace black (SCF).

"Vulcan XC-72." Extra-conductive furnace black (ECF).

vulcanization. Process of combining rubber with sulfur or certain other additives under the influence of heat and pressure to eliminate tackiness when warm and brittleness when cool, and to otherwise improve the useful properties of rubber such as strength, elasticity and abrasion resistance.

vulcanization accelerators. See accelerator.

"**Vulcastab.**" ²⁰⁶ Brand name for a proprietary line of surface active agents for use as auxiliaries in natural and synthetic latex.

"**Vulcatard.**" ²⁰⁶ Brand name for proprietary retarders for natural and synthetic rubbers.

"**Vulcatex.**" ²⁰⁵ Plastic caulking compound having unusual adhesion and elasticity between extremely high and low temperatures.

"**Vulcoid.**" ²⁸¹ Trademark for a resin-impregnated vulcanized fiber. It is a light-weight electrical insulator of great mechanical adaptability which has arc and moisture resistance and can be drawn and formed. Approved by Underwriters' Laboratories as Class A Insulation.

Forms: Sheets; tubes, rods, fabricated parts.

Uses: Contact and instrument panels, knife switch guides; arc deflector spacer bushings; electrical insulation; motor and transformer lead bushings and terminal blocks.

"**Vulcosal.**" ²³³ Trademark for the industrial grade of salicylic acid, used as a stabilizer.

"**Vulklor.**" ²⁴⁸ Trade name for tetrachloro-para-benzoquinone.

Properties: Golden yellow powder; sp.gr. 1.97; m.p. 290°C; good storage stability; slightly soluble in acetone and benzene. Insoluble in water, gasoline, and ethylene dichloride.

Use: Rubber vulcanizing agent.

"**Vultac.**" ²⁰⁴ Trademark for alkylphenol disulfides used as vulcanizing agents as total or partial replacement for sulfur; processing aid for improving pigment dispersion;

resinous type softener; tack increaser for butadiene rubber.

"**Vycor.**" ²⁰ Trademark for heat and chemical resistant glassware of various compositions and physical properties, all characterized by extremely low coefficients of expansion, and accessories used therewith.

"**Vycor Brand Glass No. 7900.**" ²⁰ Trademark for a glass comprising approximately 96% silica made by a unique process in which an article fabricated by conventional methods is leached in hot chemical solutions to remove substantially all of the ingredients except silica. The silica residue, after being washed and dried, is fired at high temperatures, becoming a transparent, vitreous glass of simple chemical composition, exceptional chemical stability, high softening point and extremely low expansion coefficient.

Physical properties: Softening point approximately 1500°C. Linear coefficient of expansion per °C 0.0000008; sp.gr. 2.18; refractive index 1.458, loss in weight on heating and cooling, negligible; visible light transmission for 2 mm thickness, 92%; ultraviolet transmission at 254 millimicron line for 2 mm thickness, 2 to 4% (not controlled). (A similar glass, No. 7910, made under controlled conditions, will transmit over 60% radiation at 254 millimicrons in 2 mm section.) Temperature limit in service, 900°C.

Chemical durability: This glass is very stable and resists chemical attack as shown by the following:

Loss in weight, 100 lbs steam pressure, 96 hours, 0.0001 grams per sq cm.

Loss in weight, boiling 6 hours in 5% sodium hydroxide, 0.0015 grams per sq in.

Loss in weight, 5% hydrochloric acid for 72 hours at 80°C, negligible.

Durability at elevated temperatures:

No. 7900 glass is attacked at elevated temperatures by basic material, the rate of attack increasing as the temperature increases; therefore, this glass can not be recommended for alkaline fusions, or for ashing material which gives a basic ash, unless the condition of the glassware and its tare weight are unimportant after ashing. Some metals at high temperatures produce an attack on, or cause devitrification of No. 7900 glass. Accelerated tests at 1150°C for two hours in vacuum show that the following metals affect the glass: magnesium, aluminum, manganese, zinc, iron, thallium, cobalt, vanadium, and tungsten. These are listed in order of decreasing attack.

Strongly reducing gases tend to accelerate devitrification at high temperatures.

Uses: The manufacture of laboratory and industrial glassware, including beakers, crucibles, flasks, dishes, tubes, cylinders, containers, flat glass rods.

"**Vycron.**" ²⁸⁷ Trademark for a polyester fiber spun from "Vitel." "Vycron" is a tough durable fiber wet or dry; produced in 1.5, 3 and higher denier for apparel and other

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

uses. Also available as direct spun yarn and as tow.

"Vydax." ²⁸ Trademark for fluorocarbon telomers.

Properties: Chemically and thermally stable; insoluble; nonflammable.

Uses: Dry lubricants and release agents.

"Vygen Resins." ¹⁷⁹ Trademark for a complete series of polyvinyl chloride polymers.

"Vygen" PVC resins are thermoplastic and used in calendering, extrusion and molding applications. They are characterized by good heat and light stability, toughness, chemical resistance, flame resistance, and electrical insulation properties.

Uses: Film, sheeting, coated fabrics, luggage, wall covering, flooring, extruded goods, gaskets, wire insulation, toys, and automotive parts.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

W

W. Symbol for tungsten.

"W-545." ³⁰⁸ Trademark for an austenitic iron-base alloy containing nickel, chromium, and relatively small proportions of molybdenum, titanium, boron, silicon, and manganese. This alloy is precipitation-hardening and was developed primarily to meet the need for improved gas turbine discs, one of the most critical components of jet engines. It has exceptionally high creep strength combined with good ductility, resistance to notch sensitivity, and excellent oxidation resistance in the temperature range of 1000°F to 1350°F — the range in which gas turbine discs operate.

wad (bog manganese). Mixture of manganese oxides, often with oxides of other metals. Dark brown or black in color; often soft and loose, but sometimes hard and compact. Luster, dull. Contains 10-20% of water. Sp.gr. 3-4.26; hardness 0.5-6.

Occurrence: United States (large deposits in Montana, also found in sixteen other states), Canada (New Brunswick); Norway
Uses: Manufacture of chlorine, paint

wad clay. A low-grade fire-clay used in grouting the joints between saggars when they are set up in bungs in the kilns.

wahoo. See euonymus.

"Wallerstat." ¹⁷³ Trademark for an antistatic, antilint agent for the dry cleaner. It eliminates static and lint and permits the dry cleaner to run mixed loads. It works in the wheel with regular brand and amount of soap.

"Wallkyd." ³⁶ A group of alkyd resins used in the manufacture of interior flat paints where good soil-removal and odorless characteristics are desirable.

Physical properties: Non-volatile 34-41%; viscosity (Gardner-Holdt) Z-Z³, color (Gardner 1933) 4-8; acid number 2-5.

"Wallpol." ³⁶ Colloidal dispersions of solid polyvinyl acetate resin particles in water. Generally used for the manufacture of interior and exterior paints and primer sealers.

Physical properties: Non-volatile 54-56%; pH 3.5-6.8, color, white opaque.

walnut oil.

Properties: The cold-pressed oil is a colorless or pale yellowish-green liquid, pleasant odor; agreeable, nutty taste. The hot-pressed oil has a greenish tint and an acrid taste and odor. Sp.gr. (15°C) 0.925-0.927;

saponification value 188-196; iodine value 143-148; refractive index (15°) 1.4808. Soluble in alcohol, ether, chloroform, and carbon disulfide.

Derivation: By expressing the kernels of *Juglans regia*, Persian or (commonly) English walnut.

Method of purification: Filtration.

Grade: Technical.

Containers: Wooden barrels.

Uses: Cold-pressed oil: edible products.

Hot-pressed oil: paints, artists' colors, soap.

Shipping regulations: None.*

Warburg's yellow enzyme (old yellow enzyme; yellow oxidation enzyme). A yellow, oxidation enzyme found in yeast originally by Warburg and Christian. It is composed of a protein united to riboflavine through phosphoric acid. It acts as a dehydrogenase. The above workers have prepared the enzyme synthetically.

"Warcifix" Z. ⁴² Proprietary product.

Properties: White powder, disperses in water above 20°C.

Containers: 44-gal fiber container.

Use: Color fixative for application in textile and in leather dyeing operations as an aftertreatment to prevent dye bleed.

"Warco" GFI. ⁴² Proprietary product. High molecular weight amine compound.

Properties: Dark brown oily liquid; soluble in water above 20°C.

Containers: 55-gal open head steel drums.

Use: In textile dyeing of acetate fabrics as a "gas fading" inhibitor.

"Warcolene" D. ⁴² Proprietary product. A non-ionic product.

Properties: Creamy white emulsion; disperses readily in water at 25°C.

Containers: 55-gal steel drums.

Use: Textile lubricant specifically designed for difficult sewing problems.

"Warcolene" 362-M. ⁴² Proprietary product. A non-ionic surfactant.

Properties: White paste, disperses readily in water at 60°C.

Containers: 55-gal open head steel drums.

Use: Cotton textile softener with excellent wetting and rewetting properties.

"Warco" Silk Soaking Oils. ⁴² Proprietary products. Comprised of blends of sulfated vegetable oils and mineral oils, alkyl amine condensates, high molecular weight amines.

Properties: Dark amber liquids; dispersible

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in water at 30°C.

Containers: 55-gal steel drums.

Uses: Textile products for silk soaking, throwing and finishing.

"Warcosol." ⁴² Proprietary products.

Alkyl naphthalene sodium sulfonates.

Properties: Light yellow liquids and tan colored pastes. Disperse readily in water from 25 to 60°C.

Containers: 55-gal steel drums.

Uses: Wetting agents for wet textile processes in scouring and dyeing.

"Warcosol" 23-T. ⁴² Proprietary product. Sulfonated ester.

Properties: Colorless viscous liquid; soluble in water above 25°C.

Containers: 55-gal open head steel drums.

Use: Textile wet finishing agent. Extremely efficient as a rewetting agent for fabrics to be stored and then rewet. Used in dye-house and in sanforizing operations.

ware clay. A term sometimes used synonymously with ball clay.

warfarin (3-(alpha-acetonylbenzyl)-4-hydroxycoumarin) $C_{19}H_{16}O_4$.

Properties: Colorless, odorless, tasteless crystals; m.p. 161°C. Soluble in alcohol and ether; insoluble in water.

Derivation: Condensation of benzylideneacetone and 4-hydroxycoumarin.

Method of purification: Recrystallizing from alcohol.

Grades: Technical.

Containers: Drums.

Use: Rodenticide.

Warning! Poison. Keep away from humans, domestic animals and pets (U.S.D.A. pesticides regulations; similar MCA warning label.)

warfarin sodium $C_{19}H_{15}NaO_4$. 3-(alpha-Acetonylbenzyl)-4-hydroxycoumarin sodium.

Properties: Colorless, odorless, tasteless solid. Soluble in alcohol, acetone, and water; insoluble in chloroform, ether; pH of 1% solution 7.2-8.3.

Derivation: Neutralization of warfarin with aqueous sodium hydroxide.

• Grades: U.S.P. XVI, clinical.

Forms: Tablets; ampules.

Use: Medicine.

washed clays. Purified clays, with low silica and grit. They result from mixing raw clay with water and allowing sedimentation to cause separation of the impurities from the clay.

washed sulfur. See sulfur lotum.

washing blue. A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues.

washing soda. See sal soda.

wash oil. An absorption oil.

Wassermann test. A diagnostic test used for the detection of syphilis by subjecting the blood sample under investigation to action of a specially prepared hemolytic serum.

waste disposal. See Zimmermann process.

watch oil. See porpoise oil.

"Watchung." ²⁸ Trademark for a line of red and maroon pigments possessing excellent heat and grease resistance.

Uses: Principally in printing ink and plastics.

water (hydrogen oxide) H_2O .

Properties: Clear, colorless liquid which is practically tasteless and odorless. Is the standard of reference for many physical properties (centigrade temperature scale, density, calorie, etc.). Sp.gr. (4°C) 1.0000; m.p. 0°C (32°F); b.p. 100°C (212°F); vapor pressure (100°) 760 mm. Weight per gallon (15°) 8.337 lbs; wt. per cu ft 62.3 lbs. Water is the most common solvent.

Purification: Distillation; ion exchange systems (see zeolites).

For chemical use, water is usually classified as purified, soft or hard. Purified water of U.S.P. standards is either distilled or de-ionized and is neutral and free from contaminants according to a set of prescribed tests of ordinary precision. Hard water contains dissolved salts of calcium and magnesium. Degree of hardness is often expressed in terms of grains per gallon of calcium carbonate. (1 grain per gallon $CaCO_3$ is equivalent to 17.1 parts per million.) Water containing up to about 5 grains of hardness is considered soft; over 30 grains is very hard. For water of other than the common isotopic hydrogen or oxygen, see heavy water.

water-base paint. See water paint.

water demineralizers. See zeolites.

water elder. See viburnum opulus.

water gas (blue gas, blue water gas). A gas made by decomposing steam by passing it over a bed of incandescent coke, or coke and coal. In the operation of the water-gas generator, after the bed of incandescent coke is partly quenched by the "make" or "steam blow" it is revived by an "air blow." A water gas may also be made by high temperature reaction of steam with natural gas or similar hydrocarbons. Synthesis gas (see under Uses) may be made by either process, but its composition may vary considerably from the example below.

Typical composition:

Illuminants	0.0%
Carbon monoxide	40.9
Hydrogen	50.8
Methane	0.2
Carbon dioxide	3.4
Oxygen	0.9
Nitrogen	3.5
Btu per cubic foot,	299.0

Since this gas is low in heating value and burns with a nonluminous flame, it is enriched for ordinary city gas purposes with oil gas and is then known as carburetted water gas (q.v.).

Uses: Welding; heat treatment; melting of

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

metals; glass making; other industrial uses in which its high flame temperature (up to 3000°F) is of advantage. As synthesis gas, also used as source material in synthesis, as for ammonia, methanol and in the Oxo and Fischer-Tropsch processes for hydrocarbons, oxygenated organic compounds, and synthetic fuels.

water glass. See sodium silicate.

water of crystallization. Water chemically combined in many crystallized substances which may be removed at 100°C, usually with loss of crystalline properties.

water paint (water-base paint). A paint that is a water emulsion or water dispersion. Water paints formerly included whitewash, cement suspensions, and calcimine, and were limited in use. They are now almost entirely emulsion paints (q.v.), having latex, casein or synthetic resins as binders, and are used in large volume. Gel paints (q.v.) are a fast-developing type of water paint.

"Waterplug." ¹⁹⁵ Trade name for a quickset hydraulic cement used to stop water running or seeping through masonry walls.

waterproof cement. Hydraulic cement (Portland cement) that has been given a surface coating, or else made with the use of substances or a manufacturing process that results in greatly reduced moisture absorption and transmission. Common surface treatments are alternate treatments with soap and alum to produce insoluble aluminum soap in the pores. Water glass coatings function similarly, as do aluminum, magnesium, and zinc fluosilicates. Paints can be used only after a pre-treatment as, for example, with zinc sulfate to convert calcium hydroxide of the cement to materials that do not affect the paint film. Casein and formaldehyde are sometimes used to protect the paint from the calcium hydroxide. Paraffin and tar are frequently used to waterproof cement. In addition to surface coatings, cement is made more or less waterproof by properly incorporating hydrated lime or soap in the mixture.

waterproofing salts. See aluminum acetate. This is a specific synonym. There are many other salts which act as water-proofing agents.

water softeners. Substances, which, when added to water, lower its degree of hardness (see water). They include a variety of compounds such as sal soda, trisodium phosphate, sodium metaphosphate, sodium tetraphosphate, and the zeolites. All soften water by either removing calcium and magnesium ions from the water or by sequestering these ions into a form which does not exhibit their usual properties.

water-soluble gums. See gums.

water-soluble oils. (See also soluble oils.) Ammonia, potash, or sodium soaps of oleic, sulfo-fatty, rosin, or naphthenic

acids dissolved in mineral oils. Sometimes the rosin oils are blown beforehand (see blown oils) and sometimes ammoniacal liquor, naphtha or alcohol is added. The final products form permanent emulsions or almost clear solutions with water.

Uses: Boring; lathe-cutting; milling; polishing lubricants; dressing textile fibers; dust laying.

wattle bark (Australian bark, mimosa bark).

Derivation: From the Australian wattles, *Acacia pycnantha*, *Acacia mollissima* and *Acacia binervata*, and other native Australian and South African acacias. Bark contains 25-35% tannin.

Grades: Based on tannin content.

Use: Source of wattle bark extract, used in tanning industry.

wattle gum (Australian black wattle gum). A variety of arabic gum.

Properties: Dark reddish, hard, glossy tears or lumps, strong astringent taste, contains tannin and more galactan, less araban than ordinary arabic gum.

Uses: Adhesives; polishes; printing textiles; paper size; inks.

wavellite $Al_2(OH)_3(PO_4)_2 \cdot 5H_2O$. A natural hydrated basic aluminum phosphate.

Properties: Color white, yellow, green; luster vitreous, hardness 3.5-4, sp. gr. 2.33, usually occurs in radiating aggregates. Occurrence. Pennsylvania, Arkansas, Europe, Brazil.

Use: Has been used as a source of phosphorus

wax-berry. See myrica.

wax distillate. Lubricating oil distillate from petroleum, which is dewaxed, earth treated, and filtered to produce neutral lubricating oils and wax.

waxes. Unctuous, fusible, variably viscous to solid substances, having a characteristic waxy luster, which are insoluble in water but soluble in most organic solvents. They are extremely susceptible to changes in temperature and their origin, composition and color are variable. They are usually composed of high molecular weight substances, and may be grouped according to their origin as follows (a) Animal: spermaceti, beeswax, stearic acid, Chinese wax, etc. (b) Vegetable: carnauba, Japan, bayberry, candelilla, etc. The animal and vegetable waxes are mostly fatty acid esters of higher monohydroxy alcohols, as for example, ceryl cerotate (q.v.). (c) Mineral: ozocerite, montan, ceresin, paraffin, etc. (see also petroleum waxes). These mineral waxes are usually high molecular weight esters or hydrocarbons. (d) Synthetic (varied chemically), as the medium weight polyethylenes, polyethylene glycols and polyoxyethylene esters, chloronaphthalenes, sorbitols, chlorotrifluoroethylene resins. See also specific waxes mentioned above.

waxes, microcrystalline. Waxes derived from petroleum and characterized by the fineness of their crystals in distinction to the larger

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

crystals of paraffin wax. They consist of saturated aliphatic hydrocarbons such as $C_{46}H_{94}$.

Properties: White, amber or black solids; usually odorless, tasteless and chemically inert.

Typical specifications: Sp gr. (60°F) 0.92-0.94; m.p. 190-195°F; penetration (ASTM D5-25) 2/7; saponification no. (max) 2. These waxes are often emulsifiable, but are impermeable to water vapor. They have useful electrical, heat-sealing and adhesive properties, and are coming into increasing use in the processing and packaging industries.

Uses: Paper and packaging; wire insulation compounds, printing inks, protective coatings and polishes, ski wax; leather treatment; rust preventives, cosmetics; waterproofing; lubricant manufacture, phonograph records.

See also oxidized microcrystalline waxes.

"Waxine" Sizes. ⁵⁷ Trademark for acid-stable, aqueous emulsions of various petroleum waxes, combined with rosin. Rosin present entirely in free state (not saponified).

Use: Used widely in paper industry because they impart the desirable features of wax without excessive slipperiness in sheet.

See also "Alwax" sizes.

waxmyrtle. See myrica.

"Waxol." ²⁰⁶ Brand name for wax and tallow emulsions for finishing textiles.

"Waxoline." ²⁰⁶ Brand name of line of proprietary dyestuffs soluble in oils and waxes. "Waxoline" lacquers are dyestuffs for clear nitrocellulose lacquers.

wax tallings. A brown, sticky, semi-asphalt product obtained in the destructive distillation of petroleum tar just prior to the formation of the coke.

Uses: Wood preservative and in the manufacture of roofing paper.

websterite. See aluminite.

"Weedez." ¹⁴⁷ Trademark for weed killer based on 2,4-D, in the form of impregnated wax bar and stick.

Containers: 4-lb bars (12 in case), sticks (12 in case).

Uses: To control broadleaved weeds in turf.

weed-killers. *See herbicides.

weight. The force with which a body is drawn toward the earth by gravity.

weight, atomic. See atomic weight.

weighting agent. In soft drink technology, a weighting agent is an oil or oil-soluble compound of high specific gravity, such as a brominated olive oil, which is added to the citrus flavoring oils to raise the specific gravity of the mixed oils to about unity so that stable emulsions with water can be made for use in flavoring soft drinks.

"Weldal." ¹⁴² Trademark for chromate-

containing composition designed for preparing aluminum for resistance welding. It is supplied as a yellow powder that is dissolved in water.

welding. "A metal-joining process by which coalescence is produced by heating to suitable temperatures with or without the application of pressure, and with or without the use of filler metal." (American Welding Society.) Brazing means welding above 800°C with a non-ferrous filler metal; soldering implies use of a lower melting filler (solder) with the joint depending on adhesion rather than alloying.

Most industrial welding involves the fusion welding of two molten edges or surfaces. The three principal heat sources are electric arc (most frequent), electric resistance, and flame.

Electric arc welding often involves the use of consumable electrodes of the same composition as the work, but nonconsumable electrodes of tungsten or carbon are also used. Covered or cored electrodes are designed with the electrode metal surrounded by or inserted through a casing which feeds flux, inert gases, or other additives to the working area.

Resistance welding is used on sheet metal assemblies, such as automobile bodies. The coalescence of the parts occurs from the alternate application to the work of pressure and electric current, which heats the work by resistance. Spot, seam and flash welding are common techniques.

Gas welding produces a relatively low temperature, useful for brazing, welding thin material, and avoiding cracks (as with cast iron). The most common fuel is an equal-volume mixture of oxygen and acetylene.

Forge welding involves pressure applied after furnace-heating. Aluminum can be cold welded by pressure alone. Ultrasonic welding is a new technique needing no heat and only light pressure.

"Weldopax." ³³⁷ ("Rflux C"). Trade name for zirconium oxide used in weld rod coatings to increase slag viscosity.

"Weltone." ¹⁰⁸ Trademark for a powdered composition of sodium hexametaphosphate, alkaline salts, a disinfecting agent and a wetting agent.

Containers: 15-lb cans; 40- and 100-lb drums.

Uses: For cleaning and developing water wells. Removes clay, silt, drilling mud and other mineral deposits from water wells.

Werner complex. See coordination compound.

wernerite (scapolite)

$(Na, Ca)_4Al_3(Al, Si)_3Si_4O_{24}(Cl, CO_3, SO_4)$. A complex silicate mineral of variable formula. Marialite is a sodium-rich member of the series, and meionite is the calcium-rich member.

Properties: Color white, gray, greenish, bluish, reddish; luster vitreous, hardness 5-6; sp.gr. 2.65-2.74.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Occurrence: Massachusetts, New York, Canada, Madagascar.
Use: Gem stone.

"Wescodyne." ²⁸⁴ Trademark for a cleaner-disinfectant containing nonionic-iodine complexes. Claimed to be non-toxic, non-irritating, non-staining, when used as directed. Germicidally effective against bacteria, viruses, M. Tuberculosis, spores, etc.

Use: In hospitals.

"W.E.S. Oil." ¹⁷⁵ Brand name for a semi-refined coal tar distillate.

Properties: Straw to dark amber colored liquid; distills 10% to not below 165°C; 70% to not above 190°C and 95% to not above 235°C; sp. gr. (15.5/15.5°C) 0.930-0.950; approx. wt/gal 7.75 lb.

Use: A high-boiling, slow-drying solvent designed for use in wire enamels and metal coatings.

"Wes-X." ³⁰⁸ Trademark for proprietary addition agents and plating salts used in the deposition of bright and leveled deposits of tin, copper and nickel.

"Wetanol." ⁷³ Trademark. Modified sodium lauryl sulfate.

Properties: White, practically odorless powder, pH of 1% aqueous dispersion at 25°C, 5. Soluble in water, insoluble in alcohol, hydrocarbons, mineral oil, vegetable oils. Containers: 400-lb drums; 50-, 8-lb cont. Uses: Wetting, penetrating, scouring agent.

"Wet-Ege Spirits." ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run distillation.

Properties: Water-white; initial boiling point 320-328°F, 95% distills between 380 and 388°F; sp. gr. 0.784 (60°F); flash point (TCC) 118°F; mild, nonresidual odor, holds a wet edge longer than mineral spirits.

Uses: In brushing enamels, fly sprays, polishes, for cleaning garments, degreasing hides, washing metal before painting, and as a carrier for chemicals in application.

Wetherill process (American process). Method for making zinc oxide pigment directly from franklinite ore. The ore is roasted with anthracite coal and the zinc vapor oxidized with air.

"Wetsit." ⁷⁸ Trademark for a wetting agent of the alkyl aryl type which also contains aromatic properties for added solvent action on pectins, waxes, grease, etc. Used for various cleaning compounds; for scouring and dyeing textiles; for removal of emulsions from photographic film.

"Wetting Agent F-126." ¹⁵⁸ Trade name for a mixture of ammonium salts of completely fluorinated carboxylic acids, chiefly perfluorocaprylic acid.

Properties: Fine, white, free-flowing powder with a faintly musty odor; bulk density, 0.6-0.7 g/cc; surface tension (0.35% aqueous solution), 16 dynes; decomposes at 175°C (before melting); soluble in water,

acetone, diethyl ether, methanol, methyl ethyl ketone, formamide; insoluble in benzene, toluene, xylene, Stoddard solvent, heptane, carbon tetrachloride, perchloroethylene; stable toward extreme oxidizing conditions.

Uses: Specialized wetting agent for low surface tension or non-sudsing detergency.

wetting agents. Any compounds that cause water to penetrate more easily into, or to spread over the surface of, another material. Used particularly with respect to textiles, paper, and leather, and similar materials, but also used more generally. Soaps, detergents, and surface-active agents are used as wetting agents, their effectiveness being related to their capacity for reducing surface tension or interfacial tension. See surface-active agents and detergents.

WFNA. Abbreviation for white fuming nitric acid. See nitric acid, fuming.

whale oil (body oil; blubber oil).

Properties: Yellowish-brown, non-drying, fixed oil; strong fishy odor. Soluble in alcohol, ether, benzene, chloroform, and carbon disulfide.

Constants: Sp. gr. 0.925-0.930; saponification value 188-193; iodine value 120.

Derivation: By boiling the blubber of the Greenland or other whales, and skimming off the oil.

Method of purification: Filtration.

Grades: Crude No. 1, crude No. 2; natural winter, bleached winter.

Containers: 375-lb barrels; 8000-gal tank cars.

Uses: Leather tanning and dressing; lubrication; tempering steel; soap-making, illumination; fat manufacture (by hydrogenation); oleomargarine, plant insecticide; sheep dips, edible oils.

Shipping regulations: None.*

wheat germ oil. A fat-soluble oil extracted from the wheat germ. Useful as a source of vitamin E.

Containers: 5-gal drums.

whey (milk serum). The liquid remaining after the fat and casein have been removed from milk. It is essentially a 5% (approx) water solution of lactose.

whiskers. Minute hair-like crystals of certain metals which have been obtained under special conditions in a very pure state. Iron whiskers, for example, are said to have remarkable tensile strength.

whisky. A distilled alcoholic beverage.

Properties: Light yellow to amber liquid; sp. gr. 0.923-0.935 (15.56°C); 47-53% alcohol by volume.

Derivation: Distillation of fermented malted grains, as corn, rye, or barley. After distillation the whisky is aged in wooden containers four years or more to improve its flavor. The characteristics of various brands and grades are due to slight "impurities", and also to the principal grain

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

used in the mash, i.e., rye whisky comes from a mash in which rye predominates.

white acid. A mixture of ammonium bifluoride and hydrofluoric acid used for etching glass.

white antimony. See valentinite.

white arsenic. See arsenic trioxide.

white bole. See kaolin.

white carbon black. A form of silica produced in the gas phase and having extremely fine particle size, and rubber reinforcing properties similar to carbon black.

white cedar. See thuja.

white cinnamon. See canella.

white clay. See kaolin.

white copperas. See zinc sulfate.

white dye. An optical bleach (q.v.) or, in general, any substance, such as bluing, which may be added to a white article to increase its apparent whiteness.

white flag. See orris.

white iron pyrites. See marcasite.

"Whitekote." ¹³⁹ Trademark for a dolomitic, normal, hydrated lime having a neutralizing value reported as 166% in terms of calcium carbonate, used in neutralizing and soil stabilization and other processes requiring an air-floated lime high in magnesium.

white lead, basic silicate. A pigment made up of an adherent surface layer of basic lead silicate and basic lead sulfate cemented to silica.

Properties: Excellent film-forming properties with vegetable drying oils combined with low specific gravity.

Derivation: Fine silica is mixed with litharge and sulfuric acid. The mixture is then furnace in a rotary kiln and ground to break up agglomerates.

Use: As white lead pigment in exterior mixed pigment house paints.

white leads. Among the most used white pigments. Name primarily applied to lead carbonate, basic (q.v.), but also used for lead sulfate, basic (white lead sulfate) and lead silicate, basic (white lead silicate).

white lead, sublimed. See lead sulfate, basic.

white metal.

1. A group of alloys having relatively low melting points. They usually contain mainly tin, lead, or antimony as the chief component. Type metal, Babbitt, pewter, and Britannia metal are of this group.

2. The term white metal is also applied to copper matte containing about 75% copper, as obtained in copper smelting operations. See copper.

white mineral oil. See petrolatum, liquid.

white petrolatum. See petrolatum.

white pine bark. The inner bark of the white pine, *Pinus strobus* of eastern North America. Used in making cough syrups.

Grade: N.F. XI.

Containers: Bales.

white Portland cement. A very pure Portland cement free of iron compounds. See cement, Portland.

white powder. See gunpowder, white.

white precipitate. See mercury, ammoniated.

white precipitate, fusible. See mercury, ammoniated.

white Senaar gum. See arabic gum.

"White Star." ⁶⁷ Trademark for white arsenic.

"Whitetex." ⁴³² Trademark for a clay used as a filler in rubber products.

white vitriol. See zinc sulfate.

white wax. See beeswax, bleached.

white wood bark. See canella.

whiting (Paris white; gilder's whiting). Finely ground, naturally occurring calcium carbonate, CaCO_3 , about 98% pure, contaminated with silica, iron, aluminum, or magnesium. Not to be confused with chalk, prepared, or chalk, precipitated. See calcium carbonate for distinctions.

Properties: White amorphous powder; sp. gr. 2.7; insoluble in water, soluble in acids.

Derivation: Traditionally from chalk (q.v.), the crude product obtained from the chalk cliffs of England, France, and Belgium. A pure limestone or calcite is the principal commercial source of whiting. The crude chalk or limestone is ground dry or wet, air- or water-floated and sieved. Grades are based on particle size, softness and light reflectance. Dry ground, air-floated limestone whiting can be as fine as 99% through 300 mesh.

Grades: Various. Paris white is the finest grade; coarser grades are extra gilders whiting, gilders whiting and commercial, the last being quite coarse and of poor color. A putty grade is also sold. See also cliff-stone Paris white.

Uses: As an inexpensive filler and extender wherever safe from acids, as pigment extender, rubber filler; putty (mixture with linseed oil), ceramics, glass; soaps; detergents, linoleum; whitewash; paper; inks; wood filler.

wild black cherry bark. See *prunus virginiana*.

wild cherry. See *prunus virginiana*.

wild ginger. See *asarum*.

wild ginger oil. See *asarum canadense* oil.

wild saffron. See *colchicum*.

wild tobacco. See *lobelia*.

wild vanilla. See *liatris*.

wilkinite. See bentonite.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

willemite Zn_2SiO_4 . Natural zinc orthosilicate. Troostite is a manganese-bearing variety.

Properties: Color yellow, green, red, brown, white; luster vitreous to resinous; sometimes fluoresces in ultraviolet light; hardness 5.5; sp.gr. 3.3.

Occurrence: New Jersey; New Mexico; Africa; Greenland.

Use: Ore of zinc; a phosphor.

Williamson's blue. A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues.

Williamson synthesis. An organic method for preparing ethers by the interaction of an alkyl halide with a sodium alcoholate (or phenolate).

"WIN 3000." ¹⁶² Trade name for ammonium polystyrene sulfonate. Also known as Permutit Z. Used in decalcification of bone for cytologic study.

window glass. See glass.

wine. The fermented juice of grapes or other fruits or plants. It usually contains about 7-20% alcohol (by volume). The higher percentages are obtained by the addition of pure alcohol (called fortifying). Coloring matter, sugars, and small amounts of acetic acid, salts (see wine lees), higher fatty acids, etc. give wines their distinctive appearance and flavor.

wine ether. See ethyl pelargonate.

wine gallon. Same as ordinary U.S. gallon.

wine lees. A deposit or sediment which collects in the bottom of wine casks during the fermentation of wine. Wine lees vary greatly in quality, but usually contain from 20-35% potassium acid tartrate and up to 20% calcium tartrate. They also contain yeast cells, proteins, and other solid matter which was suspended in the grape juice.

Use: Similar to argols (q.v.).

Shipping regulations: None.*

winestones oil. See grape-seed oil.

"Wing-Stay." ²⁶⁵ Trademark for the first of a series in rubber chemicals used as a non-staining, nondiscoloring antioxidant.

Properties: Pale amber liquid; stable to heat; exhibits comparatively low volatility; will not hydrolyze; completely soluble in most organic solvents.

Uses: Protection against deterioration and discoloration in GR-S and natural rubber compounds, and in natural and synthetic rubber latices. Also suitable for a wide variety of light colored foam rubber products.

"Wingstop." ²⁶⁵ Trademark for a series of rubber chemicals used as polymerization terminating agents to stop polymerization reactions at a certain point.

"Wingstop B" - sodium dimethyldithiocarbamate.

"Wingstop K" - potassium dimethyldithiocarbamate.

Uses: As short-stopping agents in the preparation of synthetic rubbers, particularly for SBR latices and similar emulsion polymerization systems.

winter bloom. See hamamelis.

wintergreen. See gaultheria.

wintergreen oil (gaultheria oil). See also methyl salicylate.

Properties: Colorless, yellowish or reddish liquid; characteristic strongly aromatic odor quite distinct from that of betula oil; sweetish, warm and aromatic taste. Solubility in alcohol: in 6 to 8 vols of 70% alcohol.

Chief known constituents: Methyl salicylate; a paraffin; a ketone; an alcohol; an ester.

Constants: Sp.gr. 1.180-1.193 (15°C); optical rotation $-0^\circ 25'$ to -1° ; refractive index 1.535-1.536; saponification value 354-365 (96-99% methyl salicylate).

Derivation: Distilled from the leaves of Gaultheria procumbens.

Adulteration: Mineral oil; betula oil; artificial methyl salicylate.

Containers: Cans.

Uses: Flavoring compounds; medicine; perfumery, confectionery.

Shipping regulations: None.*

winterize. A process of refrigerating edible and lubricating oils to crystallize the saturated glycerides, which are then removed by filter pressing.

wire glass. Made by rolling into a softened sheet of heavy glass a netting of wire, then annealing in the usual way. Such glasses have the important advantage that they may crack (as in a fire) but will, nevertheless, remain suspended.

"Witall." ¹⁰⁴ Trademark for a line of driers manufactured from highly refined tall oil acids available in usual metallic salts including cobalt, lead and manganese. Equals naphthenate driers in action.

"Witcarb R." ¹⁰⁴ Trademark for a finely precipitated calcium carbonate having a particle size of 0.03-0.05 micron.

witch hazel. See hamamelis.

"Witcizer." ¹⁰⁴ Trademark for ester plasticizers used in the plastics, paint and lacquer industries.

"Witcoblak." ¹⁰⁴ Trademark for pigment blacks including both channel and furnace grade blacks. Suitable for use in news inks, paints, plastics, phonograph records, paper, pigmentation of paperboard, caulking compounds, etc.

"Witcolite." ¹⁰⁴ Trademark for a resinous hydrocarbon used as underground pipe insulation. Exhibits high thermal insulation and protects against corrosion and acids and alkalis found underground.

"Witcote." ¹⁰⁴ Trademark for industrial asphalt paint; a bituminous mastic compound, provides protection against rust

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and corrosion, unaffected by water or chemicals.

withdrawing agent. See entrainer.

witherite BaCO_3 . A natural barium carbonate usually found in veins with lead ores.

Properties: White, yellowish or grayish.

Vitreous, inclining to resinous luster.

Constants: Sp.gr. 4.27-4.35; hardness 3-3.75.

Occurrence: United States (Kentucky, Lake Superior region), England (most important source), Germany, Austria, Japan.

Uses: Chemicals (barium dioxide, barium hydroxide, blanc fixe); plate glass and porcelain; brick making (prevents efflorescence and discoloration by soluble sulfates); rat poison.

"Wittox." ¹⁰⁴ Trademark for copper and zinc naphthenate fungicides.

Wohlwill process. The official process of the U.S. mints for refining gold. It consists in subjecting gold anodes to electrolysis in a hot solution of hydrochloric acid containing gold chloride, the solution being continuously agitated with compressed air.

"Wolfco Solvent." ⁷⁸ Trademark for a detergent used for scouring cotton and rayon goods.

wolfram. See tungsten. Wolfram is the official international alternate name for tungsten. The latter is preferred in the U.S.

wolframic acid. See tungstic acid.

wolframic acid, anhydrous. See tungstic oxide.

wolframite $(\text{Fe}, \text{Mn})\text{WO}_4$. A natural tungstate of iron and manganese. Ferberite is the iron-rich member of the series, and huebnerite is the manganese-rich member. Usually found with granite and pegmatite.

Properties: Color black to brown; luster sub-metallic to resinous; streak black to brown; hardness 5-5.5, sp.gr. 7.0-7.5.

Occurrence: Colorado, South Dakota, Nevada, China, Burma, Australia, Bolivia, Europe.

Use: Chief ore of tungsten.

wolfram white. See barium tungstate.

wolfbane. See aconite.

wollastonite CaSiO_3 . A natural calcium silicate, found in metamorphic rocks.

Properties: Color white to brown, red, gray, yellow; luster vitreous to pearly; hardness 4.5-5; sp.gr. 2.8-2.9.

Occurrence: New York; California.

Grades: Fine, medium paint grades.

Uses: In ceramics; paint extender; welding rod coatings; rubber; alloying agent; in silica gels; as paper coating pigment; as reinforcing fiber in plastics, cements, and wallboard; mineral wool; soil conditioner.

"Wolman" Salts. ¹¹ Trademark for a patented wood preservative containing sodium fluoride, sodium chromate, sodium arsenate and dinitrophenol.

wood. Wood is composed principally of 40-60% cellulose and 20-40% lignin, together with gums, resins, a variable amount of water, and inorganic matter left as ash when the wood is burned. Its fuel value, varies widely around 3000-6000 Btu per lb according to variety, moisture, etc.

Uses: Pulp and paper; construction; containers, especially because of its cheapness and resistance to dilute acids; for destructive distillation (not so important as formerly), from which are obtained charcoal, acetic acid, methyl alcohol, turpentine, pine oil, etc.; for extraction, to give turpentine, rosin, pine oil, tars, etc.; source for carbohydrates, cattle food, ethyl alcohol; see also wood ashes, wood flour, wood pulp.

wood, agatized. See wood, petrified.

wood alcohol. Methanol (q.v.) (CH_3OH) from destructive distillation of wood. Also called natural methanol. When pure its properties are identical with those of synthetic methanol.

wood ashes.

Use: As a fertilizer for their potash content, which varies widely around 4% K_2O .

woodbine, wild. See gelsemium.

wood distillation gas. See wood gas.

wood ether. See dimethyl ether.

wood flour (wood meal). Pulverized dried wood from either soft or hardwood wastes but mostly from spruce, white pine, and poplar. Graded according to color and fineness.

Grades: Domestic standard, domestic fine, imported 40-60 mesh, 70-80 mesh, etc.

Uses: An absorbent for nitroglycerin in the manufacture of dynamite; filler for plastics, linoleums, paperboard; soaps; fur cleaning; polishing agents; Sorel cement.

wood gas (wood distillation gas). Gas produced during production of charcoal by heating wood in absence of air.

Typical composition:

	% by volume
Hydrogen	2.2
Methane	16.8
Hydrocarbons	1.2
Carbon monoxide	23.4
Carbon dioxide	37.9
Oxygen	2.4
Nitrogen	16.0
Btu's/cu ft, 290.	

Usually used as a fuel at the production site.

"Wood-Glu No. 2140." ¹⁷⁰ Trademark. Cold run, fast setting thermoplastic resin emulsion which requires no heating and can be safely used winter and summer. Used as a general woodworking glue. Available in liquid form, weighing approx 9 lbs/gal.

wood, indurated. A wood hardened by impregnation with a phenol-formaldehyde product. Used in storage batteries.

wood meal. See wood flour.

wood oil. See tung oil.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

wood, petrified (wood, silicified; wood, agatized). A natural material composed of opal or chalcedony (agate) and formed by the replacement of wood by silica. The replacement takes place in such a way that the original form and structure of the wood is preserved.

Occurrence: Arizona, California, Colorado, South Dakota, Utah, and Wyoming.

wood pulp (paper pulp). Produced for its cellulose content and used for the making of various kinds of paper, paperboard, rayon, and nitrocelluloses. The cellulose fibers from wood are used mainly in two forms: (1) as ground wood or mechanical pulp, which is merely finely divided wood without purification, and is made into newsprints, cheap manila papers, and nonpermanent tissues, (2) as chemical pulp, of which there are three kinds: (a) soda process pulp, obtained from the digestion of wood chips (mostly poplar) by caustic soda, (b) sulfite process pulp (mostly spruce and other coniferous woods) obtained by digestion with a solution of magnesium, ammonium or calcium disulfite containing free sulfur dioxide; and (c) sulfate process pulp, in which sodium sulfate is added to the caustic liquors but is reduced by the carbon present to the sulfide, which becomes a digesting agent. Sulfite and sulfate pulps (chiefly pine and other coniferous woods) make up the bulk of the paper pulps, and may be bleached or unbleached.

Bleaching is usually done with chlorine gas, chlorine dioxide, or alkaline hypochlorites. Sulfate pulps are known as kraft pulps because of their strength, and the unbleached varieties are used for wrapping papers and shipping containers. Bleached kraft pulp is used in print paper, but the bulk of such papers are made from mixtures of ground wood and bleached sulfite pulp. See also cellulose; lignin

wood rosin. See rosin.

wood, silicified. See wood, petrified.

Wood's metal. A very low melting cadmium-bismuth alloy chiefly used for sprinkler systems. See table under fusible alloys.

wood-sour. See barberry.

wood sugar. See D(+)-xylose.

wood-tar. See tar, wood.

wood vinegar. See pyroligneous acid.

wool. Stable fibers, usually 2-8 in. long, obtained from the fleece of sheep (and also alpaca, vicuna, and certain goats). Physically, wool differs from hair in fineness and by the presence of prominent cortical scales and a natural crimp. The latter properties are responsible for the felting properties of wool and the ability of the fibers to cling together and be spun into stable yarns. Chemically, wool consists essentially of protein chains (keratin) bound together by disulfide cross linkages.

Properties: Tensile strength 20,000-29,000

psi; elongation 25-50%; sp.gr. 1.32; moisture regain 16% (70°F, 65% relative humidity); decomposes about 260°F, scorches at 400°F. Resistant to most acids except hot sulfuric; destroyed by alkalis and chlorine bleach; resistant to mildew but attacked by insects.

Sources: Australia, Argentina, U.S., New Zealand, Uruguay, Russia, England.

Uses: Outerwear; blankets; carpets; upholstery; felt.

wool fat. See lanolin, anhydrous.

wool-fat, hydrous. See lanolin.

wool-fat pitch. See stearin and fatty acid pitches.

wool grease. See degrass.

wool pitch. See stearin and fatty acid pitches.

wool wastes. Wool from old woolen materials which have been cut up for re-making into cloth. Some of the wool is so cut up as to cause rejection as unfit for spinning. Used as a fertilizer. Wool waste usually contains from 4-7% ammonia. Pure wool shoddy may contain as much as 15% nitrogen and is particularly valued by hop growers.

Shipping regulations: None.*

worm-grass. See spigelia.

wormseed. See santonica.

wormseed oil, American. See chenopodium oil.

wormseed oil, Levant (chenopodium oil, Levant).

Properties: Yellow essential oil; penetrating, disagreeable odor. Soluble in 2-3 vols and more of 70% alcohol.

Chief known constituents: Cineol, pinene, terpenes.

Constants: Sp.gr. 0.915-0.940 (15°C); optical rotation -1° 50' to -7°, refractive index, 1.465-1.469 (20°C).

Derivation: By distillation of the unexpanded flower heads of *Artemisia maritima*, L. (var. *Stechmanni*).

Use: Medicine.

Shipping regulations: None*

wormwood. See absinthium.

wormwood oil (*artemisia absinthium* oil; absinthine oil).

Properties: The oil from the fresh herb has a dark green color, while that from the dry herb is yellowish-green or yellowish-brown; becomes dark brown with age; strong somewhat unpleasant odor characteristic of absinthe, bitter, scratching, lingering taste. Soluble in 1-2 vols of 80% alcohol (additional solvent may cause opalescence and turbidity); usually soluble in all proportions of 90% alcohol.

Chief known constituents: Thujone, thujyl alcohol, phellandrene, cadinene.

Constants: The condition of the herb at the time of distillation and the length of the distillation influence greatly the properties of the oil, consequently there is considerable variation in the properties of the different market samples. Sp.gr. 0.901-0.954;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

refractive index 1.460-1.470; acid value, American, up to 2.2, French, up to 6.7; ester value, American, 46-89, French, 11-108.

Derivation: Distilled from the leaves of *Artemisia absinthium*, L.

Adulteration: Turpentine.

Containers: Bottles; cans.

Uses: Medicine; flavors.

Shipping regulations: None.*

wort. A clear infusion of plant materials (such as grains) obtained as a preliminary to fermentation; term used especially in brewing.

"Worthite." ²⁶⁹ Trademark for an austenitic stainless steel, containing 3% silicon, 20% chromium, 24% nickel, 2.75% molybdenum, 1.75% copper. Corrosion resisting properties are excellent for most concentrations and temperatures of sulfuric, sulfurous, phosphoric, nitric, acetic, fatty, mixed and most other acids, and to hot caustic soda and other alkalis. It is widely used in the chemical pump field for many varieties of corrosive environments, such as the paper industry, the citrus fruit canners, sea water, sulfuric acid plants, etc. It is available as castings and wrought bars.

"WR 1339." ¹⁶² Trade name for "Triton A-20", an alkyl aryl polyether alcohol. No diluent is present in "WR 1339". A non-ionic surface active agent of low toxicity. Viscous amber colored liquid, soluble in oil and water; chemically stable in the presence of acids, bases and salts at sterilizing temperatures. Less satisfactory as a wetting agent than other "Tritons", but is a good emulsifying agent and interfacial tension depressant.

"Wrinkle" Finish. ⁴³⁵ Trademark for an organic protective coating, applicable to any surface, which inherently develops a textured surface during the drying phase.

wulfenite PbMoO_4 , sometimes with Ca, Cr, V. Yellow, orange or bright orange-red mineral of resinous luster. Found in veins with ores of lead.

Constants: Sp.gr. 6.7-7.0; hardness, 2.75-3.

Occurrence: United States (Massachusetts, New York, Pennsylvania, Nevada, Utah, New Mexico, Arizona); Hungary; Austria; Germany; Australia.

Uses: Ore of molybdenum.

Wulff process. A process for producing acetylene by treating a hydrocarbon gas such as butane with superheated steam in a regenerative type refractory furnace that operates at 2100-2500°F. Contact times are very short and various other by-products such as ethylene, hydrogen, and carbon dioxide are formed and various distillation and solvent extraction processes are used to purify the acetylene.

wurtzite. A natural zinc sulfide of the same composition as sphalerite, ZnS , but hexagonal in its crystallization. Found in United States (Missouri, Montana), Czechoslovakia, France, Cornwall.

"Wyamine." ²⁴ Trademark for mephentermine (N-methyl, phenyl-tert-butylamine).

"Wydase." ²⁴ Trademark for a highly purified testicular hyaluronidase.

"Wyex" (EPC). ²⁸⁵ Proprietary brand name for easy processing channel carbon black. Properties: Sp.gr. 1.77; free-flowing pellets; bulk density 25 lbs/cu ft; particle diameter 30 millimicrons; pH 4.1-4.5; ash 0.05% max; 99.9% thru 325 mesh screen; color (Nigrometer) 85-86.

Containers: 50-lb paper bags or bulk.

Uses: As a reinforcing ingredient for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, good tensile and tear strength; as a black coloring agent in rubber, paper, plastics, paint and ink.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"X-12." ²⁸ Trademark for a flame retardant based on ammonium sulfamate and modified to retain original fabric or paper properties, prevent afterglow, and insure penetration.

Properties: White, crystalline powder completely soluble in hot water; resistant to removal by dry cleaning solvents.

Containers: 50-lb fiber drums, 100-lb paper bags.

Use: One-step, renewable-type flame retardant treatment for cellulosic materials, including cotton, viscose rayon, and paper.

xanthates. See xanthic acids.

xanthene (diphenylenemethane oxide, tricyclic) $\text{CH}_2(\text{C}_6\text{H}_4)_2\text{O}$, the central structure of the fluorescein, eosin and rhodamine dyes.

Properties: Yellowish, crystalline leaflets.

Constants: M.p. 100.5°C , b.p. 315°C . Soluble in ether; slightly soluble in alcohol, very slightly soluble in water.

Derivation: By the condensation of phenol and ortho-cresol by means of aluminum chloride.

Grade: Technical.

Containers: Tins; glass bottles.

Use: Organic synthesis, fungicide.

Shipping regulations: None.*

xanthene-9-carboxylic acid $\text{O}(\text{C}_6\text{H}_4)_2\text{CHCOOH}$

Properties: White crystals, m.p. 220°C ; soluble in alkalis.

Use: Intermediate.

xanthene dyes. Dyes whose molecular structure is related to that of xanthene. The aromatic (C_6H_4) groups are the source of the color and thus constitute the chromophore group. The Colour Index number ranges from 739 to 784. The dyes are closely related structurally to diaryl methane dyes. Phenolphthalein (Colour Index 764), and eosin (Colour Index 768) are examples of this class.

xanthene ketone. See xanthone.

xanthenol. See xanthidrol.

xanthic acids (xanthogenic acids). Substituted dithiocarbonic acids of the type ROC(S)SH , in which R is ordinarily an alkyl radical. Unless otherwise designated, xanthic acid is understood to be the ethyl derivative $\text{C}_2\text{H}_5\text{OC(S)SH}$. This is a liquid melting at -53°C and undergoing decomposition at room temperature. Xanthic acid salts, in which a metal replaces the hydrogen, are called xanthates. The simpler salts, sodium, potassium ethyl, propyl, or butyl xanthates, are used as flotation collectors.

xanthine (dioxopurine) $\text{C}_5\text{H}_4\text{N}_4\text{O}_2$. A purine base found in the blood and urine and some plants. Theophylline and theobromine, the alkaloids found in tea and cocoa respectively, are both dimethyl xanthines.

Properties: Yellowish-white powder; sublimes with partial decomposition. Soluble in potassium hydroxide, insoluble in water and acid. $A_M = 9.3 \times 10^3$ at 277.5 millimicrons and pH 10.

Derivation: By the action of nitrous acid on guanine.

Grades: Technical, C.P., monohydrate; sodium salt. Radioactive forms available.

Containers: Tins, glass bottles.

Use: Organic synthesis, medicine

Shipping regulations: None *

xanthine oxidase. An enzyme found in animal tissues which acts upon hypoxanthine, xanthine, aldehydes, reduced coenzyme I, etc., producing, respectively xanthine, uric acid, acids, oxidized coenzyme I, etc.

Use: Biochemical research

xanthogenic acids. See xanthic acids.

xanthone (benzophenone oxide, dibenzopyrone, xanthene ketone) $\text{CO}(\text{C}_6\text{H}_4)_2\text{O}$. Occurs in some plant pigments

Properties: White needles or crystalline powder, m.p. $173-4^\circ\text{C}$, b.p. 350°C , sublimes. Insoluble in water, soluble in alcohol, chloroform, and benzene, especially when hot

Uses: Larvicide, intermediate for dyes, perfumes and pharmaceuticals.

xanthophyll $\text{C}_{40}\text{H}_{56}\text{O}_2$

Properties: Yellow pigment which accompanies chlorophyll in green leaves of plants

Chemically it is allied to the hydrocarbon carotene, $\text{C}_{40}\text{H}_{56}$. M.p. $190-3^\circ\text{C}$; insoluble in water, slightly soluble in alcohol and ether

Occurrence. It is especially found in autumn leaves and is believed to be the residue obtained by the fading of chlorophyll.

See also lutein.

xanthophyll oil. Obtained from corn gluten; used in poultry feeds.

xanthopterin $\text{C}_6\text{H}_5\text{N}_5\text{O}_2 \cdot \text{H}_2\text{O}$. 2-Amino-4,6-dihydroxypteridine. Pigment found in the wings of butterflies. Can be converted by yeast into folic acid.

Properties: Orange-yellow crystals; sinters around 360°C , decomposes above 410°C . Practically insoluble in water; freely soluble in dilute ammonium or sodium hydroxide giving yellow solutions, and in 2N

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

hydrochloric acid giving colorless solutions.

Use: Biochemical research.

xanthorrhoea resin. See accroides gum.

xanthuremic acid (4,8-dihydroxyquinaleic acid) $C_{10}H_7NO_4$. A factor in vitamin B deficiency studies.

Properties: Sulfur-yellow crystals, m.p. $286^\circ C$. Insoluble in water, soluble in alkaline hydroxides or hot dilute hydrochloric acid.

Derivation: Excreted by pyridoxine-deficient animals after ingestion of tryptophan.

Use: Medicine.

xanthidrol (xanthanol) $HCOH(C_6H_4)_2O$. A derivative of xanthene.

Properties: White powder, m.p. $123^\circ C$. Insoluble in water; soluble in alcohol.

Derivation: Reduction of xanthone with alcohol and sodium.

Method of purification: Recrystallization.

Grades: C.P. (analytical).

Containers: Glass bottles.

Use: Determination of urea, and of DDT.

Xe. Symbol for xenon

xenol. See phenylphenol.

xenon. Xe. Element of atomic number 54 of the zero group in the periodic table.

Properties: Colorless wholly inert gas—does not combine chemically with any element. Liquefies at $-106.9^\circ C$; density 5.89 g/l.

Derivation: By fractional distillation of liquid air.

Grades: Highest purity

Containers: Hermetically sealed glass flasks; cylinders

Use: Filling electrical luminescent tubes; radio and television tubes.

Shipping regulations: Nonflammable gas. Green label.*

xenotime YPO_4 . A natural phosphate of yttrium. Rare earth metals, thorium, and uranium, also may be present.

Properties: Color, yellowish brown, reddish brown, streak pale brown, luster, vitreous, hardness 4-5; sp.gr. 4.4-5.1

Occurrence: North Carolina, Georgia, Alabama, New York, Colorado; Europe, Africa

xenyl. The biphenyl radical, $C_6H_5C_6H_4\cdot$

xerography. A "dry" method of photography or photocopying employing a smooth metallic plate covered with a layer of photoconductive powder, such as selenium or anthracene. The surface of this specially coated plate is given an electric charge by passage under a series of charged wires. An image of the material to be photographed is projected onto the charged plate through a camera lens and the electric charges disappear in the areas exposed to light but elsewhere the surface retains its charge. A powder consisting of a coarse carrier and a fine developing resin is then spread over the surface of the plate. Adhesion

between powder and plate occurs only where the plate retained its charge. Elsewhere developing resin and carrier are not retained on the plate, which thus has become a negative of the original image. A positive is obtained by placing a piece of paper against the plate, and applying an electric charge as in the first stages of the process. This causes adhesion of developing resin and its carrier to the paper. This positive print is fixed by heating in a press for a few seconds to melt the developing resin and fuse it to the paper. Colored prints are possible by use of suitable developing resins. Various materials other than paper can be printed. Applications are in copying letters, drawings, and charts, in lithography, photoengraving, and printing and in transferring designs to other materials.

"Xerols." ¹⁹ Brand name for a series of self-emulsifying waxes.

xi particle. See fundamental particle.

"X-OX." ²⁴¹ Brand name for a red powder consisting primarily of rare earth oxides used in pitch polishing or precision optical elements.

"X-3 Oxygen Corrosion Inhibitor." ¹⁰⁸ Specially formulated metaphosphate-type corrosion inhibitor. This granular product contains inorganic film formers and accelerators. Containers: 100-lb drums.

Uses: In oilfield secondary waterflood operations to protect distribution lines, pumps, storage tanks, etc., from oxygen corrosion.

"X-2 Oxygen Inhibitor." ¹⁰⁸ Highly polar, film-forming corrosion inhibitors in liquid form. Easily dispersible in fresh waters or concentrated brines.

Containers: Lined cans, 40 lbs. Lined drums, 425 lbs.

Uses: Control carbon dioxide and hydrogen sulfide corrosion in water flood systems.

x-rays (roentgen rays). Invisible radiation of the same nature as light radiation, but of extremely short wave length (0.06-120A). Will be emitted as the result of electron transitions in the inner orbits of heavy atoms which are being bombarded in a vacuum tube by cathode rays (electrons). The most notable properties of these waves are:

1. Penetration through various thicknesses of all solids.
2. Action on photographic plates, fluorescent screens.
3. Ionization of a gas through which they pass.

The applications are many. Used widely in analysis of crystalline structure, in treatment of cancer, surgery (location of fractures, foreign bodies), in metallurgy, determination of molecular structure, etc.

xylene (dimethylbenzene) $C_6H_4(CH_3)_2$. A commercial mixture of the three isomers, ortho-, meta-, and para-xylene (q.v.). The last two isomers predominate.

Properties: Clear liquid, toxic and flammable; soluble in alcohol and ether; insoluble in

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water. Sp.gr. approximately 0.86; see under Grades for boiling range.

Derivation: Fractional distillation from petroleum (90%), coal tar or coal gas.

Grades: Nitration (b.p. range 137.2-140.5°C); 3° (b.p. range 138-141°C); 5° (b.p. range 137-142°C, high in meta isomer); 10° (b.p. range 135-145°C); industrial (b.p. 90% below 150°C, complete below 160°C). Also other grades depending upon use. In some cases one or another of the individual isomers are partially removed for use in chemical production.

Containers: Glass bottles, 5-, 55-, 110-gal drums; tank cars, tank trucks.

Uses: Aviation gasoline (largest use); protective coatings; solvent for alkyl resins, lacquers, enamels, rubber cements; synthesis of various organic chemicals (see individual isomers).

Warning! Flammable. Use with adequate ventilation. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

meta-xylene (1,3-dimethylbenzene) 1,3-C₆H₄(CH₃)₂.

Properties: Clear, colorless liquid, toxic and flammable, soluble in alcohol and ether; insoluble in water. Sp.gr. (15°C) 0.8684; m.p. -47.4°C; b.p. 138.8°C; refractive index (20°C) 1.4973.

Derivation: Selective crystallization or solvent extraction of meta-para mixtures.

Grade: 95%.

Uses: Solvent; intermediate for dyes and organic syntheses, especially isophthalic acid; insecticides.

Caution: Keep away from heat and open flame, use with adequate ventilation.

Shipping regulations: Flammable liquid. Red label.*

ortho-xylene (1,2-dimethylbenzene)

1,2-C₆H₄(CH₃)₂.

Properties: Clear, colorless liquid; toxic, flammable; soluble in alcohol and ether; insoluble in water. Sp.gr. (20/4°C) 0.8968, m.p. -25°C; b.p. 144°C; refractive index (20°C) 1.505; wt/gal 7.36 lb.

*Grade: 99%, free of hydrogen sulfide and sulfur dioxide.

Uses: Manufacture of phthalic anhydride, vitamin and pharmaceutical syntheses; dyes; insecticides.

Warning: Flammable. Keep away from heat and open flame. Use with adequate ventilation. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

para-xylene (1,4-dimethylbenzene)

1,4-C₆H₄(CH₃)₂.

Properties: Colorless liquid; crystals at low temperature; toxic and flammable, soluble in alcohol and ether; insoluble in water. Sp.gr. (20°C) 0.8611; m.p. 13.2°C; b.p. 138.5°C; refractive index (21°C) 1.5004.

Derivation: Selective crystallization or solvent extraction of meta-para mixtures.

Uses: Synthesis of terephthalic acid for production of synthetic resins and fibers (for

example "Dacron," "Mylar," "Terylene"); vitamin and pharmaceutical synthesis; insecticides.

Caution: Keep away from heat and open flame; use with adequate ventilation.

Shipping regulations: Flammable liquid. Red label.*

para-xylene-alpha, alpha'-diol C₆H₄(CH₂OH)₂.

Properties: White crystalline solid. M.p. 118°C; b.p. 138-144°C (0.8-1.0 mm).

Slightly soluble in water (25°C).

Purity: Approximately 98%.

Uses: Crosslinker for polyurethanes; in esters, polyethers, polyesters, polycarbonates.

xylene substitute. A petroleum product having the following characteristics:

Constants: Sp.gr. 0.760; distillation range 130-170°C; refractive index 1.41 at 20°C; flash point 45°F.

Uses: Solvent and diluent.

Shipping regulations: Flammable liquid. Red label may be required.*

xenolol (dimethylphenol, hydroxydimethyl benzene; dimethylhydroxybenzene)

(CH₃)₂C₆H₃OH. Found in the cresylic acid or tar acid fraction from coal tar. There are six isomers. See commonly used isomers following.

Properties: White, crystalline solids; sp.gr. (15°C) 1.02-1.03; m.p. varies, 20-76°C; b.p. 203-225°C. Only slightly soluble in water, soluble in most organic solvents and in caustic soda solution. Approximate wt/gal: 8.52 lb.

Derivation: By fusing the xylenesulfonic acids with potassium hydroxide.

Method of purification: Crystallization.

Grades: Technical.

Containers: Fiber drums.

Uses: Disinfectants; solvents, pharmaceuticals, insecticides and fungicides; plasticizers; rubber chemicals; additives to lubricants and gasolines, plastics; wetting agents; dyestuffs.

Shipping regulations: None.*

2,4-xenolol (1-hydroxy-2,4-dimethylbenzene; 1,3-dimethyl-4-hydroxybenzene; 1,3,4-xenolol) 1,2,4(OH)(CH₃)₂C₆H₃.

Properties: Colorless needles; sp.gr. 1.036 (20°C), m.p. 26°C; b.p. 211.5°C; very slightly soluble in water, soluble in alcohol and ether.

2,5-xenolol (1-hydroxy-2,5-dimethylbenzene; 1,4-dimethyl-2-hydroxybenzene; 1,4,2-xenolol; 2,5-dimethylphenol).

Properties: Colorless liquid; sp.gr. 1.169 (15°C); m.p. 74.5°C; b.p. 211.5°C. Soluble in water and alcohol; very soluble in ether.

Grades: Up to 90%; other isomers are the chief impurity.

Containers: Drums; tank cars.

2,6-xenolol (1-hydroxy, 2,6-dimethylbenzene; 1,3,2-xenolol; 1,3-dimethyl-2-hydroxybenzene).

Properties: Colored solid; m.p. 45°C; b.p.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- 201°C; soluble in hot water and alcohol.
Grade: 95% pure.
- 3,4-xenol** (1-hydroxy-3,4-dimethyl benzene; 1,2-dimethyl-4-hydroxybenzene; 1,2,4-xenol; 3,4-dimethyl phenol) $1,3,4(\text{OH})(\text{CH}_3)_2\text{C}_6\text{H}_3$.
Properties: Solid; sp. gr. 1.023 (17°C); m.p. 65°C; b.p. 225°C; soluble in water, alcohol, and ether.
Grades: 95%, 62.5%, 56%, 51%, 46%; other xenols are the chief impurity.
Containers: Drums; tank cars.
- 3,5-xenol** (1-hydroxy-3,5-dimethyl benzene; 1,3-dimethyl-5-hydroxybenzene; 1,3,5-xenol; meta-xenol; 3,5-dimethyl phenol) $1,3,5(\text{OH})(\text{CH}_3)_2\text{C}_6\text{H}_3$.
Properties: Solid; m.p. 68°C; b.p. 219.5°C; sp. gr. 1.01 (approx.); slightly soluble in water, soluble in alcohol and NaOH.
Grades: 95%, 90%, 60.5%, 55.5%, 50%, 46%, 41%; other xenols are the chief impurity.
Containers: Drums; tank cars.
- 1,2,4-xenol.** See 3,4-xenol.
- 1,3,2-xenol.** See 2,6-xenol.
- 1,3,4-xenol.** See 2,4-xenol.
- 1,3,5-xenol.** See 3,5-xenol.
- 1,4,2-xenol.** See 2,5-xenol.
- meta-xenol.** See 3,5-xenol.
- "Xylex 780."** ²⁷⁷ Trademark for a chemical peptizing agent for rubber.
Containers: 1-, 5-, and 55-gal metal drums; tank cars.
Uses: Peptizing agent or softener to facilitate processing of natural and synthetic rubbers, devulcanizing agent for reclaiming natural and/or synthetic rubbers.
Shipping regulations: None.*
- xylidine** (aminodimethylbenzene; aminoxylene, dimethylaniline) $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{NH}_2$. A varying mixture of the six isomers. See commonly used isomers following
- Properties: Liquid, sp. gr. 0.97-0.99, b.p. 213-226°C; insoluble in water; soluble in alcohol and ether.
- Derivation: Nitration of xylene and subsequent reduction.
Grade: Technical.
Containers: 425- and 800-lb drums; tank cars.
Uses: Dyestuff intermediates; organic syntheses; pharmaceuticals.
Danger: Hazardous liquid and vapor rapidly absorbed through skin. MCA warning label.
- 2,3-xylidine** (ortho-xylidine; 1-amino-2,3-dimethylbenzene) $1,2,3(\text{NH}_2)(\text{CH}_3)_2\text{C}_6\text{H}_3$.
Properties: Liquid; sp. gr. (15°C) 0.991; m.p. less than -15°C; b.p. 224°C; slightly soluble in water; soluble in alcohol and ether.
- 2,4-xylidine** (meta-xylidine; 1-amino-2,4-dimethylbenzene) $1,2,4(\text{NH}_2)(\text{CH}_3)_2\text{C}_6\text{H}_3$.
Properties: Liquid; sp. gr. (20°C) 0.974; b.p.
- 216°C; slightly soluble in water, soluble in alcohol, ether, and benzene.
- 2,5-xylidine** (para-xylidine; 1-amino-2,5-dimethylbenzene) $1,2,5(\text{NH}_2)(\text{CH}_3)_2\text{C}_6\text{H}_3$.
Properties: Liquid; sp. gr. (15°C) 0.980; m.p. 15.5°C; b.p. 217°C; slightly soluble in water and alcohol, soluble in ether.
- 2,6-xylidine** (2,6-dimethylaniline; 1-amino-2,6-dimethylbenzene) $(\text{CH}_3)_2\text{C}_6\text{H}_3\text{NH}_2$.
Properties: Colorless liquid; b.p. 216.9°C. Insoluble in water; slightly soluble in alcohol and ether.
Purity: 98.0% min.
Containers: Drums.
Use: Organic intermediate.
- meta-xylidine.** See 2,4-xylidine.
- ortho-xylidine.** See 2,3-xylidine.
- para-xylidine.** See 2,5-xylidine.
- xylitol** (pentanepentol) $\text{CH}_2\text{OH}(\text{CHOH})_3\text{CH}_2\text{OH}$.
Properties: White, odorless, crystals. Sp. gr. (55% aq. sol.) 1.2; m.p. 95°C. Soluble in water.
Purity: 99%.
Uses: Softener, humidifier, sweetener, organic synthesis; pharmaceuticals, cosmetics, plastics, synthetic resins, paper, food-stuffs.
- xylometazoline hydrochloride**
 $\text{C}_4\text{H}_9\text{C}_6\text{H}_2(\text{CH}_3)_2\text{CH}_2\text{C}_3\text{H}_5\text{N}_2 \cdot \text{HCl}$. 2(4-tert-Butyl-2,6-dimethylbenzyl)-2-imidazoline hydrochloride.
Properties: Crystals; m.p. 320°C (decompose). Somewhat soluble in water; soluble in alcohol.
Use: Medicine.
- D(+)-xylose** (wood sugar) $\text{C}_5\text{H}_{10}\text{O}_5$. (Not to be confused with phenylsazone of the same name.)
Properties: White crystalline dextrorotatory powder, sweet taste; sp. gr. (20°C) 1.525; m.p. 144°C (also given as 153°C); soluble in water and alcohol.
Derivation: Hydrolysis with hot dilute acids of wood, straw, corn cobs, etc.
Grades: Reagent, technical.
Uses: Dyeing, tanning; diabetic food.
- xylol bromides** (alpha-bromoxylenes)
 $\text{CH}_3\text{C}_6\text{H}_4\text{CH}_2\text{Br}$. Mixed ortho-, meta-, and para-isomers.
Properties: Colorless liquid; pleasant aromatic odor. Decomposed slowly by water.
Caution! Very irritant!
Constants: Sp. gr. 1.4; b.p. 210-220°C.
Derivation: Bromination of xylene.
Grade: Technical.
Containers: Lead-lined containers.
Uses: Organic synthesis; military poison gas.
Shipping regulations: Poison, class C.
Tear gas label. 75-lb max lot.*
- "Xyno Finish 9909."** ³²⁸ A brand-named cationic-nonionic liquid employed as a softening agent that produces a minimum yellowing of white fabrics.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Xynofix FL." ³²⁸ A brand-named dye-fixative of most direct colors on textile fabrics with no effect on the hand or color shade of dyed fabrics. It is a water-white viscous liquid practically odorless.

"Xynomine Paste." ³²⁸ Trademark for a product used as a detergent, wetting agent, dyeing assistant, emulsifier, bleaching assistant for peroxide, and scouring agent for wool yarn.

"Xyno Resin." ³²⁸ Proprietary name for a line of synthetic resins in emulsion and solution forms.

Grades: Vinyl and acrylic type emulsion polymers and copolymers include:

"Xyno Resin" 362, X-99, AA-40, S-69, and AN-25.

Properties: Stable water emulsions of thermoplastic, filmforming polymers of various particle size and charge, that eliminate the use of expensive and flammable solvents. They combine high solid contents with low viscosities and may be compounded into a wide variety of binders,

adhesives, sizing and coating compositions. Uses: Textile sizes and finishes, including stiffening, bodying, dulling, slipproofing and other finishing applications; nylon hosiery finishing; paper coating for greaseproofing and heat sealing; binders and adhesive formulations; cosmetics.

"Xyno Resin" LVH. ³²⁸ Trade name for cationic vinyl acetate, 50% liquid.

Uses: Specialty paper coatings additive.

"Xyno Resin R." ³²⁸ Proprietary product consisting of modified water-soluble alkyd resin solution.

"Xynotaf HV; V; and LV." ³²⁸ Solutions of a thermoplastic, vinyl type polymer available in three different viscosities, and providing different degrees of stiffness.

Uses: Textile finishes to impart special stiffening and bodying effects and effective back-filling finish for a wide variety of fabrics.

Y

Y. Symbol for yttrium.

yara-yara. See beta-naphthyl methyl ether.

"Yarmor." ²⁶⁶ Trademark for several grades of pine oil supplied to meet varying needs. They consist largely of terpeneols with minor amounts of borneol, fenchyl alcohol, terpene ketones, and other terpene materials.

Grades and properties:

"Yarmor 302." High gravity pine oil; primarily a blend of tertiary and secondary terpene alcohols; colorless to pale yellow liquid; sp.gr. 0.9436 at 15.6/15.6°C; distillation range, 213-219°C.

"Yarmor 302W." Medium-gravity pine oil; a blend of terpenes and terpene alcohols; colorless to pale yellow liquid; sp.gr. 0.9246 at 15.6/15.6°C; distillation range 199-220°C.

"Yarmor 350." Low-gravity pine oil; colorless to pale yellow liquid; sp.gr. 0.9037 at 15.6/15.6°C; distillation range 187-222°C.

"Yarmor F." Flotation grade pine oil; primarily a blend of terpene alcohols and other oxygen-containing terpenes; amber colored liquid; distillation range 200-234°C.

Uses: Making disinfectants, insecticides, and essential oils; frothing agent in the flotation of ores; wetting and penetrating agent in the wet processing of textile fibers, liquid soaps, laundry detergents, metal cleaning compounds, water paints and paint emulsions, paint and varnish solvents, and other applications.

yarow. See achillea.

yaw root. See stillingia.

Yb. Symbol for ytterbium.

yeast (barm). Living unicellular organisms known as saccharomycetaceae. The following description applies to the cultured commercial product, and not to various wild varieties.

Properties: Yellowish-white viscid liquid or soft mass, flakes, or granules, consisting of cells and spores of *Saccharomyces cerevisiae*.

Derivation: A ferment obtained in brewing. Yeasts induce fermentation through the agency of enzymes (zymases) which convert glucose and some other carbohydrates into carbon dioxide and water in the presence of oxygen or into alcohol and carbon dioxide (or lactic acid) in the absence of oxygen.

Grades: Technical; brewers'; cooking; compressed (contains about 74% moisture);

dried yeast; N.F. XI (contains no starch or filler, not more than 7% moisture nor more than 8% ash). Also graded according to vitamin B₁ content.

Containers: Tins, boxes, drums, tank trucks. Uses: Fermentation of sugars, molasses, and cereals for alcohol; brewing; medicine; baking bread and the like; important source of vitamin B complex.

Shipping regulations: None.*

yeast adenylic acid. See adenylic acid.

yeast nucleic acid. See ribonucleic acid.

yellow AB (1-benzeneazophthylamine-2; External D&C No. 9) C6H5N2C10H6NH2. Colour Index No. 22.

Properties: Orange or red platelets; m.p. 102-104°C; insoluble in water; soluble in alcohol and oils.

Use: Color for use in drugs and cosmetics, but not in foods.

yellow arsenic sulfide. See orpiment; arsenic trisulfide.

yellow cake. See triuranium octoxide.

yellow calisaya bark. See cinchona bark, calisaya.

yellow cinchona bark. See cinchona bark, calisaya.

yellow cobalt. See cobalt-potassium nitrite.

yellow copper. See chalcopyrite.

yellow dock. See rumex.

yellow gentian. See gentian.

yellow glass. Selenium is added to a soda lime glass.

yellow jasmin. See gelsemium.

yellow lakes. Pigments made by precipitating soluble yellow dyes on an aluminum hydrate base. The yellow lakes are transparent in oil and lacquer vehicles and are used for metal decorating finishes, such as cans, bottle caps, novelties, etc. They withstand the customary baking schedules for finishes of this type and in combination with orange lakes, produce gold shades. Aluminum hydrate has the desirable property of being transparent in oil and varnish vehicles, but unfortunately it also is reactive with some vehicles and care must be taken to be sure that the vehicle used is compatible with pigments containing aluminum hydrate. The yellow lakes do not have sufficient permanency for finishes that are to receive severe exterior exposure.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

yellow moccasin flower. See *cypripedium*.

yellow OB (1-ortho-tolueneazobenzyl-amine-2; External D & C No. 10)

$\text{CH}_3\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{NH}_2$. Colour Index No. 61.

Properties: Orange or yellow powder; m.p. 122-125°C; insoluble in water; soluble in alcohol and oils.

Use: Color for use in drugs and cosmetics, but not in foods.

yellow oxidation enzyme. See Warburg's yellow enzyme.

yellow precipitate. See mercuric oxide, yellow.

yellow prussiate of potash. See potassium ferrocyanide.

yellow prussiate of soda. See sodium ferrocyanide.

yellow puccoon. See *hydrastis*.

yellow root. See *hydrastis*

yellow salt. See uranyl nitrate

yellow saunders. See *santalum album*

yellow ultramarine. See calcium chromate

yellow wax. See beeswax

yerba maté. The leaves of *Ilex paraguayensis*, a tree found in Paraguay. Used in South America in the same manner as tea, for a beverage

yerba santa. See *eriodictyon*

ylang ylang oil (mosoi flower oil; anona oil)

A yellowish volatile oil distilled from the flowers of *Cananga odorata*, the principal sources of which are the Philippines and Réunion (Bourbon variety). The oil is often confused with cananga oil (q.v.), which comes from a Javanese variety of *Cananga odorata*. There is considerable difference in the constants, according to the quality and the fraction that is sold. The major components are linalool, geraniol and their esters, pinene, with small amounts of para-cresol methyl ether, and various other substances.

Constants:

• Manila ylang ylang oil: Sp. gr. 0.911-0.958 (30/4°); optical rotation -27 to -49° 7' (mostly -32 to -45°); refractive index 1.4747-1.4940 (rarely over 1.4900); ester value 90-150 (usually 100 or more). This is the first fraction to distil over. Later fractions are sometimes called cananga oil.

Réunion ylang ylang oil: Sp. gr. 0.932-0.962 (15°C); optical rotation -34 to -64°; ester value 96-134.

Adulteration: Coconut fat, fatty oils, turpentine oil, alcohol, and petroleum.

Containers: Bottles.

Uses: Medicine; perfumery

Shipping regulations: None.*

ylem. The original flux of neutrons that was the beginning of all matter.

yohimbine (aphrodine; corynine; quebrachine) $\text{C}_{21}\text{H}_{26}\text{O}_3\text{N}_2$. Poisonous! An alkaloid.

Properties: Glistening, needle-like alkaloid; m.p. 234°C; soluble in alcohol and ether; very slightly soluble in water.

Derivation: By extraction from the bark of *Corynanthe yohimbé*, found in the Cameroons

Method of purification: Crystallization

Grade: Technical.

Use: Medicine

Shipping regulations: None.*

yohimbine hydrochloride $\text{C}_{21}\text{H}_{26}\text{O}_3\text{N}_2 \cdot \text{HCl}$.

Properties: White crystals or powder; m.p. 302°C; soluble in water and alcohol. Poisonous.

Containers: Bottles; tins.

Use: Medicine.

ysop. See hyssop.

ytterbia. See ytterbium oxide.

ytterbium Yb. One of the rare-earth metals (q.v.) of the yttrium group; atomic number 70; valence +2 and +3; very scarce

Properties: Metallic luster; quite malleable; m.p. 824°C; b.p. 1500°C (approx.); sp. gr. 7.01; reacts slowly with water; soluble in dilute acids and liquid ammonia. The solid dichloride when heated near the melting point decomposes into the trichloride and metallic ytterbium.

Derivation: Reduction of the oxide with lanthanum or misch metal.

Grades: Regular high purity (ingots and lumps).

Uses: Special alloys

ytterbium oxide (ytterbia) Yb_2O_3

Properties: Colorless mass when free of thulia but tinted brown or yellow when containing thulia. The weakest base of the yttrium group with the exception of scandia and lutetia. Slightly hygroscopic, absorbs water and carbon dioxide from the air; sp. gr. 9.2. Soluble in hot, dilute acids, less so in cold acids.

Grades: Purities to 99.9%.

Containers: Glass bottles; fiber drums

Uses: Special alloys, dielectric ceramics.

Shipping regulations: None *

ytterbium salts.

ytterbium chloride $\text{YbCl}_3 \cdot x\text{H}_2\text{O}$. Available as 45% Yb_2O_3

ytterbium fluoride $\text{YbF}_3 \cdot x\text{H}_2\text{O}$. Available as 77% Yb_2O_3

ytterbium nitrate $\text{Yb}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Available as 43% Yb_2O_3 .

ytterbium sulfate $\text{Yb}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$. Colorless prisms; sp. gr. 3.29, soluble in cold water

Grades: (all salts) 99%; 99.9% Yb salts.

Containers: Glass bottles, fiber drums

yttria. See yttrium oxide.

yttrialite. One of the rare-earth minerals. It is a silicate of the yttrium metals (43 to 47%), thorium (10 to 20%), and cerium metals (5 to 8%). Color on the fresh fracture olive-green, changing to orange-yellow on surface.

Constants: Sp. gr. 4.575

Occurrence: Texas.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

yttrium Y. Element of atomic number 39, of group III of the periodic table. Historically considered one of the rare-earth metals, but strictly speaking, not a member of this group.

Properties: Dark gray metal; sp. gr. 4.47; m. p. 1500°C; b. p. 3200°C (approx.). Soluble in dilute acids and potassium hydroxide solution; decomposes water; known only in the tripositive state.

Derivation: Reduction of the fluoride with calcium.

Impurities: Rare earths.

Grades: Regular high purity (ingots, lumps, turnings); metallurgical; low-oxygen; crystal sponge.

Containers: Wooden kegs or fiber drums.

Uses: In nuclear technology because of its high neutron transparency; iron alloys; incandescent gas mantles.

Shipping regulations: None.*

yttrium acetate $Y(C_2H_3O_2)_3 \cdot 8H_2O$.

Properties: Colorless crystals. Soluble in water.

Derivation: By the action of acetic acid on yttrium oxide.

Method of purification: Crystallization.

Impurities: Rare earths.

Grade: Technical.

Containers: Glass bottles.

Use: Analytical chemistry.

Shipping regulations: None.*

yttrium antimonide YSb. Used as a high-purity binary semiconductor.

yttrium arsenide YAs. Used as a high-purity binary semiconductor.

yttrium bromide $YBr_3 \cdot 9H_2O$.

Properties: Colorless crystals. Hygroscopic. Soluble in water; slightly soluble in alcohol, insoluble in ether.

yttrium carbonate $Y_2(CO_3)_3 \cdot 3H_2O$.

Properties: Reddish-white to white powder. Soluble in acids, insoluble in water, alcohol and ether.

Derivation: By the interaction of solutions of yttrium chloride and sodium carbonate

Impurities: Erbium salts.

Grades: Technical.

Containers: Wooden kegs or fiber drums.

Use: Incandescent gas mantles.

Shipping regulations: None.*

yttrium chloride $YCl_3 \cdot 6H_2O$

Properties: Reddish-white, transparent, deliquescent prisms. Soluble in water and alcohol; insoluble in ether. Sp. gr. 2.18, decomposes at 100°C.

Derivation: By the action of hydrochloric acid on yttrium oxide.

Method of purification: Crystallization.

Impurities: Erbium salts.

Grades: Purities to 99%.

Containers: Glass bottles.

Use: Analytical chemistry.

Shipping regulations: None.*

yttrium fluoride $YF_3 \cdot xH_2O$.

Grade: Up to 99.9+ % yttrium salts (available as 65% Y_2O_3).

Containers: Glass bottles.

yttrium-iron garnet. Used for microwave devices. See garnet.

yttrium nitrate $Y(NO_3)_3 \cdot 6H_2O$.

Properties: Reddish-white crystals; loses $3H_2O$ at 100°C; soluble in water, alcohol and nitric acid.

Derivation: By the action of nitric acid on monazite sand.

Method of purification: Fractional crystallization.

Impurities: Rare earths.

Grades: Purities to 99%.

Containers: Glass bottles.

Use: Production of yttrium oxide.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

yttrium oxalate $Y_2(C_2O_4)_3 \cdot xH_2O$.

Properties: White powder, insoluble in water, slightly soluble in acid. Purities up to 75% yttrium salt.

yttrium oxide (yttria) Y_2O_3 .

Properties: Yellowish-white powder. Soluble in dilute acids, insoluble in water. Sp. gr. 4.84, m. p. 2410°C.

Derivation: By the ignition of yttrium nitrate.

Impurities: Rare earths.

Grades: Purities to 99.8%.

Containers: Wooden kegs or fiber drums.

Use: Incandescent gas mantles; optical glasses; special ceramics; electronics; arc welding, organic synthesis

Shipping regulations: None.*

yttrium phosphate. See xenotime.

yttrium phosphide YP. Used as a high-purity binary semiconductor.

yttrium sulfate $Y_2(SO_4)_3 \cdot 8H_2O$.

Properties: Small reddish-white, monosymmetric crystals. Soluble in concentrated sulfuric acid, sparingly soluble in water; insoluble in alkalis. Sp. gr. 2.558

Derivation: By the action of sulfuric acid on monazite sand.

Method of purification: Fractional crystallization

Grade: C.P.

Containers: Glass bottles.

Use: Reagent

Shipping regulations: None.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Z

"Zac." ²⁰ Trademark for electrically melted and cast refractories containing zirconia, alumina, and silica for use in glass-melting units.

"Zactirin" Citrate. ²⁴ Trademark for ethoheptazine citrate. See ethoheptazine.

"Zalba." ²⁸ Trademark for a rubber antioxidant containing a hindered phenol.

Properties: Amber colored viscous liquid; sp.gr. 0.94.

Containers: 50-lb drums.

Use: Nondiscoloring antioxidant for natural and synthetic rubbers and latex. A stabilizer for the manufacture of SBR.

"Zalba" Special Rubber Antioxidant is a fortified hindered phenol; yellow cream colored powder; sp.gr. 1.27.

"Zamak." ²⁶⁸ See "Horse Head Zamak."

"Zanchol." ⁷⁰ Trademark for a brand of florantyrone, gamma-oxo-gamma-(8-fluoranthene)butyric acid.

Use: Medicine.

Zanzibar gum. A hard, usually fossil type of copal.

Derivation: Found on the island of Zanzibar and the adjoining African mainland.

Properties: Sp.gr. 1.062-1.068; m.p. 240-250°C; insoluble in most solvents.

Grades: Bean, pea, sorts.

Containers: Bags.

Use: Varnishes.

Shipping regulations: None.*

"Zarontin." ³³⁰ Trade name for ethosuximide (q.v.).

"Z-B-X." ²⁴⁸ Trademark for zinc butyl xanthate.

Properties: White powder; sp.gr. 1.45, decomposes when heated, moderately soluble in benzol and ethylene dichloride; slightly soluble in acetone; insoluble in water and gasoline.

Uses: A low temperature nonstaining and nondiscoloring ultra accelerator used in rubber cements.

"Z-C" Spray. ⁵⁵ Trademark for a fungicidal spray containing 70% ziram (q.v.).

ZDP. Abbreviation for zinc dithiophosphate. See "Ethyl."

"Zeecon." ⁴⁸ Trademark for sodium lignin sulfonate with controlled wood sugar content. Used as a cement dispersant in the manufacture of concrete.

"Zefran." ²³³ Trademark of an acrylic fiber in white staple form, based on polyacrylo-

nitrile and supplemented with a dye-receptive component; used in fibers, filaments, and yarns.

zein.

Properties: White to slightly yellow powder.

An odorless, nontoxic protein of the prolamine class, derived from corn. Tasteless. It is free of cystine, lysine, and tryptophane. It is a resinous material dispersible in water with neutral sulfonated castor oil. Soluble in dilute alcohol; insoluble in water, dilute acids, anhydrous alcohols, turpentine, esters, oils, fats. Sp.gr. 1.226

Derivation: A by-product of corn processing.

The commercial production process consists of the extraction of gluten meal with 85% isopropyl alcohol, clarification of the extract, extraction of the zein from the extract with hexane, precipitation by water and spray drying.

Containers: Bags.

Uses: Plastics; paper coating; grease-resistant coatings; adhesives, laminated board, solid color prints; printing inks; films and fibers; coating formulations. Basis of imitation shellacs.

"Zelan." ²⁸ Trademark for a line of durable water repellent textile finishes based on a long chain nitrogen complex. Used principally on rainwear fabrics.

"Zelcon" C. ²⁸ Trademark for a cationic fabric softener and conditioner, 100% active, viscous amber fluid.

Use: As the active ingredient in compounded home laundry fabric softeners and conditioners.

"Zelec." ²⁸ Trademark for a line of antistatic agents including both durable and non-durable ones. The non-durable ones are used principally as textile processing assistants, the durable ones as finishes for the newer non-cellulosic synthetic fiber fabrics.

"Zenite." ²⁸ Trademark for a line of rubber accelerators based on zinc salt of 2-mercaptobenzothiazole, with or without various modifying agents.

Properties: Pale yellow powder.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

"Zeo-Dur." ¹⁸⁴ Trademark for a processed glauconite (naturally occurring greensand) cation exchanger.

"Zeogel." ²³⁶ Brand name for a special clay used in drilling fluids to give an equally high

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

yield and stable viscosity and gel characteristics in either fresh or salt water, regardless of the concentration of salt in the latter.

"Zeo-Karb." ¹⁸⁴ Trademark for a sulfonated coal type, acid resistant, cation exchanger.

"Zeolex." ²⁸⁵ Proprietary brand name for a series of precipitated, hydrated sodium silico-aluminates and sodium calcium silico-aluminates (microlitic zeolites).

Properties: Sp. gr. 2.1; bulk density 3 lbs/cu ft aerated, 15-20 lbs/cu ft packed; mean particle diameter ranges of 0.02-0.03 microns and 0.03-0.05 microns; pH 7-11.5; refractive index 1.52-1.55; various oil absorbencies; 325 mesh screen residue 0.1% max; in bright, white powder form.

Containers: 50-lb multiwall, moisture-barrier bags

Uses: Has maximum reinforcing properties and contributes extra long life to rubber for footwear, flooring, rolls, etc.; as a high-concentrate, highly-sorptive carrier for pesticide dust bases and wettable powders, as a conditioner to promote free flow and non-caking in table salt, other food products, and various deliquescent or efflorescent products, as a bulking agent, bodying agent, and flattening agent; as a mild abrasive and polishing agent, in paperboard specialties, writing, offset and book stocks to develop brightness and opacity at minimum cost, to condition certain plastic molding powders.

zeolite process. Water softening process using zeolites (q. v.).

zeolites. A class of hydrated silicates of aluminum and either sodium or calcium or both, of the type $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot n\text{SiO}_2 \cdot x\text{H}_2\text{O}$.

The term originally described a group of naturally occurring minerals, principally sodium or calcium aluminosilicates. Both natural and artificial zeolites are now used extensively for water softening. For this purpose the sodium or potassium compounds are required, since their usefulness depends on the cationic exchange of the sodium of the zeolite for the calcium or magnesium of the hard water. When the zeolite has become saturated with calcium or magnesium ion, it is flooded with strong salt solution, a reverse exchange of cations takes place, and the material is regenerated for use again. The natural zeolites are analcite, chabazite, heulandite, natrolite, stilbite, and thomsonite. See also glauconite, which is similar in use.

Artificial zeolites are made in a variety of forms ranging from gelatinous to porous and sandlike and are used as gas adsorbents and drying agents as well as water softeners. The term zeolite now includes such diverse groups of compounds as sulfonated organics or basic resins, which act in a similar manner to effect either cation or anion exchange. See ion exchange resins

Containers: Bags; drums.

"Zeo-Rex." ¹⁸⁴ Trademark for a sulfonated coal type, acid-resistant cation exchanger.

"Zeotone." ¹⁰⁸ Trademark for a powdered, corrosion-inhibiting, hexametaphosphate compound specially formulated for cleaning and disinfecting domestic and industrial water softeners.

Containers: 2-lb cans; (12/case); 100-lb drums.

"Zepar" BP. ²⁸ Trademark for a reducing agent. White free-flowing granular powder readily soluble in water.

Use: Bleaching agent for groundwood pulp.

"Zephfleur." ¹⁸⁸ Trademark for identifying a series of perfume bases for colognes.

"Zephiran" Chloride. ¹⁶² Trademark for benzalkonium chloride.

Zerewitinoff reagent. Solution of methyl magnesium iodide in purified n-butyl ether. A clear, light colored liquid which reacts rapidly with moisture and oxygen.

Uses: As analytical reagent for active hydrogen atoms in organic compounds; also to determine water, alcohols, and amines in inert solvents.

"Zerex." ²⁸ Trademark for anti-rust anti-freeze based on ethylene glycol and containing MR8 rust inhibitor that protects all metals including aluminum. A clear, odorless, slightly viscous liquid with a fluorescent color.

Containers: 1-gal cans, 6/carton; 1-qt cans, 24/carton.

Uses: As a high-boiling anti-freeze for combustion engines, particularly at high altitudes or very low temperatures or under severe driving conditions.

"Zerlice." ⁵¹ Trademark for light lubricating oils suitable for many general machinery applications, particularly where low temperatures are encountered. Used in refrigerating machines having low evaporator temperatures.

"Zerlate." ²⁸ Trademark for agricultural and horticultural fungicide based on ziram (zinc dimethyldithiocarbamate).

Containers: 3- and 50-lb bags.

Use: Control of certain vegetable diseases and brown rot of peaches.

"Zerlon." ²³³ Trademark for a methyl methacrylate-styrene copolymer used as a plastic molding grade material.

"Zerok." ⁴¹ Trade name for a synthetic resin coating of the vinyl type which is resistant to oxidizing acids and useful for protection against fumes and splashing.

"Zerone." ²⁸ Trademark for anti-rust anti-freeze based on methanol and containing a dye and chemical inhibitors. A clear violet mobile liquid with odor of methanol.

Containers: 54-gal drums, 1-gal cans, 6/carton; 1-qt cans, 24/carton.

Uses: Anti-freeze for combustion engines,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

recommended for use in cooling systems with normal thermostats operating below 160°F.

Precaution: Same as for methanol.

"Zeset." ²⁸ Trademark for a reactive type finish for imparting durable crease resistance, dimensional stability, and hydrophobic characteristics to cellulosic textiles.

"Zetafin." ²³³ An ethylene-ethyl acrylate copolymer with properties similar to flexible polyvinyl polymers.

zeta potential (electrokinetic potential). The potential across the interface of all solids and liquids. More specifically, it is the potential across the diffuse layer of ions surrounding a charged colloidal particle; and is largely responsible for colloidal stability. Destruction of the zeta potential, accompanied by precipitation of the colloid, can occur by addition of polyvalent ions of sign opposite to that of the colloidal particles. (This principle is used in water purification.) Zeta potentials can be calculated from electrophoretic mobilities, i.e., the rates at which colloidal particles travel between charged electrodes placed in the solution.

"Zetax." ⁶⁹ Trademark for zinc 2-mercapto-benzothiazole.

Properties: Pale yellow powder; sp.gr. $1.70 \pm .03$; melting point above 300°C, zinc content 15-18%.

Uses: In natural rubber, primary accelerators, activator of benzothiazyl disulfide and for ultras combinations, and accelerator for low sulfur. In nitrile rubber and SBR, primary accelerator. In butyl, activator for ultras. Also as latex accelerator for foams and films.

zibeth. See civet.

Ziegler catalysts. Particular types of stereospecific catalysts which are usually chemical complexes derived from a transition metal halide and a metal hydride or a metal alkyl. The transition metal may be any of a large number of those in groups IV to VIII of the periodic table, the hydride or alkyl metals are those of groups I, II, and III. Typically, titanium chloride is added to aluminum alkyl in a hydrocarbon solvent to form a dispersion or precipitate of the catalyst complex. These catalysts usually operate at atmospheric pressure and are used to convert ethylene to linear polyethylene, and also in stereospecific polymerization of propylene to crystalline polypropylene.

Ziegler process. A process for polymerizing ethylene or propylene into linear polyethylene or polypropylene. Higher olefins may also be used. The process features low pressures and aluminum alkyls as catalysts.

Ziehl's stain. See carbolfuchsin.

"Zilloy." ²⁶⁸ See "Horse Head Zilloy."

Zimmermann process. A process for waste disposal used for sewage sludge and industrial wastes, such as sulfite pulp from paper mills. The organic material is oxidized with air in water at high temperature (up to 700°F) and pressure (up to 1800 psi). The water from the process may then be treated by conventional processes and released into streams.

"Zinar." ⁷⁹ Trademark for a high melting, pale colored zinc resinate which has a negative acid number (slightly basic).

Constants: Sp.gr. (25°C) 1.150; m.p. (capillary tube) 160°C; metallic zinc (combined) 5.6%; color M.

Containers: Non-returnable, light gauge galvanized drums containing about 530 lbs net. Tare 14-16 lbs.

Uses: Paints; varnishes; adhesives; linoleum print paint; ethyl cellulose lacquers.

zinc Zn. Element of atomic number 30, Group II of periodic table. Referred to in metal trades as spelter.

Properties: Shining white metal with bluish gray luster. Not found native. Soluble in acids and alkalis. Insoluble in water. Sp.gr. 7.14; m.p. 419°C; b.p. 907°C.

Ores and minerals: See calamine, franklinite, hydrozincite, smithsonite, sphalerite, willemitte, wurtzite, zincite.

Derivation: By roasting the ore, and then heating with carbon out of contact with air. Also obtained by electrolysis.

Grades: Technical, high purity (impurities less than 10 ppm).

Forms available: Slab, rolled (strip, sheet, rod, tubing), wire, mossy zinc, zinc dust (see separate entry), zinc anodes.

Uses: Alloys such as brass, bronze, Babbitt, German silver, and many die-casting alloys; galvanizing iron and other metals; electroplating; metal spraying; automotive parts; electrical fuses, anodes, meter cases; household articles, roofing, gutters; engravers' plates; cable wrappings, organ pipes, etc.

zinc 65. Radioactive zinc of mass number 65.

Properties: Half-life, 250 days, radiation, beta, gamma and K.

Derivation: Pile irradiation of zinc metal and, in the cyclotron, by bombarding copper 65 with deuterons.

Forms available: Zinc metal and zinc chloride in hydrochloric acid solution.

Uses: To study wear in alloys, the nature of phosphor activators, galvanizing, the function of traces of zinc in body metabolism, the functions of oil additives in lubricating oils, etc.

Shipping regulations: Class D poison, radioactive material. Red label.*

zinc acetate $\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, monoclinic, crystalline plates; pearly luster; faint acetous odor; astringent taste. Soluble in water and alcohol. Sp.gr. 1.735; m.p. 237°C.

Derivation: By the action of acetic acid on

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

zinc oxide.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles and cartons; fiber drums.

Uses: Medicine; preserving wood, textiles (mordant in dyeing with alizarin blue and similar dyes, resist in dyeing with aniline black, substitute for tartar emetic in dyeing with basic dyes, calico printing), zinc chromate; laboratory reagent; feed additive.

Shipping regulations: None.*

"Zincalume." ⁷² Trade name for a bright zinc plating process; composed of zinc cyanide, sodium cyanide, sodium hydroxide and addition agents.

zinc ammonium chloride $\text{ZnCl}_2 \cdot 2\text{NH}_4\text{Cl}$. A complex salt. Double salts with 3 or 6 molecules ammonium chloride have also been prepared.

Properties: White powder or crystals; soluble in water, sp.gr. 1.8.

Grade: Technical (foaming and non-foaming).

Containers: 100-lb paper bags; 400-lb barrels.

Uses: Welding; soldering flux, dry batteries, galvanizing.

Shipping regulations: None.*

zinc ammonium nitrite.

Shipping regulations: Oxidizing material.

Yellow label.*

zinc ammonium sulfate (ammonium zinc sulfate) $\text{ZnSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water.

zinc antimonide. Used in thermoelectric devices.

zinc arsenate. Variable composition approximating $5\text{ZnO} \cdot 2\text{As}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$. Occurs in nature as mineral kottigit, $\text{Zn}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$. Insoluble in water; soluble in acids or alkalis. White, odorless powder.

Poisonous.

Preparation. Reaction of a solution of sodium arsenate and a soluble zinc salt.

Use: Insecticide.

Shipping regulations: Class B poison. Poison label.*

zinc arsenite (zinc meta-arsenite; ZMA)

$\text{Zn}(\text{AsO}_2)_2$.

Properties: Colorless powder, soluble in acids, insoluble in water. Federal Specification TT-W-581 describes the composition of the solution used for wood preservation.

Uses: Timber preservative, insecticide.

Warning: Poisonous if swallowed. MCA warning label.

Shipping regulations: Class B poison. Poison label.*

zinc bacitracin.

Properties: Creamy-white powder; slightly soluble in water. May be used in formulations requiring heat processing. Usually has 50-60 units/mg of bacitracin activity.

Derivation: By the action of zinc salts on

bacitracin broth.

Use: Preserving silage for feed.

zinc baryta white. See lithopone.

zinc benzoate $\text{Zn}(\text{C}_6\text{H}_5\text{CO}_2)_2$.

Properties: White powder; slightly soluble in water.

Use: Medicine.

zinc bichromate. See zinc dichromate.

zinc blende. See sphalerite.

zinc bloom. See hydrozincite.

zinc borate. Of indefinite composition, containing zinc oxide (ZnO) and boric oxide (B_2O_3) in various ratios. A typical specification is ZnO 45%, B_2O_3 34%. May have 20% water of hydration.

Properties: White, amorphous powder; soluble in dilute acids; slightly soluble in water.

Derivation: Interaction of the oxides at 500-1000°C, or of zinc oxide slurries with solutions of boric acid or borax.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Tins, bags.

Use: Medicine; fireproofing textiles; fungistat and mildew inhibitor, flux in ceramics.

zinc bromide ZnBr_2 .

Properties: White, hygroscopic, crystalline powder. Soluble in water, alcohol, and ether. Sp.gr. 4.219; m.p. 394°C; b.p. 650°C.

Derivation: By the interaction of solutions of barium bromide and zinc sulfate, with subsequent crystallization.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: Glass bottles.

Uses: Medicine; photography (plates, papers); manufacture and finishing of rayon. A solution of 80% zinc bromide is used as a radiation viewing shield.

Shipping regulations: None.*

zinc, butter of. See zinc chloride.

zinc cadmium sulfide. A fluorescent pigment; a phosphor.

zinc calcium resinate. A mixed soap similar to zinc resinate, but containing varying proportions of calcium.

zinc caprylate $\text{Zn}(\text{C}_8\text{H}_{15}\text{O}_2)_2$.

Properties: Lustrous scales; slightly soluble in boiling water, fairly soluble in boiling alcohol. M.p. 136°C. Decomposes in moist atmosphere giving off caprylic acid.

Derivation: By precipitating from a solution of ammonium caprylate with zinc sulfate.

Use: Fungicide.

zinc carbolate. See zinc phenate.

zinc carbonate ZnCO_3 .

Properties: White, crystalline powder. Soluble in acids, alkalis and ammonium salt solutions; insoluble in water. Sp.gr. 4.42-4.45; loses carbon dioxide at 300°C.

Derivation: (a) By grinding the mineral smithsonite; (b) By the action of sodium

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

bicarbonate on a solution of a zinc salt.

Method of purification: Crystallization.

Impurities: Zinc oxide; zinc hydroxide.

Grades: Technical; C.P.

Containers: 1-lb bottles; 25-, 50-lb boxes; 100-, 150-lb kegs; 250-, 300-lb barrels; multiwall paper sacks.

Uses: Pigment; ceramics; fire-proofing agent; cosmetics and lotions; pharmaceuticals (ointments, dusting powders); zinc salts; feed additive.

Shipping regulations: None.*

zinc carbonate, basic. See zinc carbonate, precipitated.

zinc carbonate, precipitated (zinc subcarbonate, zinc carbonate, basic; tutia).

$2\text{ZnCO}_3 \cdot 3\text{Zn(OH)}_2$; composition variable.

Properties: Impalpable, white powder. Soluble in dilute acids, ammonium hydroxide and ammonium carbonate solution; insoluble in alcohol.

Derivation: By the action of sodium carbonate on a solution of a zinc salt.

Impurities: Zinc oxide.

Grade: Technical.

Containers: Wooden barrels, fiber drums, or tins.

Uses: Medicine (similar to zinc oxide), pigment.

Shipping regulations: None.*

zinc chlorate $\text{Zn(ClO}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless to yellowish crystals, deliquescent, sp gr. 2.15, decomposes at 60°C . Very soluble in water and alcohol; soluble in glycerin and ether.

Shipping regulations: Oxidizing material. Yellow label *

zinc chloride (butter of zinc) ZnCl_2 .

Properties: White granular deliquescent crystals or crystalline powder, poisonous, soluble in water, alcohol, glycerine and ether. Sp gr. 2.91; m.p. 290°C , b p. 732°C .

Derivation: By the action of hydrochloric acid on zinc or zinc oxide.

Method of purification: Recrystallization.

Grades: C.P.; technical. Fused, crystal, granulated, 50% solution; N.F. XI.

Containers: Bottles; drums. Solutions in tank cars and tank trucks.

Uses: Galvanizing iron, catalyst, dehydrating and condensing agent in organic synthesis; wood preservative; ingredient of soldering fluxes; burnishing and polishing compounds for steel; electroplating; disinfectant; antiseptic and deodorant preparations; textiles (mordant, carbonizing agent, mercerizing, sizing and weighting compositions, resist for sulfur colors, albumin colors and para red); cold water glues and other adhesives; special cements; glass etching compositions; petroleum refining, parchment paper, vulcanized fiber; dental cements; dentifrices; embalming and taxidermists fluids, candles, vulcanizing rubber; medicine; dyestuffs; pigments; antistatic; feed additive; some promise for fuel cells.

Warning: May cause severe skin irritation.

MCA warning label.

Shipping regulations: None.*

zinc chloride, chromated. A mixture of zinc chloride and sodium dichromate used as a wood preservative. Federal Specification TT-W-551 requires that it contain not less than 77.5% zinc chloride and 17.5% sodium dichromate dihydrate. See also CZC Chromated Zinc Chloride.

zinc chloride, chromated, copperized. See Copperized CZC Chromated Zinc Chloride.

zinc chloroiodide. A mixture of zinc chloride and iodide.

Properties: White powder. Soluble in water. Containers: Glass bottles.

Grades: Technical.

Uses: Disinfectant; pharmaceutical preparations.

Shipping regulations: None.*

zinc chromate. Of variable composition. The C.P. salt is alleged to be $\text{ZnCrO}_4 \cdot 7\text{H}_2\text{O}$, a yellow, crystalline powder. A series of compounds are known in which the ratio of ZnO to CrO_3 is 5:1, 4:1, 2:1, 1:1 and 1:2, usually with some water of crystallization. The basic compounds containing the highest zinc content are more insoluble and stable than the acidic compounds.

Derivation: By the action of chromic acid on slurries of zinc oxide, or on zinc hydroxide.

Grades: Technical; C.P.

Containers: 1-lb bottles; barrels.

Use: Pigments; artists' color, varnishes; linoleum.

See zinc yellow, which is principally zinc potassium chromate.

zinc chrome. See zinc yellow.

zinc citrate $\text{Zn}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, amorphous powder.

Slightly soluble in water.

Derivation: By the action of citric acid on zinc hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

zinc cyanide Zn(CN)_2 .

Properties: White powder, poisonous! Decomposes on heating; soluble in dilute mineral acids with production of hydrogen cyanide; insoluble in water and alcohol.

Derivation: By precipitation of a solution of zinc sulfate or chloride with potassium cyanide.

Grades: Technical.

Containers: Glass bottles; kegs; drums.

Uses: Medicine, metal plating; chemical reagent, insecticide; purifying illuminating gas.

Caution: Contact with acid liberates poisonous gas. Avoid breathing gas or dust and avoid contact with skin.

zinc dibutylidithiocarbamate

$\text{Zn[SC(S)N(C}_4\text{H}_9)_2]_2$.

Properties: White powder; sp.gr. (20/ 20°C)

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

1.24; melting range 104-108°C; pleasant odor, nontoxic. Soluble in carbon disulfide, benzene, and chloroform; insoluble in water.

Use: Rubber vulcanization accelerator; lubricating oil additive.

zinc dichromate (zinc bichromate)

$\text{ZnCr}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Orange-yellow powder; soluble in acids and hot water; insoluble in alcohol and ether.

Derivation: By the action of chromic acid on zinc hydroxide.

Grade: Technical.

Containers: Wooden kegs or fiber drums.

Use: Pigment.

Shipping regulations: None.*

zinc diethyl. See zinc ethylf.

zinc diethyldithiocarbamate $\text{Zn}[\text{SC}(\text{S})\text{N}(\text{C}_2\text{H}_5)_2]_2$.

Properties: White powder; sp. gr. (20/20°C)

1.47; melting range 172-176°C; nontoxic.

Soluble in carbon disulfide, benzene and chloroform; insoluble in water.

Containers: Drums.

Use: Rubber vulcanization accelerator.

zinc dimethyldithiocarbamate. See ziram.

zinc dimethyldithiocarbamate cyclohexyl amine complex (zinc dithioamine complex).

White powder or slurry of low solubility, used as a fungicide and rat poison.

zinc dioxide. See zinc peroxide.

zinc dithioamine complex. See zinc dimethyldithiocarbamate cyclohexylamine complex.

zinc dithionite. See zinc hydrosulfite.

zinc dithiophosphate. Term used for commercial dialkyl zinc dithiophosphate. See "Ethyl."

zinc dust. A gray powder. May form explosive mixtures with air; in bulk when damp may heat and ignite spontaneously on exposure to air.

Grades: Commercial, pigment.

Containers: Barrels.

Uses: Zinc salts and other zinc compounds; as reducing agent, precipitating agent, purifier, catalyst, polymerizing agent; in rust-resistant paints; bleaches; pyrotechnics, soot-removal, pipe-thread compounds; sherdarizing.

zinc ethyl (zinc diethyl, better, diethylzinc).

$\text{Zn}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid; takes fire on contact with air; sp. gr. (20°C) 1.207; m. p. -28°C; b. p. 118°C; decomposes in water.

Derivation: By the action of ethyl iodide on zinc and sodium-zinc; or by reacting zinc chloride with triethyl aluminum.

Grade: Technical.

Containers: Sealed tubes; steel cylinders.

Use: Organic synthesis; polyolefin catalyst; production of ethyl mercuric chloride.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

zinc ethylenebisdithiocarbamate. See zineb.

zinc 2-ethylhexoate. See zinc octoate.

zinc ethylsulfate $\text{Zn}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Clear, colorless, hygroscopic, crystalline leaflets. Keep well stoppered. Soluble in water and alcohol.

Derivation: By the interaction of zinc hydroxide and diethyl sulfate.

Grade: Technical.

Containers: Glass bottles; tins.

Use: Organic synthesis.

Shipping regulations: None.*

zinc ferrocyanide $\text{Zn}_2\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$.

Properties: White powder, decomposes on heating. Soluble in ammonium hydroxide; insoluble in water and hydrochloric acid.

Derivation: By the interaction of zinc sulfate and potassium ferrocyanide.

Grade: Technical.

Containers: Glass bottles; boxes.

Use: Medicine.

Shipping regulations: None.*

zinc, flowers of. See zinc oxide.

zinc fluoborate $\text{Zn}(\text{BF}_4)_2$. Handled as 40 or 48% solution, a colorless liquid.

Uses: Plating and bonderizing; resin curing.

zinc fluoride ZnF_2 .

Properties: White powder; poisonous! Soluble in hot acids, slightly soluble in water; insoluble in alcohol. Sp. gr. (15°C) 4.84; m. p. 872°C.

Derivation: (a) By the action of hydrofluoric acid on zinc hydroxide; (b) By the addition of sodium fluoride to a solution of zinc acetate.

Grade: Technical, about 95% pure.

Containers: Drums, barrels.

Use: Ceramic glazes and enamels, impregnating lumber; galvanizing.

Shipping regulations: None.*

zinc fluosilicate. See zinc silicofluoride.

zinc formaldehyde sulfoxylate $\text{Zn}(\text{HSO}_2 \cdot \text{CH}_2\text{O})_2$

(normal), $\text{Zn}(\text{OH})(\text{HSO}_2 \cdot \text{CH}_2\text{O})$ (basic).

Properties: Rhombic prisms. Very soluble in water (normal); insoluble in alcohol. Decomposes in acid.

Derivation: Reaction of formaldehyde and zinc sulfoxylate.

Grades: Basic, normal.

Containers: 250-lb and 300-lb drums.

Uses: Stripping and discharging agent for textiles.

See also hydrosulfite-formaldehyde compounds.

zinc formate $\text{Zn}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; sp. gr. (20°C) 2.207; decomposes on heating. Soluble in water; insoluble in alcohol.

Derivation: By the action of formic acid on zinc hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Uses: Medicine; catalyst for production of methyl alcohol; waterproofing agent; textiles; wood preservative.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

zinc glass. A glass in which zinc oxide (ZnO) replaces part of the calcium oxide of ordinary lime soda glass.

zinc gluconate. Dietary supplement accepted by F.D.A.

zinc glycerinophosphate. See zinc glycerophosphate.

zinc glycerophosphate (zinc glycerinophosphate) $C_3H_5(OH)_2OPO_3Zn$.

Properties: White, amorphous powder. Soluble in water; insoluble in alcohol and ether.

Derivation: By the action of glycerophosphoric acid on zinc hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

zinc greens. Brilliant green pigments mostly consisting of mixtures of Prussian blue and zinc yellow. They are permanent to light but not to alkali or water. Mostly used for flat wall paints and interior work.

zinc hydrosulfite (zinc dithionite) (ZnS_2O_4)

Properties: White, amorphous solid, soluble in water.

Grade: Technical.

Containers: Cartons, 50-lb pails, 275-lb drums.

Uses: Brightening ground wood, kraft, and other paper pulps; treatment of beet and cane sugar juices; as a depressant in mining flotations, and for bleaching textiles, vegetable oils, straw, hemp, vegetable tannins, animal glues, etc.

zinc hypophosphite $Zn(H_2PO_2)_2 \cdot H_2O$.

Properties: White hygroscopic crystals.

Keep well stoppered. Soluble in water and alkalies.

Derivation: By the action of hypophosphorous acid on zinc hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

zinc iodate $Zn(IO_3)_2$. (May contain water of crystallization, 1- or 2H₂O).

Properties: White, crystalline powder, sp.gr. (anhydrous) 5.06. Soluble in nitric acid and alkalies, very slightly soluble in water.

Derivation: By the interaction of barium iodate and zinc sulfate, with subsequent crystallization.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine (topical).

zinc iodide ZnI_2 .

Properties: Hygroscopic, white, crystalline powder, sharp, saline taste. Keep well stoppered. Turns brown on exposure to light or air. Soluble in water, alcohol and alkalies. Sp.gr. 4.67; m.p. 446°C, b.p. 625°C.

Derivation: By the interaction of barium iodide and zinc sulfate, with subsequent crystallization.

Method of purification: Recrystallization.

Grade: Technical.

Containers: Wooden kegs; glass bottles.

Use: Medicine; analytical reagent.

zinc isovalerate. See zinc valerate.

zincite (red zinc ore; zinc oxide, red) ZnO .

Natural zinc oxide, usually with some manganese.

Properties: Color red to orange-yellow; luster subadamantine, streak orange-yellow; hardness 4-4.5, sp.gr. 5.6.

Occurrence: New Jersey.

Use: Ore of zinc.

zinckenite. See zinckenite

zinc lactate $Zn(C_3H_5O_3)_2 \cdot 3H_2O$.

Properties: White crystals. Soluble in water.

Derivation: By the action of lactic acid on zinc hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

zinc laurate $Zn(C_{12}H_{23}O_2)_2$.

Properties: White powder, m.p. 128°C, insoluble in water and alcohol.

Derivation: Precipitation of a soluble coconut oil soap with a solution of a zinc salt.

Containers: Barrels.

Uses: Paints, varnishes, rubber compounding

zinc linoleate $Zn(C_{17}H_{31}COO)_2$. A firm, tan-colored solid containing 8.5 to 9.5% zinc.

Derivation: Precipitation from solutions of the sodium linoleate and soluble zinc salt, or by fusion of the fatty acid and zinc oxide.

Uses: As drier, especially with cobalt and manganese soaps.

zinc malate $Zn(OOCCH_2CHOHCOO) \cdot 3H_2O$.

Properties: White, crystalline powder. Soluble in water.

Derivation: By the action of malic acid on zinc hydroxide.

Grades: Technical.

Method of purification: Crystallization.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

zinc metaarsenite. See zinc arsenite.

zinc naphthenate.

Properties: Amber, viscous, basic liquid or basic solid. The liquid contains 8-10% Zn, the solid contains 16% Zn. Very soluble in acetone.

Derivation: Fusion of zinc oxide or hydroxide and naphthenic acid, or precipitation from mixture of soluble zinc salts and sodium naphthenate.

Containers: Small metal drums; fiber drums.

Uses: As drier and wetting agent in paints, varnishes and resins; insecticide and fungicide; wood preservative; waterproofing of textiles; insulating materials.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

zinc nitrate $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless lumps or crystals.

Soluble in water and alcohol. Sp. gr.

(13°C) 2.065; m. p. 36.4°C; b. p. 131°C;

loses water of crystallization at 105°C.

Derivation: By the action of nitric acid on zinc or zinc oxide.

Method of purification: Crystallization.

Grades: Technical; C.P.

Uses: Acidic catalyst; resin setter, latex coagulant; medicine; chemical reagent and intermediate; mordant.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

zinc octoate (zinc 2-ethylhexoate). Light straw colored viscous liquid.

Properties: Sp. gr. 1.16; insoluble in water, soluble in common organic hydrocarbon solvents.

Use: Catalyst.

zinc oleate $\text{Zn}(\text{C}_{17}\text{H}_{33}\text{COO})_2$.

Properties: Dry, white to tan, greasy, granular powder, containing from 8.5 to 10.5% zinc, m. p. 85.5°C. Soluble in alcohol, ether, carbon disulfide and ligroin; insoluble in water.

Derivation: By the interaction of solutions of zinc acetate and sodium oleate, or by fusion of zinc oxide and oleic acid.

Grade: Technical.

Containers: Tins; wooden kegs, glass bottles, barrels.

Use: Medicine, paints, resins and varnishes.

Shipping regulations: None.*

"Zincon." ¹⁶⁹ Trademark for 2-carboxy-2'-hydroxy-5'-sulfoformazylbenzene used in colorimetric determination of zinc and copper.

zinc ores. See under zinc.

zinc orthophosphate. See zinc phosphate.

zinc orthosilicate. See willemite.

zinc oxalate $\text{ZnC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$.

Properties: White powder. Soluble in acids and alkalis; slightly soluble in water.

Sp. gr. (24°C) 2.562.

Derivation: By the interaction of zinc sulfate and sodium oxalate.

Grades: Technical; C.P.

Containers: 1-lb bottles; boxes.

Uses: Zinc oxide; organic synthesis.

Shipping regulations: None.*

zinc oxide (Chinese white, zinc white, flowers of zinc; nil alba, philosopher's wool) ZnO . Properties: Amorphous, odorless, white or yellowish white powder, absorbs carbon dioxide from the air, sp. gr. 5.47; m. p. above 1800°C; soluble in acids; insoluble in water and alcohol.

Derivation: (a) Oxidation of vaporized pure zinc (French process) or previously roasted sulfide ore (American process). (b) By heating zinc carbonate. (c) Oxidation of vapor fractionated die castings. See also Wetherill process.

Impurities: Zinc carbonate.

Grades: American process, lead-free;

French process, lead-free, green seal,

red seal, white seal (according to fineness);

leaded (with lead sulfate); U.S.P. XVI.

Containers: 50-lb kegs; 100-lb drums; multi-wall paper sacks; glass bottles.

Uses: Paint pigment; as mold growth inhibitor in paints; zinc salts; accelerator-activator and reinforcing agent in rubber manufacture; ceramic glazes; matches; linoleum (pigment); dental cements; medicine; feed additive; seed treatment; chemical warfare; cosmetics; zinc soaps; opaque glass; white printing inks; candles; "Celluloid;" textile printing (resist); white glue and gelatin; in rayon manufacture.

Shipping regulations: None.*

zinc oxide, leaded. Contains lead sulfate.

zinc oxide, red. See zincite.

zinc palmitate $\text{Zn}(\text{C}_{16}\text{H}_{31}\text{O}_2)_2$.

Properties: White amorphous powder; sp. gr.

1.121; m. p. 100°C; insoluble in water and

alcohol; slightly soluble in benzene and toluene.

Grade: Technical.

Containers: Cartons, bags.

Use: Flatting agent in lacquer; pigment suspending agent for paints; rubber compounding; lubricant in plastics.

zinc perborate $\text{Zn}(\text{BO}_3)_2$ with water of hydration.

Properties: Amorphous, white powder; insoluble in water but slowly decomposed by it, liberating hydrogen peroxide.

Derivation: Interaction of sodium peroxide, boric acid and zinc salt, or of boric acid and zinc peroxide.

Grade: Technical.

Containers: Tins, glass bottles.*

Use: Medicine; oxidizing agent.

Shipping regulations: None.*

zinc permanganate $\text{Zn}(\text{MnO}_4)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Violet-brown or black, hygroscopic crystals, sp. gr. 2.47; loses $5\text{H}_2\text{O}$ at 100°C. Decomposes on exposure to light and air. Soluble in water and acids; decomposes in alcohol.

Grades: Technical (about 95% pure).

Containers: Glass bottles, tins.

Use: Medicine, oxidizing agent.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

zinc peroxide (zinc dioxide) ZnO_2 .

Properties: White powder containing 45-60% ZnO_2 , balance ZnO ; sp. gr. 1.571; decomposes rapidly above 150°C. Decomposes in acids, insoluble in water but gradually decomposed by it.

Derivation: By the action of barium peroxide on zinc sulfate solution, followed by filtration.

Grades: U.S.P. XVI (mixture of peroxide, carbonate and hydroxide); technical, 50-60%.

Containers: Glass bottles; 100-, 200-lb drums.

Uses: Cosmetics, medicine; vulcanizing agent;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

high temperature oxidation reactions.
 Fire hazard: Dangerous.
 Shipping regulations: Oxidizing material.
 Yellow label.*

zinc phenate (zinc carbolate; zinc phenolate)
 $\text{Zn}(\text{C}_6\text{H}_5\text{O})_2$. (May be only a mixture of zinc oxide and phenol.)
 Properties: White powder. Soluble in alcohol; slightly soluble in water.
 Derivation: By heating zinc hydroxide with phenol and extracting with alcohol.
 Method of purification: Recrystallization.
 Grade: Technical.
 Use: Medicine; insecticide.
 Shipping regulations: None.*

zinc phenolate. See zinc phenate.

zinc phenolsulfonate (zinc sulfophenate; zinc sulfocarbonate) $\text{Zn}(\text{SO}_3\text{C}_6\text{H}_4\text{OH})_2 \cdot 8\text{H}_2\text{O}$.
 Properties: Colorless, transparent crystals or white granular powder; odorless, astringent metallic taste; effloresces in air; turns pink on exposure to air and light; loses water of crystallization at 120°C ; soluble in water and alcohol.
 Derivation: By heating zinc hydroxide with phenol-sulfonic acid.
 Method of purification: Crystallization.
 Grades: N.F. XI; technical.
 Containers: Glass bottles; 200-lb drums.
 Use: Medicine.

zinc phosphate (zinc orthophosphate, zinc phosphate, tribasic) $\text{Zn}_3(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$
 Properties: White powder. Soluble in acids and ammonium hydroxide; insoluble in water. Sp.gr. 3.03.
 Derivation: By the interaction of zinc sulfate and trisodium phosphate.
 Grades: Technical, about 98% pure.
 Containers: Boxes; wooden kegs, glass bottles.
 Uses: Medicine; dental cements, phosphors.
 Shipping regulations: None.*

zinc phosphate, tribasic. See zinc phosphate.

zinc phosphide Zn_3P_2 .
 Properties: Dark gray, gritty powder; sp.gr. 4.55; stable if kept dry; insoluble in water and alcohol, soluble in acids with production of flammable phosphine. Reacts violently with oxidizing agents.
 Derivation: By passing phosphine into a solution of zinc sulfate.
 Grades: Technical, about 80-85% pure.
 Containers: Tins; glass bottles.
 Uses: Medicine; rat poisons.
 Warning! Poisonous if swallowed. MCA warning label.
 Shipping regulations: None.*

zinc phosphite $\text{ZnHPO}_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$.
 Properties: White granular, crystalline powder. Soluble in cold water, insoluble in hot water.
 Derivation: The present commercial method is by reacting zinc powder and phosphorus. By the action of phosphorous acid on zinc hydroxide.
 Method of purification: Crystallization.
 Grades: Technical.

Containers: Tins; glass bottles.
 Use: Medicine.
 Shipping regulations: None.*

zinc potassium chromate. See zinc yellow.

zinc potassium iodide. See potassium zinc iodide.

zinc potassium sulfate (potassium zinc sulfate)
 $\text{K}_2\text{SO}_4 \cdot \text{ZnSO}_4 \cdot 6\text{H}_2\text{O}$.
 Properties: White crystals, soluble in water.

zinc powder. Finely divided metallic zinc. See zinc dust.

zinc propionate $\text{Zn}(\text{OOC}_2\text{H}_5)_2$.
 Properties: Occurs as platelets, tablets, or needlelike crystals. Fairly soluble in water, slightly soluble in alcohol. Decomposes in moist atmosphere, liberating propionic acid.
 Derivation: By dissolving zinc oxide in dilute propionic acid and concentrating the solution.
 Use: Fungicide on adhesive tape.

zinc pyrophosphate $\text{Zn}_2\text{P}_2\text{O}_7$.
 Properties: White powder, sp.gr. 3.756; soluble in acids and alkalies, insoluble in water.
 Derivation: By heating a soluble zinc salt with ammonium phosphate.
 Grade: Technical.
 Containers: Wooden kegs or fiber drums.
 Use: Pigment.
 Shipping regulations: None.*

zinc resinate.
 Properties: Powder, clear amber lumps, or clear yellowish liquid. May be acid, basic or neutral. Soluble in some organic solvents, as ether, amyl alcohol.
 Derivation: By fusion of zinc oxide and rosin, or by precipitation from solutions of zinc salts and sodium resinate.
 Containers: 55-gal drums.
 Uses: Wetting, dispersing and hardening agent, drier, in paints, varnishes and resins

zinc rhodanide. See zinc thiocyanate.

zinc ricinoleate
 $\text{Zn}[\text{CH}_3(\text{CH}_2)_5\text{CHOHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CO}_2]_2$.
 Fine white powder with faint fatty acid odor.
 Properties: M.p. $92-95^\circ\text{C}$; sp.gr. (25/ 25°C) 1.10.
 Containers: 50-lb bags.
 Uses: Fungicide, emulsifier; greases; lubricants; waterproofing; lubricating oil additive; stabilizer in vinyl compounds.

zinc salicylate $\text{Zn}[\text{C}_6\text{H}_4(\text{OH})\text{COO}]_2 \cdot 3\text{H}_2\text{O}$.
 Properties: White, crystalline needles or powder; soluble in water and alcohol.
 Derivation: By heating zinc hydroxide and salicylic acid.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: Tins; glass bottles.
 Use: Medicine.
 Shipping regulations: None.*

zinc silicate (zinc orthosilicate). See willemite.

*See "I. C. C. Shipping Regulations," page xiii.
 Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

zinc silicates. Used for phosphors; spray ingredients; to remove traces of copper from gasoline.

zinc silicofluoride (zinc fluosilicate)

Properties: White crystals; sp.gr. 2.104. Decomposes on heating. Soluble in water. Derivation: Reaction of zinc oxide and fluosilicic acid.

Containers: Bulk; barrels, drums.

Grades: Technical.

Uses: Concrete hardener; laundry sour; preservative; mothproofing agents.

zinc-silver oxide battery. Primary or secondary battery used where space and weight are critical, i.e., in missiles. The battery has large energy output for its weight, but the components are expensive and the cycle life is short. To avoid deterioration, the potassium hydroxide electrolyte is added just before use.

zinc stearate $\text{Zn}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$. Percentage of zinc may vary according to intended use, some products being more basic than others.

Properties: (pure substance) White, agglutinating powder, free from grittiness and with faint characteristic odor; sp.gr. 1.095, m.p. about 120°C. Soluble in acids; soluble in common solvents when hot.

Derivation: By the action of sodium stearate on solution of zinc sulfate.

Grades: U.S.P. XVI; technical; available free from chick edema factor.

Containers: Glass bottles, bags, cartons.

Uses: Medicine; cosmetics; drying lubricant in rubber; waterproofing agent; lacquers, plastics; powder metallurgy, as a dietary supplement.

Shipping regulations: None.*

zinc subcarbonate. See zinc carbonate, precipitated.

zinc sulfate (white vitriol, white copperas, zinc vitriol) $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$. See goslarite.

Properties: Colorless crystals, small needles or granular crystalline powder, without odor; astringent, metallic taste; efflorescent in air. Keep well stoppered. Solutions acid to litmus. Sp.gr. 1.9661; m.p. 50°C if rapidly heated, soluble in water and glycerol, insoluble in alcohol.

Derivation: (a) By roasting zinc blende in a reverberatory furnace and lixiviating, with subsequent purification; (b) by the action of sulfuric acid on zinc or zinc oxide.

Method of purification: Crystallization.

Grades: Technical; U.S.P. XVI, reagent.

Containers: Glass bottles; barrels; fiber drums; multiwall paper sacks.

Uses: Medicine; mordant in calico printing; preservative for skins and wood; bleaching paper; preparing zinc chemicals; clarifying glue; reagent in analytical chemistry; feed additive; pesticide adjuvant; fungicide.

zinc sulfate dried (zinc sulfate monohydrate)

because it is less likely to cake than the heptahydrate.

Properties: White, free flowing powder; soluble in water; insoluble in alcohol.

Use: Agricultural sprays; chemical intermediate; glue clarifying; dyestuffs; electroplating; manufacturing of rayon.

zinc sulfate monohydrate. See zinc sulfate dried.

zinc sulfide. ZnS or $\text{ZnS} \cdot \text{H}_2\text{O}$.

Properties: Yellowish, white powder; stable if free from water of crystallization and kept dry; sp.gr. greater than 4; m.p. 1020°C; sublimes at 1180°C; soluble in acids; insoluble in water.

Derivation: By passing hydrogen sulfide gas into a solution of a zinc salt. See also wurtzite and sphalerite.

Grades: Technical; C.P.; fluorescent or luminous.

Containers: 1-lb bottles; barrels; bags.

Uses: Pigment (paint, linoleum, artificial leather); white and opaque glass; white opaque glues and gelatins; base for color lakes; rubber; plastics; dyeing (hydrosulfite process); ingredient of lithopone, as a phosphor in x-ray and television screens and on luminous watch faces.

Shipping regulations: None.*

zinc sulfide white. See lithopone.

zinc sulfite $\text{ZnSO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder; absorbs oxygen from the air to form sulfate. Soluble in sulfurous acid; insoluble in cold water and alcohol; decomposes in hot water.

Derivation: By the action of sulfurous acid on zinc hydroxide.

Method of purification: Crystallization.

Impurities: Zinc sulfate.

Grades: Technical; C.P.

Containers: Glass bottles, tins.

Uses: Medicine, preservative for anatomical specimens.

Shipping regulations: None.*

zinc sulfolcarbolate. See zinc phenolsulfonate.

zinc sulfocyanate. See zinc thiocyanate.

zinc sulfophenate. See zinc phenolsulfonate.

zinc sulfoxylate ZnSO_2 .

Properties: White crystalline material; decomposed by heat; salt of unstable sulfoxylic acid, H_2SO_2 ; zinc sulfoxylate is a strong reducing agent.

Derivation: By the action of zinc and sulfur chloride in ethereal solution, or by the action of sulfur dioxide on granulated zinc in absolute alcohol.

Containers: Fiber drums, multiwall shipping sacks.

Use: A stripping agent in dyeing.

Shipping regulations: None.*

zinc sulfoxylate formaldehyde. See zinc formaldehyde sulfoxylate.

zinc tallate. A mixture of zinc resinate and zinc salts of unsaturated fatty acids. Produced from a soluble tall oil soap and a solution

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

of a zinc salt. Of limited use as a drier in paints.

See also soaps, metallic.

zinc thiocyanate (zinc rhodanide; zinc sulfo-cyanate) $\text{Zn}(\text{CNS})_2$.

Properties: White hygroscopic powder or crystals. Keep well stoppered. Soluble in water, alcohol and ammonium hydroxide.

Derivation: By the interaction of zinc hydroxide and ammonium thiocyanate.

Method of purification: Crystallization.

Grade: Technical. See also solution, next article.

Containers: Glass bottles.

Use: Analytical chemistry

Shipping regulations: None.*

zinc thiocyanate solution.

Typical specifications: Colorless, 32.5-33.5% aqueous solution; sp. gr. 1.25-1.30.

Containers: Stainless steel drums; 550 lbs net.

Uses: Swelling agent for cellulose esters, dyeing assistant.

zinc-tin amalgam. *Composed of zinc 25%, tin 25%, mercury 50%.

Grade: Technical.

Containers: Glass bottles.

Uses: Electrical machines; dental cement

Shipping regulations: None.*

zinc undecylenate $[\text{CH}_2\text{CH}(\text{CH}_2)_9\text{COO}]_2\text{Zn}$

Properties: A fine, white amorphous powder; nearly insoluble in water and alcohol; m.p. 115-116°C

Grade: N.F. XI.

Containers: Drums

Use: Medicine; cosmetics; chemical intermediate.

zinc valerate (zinc isovalerate)

$\text{Zn}[\text{OOCCH}_2\text{CH}(\text{CH}_3)_2] \cdot 2\text{H}_2\text{O}$

Properties: White, pearly crystals or powder with disagreeable odor. Keep well stoppered. Soluble in hot water and alcohol; very slightly soluble in ether

Derivation: Interaction of zinc sulfate and sodium isovalerate or zinc carbonate and isovaleric acid.

Containers: 1-lb bottles.

Use: Medicine.

zinc vitriol. See zinc sulfate, also goslarite.

zinc white. Zinc oxide pastes used by commercial artists. See also zinc oxide.

zinc yellow (citron yellow, buttercup yellow, zinc potassium chromate, zinc chrome).

Properties: A greenish yellow pigment of comparatively low tinting strength. Is partially water-soluble. Consists principally of zinc potassium chromate, about $4\text{ZnO} \cdot \text{K}_2\text{O} \cdot 4\text{Cr}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$.

Derivation: Made by reaction of a solution of potassium dichromate with zinc oxide and sulfuric acid.

Containers: 250-lb bags.

Uses: Principally in the manufacture of rust-inhibitive paints, particularly primers such as are now being used by the aircraft industry. In making green trim paints in

combination with hydrated chromium oxide, it should not be used where the soluble chromates may be objectionable. Not used alone for yellow enamels since severe exposure tends to turn it greenish and less brilliant. Occasionally used as an artists' color. See zinc chromate.

zinc zirconium silicate $\text{ZnO} \cdot \text{ZrO}_2 \cdot \text{SiO}_2$.

Properties: White powder; sp. gr. 4.8; density 115 lbs/cu ft; m.p. 3800°C; soluble in hydrofluoric acid; insoluble in water and alkalis; slightly soluble in mineral acids and hot conc. sulfuric acid.

Containers: Bags, barrels, carloads.

Uses: Opacifier for ceramic glazes.

zineb (zinc ethylenebisdithiocarbamate)

$\text{Zn}(\text{CS}_2\text{NHCH}_2)_2$.

Properties: Light tan solid, insoluble in water.

Derivation: Reaction of sodium ethylenebisdithiocarbamate with zinc sulfate or other zinc salts. In practical application as a fungicide these reactants are mixed in the presence of lime, and the zineb is not formed until after reaction of the carbon dioxide of the air with the film of the other chemicals on the leaf or fruit

Grades: Commercial dusts and wettable powders usually contain 65% active material.

Caution! May cause irritation of eyes, nose, throat, and skin. May be harmful if inhaled or swallowed. MCA warning label.

Uses: Insecticide and fungicide.

zingiber. See ginger.

zinkenite (zincenite) $\text{Pb}_6\text{Sb}_{14}\text{S}_{27}$. A natural sulfantimonide of lead, found in metallic veins.

Properties: Color and streak steel gray;

luster metallic; hardness 3-3.5, sp. gr. 5.3

Occurrence: Colorado; Arkansas, Nevada, Europe.

"Zinol." ⁷⁹ Trademark for a special zinc resinates in solution in mineral spirits.

Properties: Solids 64.0%, viscosity (Gardner-Holdt) "K" (25°C); acid number 12; color (Hellige) 7-8, metallic zinc (combined) 4.3%, wt/gal (25°C) 8.18 lbs. The resin contained in "Zinol" conforms quite closely to the following typical analysis: m.p. (capillary tube) 80°C, acid number 18; metallic zinc (combined) 6.7%

Containers: 55-gal drums, tank cars.

Uses: Printing ink, paint and varnish.

"Zin-O-Lyte." ²⁸ Trademark for a series of zinc plating compounds.

"Zin-O-Lyte" Salts. Fine, white powder containing sodium cyanide and other chemicals for the zinc plating bath.

Containers: 100-lb drums.

Addition Agent O is a heavy gray powder containing molybdenum; soluble in caustic soda solution; insoluble in water.

"Zin-O-Lyte" Brightener. Organic addition agent; fine powder; water-soluble. Used to increase brightness and current efficiencies and to widen the bright current density range.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Z. I. P." ⁴⁰¹ Trade name for a deer and rabbit taste repellent containing zinc dithiocarbamate-amine complex (20%).

Containers: 1-quart and 1-, 5-, 55-gal containers.

Uses: Is diluted with water and used as a spray on vegetation such as nursery stock, forestry seedlings and ornamentals for protection against deer and rabbit damage.

Caution! May be harmful if swallowed. May cause irritation of nose, throat and skin. Avoid breathing spray. Avoid contact with eyes, skin or clothing.

ziram (zinc dimethyldithiocarbamate) $Zn(SCSCH_3CH_3)_2$.

Properties: White and odorless when pure; m.p. 246°C; almost insoluble in water; soluble in acetone, carbon disulfide, chloroform, in dilute alkalis, and in concentrated hydrochloric acid.

Derivation: Reaction of sodium dimethyldithiocarbamate with a soluble zinc salt in aqueous solution.

Grades: 76% wettable powder; 90% technical powder.

Containers: 3-, 50-lb multiwall bags; drums. Caution! May cause irritation and be harmful if inhaled. MCA warning label.

Uses: Rubber accelerator; fungicide.

"Zirberk." ⁶¹ Trademark for zinc dimethyldithiocarbamate. See ziram.

zircite. See zirkite.

"Zirco." ²³⁰ Trademark for a zirconium organic complex in odorless mineral spirits. Not a paint drier, has synergistic action on metallic driers.

"Zircofrax." ²⁸⁰ Trademark for super-refractory products made from zirconium oxide and zirconium silicate.

Properties: High refractoriness; great strength; high thermal conductivity; high resistance to attack by acids and acid slags; porosity about 25%, permeability low.

Uses: Bricks and special shapes for ceramic kiln furniture and in chemical and metallurgical furnaces where severe slagging occurs.

zircon $ZrSiO_4$. A natural zirconium silicate found in igneous rocks. May contain uranium, hafnium, and other elements in minor quantities.

Properties: Color brown, gray, red, colorless; luster adamantine; hardness 7.5; sp. gr. 4.68. Insoluble in acids.

Occurrence: North Carolina; Maine; New York; Florida; India; Australia, Brazil.

Uses: Source of zirconium oxide and metallic zirconium; gem stone; abrasive; refractories; enamels; source of hafnium.

zircon, Australian. See Zircon Granular "TAM" and Zircon Milled "TAM."

zircon, Florida. See Zircon Milled "G" and Zircon Milled "TAM."

zircon flour. Finely milled zircon sand used as a mold wash.

Zircon Granular "G." ³³⁷ Trade name for 98% zircon ($ZrSiO_4$). Gray white powder, sp. gr. 4.6; bulk density 184 lbs/cu ft; fineness -70 mesh to +270 mesh. Used as coarse ingredient in zircon super-refractories, as a smelter addition in producing zirconium porcelain enamel frits, and as a sand seal in high temperature furnace insulations.

Containers: 100-lb paper bags, 500-lb barrels, 60,000-lb carloads.

Zircon Granular "TAM." ³³⁷ (Australian zircon) Trade designation for zirconium silicate ($ZrSiO_4$) with 98+% zircon, 0.05% Fe_2O_3 , 0.1% TiO_2 , 0.5% Al_2O_3 (max); white powder, sp. gr. 4.6; bulk density 179 lbs/cu ft; dissociates at 3200°F; screen analysis +80 mesh 3%, -200 mesh < 1%. Insoluble in water, dilute mineral acids, alkalis, hot concentrated sulfuric acid; slightly soluble in hydrofluoric acid. Used as the coarse ingredient of mixes for special crucibles and refractory items, and in electrical cements.

Containers: 100-lb paper bags; 500-lb barrels; 36,000-lb carloads.

"Zircon H-W." ⁴⁴⁶ Trade name for compound made from the purified mineral by impact pressing, or by air ramming or slip casting for more intricate shapes.

Properties: High density (230 lbs/cu ft) helps it to resist the wetting and penetration of molten glass. Resistant also to thermal spalling, fluxing conditions; has constancy of volume under soaking heat in excess of 2900°F.

Uses: To pave glass tank bottoms and floors; line sodium meta-phosphate and sodium silicate furnaces; tap hole blocks for aluminum and non-ferrous melting; and as nozzles for continuous steel casting operations.

zirconia. See zirconium oxide.

zirconia, stabilized, fused. Zirconium oxide which has been fused with small additions of other oxides to improve its thermal-mechanical properties.

Typical assay: 0.20% SiO_2 , 0.52% Fe_2O_3 , 0.22% TiO_2 , 4.96% CaO ; 94.1% ZrO_2 .

Properties: Sp. gr. 5.6; fusion point 2540-2600°C; coefficient of thermal expansion 0.000080.

Grades: Available in standard mesh sized grains.

Uses: High temperature furnace linings; rocket motors; setter-plates on which dielectrics of barium and strontium titanate are fired.

zirconic anhydride. See zirconium oxide.

zirconium Zr. Element of atomic number 40, group IV of the periodic table. Ninth most abundant metal in the earth's crust.

Properties: Hard, lustrous, grayish, crystalline scales or gray amorphous powder; sp. gr. 6.4; m.p. about 1850°C; soluble in hot, very concentrated acids; insoluble in water and cold acids.

Sources: Zircon; baddeleyite.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: The ore is converted to a carbonitride, which is chlorinated to obtain zirconium tetrachloride. This is reduced with magnesium (Kroll process) in an inert atmosphere. The metal can be prepared in a highly pure and ductile form by vapor-phase decomposition of the tetraiodide. Hafnium must be removed for uses in nuclear reactors (see hafnium).

Grades: Plate, strip, bars, wire; sponge and briquettes; powder; technical; pure (hafnium-free).

Containers: Cans/box.

Uses: Greatest consumption for atomic energy purposes because when free of hafnium, zirconium is corrosion-resistant and has low absorption for neutrons; hence used in nuclear reactor chambers, tubing, etc. Also used as a "getter" material in high-vacuum work, deoxidizer in metal castings; ingredient in flashlight powder; suggested antidote for plutonium poisoning; alloying agent in nickel-chromium and other non-ferrous alloys; bonding agent for ceramic-to-metal seals; high intensity electric arc light. Radioactive zirconium is used in medicine. Zirconium compounds are used in three major fields: (1) chemical process industry, as in leather tanning, catalysts, water repellents for textiles, (2) ceramics and (3) metallurgy. See also zirconium ferro alloys.

Caution: Powder has comparatively low ignition temperature; highly flammable in dry state; explosive in contact with oxidizing agents.

Shipping regulations: Powder, sponge, or scrap, wet or dry: flammable solid. Yellow label. Liquid solutions or mixtures: flammable liquid. Red label.*

zirconium 95. Radioactive zirconium of mass number 95.

Properties: Half-life, 63 days; radiation, beta and gamma.

Derivation: Obtained in a mixture with niobium from the fission products of nuclear reactor fuels.

Forms available: Zirconium oxalate complex in oxalic acid solution

Uses: To trace the flow of heavy petroleum products in pipelines; to measure the rate of catalyst circulation in petroleum cracking plants; to study the cracking and polymerization of hydrocarbons with various catalysts; etc.

Shipping regulations: Class D poison, radioactive material. Red label.*

zirconium acetate solution $\text{H}_2\text{ZrO}_2(\text{C}_2\text{H}_3\text{O}_2)_2$ in aqueous solution.

Properties: (a) Available as 22% ZrO_2 .

Clear to pale amber solution; sp.gr. 1.46 (approx); pH 3.8-4.2 (20°C); f.p. -7°C, stable at room temperature. (b) Available as 13% ZrO_2 . Pale-amber liquid, sp.gr. 1.20 (approx); pH 3.3-4.0 (20°C), stable at room temperature, but temperature of hydrolysis decreases with pH; undergoes exchange with anion exchange resins, but not with cation exchangers.

Containers: 500-lb (polyethylene lined) drums; 30,000-lb carloads.

Uses: Marine fuel oil additive to combat vanadium deposits on boiler tubes; water-repellent ingredient for textiles; curing agent for silicone resins used for water repellency; precipitating agent for gelatin and starch on paper and fabrics.

zirconium acetylacetonate. See zirconium tetraacetylacetonate.

zirconium aluminum Zr, Al alloy. Used for grain refinement in magnet alloys and as a source of zirconium.

zirconium ammonium fluoride (ammonium zirconifluoride) $\text{Zr}(\text{NH}_4)_2\text{F}_6$.

Properties: White crystals. Soluble in water.

zirconium anhydride. See zirconium oxide.

zirconium boride ZrB_2 .

Properties: Gray metallic crystals or powders; sp.gr. 6.085, m.p. 3000°C; Mohs hardness 8; electrical resistivity 9.2 microhm-cm at 20°C; excellent thermal shock resistance; poor oxidation resistance above 1100°C.

Uses: Refractory for special high temperature aircraft and rocket applications; electrodes in metal refining; thermocouple protection tubes; metallurgical additive; high temperature electrical conductor.

zirconium carbide ZrC .

Properties: Sp.gr. 6.78; hardness Mohs 8+; m.p. 3540°C, insoluble in water and hydrochloric acid; soluble in oxidizing acids and attacked by oxidizers; fine powder is pyrophoric.

Derivation: By heating zirconium oxide and coke in an electric furnace.

Grade: Technical.

Containers: Iron drums.

Uses: Incandescent filaments, abrasive; source for pure zirconium and zirconium compounds, cermet component; metallurgical additive; high temperature electrical conductor; refractory.

zirconium carbonate. See zirconium carbonate, basic.

zirconium carbonate, basic (zirconyl carbonate, zirconium carbonate) ZrOCO_3 or $\text{ZrOCO}_3 \cdot x\text{H}_2\text{O}$.

Properties: White, amorphous powder. Soluble in acids, insoluble in water.

Derivation: By adding sodium carbonate to a solution of zirconium salt.

Grade: Technical.

Containers: Glass bottles; wooden kegs.

Uses: Preparation of zirconium oxide.

Shipping regulations: None.*

zirconium carbonitride ZrCN . Zirconium cyanonitride. A solid used for the production of zirconium and its compounds including the tetrachloride. Also, a deoxidizer and source of zirconium in steels.

zirconium chloride. See zirconium tetrachloride.

zirconium chloride, basic. See zirconium oxychloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

zirconium dioxide. See zirconium oxide.

zirconium disilicide Zr_2Si . A solid which forms coatings resistant to flame or blast impingement. Also has special alloy applications.

zirconium ferro alloys (ferrozirconium alloys).

Alloys used in the manufacture of steel.

12 to 15 percent zirconium alloy: Approximate analysis: zirconium 12-15%, silicon 39-43%; iron 40-45%. Application: Steel of high silicon content.

35-40 percent zirconium alloy: Approximate analysis: zirconium 35-40%, silicon 47-52%, iron 8-12%. Application: Steel of low silicon content.

Uses: Zirconium is used as a deoxidizer and scavenger of steel in amounts between 0.05 and 0.10%. It acts first on the oxygen and nitrogen in the steel, tending to eliminate them as well as non-metallic inclusions. In amounts of 0.10 to 0.15%, it forms zirconium nitride. When present in steel above 0.15%, it combines with sulfur, forming zirconium sulfide. This prevents tearing in rolling and produces a better surface on high-sulfur steel.

zirconium glycolate $\text{H}_4\text{ZrO}(\text{C}_2\text{H}_2\text{O}_3)_3$.

Properties: Solid; decomposes without melting on heating to about 220°C; insoluble in water and organic solvents; soluble in alkali and sulfuric acid solutions. One or more of the acidic hydrogens may be replaced by alkali metals or ammonium to give water-soluble salts.

Containers: 250-lb (polyethylene lined) fiber drums (41 gals).

Uses: Cosmetics (deodorant); medicine; sequestrant; source of high purity zirconia.

zirconium hydride ZrH_2 . Contains 1.7 to 2.1% combined hydrogen which can be driven off in a vacuum above 600°C. Because powdered zirconium is extremely hazardous, it is shipped as the hydride.

Properties: Gray-black metallic powder. Stable toward air and water. Sp. gr. 5.6.

Derivation: Reduction of zirconia with calcium hydride or magnesium in the presence of hydrogen; direct combination of hydrogen and zirconium metal.

Grades: Commercial (contains hafnium); reactor (hafnium free).

Uses: Vacuum tube getter; powder metallurgy; metal-foaming agent; combustible mixtures; nuclear moderators; reducing agent; hydrogenation catalyst.

Hazards: Reactive with oxidizing agents.

zirconium hydroxide $\text{Zr}(\text{OH})_4$.

Properties: White, bulky, amorphous powder. Soluble in dilute mineral acids; insoluble in water and alkalis. Sp. gr. 3.25; decomposes to ZrO_2 at 550°C.

Derivation: By the action of a solution of sodium hydroxide on a solution of a zirconium salt.

Grade: Technical.

Containers: Wooden kegs; glass bottles.

Use: Zirconium compounds; pigments, dyes,

glass.

Shipping regulations: None.*

zirconium lactate $\text{H}_4\text{ZrO}(\text{CH}_3\text{CHOCO}_2)_3$.

Properties: White, slightly moist pulp; decomposes without melting; very slightly soluble in water and the common organic solvents; soluble in aqueous alkalis with formation of salts; decomposes to hydrous zirconia above pH 10.5. Efficient odor absorber.

Grade: Zirconia 25% (min).

Containers: 250-lb (polyethylene lined) fiber drums (41 gals).

Uses: Body deodorants; source of zirconia.

zirconium naphthenate.

Properties: Amber-colored, heavy liquid.

Completely transparent. Consistency equivalent to that of heavy lubricating oil. Very stable. Unlike other metallic naphthenates possesses no drying properties. Soluble in all common solvents. Sp. gr. 1.05.

Derivation: By heating a mixture of naphthenic acid and zirconium sulfate.

Grade: Technical.

Uses: Ceramics (enamels, glazes); lubricants; paints and varnish (anti-chalking agent, minimizer of moisture and solar radiation effects).

zirconium nitrate $\text{Zr}(\text{NO}_3)_4 \cdot 5\text{H}_2\text{O}$.

Properties: White hygroscopic crystals. Soluble in water and alcohol. Decomposes at 100°C.

Derivation: By the action of nitric acid on zirconium oxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Kegs, drums.

Use: Preservative.

Shipping regulations: Oxidizing material.

Yellow label.*

zirconium nitride ZrN . A brassy-colored powder produced by heating the metal in nitrogen.

Properties: Sp. gr. 7.09; hardness Mohs 8+; m.p. 2930°C; slightly soluble in dilute hydrochloric or sulfuric acid; soluble in concentrated acid.

Uses: Special crucibles; cermets; refractories.

zirconium orthophosphate. See zirconium phosphate.

zirconium oxide (zirconia; zirconium dioxide; zirconic anhydride; zirconium anhydride) ZrO_2 . Occurs in nature as baddeleyite and zirkite.

Properties: Heavy white amorphous powder; sp. gr. 5.73; m.p. 2700°C; hardness 6.5; refractive index 2.2; insoluble in water and most acids or alkalis at room temperature, soluble in nitric acid and hot concentrated hydrochloric, hydrofluoric, and sulfuric acids. Most heat resistant of commercial refractories.

Derivation: By heating zirconium hydroxide or zirconium carbonate.

Grades: Reagent; technical; crystals; fused;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

C.P. (99% zirconia).

Containers: Bags; drums; carloads.

Uses: Pigment for paints, lacquers, resins and inks; component of dielectrics; pharmaceutical agent; catalyst; piezoelectric crystals; color stabilizer of organic dyes; to increase light efficiency of lacquers or resins used as light reflectors; crucibles; furnace linings; x-ray photography; substitute for calcium oxide in calcium lights; opacifier in white glass for indirect electric lighting; ceramics; acid-proof enamel; refractory utensils and cermets; metallurgy; source of zirconium; abrasive and polishing agent.

Shipping regulations: None.*

See also zirconia, fused, stabilized.

Zirconium Oxide 45006. ³³⁷ Trade designation for proprietary zirconium oxide containing 98+ % ZrO_2 . Salmon colored powder, sp. gr. 5.7, bulk density 89 lbs/cu ft; m.p. 4900°F. Available as -20 mesh with 0.5% SiO_2 , 0.5% TiO_2 , 0.5% Al_2O_3 , (max); also as -325 mesh with 1.0% SiO_2 , 0.5% TiO_2 , 0.75% Al_2O_3 , (max). Used as setter material in firing ceramic dielectrics; a commercial source of high purity ZrO_2 , also used as a raw material for the manufacture of super-refractories.

Containers: 100-lb drums, 36,000-lb carloads.

"Zirconium oxide, E. F." ³³⁷ Trade name for electrically fused zirconium oxide available as salmon colored $\frac{1}{2}$ -inch lumps (98.5% ZrO_2) or milled material (95% ZrO_2) of -35, -80, -200, or -325 mesh; sp. gr. 5.7; bulk density 205 lbs/cu ft; m.p. 4900°F. The lumps are used in the massive packing of high temperature furnaces. The milled material is used in the manufacture of super-refractory crucibles, rods, tubes, and special shapes for use up to 4000°F under oxidizing conditions. Also used as a setter material in firing ceramic dielectrics.

Containers: 100-lb drums; 36,000-lb carloads.

zirconium oxychloride (zirconium chloride, basic; zirconyl chloride) $ZrOCl_2 \cdot 8H_2O$.

Properties: White, silky crystals, m.p. about 115°C with evolution of hydrochloric acid and water, density 44 lbs/cu ft. Soluble in water, methanol, and ethanol; insoluble in other organic solvents. Aqueous solutions are acidic.

Derivation: By the action of hydrochloric acid on zirconium oxide.

Method of purification: Crystallization.

Grades: Technical; 36% ZrO_2 , H.P.

Containers: Barrels, 250-lb (plastic lined) fiber drums; 30,000-lb carloads.

Uses: Textile, cosmetic, and grease additive; chemical reagent; source of zirconium salts, in lakes and toners of acid and basic dyes.

Shipping regulations: None.*

zirconium phosphate (zirconium phosphate, basic; zirconium orthophosphate)
 $ZrO(H_2PO_4)_2 \cdot 3H_2O$.

Properties: White, dense, amorphous powder. Decomposes on heating. Soluble in acids; insoluble in water and organic solvents. Extensively hydrolysed in basic solution.

Derivation: By the action of phosphoric acid on zirconium hydroxide.

Grade: Technical.

Containers: Glass bottles; 250-lb fiber drums; 30,000-lb carloads.

Use: Chemical reagent; cation scavenger; coagulant; carrier for radioactive phosphorus.

Shipping regulations: None.*

zirconium phosphate, basic. See zirconium phosphate.

zirconium picramate.

Shipping regulations: Wet with 20 percent of water. Oxidizing material. Yellow label.*

zirconium potassium fluoride ZrK_2F_6 . (potassium fluozirconate, potassium zirconifluoride).

Properties: White crystals. Soluble in water (hot).

Grade: Technical.

Use: Preparation of metallic zirconium.

zirconium potassium sulfate (potassium zirconium sulfate) $2K_2SO_4 \cdot Zr(SO_4)_2 \cdot 3H_2O$.

Properties: White, crystalline powder.

Slightly soluble in water.

zirconium pyrophosphate ZrP_2O_7 .

Properties: White solid; stable to about 1550°C; insoluble in water and dilute acids other than hydrofluoric acid, coefficient of thermal expansion 5×10^{-6} (approx) at 1000°C.

Containers: 250-lb fiber drums; 30,000-lb carloads.

Use: Suggested as refractory; olefin polymerization catalyst; phosphor.

zirconium silicate. See zircon.

zirconium sodium sulfate

$2Na_2SO_4 \cdot Zr(SO_4)_2 \cdot 3H_2O$.

Properties: White solid.

Containers: Drums.

Use: Manufacture of zirconium.

"Zirconium Spinel." ³³⁷ Trade designation for a synthetic complex containing 40% ZrO_2 , 20% SiO_2 , 20% Al_2O_3 , 19% ZnO . White powder, particle size 44 microns max; sp. gr. 4.7; bulk density 98 lb/cu ft; m.p. 3100°F. Insoluble in water, partly soluble in dilute acids, insoluble in alkalis, soluble in hot concentrated sulfuric acid. Used as an opacifier that widens the firing range of a glaze, and promotes high gloss and smooth texture.

Containers: 80-lb paper bags; 500-lb barrels, 30,000-lb carloads.

zirconium sulfate $Zr(SO_4)_2 \cdot 4H_2O$.

Properties: White, crystalline powder; bulk density 70 lbs/cu ft; decomposes to monohydrate at about 100°C. Soluble in water; slightly soluble in alcohol; insoluble in hydrocarbons. Aqueous solutions are strongly acidic; will precipitate potassium and amino

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v

acids from solution; are decomposed by bases and heat.

Derivation: By the action of sulfuric acid on zirconium hydroxide.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles; 500-lb (plastic lined) steel drums.

Uses: Chemical reagent; lubricants; catalyst support; protein precipitation; tanning.

Shipping regulations: None.*

zirconium sulfate, basic (zirconyl sulfate) ZrOSO_4 (approximately). Similar in properties to the oxychloride, and is prepared in a similar fashion, the end result being in cake form. Used in textile treatment. The material is also handled as an acidic water solution.

zirconium tetraacetylacetonate (zirconium acetylacetonate; zirconium tetrapentanedionate) $\text{Zr}(\text{C}_5\text{H}_7\text{O}_2)_4$.

Properties: A colorless, crystalline tetra-chelate; density 1.415; m.p. 194-5°C (decomposition begins at 125°C). Soluble in pyridine, acetone, benzene, and other organic solvents having some polarity; slightly soluble in water.

Derivation: Reaction between zirconyl chloride, acetylacetone and sodium carbonate.

Uses: Cross-linking agent for polyol, polyester, and polyalkoxy resins; lubricant and grease additive; reagent; catalyst.

zirconium tetrachloride (zirconium chloride) ZrCl_4 .

Properties: White, lustrous crystals. Soluble in alcohol; decomposes in water. Sp. gr. 2.8; sublimes above 300°C.

Derivation: By the action of hydrochloric acid on zirconium hydroxide.

Grade: Technical.

Containers: Glass bottles; drums.

Uses: Source of the pure metal (formed as intermediate in process); analytical chemistry; water repellents for textiles; pigments; tanning agent; catalysis.

Shipping regulations: None.*

zirconium tetrapentanedionate. See zirconium tetraacetylacetonate.

Zircon Milled, "G." ³³⁷ (Florida zircon).

Trade name for zircon with 96% ZrSiO_4 . Gray white powder; sp. gr. 4.5; bulk density 95 lbs/cu ft; available as fine grind (0.1% + 200 mesh, 1.0% + 325 mesh) and coarse grind (1% + 200 mesh, 10% + 325 mesh). Used as fine ingredient in zircon refractories, and as a component of enamel frits, ceramic insulators for spark plugs, low-loss electrical porcelains and acid resistant chemical porcelain.

Zircon Milled "TAM." ³³⁷ (Australian and Florida zircon milled). Trade designation for 96% ZrSiO_4 ; white powder with average particle size less than 44 microns, sp. gr. 4.5; bulk density 109 lbs/cu ft. Used for slip casting of high grade zircon refractories, as an ingredient of electrical and chemical porcelains, and as an opacifier in

some ceramics.

Containers: 80-lb paper bags; 550-lb barrels; 36,000-lb carloads.

zircon sand. Term applied to sand containing considerable zirconium, titanium and related metals. Used as a source of these elements, and also as a high heat resistant sand for casting of alloys.

zirconyl carbonate. See zirconium carbonate, basic.

zirconyl chloride. See zirconium oxychloride.

zirconyl hydroxychloride solution

$\text{ZrOOHCl} \cdot n\text{H}_2\text{O}$.

Properties: Colorless or slightly acid solution; sp. gr. 1.26; forms a soluble glass on evaporation; pH of solution 0.8 (approx); reacts with alkalis to form hydrous zirconia. Solution assays 20% zirconia.

Containers: 500-lb (plastic lined) steel drums; 30,000-lb carloads.

Uses: Pharmaceuticals; deodorants; precipitation of acid dyes; synthesis of zirconium compounds; water-repellents for textiles.

zirconyl hydroxynitrate solution. See zirconyl nitrate solution (basic).

zirconyl nitrate solution (basic) (zirconyl hydroxynitrate solution) $\text{ZrO}(\text{OH})\text{NO}_3$.

Properties: Sp. gr. (25°C) 1.35.

Uses: Gelations and improving lamination bonds of polyvinyl alcohol.

zirconyl sulfate. See zirconium sulfate, basic.

"Zircopax." ³³⁷ Trade name for 94-96.5% pure zircon; white powder, sp. gr. 4.5; bulk density 98 lbs/cu ft; average particle size 15 microns max. Used as an opacifier in glazes for wall tile, sanitary ware, electrical porcelain and art ware to impart craze resistance, whiteness, color stability, and reduction of chrome flashing.

Containers: 80-lb paper bags; 500-lb drums; 36,000-lb carloads.

"Zircotan." ²³ Trademark for zirconium tanning agents which produce through-white leather.

Use: Production of white kid suede, glove leathers, retannage of chrome leather.

"Zirex." ⁷⁹ Trademark of a special zinc resin having a high melting point; high zinc content (twice as high as "Zitro") with a pale color and a negative acid number (slightly basic).

Constants: Sp. gr. (25°C) 1.162; m.p. (capillary tube) 132°C; metallic zinc (combined) 8.9%; color "N."

Containers: Non-returnable, light-weight galvanized drums of about 500 lbs gross wt. Tare 14-16 lbs.

Uses: Paints; varnishes; fiber coating compounds (with ethyl cellulose); adhesives; linoleum print paint; ethyl cellulose lacquers.

zirkite (zirkite). Name applied to baddeleyite that contains appreciable zirconium oxide. Found in Brazil.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Zirmet."** ²⁵⁰ Trademark for ductile zirconium for vacuum tube getters; available as thin sheet and wire.
- "Zirox B."** ³³⁷ Trade name for zirconium oxide containing 90% ZrO_2 and 5-8% SiO_2 . White cream powder, sp.gr. 5.4; bulk density 72 lbs/cu. ft.; maximum particle size 5 microns. Used as a polishing compound for ophthalmic lenses, precision glass polishing, also for polishing glazes, marble and granite. "Zirox C" is closely similar with bulk density 70 lbs/cu. ft. Containers: 50-lb drums, 100-lb drums, 36,000-lb carloads.
- "Zirox D."** ³³⁷ Trade name for a zirconium oxide similar to "Zirox B" but with improved suspension properties to permit use in recirculating automatic equipment.
- "Zitro."** ⁷⁹ Trademark of a zinc resinate having a high melting point, high zinc content, pale color and low acid number. Constants: Sp.gr. (25°C) 1.130, m.p. (capillary tube) 132°C; metallic zinc (combined) 4.9%; acid number 15; color "N." Containers: Nonreturnable light-weight galvanized drums of about 500 lbs gross weight. Tare 14-16 lbs. Uses: Paints; varnishes; fiber coating compounds (with ethyl cellulose); adhesives, linoleum print paint; ethyl cellulose lacquers.
- ZMA.** Abbreviation for zinc metaarsenite. See zinc arsenite.
- Zn.** Symbol for zinc.
- "Zobar."** ²⁸ Trademark for a weed killer based on an aqueous solution of the dimethylamine salts of polychlorobenzoic acids, containing 4 lb of acid equivalent per gallon. Use: See "Trysben" 200.
- zoisite (thulite)** $Ca_2(AlOH)Al_2(SiO_4)_3$. One of the epidote (q.v.) group of minerals. Properties: Grayish-white, gray, peach-blossom to rose-red, green; white or uncolored streak; vitreous or pearly luster. Sp.gr. 3.25-3.37, hardness 6-6.5. Occurrence: United States (Tennessee, Massachusetts, Pennsylvania), Austria, Switzerland, Norway, Italy. Uses: Ornamental stone.
- "Zonyl" E-7.** ²⁸ Trademark for a fluoroalcohol pyromellitate. Amber oil. Use: Thermally stable fluid-lubricant and power fluid.
- "Zonyl" E-91.** ²⁸ Trademark for fluoroalcohol camphorate. Amber oil. Use: Thermally stable liquid-lubricant and power fluid.
- "Zonyl" S-13.** ²⁸ Trademark for a fluorochemical surfactant, a free acid of fluoroalkyl phosphate. Brown waxy solid. Use: Chemically stable surface active agent.
- "Zopaque."** ²⁹⁶ Trademark for pure titanium dioxide (q.v.), manufactured from ilmenite and specially processed to control crystal growth. It is used in nearly every industry requiring a white opacifying agent.
- "Zoron" CR.** ²⁸ Trademark for a resin finish. A clear solution of thermosetting resin. Use: Synthetic tanning assistant to tighten leather grain.
- "Zoron" TR.** ²⁸ Trademark for an anionic alkaline dispersion of unplasticized thermoplastic resin. Light cream-colored liquid. Use: As a base for seasoning to obtain a glossy top finish for leather and leather articles.
- zoxazolamine** $C_7H_5ClN_2O$. Properties: White to creamy white, odorless powder or glistening crystals; freely soluble in alcohol; nearly insoluble in water; m.p. 183-188°C. Grade: N.F. XI. Use: Medicine.
- Zr.** Symbol for zirconium.
- Zr "G."** ²⁵⁰ Trademark for a highly pyrophoric zirconium metal powder of low oxide and impurity content. Particle size is 99% minus 200 mesh with average Fisher subsieve size 3 ± 1 microns. Uses: Production of pyrotechnics, ammunition, photo flash bulbs. Containers: Packed under water in special I.C.C. approved containers.
- zymase.** The enzyme present in yeast which converts sugars to alcohol and carbon dioxide.
- zymohexase.** See aldolase.
- "Zytel."** ²⁸ Trademark for nylon resin available as molding powders, extrusion powder and soluble resin.
- "Zytron."** ²³³ O-[2,4-dichlorophenyl]-O-methyl isopropylphosphoramidothioate. Use: As active ingredient for crab grass control; either as dry material or liquid emulsion.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Nos.

"99." ²³³ Trademark for 2,4-D base compounds.

"#140." ¹³³ Trademark for a general purpose black for inks and paints; low oil absorption. Made by impingement process. Available in uncompressed and densed form. Container: 25-lb bags. .

606. See arsphenamine. The name arose from the fact that this was the 606th and finally successful compound Ehrlich had tried against syphilis.

"6-12" ("Six-Twelve.") ²¹⁴ Trademarks for an insect repellent. Active ingredient, ethylhexanediol, 100%.

Properties: Colorless, odorless liquid; contains no grease or oil.

Uses: Effective repellent against mosquitoes, chiggers, stable flies, black flies and gnats.

"#999." ¹³³ Trademark for an intermediate color impingement carbon black made from natural gas. Used for industrial paints and plastics; excellent ultraviolet screening properties. Protects polyethylene from ultraviolet breakdown.

Containers: 12½-lb bags (powdered form); 25-lb bag (beads).

1080. See sodium fluoroacetate.
